The development of intervention and prevention programs for gambling disorder among Asian populations is constantly evolving. This symposium will highlight current best practices for treatment among Asian gamblers (Raylu, Loo & Oei, 2013) and provide a platform for further development and assessment of treatment effectiveness in Malaysian samples. Recent prevalence research in Malaysia highlighted that 4.4% of Malaysians were identified to be problem gamblers (Loo & Ang, 2013). As research on gambling addiction in Malaysia is still at its infancy, this symposium will employ a mixed methods approach in understanding the factors implicated in the recovery process. Results of the analyses will provide an understanding of the lived experience of recovering Malaysian gamblers (Choong, Loo & Ng, 2014) and examine factors that predict problem gambling among this sample. Implications and suggestions for research among Asian problem gamblers and more specifically among Malaysian problem gamblers will be discussed.
