

.....

## Subject Index

- Abfraction, tooth wear 89
- Abrasion
  - relative dentine abrasion 93, 94, 96–99
  - relative enamel abrasion 96–99
  - tooth wear 87, 88
- Acid phosphatase, calculus formation role 20, 22
- Acquired pellicle
  - composition
    - bacteria 47–49
    - carbohydrates 38
    - lipids 38, 39
    - matrix-assisted laser desorption mass spectrometry 37
    - proteins 31, 32, 34–38, 123
  - definition 29
  - dentifrice effects 54, 55
  - diet effects 48
  - extrinsic stain formation
    - chlorhexidine staining 50–52
    - natural stains 52–54
  - fluoride effects 55
  - formation
    - in vitro models 34
    - proteolytic processes 34
    - salivary protein adsorption 30–33
    - stages 30, 123
  - functions
    - bacterial adherence modulation 47–49
    - lubrication of tooth surface 43, 44, 124
    - maturation and protective properties 46, 96
    - mineral homeostasis 46, 47
    - semipermeable barrier 44–46, 123, 124
    - mechanical properties 125–127
    - tannin effects 124–127
    - thickness 106
    - tooth wear protection 90
    - ultrastructure 29, 33, 39–43, 55, 56
- Atomic force microscopy (AFM), tannin-reacted pellicle studies 125
- Attrition, tooth wear 88, 89
- Bacteria
  - calculus and caries formation 21
  - pellicle adhesion 57–59
- Beta-blockers, calcium formation inhibition 8
- Brushing
  - demineralization and remineralization in vitro model studies 70–72
  - pellicle effects 54, 55
  - plaque composition effects 136
  - tooth wear assessment
    - clinical studies 93, 94
    - implications 100, 101
    - in situ studies 95–100
    - in vitro tests 90–93
- Calcium glycerophosphate, demineralization and remineralization in vitro model studies 71, 72

- Calcium, plaque chemical saturation of
  - enamel minerals in relation to caries susceptibility 134, 135, 143–145
- Calculus
  - aging association 1, 6
  - beta-blocker inhibition 8
  - caries incidence and prevalence
    - relationship 3–8
  - composition 9
  - fluoride effects 5, 6, 22
  - mineralization 1
  - pH and formation 9, 16, 17
  - saliva factors
    - bacteria species 21
    - calcium and phosphate 14, 15
    - enzymes 20
    - immunoglobulin A 20
    - inorganic factors 12
    - lipids 19
    - organic factors 12
    - overview 11
    - plaque 9, 12, 13
    - predicted effects 13, 14
    - protein 17–19
    - pyrophosphate 22
  - scoring 2
- Caries, *see also* Plaque
  - aging association 1, 6
  - calculus incidence and prevalence
    - relationship 3–8
  - composition 9
  - demineralization 1
  - fluoride effects 5, 6, 22
  - hidden caries 76
  - lesions, *see* White spot lesions
  - pH and formation 9, 10, 16, 17
  - saliva factors
    - bacteria species 21
    - calcium and phosphate 14, 15
    - enzymes 20
    - immunoglobulin A 20
    - inorganic factors 12
    - lipids 19
    - organic factors 12
    - overview 11
    - plaque 9, 12, 13
    - predicted effects 13, 14
    - protein 17–19
    - pyrophosphate 22
- Chlorhexidine, pellicle staining 50–52
- Confocal laser scanning microscopy (CLSM), acquired pellicle ultrastructure studies 39, 40
- Degree of saturation, plaque 133–135
- Demineralization, *see* Caries; Mineralization models; White spot lesions
- Dentifrice, *see* Brushing
- Dentine
  - enamel demineralization effects 76–78
  - hydration effects on mechanical properties 109, 110
- Elasticity, *see* Young's modulus of elasticity
- Electron microprobe analysis
  - enamel composition analysis 110, 111, 113
  - white spot lesion composition analysis 121, 122, 128
- Enamel
  - chemical variation 110, 111, 115
  - hardness 106, 107, 110, 111, 114–118
  - hydration effects on mechanical properties 109, 110
  - nanindentation studies 107, 109, 128
  - site-specific differences in mechanics 117, 118, 127
  - Young's modulus of elasticity 106, 107, 110, 111, 114–118
- Enamel-dentine junction (EDJ)
  - composition analysis 113
  - demineralization 76–78
  - mechanical properties 105, 110, 114–116
  - ultrastructure 113, 116
- Erosion, tooth wear 87, 96
- Fluoride
  - calculus and caries formation effects 5, 6, 22
  - demineralization and remineralization in vitro model studies 71, 72, 77, 78, 81
  - pellicle effects 55

- plaque composition
  - acid production effects 141
  - clearance rate 146
  - mouthrinse composition effects 140, 141
  - oral soft tissue as reservoir 142
  - site-specific differences in oral concentration 138–140
- Hardness, enamel 106, 107, 110, 111, 114–118
- Immunoglobulin A, calculus and caries formation effects 20
- $K_{en}$  value, bovine enamel 79
- Lactic acid, plaque chemical saturation of enamel minerals in relation to caries susceptibility 134, 135, 137
- Lipids, calculus and caries formation 19
- Lysozyme, caries formation role 20
- Mass spectrometry (MS)
  - acquired pellicle composition analysis 37
  - white spot lesion composition analysis 121, 122, 128
- Mineralization models
  - bovine enamel models 78–82
  - fluoride studies 71, 72, 77, 78, 81
  - lesion parameters at baseline, effects on subsequent demineralization and remineralization 66–70
  - pH cycling 65, 70–72
  - simulated plaque-fluid driving forces 72–75
  - substrate interactions 76–78
  - treatment studies 70–72
- Nanodynamic mechanical analysis, tannin-reacted pellicle studies 125, 126
- Nanoindentation, enamel mechanical studies 107, 109, 128
- Pellicle, *see* Acquired pellicle
- pH
  - calculus and caries formation effects 9, 10, 16, 17
  - cycling, in vitro models 65, 70–72, 122
  - demineralization and remineralization in vitro model studies 73
  - plaque 135, 137, 138
- Phosphate, plaque chemical saturation of enamel minerals in relation to caries susceptibility 134, 135, 143–145
- Plaque
  - calculus and caries formation 9, 12, 13, 132
  - chemical saturation of enamel minerals in relation to caries susceptibility
    - calcium 134, 135, 143–145
    - degree of saturation 133–135
    - lactic acid 134, 135, 137
    - pH 135, 137, 138
    - phosphate 134, 135, 143–145
  - demineralization and remineralization under simulated plaque-fluid driving forces 72–75
  - fluid analysis 133
  - fluoride
    - acid production effects 141
    - clearance rate 146
    - mouthrinse composition effects 140, 141
    - oral soft tissue as reservoir 142
    - site-specific differences in oral concentration 138–140
  - oral hygiene effects on composition 136
  - radiation therapy effects on composition 136, 137
  - structure effects on acid production and clearance 137, 138
- Pyrophosphate, calculus and caries formation effects 22
- Radiation therapy, effects on plaque composition 136, 137
- Relative dentine abrasion (RDA), tooth wear assessment 93, 94, 96–99
- Relative enamel abrasion (REA), tooth wear assessment 96–99

- Saliva
  - acquired pellicle formation and protein adsorption 30–33
  - calculus and caries formation
    - factors
      - bacteria species 21
      - calcium and phosphate 14, 15
      - enzymes 20
      - immunoglobulin A 20
      - inorganic factors 12
      - lipids 19
      - organic factors 12
      - overview 11
      - plaque 9, 12, 13
      - predicted effects 13, 14
      - protein 17–19
      - pyrophosphate 22
- Scanning electron microscopy (SEM)
  - acquired pellicle ultrastructure studies 39, 42
  - enamel-dentine junction 113, 116
  - mineralization models 80, 81
  - white spot lesions 118
- Staining, pellicle
  - chlorhexidine staining 50–52
  - natural stains 52–53
  - tannins 125
- Tannin, pellicle effects 124–127
- Tooth wear
  - assessment
    - clinical studies 93, 94
    - in situ studies 95–100
    - in vitro tests 90–93
    - oral hygiene product implications 100, 101
  - definition 86
  - mechanisms
    - abfraction 89
    - abrasion 87, 88
    - attrition 88, 89
    - erosion 87
    - interaction between mechanisms 89
  - pellicle protection 90
- Transmission electron microscopy (TEM), acquired pellicle ultrastructure studies 39, 41, 42
- Wear, *see* Tooth wear
- White spot lesions
  - chemical analysis 121, 122
  - demineralization 118
  - formation 105, 118
  - mechanical properties 119, 120
  - models and generation 119, 122
  - ultrastructure 118
- Young's modulus of elasticity, enamel 106, 107, 110, 111, 114–118
