The publisher wishes to apologise for inadvertently omitting Figure 1 from this Letter to the Editor. The figure is reproduced below.

![Figure 1](image)

**FIG. 1.** (A) Longitudinal view of middle third of right upper arm at initial presentation. There is a hypoechoic fluid collection (F) lying between the biceps muscle (M) and shaft of humerus (H) with hypoechoogenicity in the inferior muscle fibres suggestive of muscle inflammation and oedema. (B) Transverse view through the same region. Increased power Doppler signal is observed in the soft tissues immediately adjacent to the hypoechoic fluid collection with some evidence of inflammation in the inferior aspect of the musculature. (C) Longitudinal view of the middle third of right upper arm 8 weeks after recommencing infliximab. There is no evidence of a hypoechoic fluid collection or myositis. DI, distal; F, fluid; H, humerus; LA, lateral; M, muscle; ME, medial; PR, proximal; S, skin. [This figure can be viewed in colour on the Rheumatology website.]

The publisher wishes to apologise for a mistake in the running head for this article, appearing in the current issue. The correct running head is below:

Glucocorticoids inhibit HAS synthases
