An unfortunate error appeared in the first sentence of the second paragraph of the Mini-review by Franco et al. (2007) that the authors would like to correct. By mistake, the dosage was switched between the two components of the doxycycline + rifampicin therapy mentioned. The dosage regimen recommended by the WHO should read ‘6-week doxycycline (200 mg/day, orally) + rifampicin (600–900 mg/day, orally)’.

The authors sincerely apologise for any inconvenience caused by this error.

Conflicts of interest: None declared.
