A 58-year-old man presented with a long history of an invasive anterior chest-wall basal-cell carcinoma (Fig. 1(A)). This was resected (Fig. 1(B) and (C)) and reconstructed with a 2-mm Gore-Tex patch and full-thickness rotation, left latissimus dorsi flap with additional split skin grafting (Fig. 1(D)).

Fig. 1. (A—D) Large anterior chest-wall BCC (A), widely resected (B and C) and reconstructed with left latissimus dorsi rotational flap, 2 mm Gore-Tex patch and split skin grafting (D).
