

we have gleaned from our experiences and studies. The relief of pain is of interest to and an obligation of all physicians. The Section on Anesthesiology through the medium of its scientific programs, its papers which are published in the Journal and its scientific exhibits serves as the avenue for the dissemination of such knowledge to physicians in other specialties. Thus, if we are to serve the

public in the capacity to which we are pledged, we can only do so by being good specialists. In order to be good specialists we must first be good doctors and in order to be good doctors we must be active participants in organizations and functions designed to support and advance medicine in all its phases.

JOHN ADRIANI, M.D.

Enzymes Alleviate Literary Gastritis

Wallerstein Co., a pioneer in the enzyme field, has scored another break-through. It now offers new biochemical catalysts to aid authors who seek to garnish the scientific diets of their colleagues and successors. These enzymes are available now; others are still in development stages:

Techno-amylase: An enzyme complex that removes bulky, starchy components which add unnecessary volume to reports. (Caution: this enzyme should not be used where reports are judged by weight.)

Techno-protease: An enzyme system that removes low quality, proteinaceous quagmire and allows readers to get to the heart of the subject.

Techno-pectinase: An enzyme system that clarifies reports by reducing their viscosity; thus, they become free-flowing, and cloud-

producing elements settle for later rapid removal. (Techno-pectinase is contraindicated in patents and pseudotechnical sales literature.)

Techno-flavor: A new enzyme that adds flavor to reports, ensuring sustained reader interest and consumption.

Anatole France once wrote:

Whenever you can shorten a sentence do.
And one always can.
The best sentence?
The shortest.
