Adverse effects of intradermal allogeneic lymphocyte immunotherapy: acute reactions and role of autoimmunity

C.Kling, J.Steinmann, E.Westphal, J.Magez and D.Kabelitz

Hum Reprod 21,429–435, 2006

The authors apologize for the following error. Feedback was 2687 of 3246 (83%) and not 2587 of 3246 (80%) (see Abstract). Therefore, some calculations are slightly incorrect, although this does not change the issues or the discussion.

In particular, local side effects have been somewhat lower than reported (Table I): redness 88%, itching 88%, swelling 63%, burning 29%, blisters 13% and local discomfort 1.5%.
