New guidelines for the antibiotic treatment of streptococcal, enterococcal and staphylococcal endocarditis

D. C. Shanson

The punctuation in the third column of Table 1 may have given an erroneous impression. The recommendations are that gentamicin should be added to either vancomycin or teicoplanin for the treatment of streptococcal endocarditis in penicillin-allergic patients.

Relationship between antimycobacterial activities of rifampicin, rifabutin and KRM-1648 and rpoB mutations of Mycobacterium tuberculosis

On page 626, column 2, line 28 the percentage figure was incorrect and should read ‘We also found that 18% of rifampicin-resistant strains were also susceptible to rifabutin . . .’
