Radiative Decay of the $\eta$-Particle

Akihiko Fujii

We have estimated the branching ratio of the radiative decay mode to the tripion decay mode of the $\eta$-particle

$$\eta^0 \rightarrow \pi^0 + \gamma$$

$$\rightarrow \pi^+ + \pi^- + \pi^0.$$  \hspace{1cm} (1)

The $\eta$-particle$^{1}$ is the three-pion resonance state with $J=1^-$, $T=0$, mass $\sim 550$ Mev, half width $\sim 25$ Mev. It has been pointed out$^{2}$ that, because of the smallness of the Q-value in the decay mode (2), the channel (1) might become relatively important and that would help the detection of the $\eta$-particle.

The phase space volumes $J_1$, $J_2$ of the modes (1) and (2) are respectively

$$J_1 = \int \delta(p_1 + p_2) \delta(m - e_1 - e_2) d^3p_1 d^3p_2$$

$$= 4\pi \mu^6 \times 1.87,$$  \hspace{1cm} (3)

$$J_2 = \int \delta(p_1 + p_2 + p_3) \delta(m - e_1 - e_2 - e_3)$$

$$\times d^3p_1 d^3p_2 d^3p_3 = (4\pi)^3 \mu^6 \times 3.04 \times 10^{-3},$$  \hspace{1cm} (4)

where $p_1$, $e_1$ are the 3-momentum and the energy of the $i$-th outgoing particle, $m = 4\mu$ is the mass of the $\eta$-particle, and $\mu$ is the pion mass.

Fermi's statistical theory$^{3}$ gives a rough estimate of the branching ratio$^{4}$

$$\frac{w_1}{w_2} = \frac{(2\pi)^3}{Q} \cdot \frac{2}{137} \cdot \frac{J_1}{J_2},$$  \hspace{1cm} (5)

where $w_1$, $w_2$ are the decay rate of the channel (1) and (2), $Q$ is the interaction volume, 2 is a statistical weight factor for the photon polarization, 1/137 is the electromagnetic coupling constant singled out from the rest of the strong interaction. Assuming $Q$ to be the sphere of radius $\beta$ in units of the pion Compton wavelength, we obtain

$$\frac{w_1}{w_2} = 0.42 \beta^3.$$  \hspace{1cm} (6)

The simple statistical model is not a good approximation here because of the spin of the $\eta$-particle. The available method$^{5,6}$ to take the angular momentum conservation into account is good only for a many-particle system and not for a system of 2 or 3 particles. Instead, we shall write down the general matrix element for the decay of a vector particle on the basis of invariance and amalgamate the unknown form factors into a single phenomenological parameter $\beta$.

The decay matrix element of the mode (1) is proportional to
where \( k, q \) and \( p \), are the 4-momentum of the photon pion and \( \eta \)-particle respectively, \( \epsilon \) and \( \eta \) are the 4-polarization of the photon and \( \eta \)-particle, and \( \epsilon^{\mu\nu...} \) is the 4-dimensional Levi-Civita tensor. The power of \( \mu \) is chosen to make \( M_\eta \) dimensionless. In the rest system of the \( \eta \)-particle it reduces to

\[
\sum_{\epsilon,\eta} |M_\eta|^2 = \frac{2m}{\mu} \cdot \frac{k^2}{k_\eta q_\eta} .
\]

(8)

Similarly the decay matrix element of the mode (2) is proportional to

\[
M_\eta = \frac{1}{\sqrt{g_1 g_2 g_3}} \epsilon^{\mu\nu...} \epsilon_1^{\mu\nu...} \eta_2^{\mu\nu...} \eta_3^{\mu\nu...} \frac{1}{\mu} ,
\]

(9)

where \( \rho^{(1)} \) is the 4-momentum of the \( i \)-th pion. Again in the rest system of the \( \eta \)-particle it becomes

\[
\sum_{\eta} |M_\eta|^2 = \frac{m}{\mu} \cdot \frac{(\rho^{(1)} \times \rho^{(2)})^2}{ \rho_0^{(1)} \rho_0^{(2)} \rho_0^{(3)} } .
\]

(10)

(Because of the momentum conservation it holds that

\[
|\rho^{(1)} \times \rho^{(2)}| = |\rho^{(2)} \times \rho^{(3)}| = |\rho^{(3)} \times \rho^{(1)}| .
\]

The "modified" phase space volume \( I_1 \) and \( I_2 \) are defined by

\[
I_1 = \sum_{k, \eta} |M_\eta|^2 \delta^4(k+q) \delta(m-k_0-q_0) d^3k d^3q ,
\]

\[
I_2 = \sum_{\eta} |M_\eta|^2 \delta^4(p^{(1)}+p^{(2)}+p^{(3)})
\times \delta(m-p_0^{(1)}-p_0^{(2)}-p_0^{(3)}) d^3p^{(1)} d^3p^{(2)} d^3p^{(3)}
\]

and calculated to be

\[
I_1 = \frac{2m}{\mu} \cdot 4\pi \mu \times 1.65 ,
\]

(11)

\[
I_2 = \frac{m}{\mu^3} \cdot (4\pi)^2 \mu \times 2.92 \times 10^{-2} .
\]

(12)

Then the branching ratio becomes

\[
\frac{\omega_1}{\omega_2} = \frac{(2\pi)^3}{I_1} \cdot \frac{1}{I_2} = \frac{3.9 \beta^3}{I_2} .
\]

(13)

Although the computation is of no more than an order of magnitude estimate, we observe that the angular momentum barrier reduces the tripion decay mode appreciably, so that the radiative decay mode may even dominate the tripion mode.
