ture that no exploration effort or production is likely in the foreseeable future.

Acknowledgments

The present study was conducted under contract to the Bendix Field Engineering Corporation (78-245-E) for the U.S. Department of Energy (Thompson et al., 1980). R.C. Dwelley and B. Goodhard of the Standard Metals Corporation provided logistical support and access to drill core and mine openings. Economic Geology reviewers read earlier drafts of the manuscript and made suggestions that significantly improved it. The author, of course, bears full responsibility for the content and interpretations.
