A patient with chest pain and dysphagia presented with a history of achalasic megaesophagus and oesophageal cancer treated with chemoradiotherapy. Computed tomography showed the presence of megaesophagus (Fig. 1), mediastinal involvement and an oesophagotracheal fistula (Fig. 2). A feeding jejunostomy was placed, and the patient was referred for supportive care.

**Keywords:** Trachea-oesophageal fistula • Oesophageal cancer • Megaesophagus • Achalasia
