Letters to the Editor

Reply: What is the ceiling level for follicular growth arrest in late follicular phase

Dear Sir,

We read Dr Ho’s letter with interest. Although it is difficult to draw any conclusion from one case report, we acknowledge his comments.

We investigated anovulatory patients treated with relatively low dose of FSH, and with LH alone in several groups. We did not investigate ovulatory patients undergoing controlled ovarian stimulation with a relatively high dose of FSH for assisted reproduction techniques. Defining the dose of LH, the LH/FSH ratio and the optimal timing for LH administration which would produce a ceiling effect in the population considered by Dr Ho is certainly worth further investigation.
