Cover illustration: The cover inset shows the male flower of *Musa acuminata malaccensis*, one of the South-East Asian wild relatives of edible bananas. Hitherto, hybridization between the different subspecies of *M. acuminata* has been understood to constitute the major evolutionary event which underpinned the emergence and selection of unseeded cultivars. However, the detection of two genetic clusters within the cultivated gene pool suggests that a different scenario may have occurred in New Guinea, especially in the case of the *M. acuminata* subspecies.
