**CLINICAL SCIENCE**

- **Carbon Footprint of General, Regional, and Combined Anesthesia for Total Knee Replacements**
  
  F. McGain, N. Sheridan, K. Wickramaratne, S. Yates, B. Chan, S. McAlister ............................................................... 976

  The carbon footprint in carbon dioxide equivalent emissions associated with general anesthesia (n = 9), spinal anesthesia (n = 10), and combined (general and spinal) anesthesia (n = 10) for total knee replacement surgery in Melbourne, Australia, were similar. Single-use equipment, electricity for the patient air warmer, and pharmaceuticals were major sources of carbon dioxide equivalent emissions across all anesthetics. Sevoflurane was a significant source of the carbon dioxide equivalent emissions of both general anesthesia and combined anesthesia. Washing and sterilizing reusable items contributed substantially to the carbon dioxide equivalent emissions of both spinal and combined anesthesia. Oxygen use was an important contributor to the carbon footprint of spinal anesthesia.

**ON THE COVER:** Health care itself contributes to climate change. Anesthesia is a “carbon hotspot,” yet few data exist to compare anesthetic choices. In this issue of ANESTHESIOLOGY, McGain et al. examined the carbon dioxide equivalent emissions associated with general anesthesia, spinal anesthesia, and combined (general and spinal anesthesia) during a total knee replacement. In an accompanying editorial, Struys and Eckelman discuss how practicing anesthesiologists can lower the environmental footprint of anesthesia. Cover Design: A. Johnson, Vivo Visuals Studio. Cover Image: “This is the waste of one operation… my operation” by Dutch spacial artist Maria Koijck, created with waste generated during her own surgery. **Basic Science**

**Arterial and Mixed Venous Kinetics of Desflurane and Sevoflurane, Administered Simultaneously, at Three Different Global Ventilation to Perfusion Ratios in Piglets with Normal Lungs**

M. Kretzschmar, J. E. Baumgardner, A. Kozian, T. Hachenberg, T. Schilling, G. Hedenstierna, A. Larsson

The washin and washout kinetics of simultaneously administered desflurane and sevoflurane were assessed in seven piglets by measuring \( P_{\text{aw}} \) and \( P_{\text{ae}} \) during uptake and elimination under normal, low, and high ventilation/perfusion ratio (\( V_{\text{A}}/Q \)) conditions. Faster arterial kinetics for desflurane were generally maintained for both washin and washout under all \( V_{\text{A}}/Q \) conditions. The low \( V_{\text{A}}/Q \) condition decreased the differences in scaled \( P_{\text{at}} \) between 0 and 5 min; the high \( V_{\text{A}}/Q \) condition increased these differences from the low \( V_{\text{A}}/Q \) value to a value approaching or exceeding the value for normal \( V_{\text{A}}/Q \). Mixed venous kinetics were slower than arterial kinetics for washin and washout and were less influenced by \( V_{\text{A}}/Q \).

**Effect of Global Ventilation to Perfusion Ratio, for Normal Lungs, on Desflurane and Sevoflurane Elimination Kinetics**

J. E. Baumgardner, M. Kretzschmar, A. Kozian, T. Hachenberg, T. Schilling, A. Larsson, G. Hedenstierna

A mathematical model of inhaled anesthetic elimination was developed in a post hoc analysis of anesthetic partial pressures measured in mixed venous and arterial blood samples after simultaneous administration of desflurane and sevoflurane to seven piglets under normal, low, and high ventilation/perfusion ratio conditions. After a brief and rapid decline in alveolar anesthetic partial pressure, the fractional clearance of anesthetic became constant, and incomplete clearance from the lungs slowed tissue washout. Slowing of tissue elimination by incomplete lung clearance became more pronounced at low ventilation/perfusion ratios, and was predicted to become more pronounced as blood/gas solubility increases.

**Intubation Biomechanics: Clinical Implications of Computational Modeling of Intervertebral Motion and Spinal Cord Strain during Tracheal Intubation in an Intact Cervical Spine**

B. C. Gadomski, B. J. Hindman, M. I. Page, F. Dexter, C. M. Puttlitz

Based on simulation of an adult cervical spine, pathologic motion does not occur even with intubation force up to twice that commonly encountered during routine tracheal intubation. However, in patients who have increased susceptibility to strain-related cord injury, potentially injurious cord strain may occur during routine tracheal intubation conditions. Critical Care Medicine

CLINICAL SCIENCE

Respiratory Drive in Patients with Sepsis and Septic Shock:
Modulation by High-flow Nasal Cannula

Respiratory drive and effort and dynamic lung compliance were evaluated in 25 nonintubated patients with extrapulmonary sepsis or septic shock using arterial blood gases, esophageal pressure monitoring, and electrical impedance tomography at baseline with low-flow nasal oxygen therapy, during high-flow nasal cannula support and again with low-flow nasal oxygen therapy. Patient comfort was evaluated using a 10-point visual analog scale at each step. High-flow nasal oxygen therapy significantly reduced respiratory drive and effort. There was no correlation between patient perceived comfort and measures of drive and effort. The impact of the findings from this physiologic study on patient outcome remain to be determined. SUPPLEMENTAL DIGITAL CONTENT IS AVAILABLE IN THE TEXT

COVID-19 Patients: A Retrospective Cohort Study
X. Zhao, C. Gao, F. Dai, M. M. Treggiari, R. Deshpande, L. Meng

In a retrospective cohort consisting of 2,070 critically ill COVID-19 patients treated in six hospitals, multivariable regression analysis showed lower in-hospital mortality associated with apixaban, aspirin, or enoxaparin treatment. Propensity score–matching analyses demonstrated lower in-hospital mortality associated with apixaban, aspirin, or enoxaparin treatment. Propensity score–matching analyses demonstrated lower mortality for patients receiving apixaban (27% [96 of 360] vs. 37% [133 of 360]), aspirin (26% [121 of 473] vs. 30% [140 of 473]), or enoxaparin (25% [87 of 347] vs. 30% [140 of 360]), or enoxaparin (25% [87 of 347] vs. 30% [140 of 347]), or enoxaparin (25% [87 of 347] vs. 30% [140 of 347]), or enoxaparin (25% [87 of 347] vs. 30% [140 of 347]). Healthcare-associated infections contribute to morbidity, mortality, and increased cost in intensive care unit patients. Understanding evidence-based prevention strategies can help to optimize patient outcomes.

Pain Medicine

CLINICAL SCIENCE

Preoperative Paravertebral Block and Chronic Pain after Breast Cancer Surgery: A Double-blind Randomized Trial

More than 350 study participants undergoing mastectomy were randomized to either paravertebral blocks with ropivacaine or saline injections. Both groups received multimodal analgesia. Although paravertebral block using ropivacaine had a small analgesic effect in the immediate postoperative period, no differences in pain 3, 6, and 12 months after surgery were detected.

Postoperative Pain and Age: A Retrospective Cohort Association Study

Data from the PAIN OUT registry involving more than 11,000 patients undergoing spinal surgery, joint replacement, and laparoscopic cholecystectomy were used in a retrospective cohort analysis. Pain reported postoperative day 1 declined slightly with age. Severe postoperative pain was prevalent regardless of age or surgical type.

INSTRUCTIONS FOR AUTHORS
The most recently updated version of the Instructions for Authors is available at www.anesthesiology.org. Please refer to the Instructions for the preparation of any material for submission to ANESTHESIOLOGY.

Manuscripts submitted for consideration for publication must be submitted in electronic format via Editorial Manager (https://www.editorialmanager.com/an). Detailed directions for submission and the most recent version of the Instructions for Authors can be found on the Journal’s Web site (http://www.anesthesiology.org). Books and educational materials for review should be sent to Alan Jay Schwartz, M.D., M.S.Ed., Director of Education, Department of Anesthesiology and Critical Care Medicine, The Children’s Hospital of Philadelphia, 6128; e-mail: Dave.Wiegand@wolterskluwer.com.

Annual Subscription Rates: United States—$1125 Individual, $2904 Institution, $442 In-training. Rest of World—$1166 Individual, $3324 Institution, $442 In-training. Single copy rate $288. Subscriptions outside of North America must add $50 for air freight delivery. Add state sales tax, where applicable. The GST of 7% must be added to all orders shipped to Canada (Wolters Kluwer Health, Inc.’s GST Identification #R895524239. Publications Mail Agreement #11198672). Indicate In-training status and name of institution. Institution rates apply to libraries, hospitals, corporations, and partnerships of three or more individuals. Subscription prices outside the United States must be prepaid. Prices subject to change without notice. Subscriptions will begin with currently available issue unless otherwise requested. Visit us online at www.lww.com.

Individual and in-training subscription rates include print and access to the online version. Online-only subscriptions for individuals ($372) and persons in training ($372) are available to nonmembers and may be ordered by downloading a copy of the Online Subscription FAQ/Back Form from the Web site, completing the information requested, and fusing the completed form to 301-223-2400. Institutional rates are for print only; online subscriptions are available via Ovid. Institutions that wish to purchase a print subscription, please contact Wolters Kluwer Health, Inc., 1800 Dual Highway, Suite 201, Hagerstown, MD 21740-6636; phone: 800-638-3030; fax: 301-223-2400. Institutions that wish to purchase an online subscription or online with print, please contact the Ovid Regional Sales Office near you or visit www.ovid.com/site/index.jsp and select Contact and Locations.
