Now there is a choice. That choice is DIGOXIGENIN. It is a highly sensitive and specific method for detection of target DNA in paraffin-embedded, frozen and cytologic specimens. DIGOXIGENIN is a plant product that allows for fast, simple detection without cross-reactivity due to endogenous biotin.

Signet also offers complete hybridization systems with Biotin and Fluorescein detection as well as components and support reagents to build a system customized for your needs.

- **Non-radioactive Labels** — Biotin, Fluorescein, and patented DIGOXIGENIN labelled DNA probes.
- **Flexible** — Complete kits including pre-hybridization, probes, and detection, or construct a custom system from these "building block" components.
- **Sensitive** — All components are configured for optimal hybridization and detection sensitivity.

For more information on DIGOXIGENIN products and entire line of In-Situ Hybridization systems, probes, and support reagents please call 800-223-0796.
