Seeing Analgesia during General Anesthesia: Three Ways

Traditional assessment of analgesia utilizes physiological parameters combined with clinical experience to guide analgesic dosage. Its efficacy is variable.

1. I think our analgesia is adequate...
   HR 65
   SBP 90
   BIS 45

2. Estimates of analgesia are produced by PK/PD models, which incorporate patient demographics to predict effect site drug concentrations.

3. Pupillary dilatation reflex amplitude (PDRA) assesses analgesia by measuring the dilatation resulting from a noxious stimulus, mediated by parasympathetic inhibition. Its efficacy is similar to PK/PD models, with an AUROC of 0.9 [95% CI 0.83, 0.96].

Probability of adequate analgesia: 98%

AUROC = area under the receiver operating characteristic curve; BIS = bispectral index; CI = confidence interval; HR = heart rate; PK/PD = pharmacokinetic–pharmacodynamic; SBP = systolic blood pressure.
