

The author emphasizes the physiology and pathology of cardiac disease throughout the book. Valvular and congenital heart disease are the primary areas of focus of the work. The chapter on anesthesia for cardiac surgery in the first year of life, by D. J. Hatch, is outstanding, with a good discussion of specific lesions and profound hypothermia.

The book gives a somewhat dated picture of cardiac anesthesia and surgery, especially in the large sections on anesthesia for closed cardiac surgery and diagnostic procedures. The physiology, pharmacology and clinical management of coronary-artery disease and myocardial revascularization are barely mentioned. With coronary-artery surgery accounting for about 60-70 per cent of cardiac surgery in the United States, it is unfortunate that only two pages in the text deal with the patient undergoing coronary revascularization.

In addition, modern therapeutic and monitoring techniques are not covered. There is no discussion of pulmonary arterial cath-

eterization, ECG monitoring, or arrhythmia detection and treatment. Pharmacologic modalities such as vasodilator therapy for heart failure, and cardioplegic solutions, are not even mentioned. The intra-aortic balloon pump is dismissed in only two paragraphs, which state how poor the results have been. The principles of postoperative intensive care are covered on one page.

In short, this book presents in a didactic manner cardiac surgery at the present time in the United Kingdom. There is little discussion of alternate techniques and therapeutic modalities. The book is written in the British style and is quite clear. Unfortunately, it is out of date with respect to modern cardiac surgery and anesthesia in the United States.
