SESSION 5 (PAPER)

INEQUALITIES AND HEALTH: EXPLORATIONS OF GENDER, RACE, AND EDUCATION

GENDERED HEALTH AND ITS LONG TERM CONSEQUENCES IN SOUTH ASIAN REGIONS
M. Choudhury, T. Bhatta, Michigan State University, East Lansing, Michigan

How social, cultural, and economic factors influence long term health of men and women in south Asian regions? A growing body of literature argues that men and women face differential challenges of health disparity in south Asian countries. In the south Asian context women experience heavier burdens of social, cultural and economic discrimination compared to men. Several other factors such as biological differences between men and women, socially defined gender roles, attitudes, and beliefs also contribute to discrimination in defining health disparity across gender. Unequal impact of various factors renders a cumulative effect on men's and women's health overtime. Based on life course perspective, this study, therefore addresses implications of social, cultural, economic and socio-biological factors contributing to health disparity across gender in South Asia. For this study, we choose to compare two south Asian nations, India and Nepal that are very similar in beliefs, attitudes, and role expectations for men and women. World Health Organization data will be analyzed for assessing men and women mortality rate to measure the nature of health outcomes existing between genders, in these two nations. World Health Organization maintains a longitudinal data set of mortality rate separately for men and women of different age groups. Our analysis of a longitudinal data set would help in understanding long term consequences of the factors influencing health disparity. In addition to knowledge expansion in the fields of Sociology and Gerontology at large, this study will also be useful to policy makers in public health and health care access.

HEALTH STATUS IN LATER LIFE: CAN YOUR ADULT CHILD'S EDUCATION BUY YOU BETTER HEALTH?
A.M. Pienta, ICPSR, University of Michigan, Ann Arbor, Michigan

Intergenerational transfers of time and money have well-documented relationships with a number of later life outcomes including health. Less is known about whether the social attainment of adult children translates into better health of the parents. Over the last several decades, the younger generation has experienced widespread gains in educational attainment that may benefit not only their life chances, but the life chances of the older parent generation. Scholars have referred to this as adult children being an “asset.” This paper examines the hypothesis that adult children’s education will have direct benefits on health status in later life, net of own education. Longitudinal data from the Health and Retirement Study (age 50+) are used to model the relationship between the educational attainment of the most educated adult child and later life health status of the parent. Findings from multivariate growth curve models suggest that the higher adult children’s education the better one’s own self-rated health in later life. This finding is robust net of other sociodemographic characteristics (including own education). Both women and men benefit from having a more educated adult child. Also, when adult children have completed more education than the parents, parents’ health is better. The paper outlines several theoretical mechanisms linking parents’ later life health to the education of their adult children.

THE EFFECT OF EDUCATIONAL ATTAINMENT ON ALLOSTATIC LOAD: DOES THE SOCIAL GRADIENT IN HEALTH VARY BY AGE?
T. Bhatta, J. Kelley-Moore, Sociology, Case Western Reserve University, Shaker Heights, Ohio

Extensive literature has established a social gradient in health demonstrating that people in higher socioeconomic strata experience better health compared to their mid- and lower socioeconomic counterparts. Yet there have been inconsistent findings about whether there are age-based patterns to the social gradient in health. Some find that education contributes to a steeper health gradient in late life relative to midlife, while others find the health gradient by education remains steady or becomes less steep in older adulthood. Using the National Health and Nutrition Examination Survey (2005–2008), we examine two questions: (1) Is there an educational gradient in allostatic load, net of other social and health factors? (2) Is there an age-based pattern to the extent of that gradient? Our Tobit models indicate that allostatic load, a summated indicator of physiologic dysregulation, tends to increase with age but there are distinctive gradient patterns by education level (< high school, high school, > high school). Within each age group, there is, on average, a difference of 0.4 between the lowest and the highest education group. This gradient, however, systematically increases across age groups, peaking for adults ages 60 to 69. There is not only a slight decrease in overall allostatic load for adults ages 70+ but an attenuation of the educational gradient. This distinctive age-based and gradient-based pattern to allostatic load informs the literature on both life course accumulative processes (stratified opportunities; selective mortality) and cohort dynamics (e.g., changing importance of a given education level). We discuss implications for both literatures.

CHILDHOOD CONDITIONS, EDUCATIONAL ATTAINMENT, AND ADULT HEALTH: WHO BENEFITS THE MOST FROM COLLEGE?
M.H. Schafer, L.A. Rinaldo, 1. Center on Aging and the Life Course, Purdue University, West Lafayette, Indiana, 2. University of Toronto, Toronto, Ontario, Canada

College-educated adults are able to age more successfully than other people in the United States, but selection bias complicates the understanding of how education affects health. This article focuses on the possibility that the health benefits of college may vary according to people’s propensity to attain a college degree in the first place. Several perspectives from life course sociology offer competing hypotheses as to whether the most or the least advantaged gain the most from educational attainment. The authors use a national survey of middle- and older-age American adults to assess risk of three serious health problems and
mortality. Results from propensity score and hierarchical regression analysis indicate that the protective effect of college attainment is indeed heterogeneous. Further, the greatest returns are among those least likely to experience this life course transition. The authors offer several explanations for this negative selection effect.

SESSION 10 (PAPER)

INFLUENCES ON PHYSICAL LIMITATIONS, PAIN, AND FRAILTY

ASSOCIATIONS BETWEEN HS CREDENTIALS AND OLDER AGE ADL AND IADL LIMITATIONS: IS A GED COMPAREABLE TO A HS DEGREE?
S.Y. Liu, M. Glymour, SHDH, HSPH, Boston, Massachusetts

Since 1943, the General Educational Development (GED) test has been used to certify a high school level of academic knowledge and skills. Currently 15-20 percent of all new high school credentials issued each year is a GED. Several studies suggest that the social and economic benefits associated with GED credentials are less than that of a traditional HS degree and similar to individuals without a HS credential. The potential difference in health returns for GED vs. high school degree holders is less well known and especially important given the disproportionate number of GED recipients who are racial/ethnic minorities. In this study we examine whether HS degree holders differ from GED recipients and individuals without any HS credentials in later-life physical functioning using the 2008 Health and Retirement Study (HRS), a nationally representative sample of older adults in the US. Compared to HS degree holders, individuals with GED credentials and those without any HS credentials had similar increased odds of having an independent activity of daily living (adjOR=1.44, 95% CI=1.11-1.88 and adjOR=1.93, 95% CI=1.69-2.21 for GED and no HS credentials respectively) and an activity of daily living limitations (adjOR=1.42, 95% CI=1.08-1.86 and adjOR=1.49, 95% CI=1.30-1.70 for GED and no HS credentials respectively) even after adjusting for age, gender, race, father’s education, childhood health and nativity. Although GED is widely accepted as the equivalent of a high school diploma, study results suggest GED credentials do not offer a comparable health advantage in older-age.

TO WHAT EXTENT ARE A PERSONS’ RESOURCES A PROTECTIVE FACTOR FOR NEGATIVE OUTCOMES OF FRAILTY
B.H. Ament1,2, M.E. de Vugt1, F.M. Koomen1, S. Mujakovic1, F. Verhey2, G.I. Kempen1, 1. Maastricht University, CAPHRI School for Public Health and Primary Care, Maastricht, Netherlands, 2. Maastricht University, Alzheimer Center Limburg, MHeNS School for Mental Health and Neuroscience, Maastricht, Netherlands, 3. Department of Health Promotion, Public Health Services, South Limburg, Sittard-Geleen, Netherlands

Although frailty is often conceptualized in terms of (personal) deficits, the level of frailty can be perceived as a complex interplay between personal deficits and personal resources. We studied whether personal resources, such as educational level, financial situation, and living alone situation, moderate the negative outcomes of personal deficits on two potential adverse consequences of frailty: self-perceived health and receiving professional care. Logistic regression analysis was performed using data from a cross-sectional survey, designed by the Public Health Service in the South of the Netherlands. The questionnaire was sent to a representative sample of people aged 70 and over. Interaction between deficits (multimorbidity, difficulty performing ADLs, psychological distress, loneliness) and resources (educational level, financial situation, living alone situation) were studied in relation to the two specific outcome measures. The sample (N=5912) included 44.3% men and 55.7% women with a mean age of 78 years. We found that the effect of ADLs on self-perceived health was modified by educational level (p<.01) (indicating a stronger relationship for those with higher education) and living alone situation (p<.05) (indicating a stronger relationship for those living alone). The effect of psychological distress on receiving professional care was modified by educational level (p<.05) (indicating a stronger relationship for those with higher education). The main effects in the final model for both deficits and resources largely remained significant. We conclude that the selected personal resources only partly moderate the impact of personal deficits on adverse outcomes.

LATE-LIFE DEPRESSION IS A PRODROME FOR FRAILTY
D. Paulson, P.A. Lichtenberg, Institute of Gerontology/Dept. of Psychology, Wayne State University, Detroit, Michigan

Frailty is a common geriatric disorder associated with decreased mobility, ADL impairment, hospitalization and death (Fried, et al., 2001). Women, who constitute a majority of adults over age 80, experience more disability and live longer with disability than men. Identification of risk factors for frailty in this vulnerable population will inform prevention efforts, contributing to preserved independence in late-life. Katz (2004) and others have identified phenomenological evidence suggesting that late-life depression may be a prodrome for frailty. The present research tests a broader theoretical framework relating cerebrovascular burden (CVB), depression, frailty and longevity using a sample of stroke-free women over the age of 80 from the Health and Retirement Survey. Frail respondents endorsed at least three indicators (loss of at least 10% of body weight, exhaustion, weakness, slowness, and falls). Respondents with high CVB endorsed at least two risk factors (hypertension, diabetes, heart disease, smoking). Respondents with probable depression were those who scored over 2 on the 8-item Center for Epidemiological Studies Depression scale. Of 485 non-frail respondents in 2000, 162 experienced frailty in 2004. Using logistic regression, incidence of new frailty was predicted by change in self-rated health (p<.001) and incidence of probable depression (p=.037), but not by age, education, BMI or CVB. In a follow-up logistic regression, incidence of death after 2004 was significantly predicted by age (p=.002), education (p=.013), BMI (p=.002), CVB (p=.004) and frailty (p<.001). These results suggest that late-life depression is a prodrome for frailty and represents a point at which enhanced integrated care is indicated.

REDUCING INTERFERENCE FROM PAIN IN LATER LIFE: THE ROLE OF LIFESTYLE FACTORS
J. Richardson, A. Moore, M. Bernard, K. Jordan, J. Sim, Arthritis Research UK Primary Care Centre, Keele University, Staffs., United Kingdom

Research shows that chronic musculoskeletal pain impacts on older people’s health and well-being, and is associated with increased use of health/social care services and decline in quality of life. Preventing the disabling effects of chronic pain as people age is consequently a major public health priority. Our research focused on individuals whose pain did not seemingly interfere with their lives or who were free of pain in old age, in order to explore how older people can best be helped as they age in the presence of musculoskeletal pain. We used data from an ongoing cohort study of older people to create three groups: (1) ‘no pain’, (2) ‘pain with no interference’, (3) ‘pain with interference’. We conducted sixty in-depth life-grid interviews, across three age bands: pre-retirement (55–64 years); post-retirement (65–79 years); and the oldest old (80+ years). Findings suggest that pain with no interference can be a long-term state, characterised by high levels of pain medication and frequently involving widespread pain, but participants appeared to be able to control its effects. This paper will therefore explore the lifestyle factors in participants’ accounts that appear to be important in reducing interference, including lifestyle, financial issues, social activity and involvement. It will also discuss the specific strategies adopted by participants for reducing interference from pain, including everyday activity, attitude and adaptation. We will explore practical implications of
THE RELATIONSHIP BETWEEN LONELINESS AND CHARACTERISTICS OF CHRONIC PAIN IN A NATIONAL SAMPLE OF AMERICANS
E. Wethington1, R. Kwon1, T. Brennan1, S.J. Parker2, C. Reid1. 1. Human Development, Cornell University, Ithaca, New York, 2. Weill Cornell Medical College, New York, New York

Theory and research suggest that loneliness should be related to the experience of chronic physical pain. However, very little research has been published using general population samples and a full spectrum of causes, severity, location, and duration of chronic pain. Using a 2010 national telephone sample of 1000 participants in the U.S., we examine the relationship between loneliness and the experience of pain. Participants are 51% female, ages ranging from 18-92; 304 reported having chronic pain, defined as any painful, aching, burning or throbbing sensations on most days during the past 3 months. Back pain and arthritis were the most frequently reported pain site and condition; 36% aged 60 or over reported chronic pain. Loneliness was measured using two items from the UCLA Loneliness Scale: feeling a lack of companionship and feeling isolated from others (r=.489, p < .0001). Of the 304 who self-reported chronic pain, 33% reported having pain causing them to cut down on their usual activities for at least 8 days in the preceding month. Across all conditions and sites of pain, the self-report rating of pain severity (0-10 intensity scale) was significantly related to the number of days usual activities were affected by pain, coded into four categories (0, 1-7, 8-14, 14+ days) (F = 14.015, p < .001). Loneliness was related to the rating of pain severity (r=.211, p < .001) and to the number of days of activity restriction (F=6.95, p < .001). We discuss implications for the treatment of older adults with pain.

SESSION 15 (PAPER)

RESIDENTIAL SHIFTS, RETIREMENT COMMUNITIES, AND ADAPTATIONS

"THE MORE INVOLVED YOU ARE, THE BETTER YOU FEEL": SOCIAL COHESION AND PERSONAL ADJUSTMENT IN CONTINUING CARE RETIREMENT COMMUNITIES
T.P. Shippee, Health Policy and Management, University of Minnesota, 420 Delaware St. SE, MMC 729, Minnesota

Objectives: This study examines the relationship between social cohesion—and residents’ adjustment and well-being in Continuing Care Retirement Communities (CCRCs). Nearly a million older adults live in CCRCs, with numbers continually increasing, yet few studies investigate how the social climate of CCRCs affects residents’ personal adjustment. Methods: Data included four years of observation in one CCRC and two years in another, as well as extended qualitative interviews with sixty consented residents who had been living in DGV for at least 3.5 years. Using a broad interpretation of ‘environment’, a ‘facets of life’ approach was taken to explore the ways in which residents’ everyday lives were connected with the environment at DGV. In particular, residents’ perceptions of their everyday routines and lifestyles in DGV compared to life outside a retirement village were explored. Findings highlight the complex relationships between aspects of everyday life (such as daily routines, social relationships, leisure activities and standards of living) and dimensions of the environment, including place as home and community, environment as an experience at individual, group and organization levels, and environment in terms of perceptual, cognitive and affective processes.

ADAPTING TO LIFE IN A RETIREMENT VILLAGE: EXAMINING RESIDENT EXPERIENCES OVER THE FIRST 12 MONTHS
D. Crisp1, T. Windsor2, K. Anstey1, P. Butterworth1. 1. Centre for Mental Health Research, Australian National University, Australian National University, Australian Capital Territory, Australia, 2. Flinders University, Adelaide, South Australia, Australia

In the face of normative age-related declines in health and mobility, increasing numbers of older adults are considering self-care accommodation within the context of a retirement community as a mechanism to maintaining independence. Whilst the benefits of downsizing are well established, relocation to a retirement community offers the additional provision of a) facilities catering for current and anticipated future healthcare needs; b) general household maintenance and cleaning services; c) the security of an enclosed complex that increases feelings of physical safety; and d) a close and supportive community network that reduces social isolation. The present study employs a prospective longitudinal design and multilevel modeling techniques to examine the adaptation of 83 older Australians (aged 57 to 90 years) to independent living units within a retirement village, over a 12 month period. Health, subjective well-being and social network outcomes are examined. Results indicate a reduction in perceived loneliness and an increase in social networks as significant benefits to relocation. Furthermore, whilst the majority of participants did not anticipate any difficulties or hold concerns prior to moving, a large proportion did report the relocation as a highly stressful experience. This presentation will highlight issues indicated to be of concern to residents in conjunction with the benefits of improved wellbeing in older people with chronic musculoskeletal pain.
experienced. Comparisons are drawn with an additional sample of community residing older adults. Recommendations are described with the aim to inform and assist aged care providers identify key factors contributing to the relocation experience and its impact on residents’ well-being and adjustment to this major transition.

THE LONG-TERM CARE ENVIRONMENT: REFLECTIONS OF NOVICE PRACTITIONERS
A. Kris, Fairfield University, Fairfield, Connecticut

Providing nursing students with instruction in a nursing home setting can offer a rich clinical experience, while simultaneously enhancing the quality of care of nursing home residents. However, nursing homes can also expose students to a myriad of quality of care issues that they may be ill-equipped to handle. To better understand the clinical experiences of sophomore nursing students, seventy-three students were asked to reflect on their clinical experiences at six Connecticut nursing homes. A total of 462 clinical reflections were systematically coded and analyzed. Themes which consistently emerged included: a) concern regarding the lack of resident autonomy, b) bearing witness to untreated pain and depression and c) a disconnect between classroom teaching and clinical experiences. These data provide insight not only into the problems of care often present in nursing homes, but allow these problems to be viewed through the lens of a novice nurse. Further, these findings call into question the goals and objectives of the nursing home clinical experience and have significant implications for clinical instructors responsible for precepting these students.

SOCIAL AND HEALTH-RELATED STRESSORS AND PROACTIVE COPING AS PREDICTORS OF RESIDENTIAL MOVES AMONG RETIREMENT COMMUNITY ELDER
L. Lovegreen, E. Kahana, Case Western Reserve University, Cleveland, Ohio

This study examined predictors of making a residential move by community dwelling elderly during a ten year period. The sample included 619 older adults (mean age= 78.5; SD=4.2) residing in an independent living retirement community located in the Sunbelt region of the US. We explored to what extent social resources and the propensity to engage in proactive behavior, are associated with moving, given exposure to specific social and health-related stressors. In terms of demographic factors, survival analysis revealed that the hazard of moving is greater for women, for older respondents, and for those with higher education. In terms of health related stressors, the hazard of moving was greater for those who experienced falls, and who had poorer subjective health ratings. In terms of living arrangements and social support, the hazard for moving was greater for respondents living with a spouse, for those living with other family members (e.g. children or siblings), and for those with shorter residential tenure. Planning and marshaling support were proactive behaviors that decreased the hazard of moving. These findings support important roles of various elements of the stress paradigm in understanding residential relocation among elderly retirement community elders. Our study called particular attention to the importance of advice seeking as a deterrent to moving and planning ahead for future care needs as a facilitator of making residential moves in later life.

SESSION 20 (PAPER)

SPOUSAL CAREGIVING EXPERIENCES AND IMPACTS
ROLE AMBIGUITY AMONG WOMEN PROVIDING CARE FOR EX-HUSBANDS
T.M. Cooney, C.M. Proulx, L.A. Snyder, J.J. Benson, C. Wood, Human Development & Family Studies, University of Missouri, Columbia, Missouri

Divorce is a common experience among cohorts approaching old age today. Divorce triggers many role changes within families, among them how ex-partners relate to one another. Although behavioral expectations for ex-spouses are not well defined, they likely differ dramatically from those for spouses. Therefore, when ex-partners assume roles typically reserved for spouses, such as caregiving, role ambiguity or confusion may result concerning what one should be doing and how one should feel in enacting the role. This paper considers the role ambiguity experienced by women caregiving for ex-husbands. This issue emerged from grounded theory analysis of in-depth interviews with 12 women, ages 45-75, who currently, or had recently, provided care for their ex-husbands. Three sources of role ambiguity were identified: interpersonal, intrapersonal, and social-structural. Interpersonally, these caregivers frequently noted that friends and family confronted them about their caregiving and openly questioned their decision. They were called “crazy” for assuming this role as an ex-wife, especially if it followed an abusive marriage. Intrapersonally, some women questioned themselves, asking “why am I doing this?” Intrapersonal experiences of role ambiguity also included surprise over strong feelings of grief about the ex-husband’s illness or death. Role ambiguity at the social-structural level was evident in caregivers’ interactions with institutions, such as hospitals and the workplace. As former spouses, some women were denied access to medical information or prohibited from making medical decisions, despite being the primary caregiver. Their ambiguous role also resulted in inflexibility at work, where some were denied leave or dealt with insensitively.

THE SOCIAL NETWORKS OF ELDERLY MEN CAREGIVERS
R. Russell, GRCSW Program, SUNY Brockport, Rochester, New York

More than one elderly million men care for spouses with cognitive impairment, and the number is projected to increase well into the future. In their roles as caregivers, their social networks change radically as their work shifts from the world of market economy to the domestic world of spousal care. How do their social networks change and what roles do social networks play in their lives as caregivers? Data for this presentation are taken from a 12 year ongoing qualitative study of elderly men caregivers in Rochester, New York. From the study, two overarching themes have consistently emerged: 1) pre-retirement social relationships were more beneficial than previously thought, and 2) multiple and varied social networks, especially with other men, are beneficial in mitigating caregiver burden. Implications for future research and provision of services are also discussed.

FAMILY CAREGIVING AND MARITAL QUALITY: EVIDENCE FROM MIDUS II
S. Kang1,2,3, N. Marks1,2,3, 1. HDFS UW-Madison, Madison, Wisconsin, 2. Institute on Aging, Madison, Wisconsin, 3. CDHA, Madison, Wisconsin

Guided by a life course perspective, this study aimed to add to a population perspective on family caregiving and marital quality by (1) examining how providing caregiving for a child, spouse, parent, or parent-in-law due to their illness or disability (in contrast to not providing caregiving for any kin or nonkin) is linked to two dimensions of marital quality (a 6-item composite measure of spousal support and a 6-item composite measure of spousal strain), and (2) evaluating how gender might moderate the link between caregiving and marital quality. Data from a sample of National Survey of Midlife in the U.S., 2005 (MIDUS II) respondents ages 34 to 83 who were married (N = 1157; 598 men, 559 women) were used to estimate multivariate models that also adjusted for numerous sociodemographic factors. Results revealed that providing caregiving for a child was associated with a lower level of spousal support (poorer marital quality) and providing caregiving for a spouse was linked to higher level of spousal strain (poorer marital quality). Models evaluating moderation of caregiving risks to marital quality by gender revealed a trend suggesting that caregiving was linked with more spousal strain among women. Supplementary single-item
analyses also revealed that women providing caregiving for a child reported lower levels of feeling that their spouse really cared about them than men providing caregiving for a child. Additionally, women providing caregiving for a spouse reported less ability to rely on help from their spouse than men providing caregiving for a spouse.

THE DYADIC EFFECTS OF STROKE SURVIVOR AND CAREGIVER MUTUALITY ON DYADIC STRESS

K. Godwin, P. Swank, S.K. Ostwald, School of Nursing, University of Texas Health Science Center at Houston, Houston, Texas.

Background: A stroke occurs, on average, every 40 seconds in the United States. The resulting functional impairment of the stroke survivor frequently requires the care of a family caregiver, often the spouse. This change from the usual spousal relationship to a caregiver/care receiver relationship can be extremely stressful for the couple. Methods: This secondary data analysis of 159 stroke survivors and their spousal caregivers examined the dyadic relationship between mutual stress, a measure of the positive caregiving relationship, and stress over the first year post discharge from inpatient rehabilitation using the Actor Partner Interaction Model (APIM). Specifically, cross-lagged regression was utilized to investigate the dyadic, longitudinal relationship between caregiver and stroke survivor mutuality and caregiver and stroke survivor stress over time. Results: Caregiver mutuality was found to influence their own stress over time (β=-3.82, p < .0001) but not the stress of the stroke survivor. Caregivers who had higher mutuality scores over the 12 months of the study had lower perceived stress. Additionally, a partner effect of stress for the stroke survivor but not the caregiver, was found, indicating that stroke survivor stress over time affected caregiver stress (β=1.18, p<.01), but caregiver stress over time did not significantly affect stroke survivor stress. Conclusion: These findings highlight the interpersonal nature of stress in the context of caregiving, especially among spousal relationships. Thus, caregivers and stroke survivors should be encouraged to focus on the positive aspects of the caregiving/care receiver relationship in order to mitigate stress.

DOES SPOUSAL CAREGIVING INCREASE RISK OF INCIDENT HYPERTENSION?: EVIDENCE FROM A NATIONALLY REPRESENTATIVE SAMPLE

B.D. Capistrant, M. Glymour, Department of Society, Human Dev & Health, Harvard School of Public Health, Boston, Massachusetts

Background: Caregiving has been linked to cardiovascular disease but no study to date has investigated the effect of spousal caregiving on incident hypertension in a nationally representative sample. Methods: We followed U.S.-based Health and Retirement Study (HRS) respondents aged 50+, married and hypertension-free (n=5,708) at baseline, on average, 5.0 years between 2000 and 2008. We defined caregiving as providing ≥14 hours of care for instrumental or basic activities of daily living per week to a spouse. We used discrete-time hazards models and time-updated exposure and covariate information to predict risk of incident hypertension. We used inverse probability weights (marginal structural models) to adjust for survival or selection bias and time-varying confounding. Confounders included core sociodemographics and health behaviors. We also tested models stratified by race. Results: We documented 1725 new diagnosis of hypertension onset during follow-up. When caregiving and all covariates are time-updated, caregiving was associated with a 39% excess risk of hypertension onset (HR=1.39, 95% CI: 1.04, 1.86). In inverse probability weighted models, caregiving poses a 40% excess risk of hypertension onset (HR=1.40, 95% CI: 1.04, 1.87). The association differed significantly (p<0.01) between blacks (HR=0.38, 95% CI: 0.09, 0.97) and whites (HR=1.57, 95% CI: 1.18, 2.12). Conclusion: Spousal caregiving poses an important independent risk of new onset hypertension for U.S. adults. Whites are at a significantly elevated risk of new onset hypertension, while Blacks are at a significantly decreased risk.

SESSION 25 (SYMPOSIUM)

IMPLEMENTING A LIFESTYLE PHYSICAL ACTIVITY INTERVENTION WITH CAREGIVERS OF PERSONS WITH DEMENTIA

Chair: C. Farran, College of Nursing, Rush University Medical Center, Chicago, Illinois
Co-Chair: J.J. McCann, Rush University Medical Center - Rush Institute for Health Aging, Chicago, Illinois
Discussant: C. Etkin, College of Nursing, Rush University Medical Center, Chicago, Illinois

The purpose of this symposium is to report preliminary processes, outcomes and issues faced during the clinical trial of a lifestyle physical activity intervention conducted with strained and sedentary family caregivers of persons with dementia. Participants attending this session will: 1) increase their knowledge concerning recruitment, treatment fidelity, control and treatment group intervention implementation and preliminary study findings; and 2) improve their ability to address selected challenges to implementing future caregiver intervention trials. Five papers will address a range of topics. The first paper will identify challenges and positive outcomes to Recruiting Strained and Sedentary Family Caregivers. The second paper will discuss approaches to Monitoring Treatment Fidelity including use of technology to support these efforts. The third paper, Implementing a Skill-Building Control Intervention will describe a quantitative assessment of caregiving skill and will differentiate clinical considerations that facilitate skill assessment. Implementing a Lifestyle Physical Activity Treatment Intervention, the fourth paper, will present the process of intervention goal setting and goal attainment, as well as challenges faced in assisting strained and sedentary family caregivers to increase their physical activity. The final paper will summarize Preliminary Physical Activity, Physical Health and Functional Study Outcomes. Discussant, Dr. Laura Gitlin, will synthesize conclusions concerning this study, facilitate group discussion of study findings and conclude with recommendations for future research.

RECRUITING STRAINED AND SEDENTARY FAMILY CAREGIVERS

C. Etkin, College of Nursing, Rush University Medical Center, Chicago, Illinois

Recruitment into clinical trials is one of the most challenging phases in the research process. This presentation will: 1) describe the theoretical approach utilized for subject recruitment for the Telephone Resources and Assistance for Caregivers (TRAC) clinical trial; and 2) articulate the enablers and barriers faced in recruiting strained and sedentary family caregivers in to a clinical trial. The social marketing approach provided a commercial theoretical framework for organizing TRAC recruitment activities. Social marketing in the TRAC study expanded upon the typical “4 Ps” of commercial marketing (product, price, place and promotion) and included identifying participants and working with partners. A number of recruitment enablers and barriers were unique to strained and sedentary caregivers of persons with AD such as the nature of the trial inclusion and exclusion criteria and the social isolation that occurs by nature of the caregiving role.

MONITORING TREATMENT FIDELITY

J.J. McCann, 1. Rush University Medical Center — Rush Institute for Healthy Aging, Chicago, Illinois, 2. College of Nursing, Rush University Medical Center, Chicago, Illinois

The TRAC clinical trial extends over 18 months, increasing the likelihood of drift from the intervention protocol. Because treatment fidelity affects both internal and external validity, it is vital to assure that the
IMPLEMENTING A SKILL-BUILDING CONTROL INTERVENTION

O. Paun, College of Nursing, Rush University Medical Center, Chicago, Illinois

A 12-month skill-building intervention was implemented with dementia caregivers in the control group of the TRAC clinical trial. After each telephone session, the telephone counselor (TC) used electronic forms to document background information, care-related concerns, program adherence goals, and to rate caregiver treatment compliance and enactment. In addition, the TC used an electronic form to document a clinical assessment of caregivers’ behavioral skill at baseline (face-to-face interview), two, six, and 12 months. This paper will: 1) describe the instrument used to conduct a professional quantitative assessment of caregiving skill and 2) discuss the interplay between theoretical knowledge and clinical expertise in facilitating this assessment process. The presentation will be illustrated with concrete examples of how clinical experience may inform the professional caregiver behavioral skill assessment process.

IMPLEMENTING A LIFESTYLE PHYSICAL ACTIVITY TREATMENT INTERVENTION

A. Eisenstein, College of Nursing, Rush University Medical Center, Chicago, Illinois

The goal of lifestyle physical activity is to help caregivers find the right combination of activities that fit their needs, interests and abilities in order to gradually increase their levels of activity. The Enhanced Physical Activity Intervention (EPAI) is designed to help strained and sedentary caregivers reach the optimal frequency, duration and intensity of exercise in a safe and enjoyable manner. Strategies for increasing physical activity rely heavily on working with caregivers to set short and long-term goals and to self-monitor activity patterns. In keeping with the current Surgeon General recommendations, caregivers are encouraged to engage in moderate physical activity 30 minutes/day for most days/week. Additional support from the telephone counselor focuses on how to overcome obstacles and barriers to physical activity brought on by caregiving responsibilities, and discussions of practical solutions to overcome them and mechanisms to prevent relapse.

PRELIMINARY OUTCOMES OF A LIFESTYLE PHYSICAL ACTIVITY INTERVENTION FOR FAMILY CAREGIVERS OF PERSONS WITH ALZHEIMER’S DISEASE

C. Faran, College of Nursing, Rush University Medical Center, Chicago, Illinois

A total of 210 caregivers were enrolled in this study. Strain is prevalent in our study, as 84% (n=176) experienced moderate to high levels of strain. Caregivers reported multiple chronic conditions and health risk factors. Major chronic physical conditions included 52% (n=109) arthritis, 16% (n=34) heart disease and 13% (n=27) diabetes. Health risk factors included hypertension (41% (n=86)) with 29% (n=61) who had a systolic blood pressure >140 at baseline; and obesity with subjects having a mean BMI of 30 and 36% (n=76) with a BMI of 30 or higher. SF-36 subscale scores and results from physical function tests were lower than national norms. Physical activity self-report and direct monitoring demonstrated high levels of sedentary behavior with caregivers reporting 2 hours of weekly physical activity and expending an average of 397 kcals per day. Changes in both self-report and direct monitoring of physical activity over 6 months will be presented.

SESSION 30 (SYMPOSIUM)

INTERPERSONAL EXPERIENCES AND CHOICES THROUGHOUT THE LIFESPAN: IMPLICATIONS FOR HEALTH AND WELL-BEING

Chair. K. Fiori, Gordon F. Derner Institute of Advanced Psychological Studies, Adelphi University, Garden City, New York

The theme of this year’s conference, “Lifestyle Leads to Lifespan,” highlights how both contextual circumstances and personal choices can influence development over the lifespan. In this symposium, we will examine how interpersonal experiences (e.g., childhood attachment experiences, social interactions) and interpersonal choices (e.g., social engagement, choosing to remain divorced) occurring throughout the lifespan may have implications for health and well-being in older adulthood. First, Merz examined how both positive (e.g., supportive parents) and negative (e.g., conflict) childhood interpersonal experiences predicted various aspects of relationship quality and well-being in adulthood. Newton examined the relationship between early adult social role with personality and well-being in late midlife women who had followed non-normative life paths. Fiori, Windsor, and Crisp found that positive social exchanges can buffer against the negative health effects of negative exchanges for young-old adults, but not for older adults. Windsor and Anstey showed that changes in positive and negative exchanges are differentially associated with changes in cognition in an aging sample. Finally, Huxhold, Fiori, and Windsor found that changes in various aspects of social networks (e.g., social engagement, emotional support) are differentially associated with changes in health in older adults. Overall, these studies highlight how both interpersonal experiences (e.g., abusive parents) and interpersonal choices (e.g., to foster close relationships) can shape development and continue to impact health and well-being into late life.

CHILDHOOD ATTACHMENT AND SOCIAL NETWORKS IN ADULTHOOD

E. Merz, Social Demography, Netherlands Interdisciplinary Demographic Institute, The Hague, Netherlands

This paper intends to gain insight into the role of childhood relationships and experiences within the parental home for the formation and meaning of later family relationships. Particularly, childhood attachment to mother and father and stressful childhood experiences were studied in their association with satisfaction in the romantic relationship, the quality of adult family ties and social loneliness in adulthood. Data from the Netherlands Kinship Panel Study (N=5,441) were analyzed to predict adult relationships with childhood experiences. Positive attachment experiences with parents, such as reliability, closeness and supportiveness during childhood were associated with greater satisfaction in the romantic relationship, stronger family ties and less loneliness in adulthood whereas stressful childhood experiences, such as conflicts and violence negatively predicted the quality of adult relationships. This study points out that attachment-theory is a useful unifying framework to study social relationships, their interconnectedness and association with outcome during all phases of the life-course.

THE ROAD LESS TRAVELLED: LIFE PATHS, PERSONALITY DEVELOPMENT, AND WELL-BEING

N. Newton, University of Michigan, Ann Arbor, Michigan

Commitment to particular roles or life paths has been associated with midlife personality development and well-being (Vandewater & Stew-
art, 1997; Hoppmann & Smith, 2007). For women following non-normative life paths - long-term single parent, not having children, or undertaking a male-dominated profession - societal punishments can ensue (Diekmann & Eagly, 2008), potentially influencing well-being. Although personality research has shown that long-term single mothers are assertive (Faith, 2007), women without children have non-traditional sex role beliefs (Bram, 1984), and women in traditionally male professions are competent (Phillips & Imhoff, 1997), women who follow these non-normative paths are still perceived as less well-adjusted, “incomplete,” and cold, respectively (Etaugh & Nekolny, 1990; Parry, 2005; Heilman, 2001). Using discriminant analysis, the current exploratory study identified unique combinations of personality traits, personality development, life satisfaction, and psychological well-being in late midlife women (mean age 62) who had followed these particular non-normative life paths.

**Positive Social Exchanges Buffer the Negative Effects of Negative Social Exchanges? Age and Gender Differences**

K. Fiori, T. Windsor, D. Crisp, J. Gordon F. Derner Institute of Advanced Psychological Studies, Adelphi University, Garden City, New York, 2. Flinders University, Adelaide, South Australia, Australia, 3. Australia National University, Canberra, Australian Capital Territory, Australia

The health effects of negative and positive social exchanges in adulthood have been well-documented. Less well-understood are how negative and positive exchanges might interact in predicting health. The purpose of this study is to examine these interactions, with particular attention paid to age and gender differences. Using a series of regressions in a sample of 561 Australian older adults (ages 55-94), we found that positive social exchanges buffered against negative health effects of negative social exchanges, but that this buffering effect varied by age and gender. Specifically, we found that positive exchanges buffered against negative exchanges for young-old adults, but not for older adults, and for women, but not for men. Findings are interpreted in light of research on individual differences in coping responses and goals among older adults.

**Associations of Positive and Negative Social Exchanges with Cognitive Functioning: A Population-Based, Longitudinal Study of Older Adults**

T. Windsor, K. Ansty, J. Flinders University, Adelaide, South Australia, Australia, 2. The Australian National University, Canberra, Australian Capital Territory, Australia

Emerging evidence indicates that positive social exchanges (e.g., supportive interactions) are associated with better cognition in older adulthood. However little is known regarding associations between negative exchanges (e.g., disagreements, tensions) and cognition. The present study examined associations of positive and negative exchanges with cognition in a sample of 2551 older adults (aged 60 to 64 at baseline) assessed at three time points over an 8-year interval. Positive exchanges were associated with better performance on tests of memory (immediate recall), speed (symbol digit modalities), and verbal ability (spot-the-word) at baseline, while negative exchanges were associated with better memory and verbal ability. Increases in positive exchanges over the study interval were associated with slower rates of decline in memory and verbal test performance, while increases in negative exchanges were associated with slower decline in speed. Results highlight the complex, context-specific nature of associations between quality of social exchanges and health-related outcomes.

**The Dynamic Interplay of Social Network Characteristics, Well-Being and Health**

O. Huxhold, K. Fion, T. Windsor, 1. German Centre of Gerontology, Berlin, Germany, 2. Adelphi University, New York, New York, 3. Flinders University, Adelaide, South Australia, Australia

This study investigated the interacting dynamics of social integration and activity engagement (structural network aspects), emotional support (a functional network aspect), and different aspects of health and well-being in a representative sample of 2034 older adults across 6-years of development. The analysis, using a single latent change score model, revealed that activity engagement was beneficial for functional health and positive affect in older ages, whereas emotional support was most clearly related to lower negative affect and higher subjective health. Mediation analyses suggested that social integration may act as a resource for activity engagement and emotional support and can consequently exert indirect influences on a number of aspects of successful aging. The results underscore the importance of considering the multifaceted nature of social relations in understanding their impact on distinct developmental goals, and across different domains of successful aging.

**Session 35 (Symposium)**

**Person-Centered Communication Strategies and Interventions**

Chair: M.Y. Savundranayagam, Helen Bader School of Social Welfare, University of Wisconsin-Milwaukee, Milwaukee, Wisconsin

The long-term care context and the cognitive impairments associated with dementia present unique challenges for the promotion of person-centered care among nursing home residents. Social interaction plays a pivotal role in the maintenance of a resident’s identity and nursing home staff are often the sole source of social interaction for residents. Given insufficient staff training, most staff communication with residents tends to be task-focused, directive, and/or patronizing. Behavioral problems, such as resistiveness to care and agitation, have been linked to such communication. Therefore, improving communication between long-term care staff and residents is a critical component of person-centered care. One of the challenges with implementing person-centered approaches in long-term care is the lack of specificity in how to communicate in a person-centered manner. As such, this symposium will include research on evidence-based communication strategies and interventions that enable long-term care staff to support the uniqueness of residents. Each presenter will provide examples of person-centered strategies from audio or video recordings of staff communication during routine care. In addition, presentations will identify structural barriers to the implementation of new communication skills in nursing home practice and discuss strategies to overcome them.

**Language-Based Communication Strategies That Support Person-Centered Communication**

M.Y. Savundranayagam, R.K. Garrett, N.M. Davidson, Helen Bader School of Social Welfare, University of Wisconsin-Milwaukee, Milwaukee, Wisconsin

This study examined the relationship between language-based and person-centered strategies that support communication with persons with dementia. Conversations (N=46) between staff-resident dyads were audio-recorded during routine care tasks over 12 weeks. Staff utterances were coded twice, using both language-based and personhood categories. Findings revealed that there were specific language-based strategies that characterized each personhood indicator. For recognition, 47% of utterances were greetings, 16% were yes/no questions, and 12% were affirmations. Questions (yes/no, choice, open-ended) comprised 91% of utterances that were coded as negotiation. A similar pattern was observed for utterances coded as facilitation-conversation starter; 65% were close-ended questions and 23% were open-ended questions. Of
utterances coded as facilitation-intent to fulfill, 80% were affirmations. Finally, 93% of utterances coded as validation were affirmations. Although the findings identify specific language-based strategies that support personhood, they also suggest that staff need training in the use of more diverse language-based strategies that support personhood.

CHANGING TALK (CHAT): PERSON-CENTERED COMMUNICATION INTERVENTION
K.N. Williams, 1. University of Kansas School of Nursing, Kansas City, Kansas, 2. University of Kansas Gerontology Center, Lawrence, Kansas

Long term care is challenged to train nursing staff in person-centered communication skills, essential to person-centered care. Training staff to communicate effectively requires extensive resources, reinforcement of skill use in practice, and administrative support. Effectiveness is limited by heavy workloads that limit consistent application of skills in practice and high turnover rates necessitating constant retraining. The Changing Talk (CHAT) communication training intervention meets these challenges in a 3-session program focused on reducing elderspeak communication. CHAT uses videos of actual staff-resident interactions to guide staff in practice of easily adopted communication strategies that are readily monitored in practice. CHAT has demonstrated effect sizes ranging from .35 to .62 in reducing elderspeak and increasing respect for residents. Qualitative data indicate insightful nuances in person-centered communication strategies. Subjects’ videos will be used to produce a training video intervention for future, self-identified communication-challenged family members.

PERSON-CENTERED COMMUNICATION STRATEGIES IN ACTION: A FOCUS ON RESIDENTS WITH DEMENTIA IN AGED CARE
E. Smith, R. Baker, M. Broughton, A.J. Angwin, C. Gallois, H.J. Chenery, The University of Queensland, Brisbane, Queensland, Australia

The ability to communicate well is critical to the provision of person-centred care in residential nursing facilities. The MESSAGE training program is designed to provide care staff with the skills to facilitate communication with residents with dementia. It highlights simple strategies to support both the cognitive and the person-centered aspects of communication (e.g. the need to be understood, the importance of social engagement, and the satisfaction of participating in enjoyable interaction). Conversations between care staff and residents with dementia were audio-recorded as part of a trial of the MESSAGE program in four aged care facilities in Queensland, Australia. Conversation transcripts were analyzed in terms of the communication strategies used (or not used) by staff. Training appeared to increase the use of verbal encouragement, and reduce under-accommodative behavior. Examples from the transcripts will be used to illustrate the communication strategies in action, and demonstrate their influence on the residents’ participation.

OPTIMIZING COMMUNICATION WITH PEOPLE LIVING WITH DEMENTIA
C.R. Manthorp, Barchester Healthcare, Harrow, Middlesex, United Kingdom

This presentation details research which produced a new toolkit and a related book. The research drew together best current practice in effective communication with people living with dementia and their social partners (Young & Manthorp, 2009; Young, Manthorp & Howell, 2010, 2011). Representatives from a wide range of stakeholders and groups in the UK (n = 150) took part in a series of consultation exercises to discuss and agree best practice. Participants included people living with dementia, family members and professional carers. A three level framework for the toolkit was agreed. Level 1 is a statement of foundational beliefs and principles underlying a person-centred and empowering approach to communication with people with dementia. Level 2 of the toolkit indexes ten components of effective communication. Level 3 consists of practical and individualised advice on communication techniques. A regime for empirically testing efficacy and for training is also outlined.

HOW TO COMMUNICATE AND “CONNECT” WITH ALZHEIMER’S: A PERSON-CENTERED STRATEGY FOR FAMILY VISITORS OF RELATIVES WITH DEMENTIA
L. Levy-Storns, UCLA, Los Angeles, California

The purpose of this pilot intervention study was to improve how family caregivers relate to their loved ones with dementia during visits in nursing homes. The core research question is: do family caregivers improve in their person-centered communication skills after an intervention? The intervention, “Are We Connected?” was a one-on-one session with a speech therapist that used video-tapes of each participating family member/relative’s actual interaction as a training stimulus. Ten volunteer family caregivers and their relatives with dementia were digitally audio- and videorecorded at mealtimes before and after the intervention. Their videos were coded for verbal and non-verbal communication techniques. Quantitative analyses indicated no improvements in family members’ communication at posttests, but pretest measures were already good, which suggests a ceiling effect. Qualitative data indicate insight into person-centered communication strategies. Subjects’ videos will be used to produce a training video intervention for future, self-identified communication-challenged family members.

SESSION 40 (PAPER)

MANAGEMENT OF CARDIOVASCULAR DISEASE

A COMMUNITY-BASED PROGRAM TO IMPROVE HEART FAILURE SELF-CARE

Approximately 5.7 million people in the United States have heart failure (HF), and 670,000 new cases are diagnosed each year. The prevalence of HF among elders is 6.6-9.4%. Despite advances in HF treatment, outcomes remain dismal including poor quality of life, increased healthcare utilization and early mortality. Nearly half of HF related admissions are preventable and attributable to poor self-care. HF self-care encompasses adherence to medication, diet and symptom monitoring behaviors and symptom management by the patient when HF symptoms occur. Unfortunately, traditional HF self-care education delivered as part of hospital-based discharge planning and outpatient care has been ineffective. The purpose of this session is to describe the development and implementation of a community-based HF self-care educational program. Guided by a Community Participatory Action framework, we partnered with key leaders of an urban senior center and clinicians providing care to an underserved population with HF to pilot a skill-building intervention for community-dwelling elders with HF. This novel approach addresses the significant challenges in self-care faced by HF patients. Recruitment for the program takes place in the community from senior centers and outpatient clinics. Weekly sessions led by a health educator, focus on building skill in the essential elements of self-care including how to plan and prepare low salt meals, identify signs of worsening heart failure; and management of symptom. The group format highlights senior center resources and leverages social supports essential to community-dwelling elders. Focus group feedback from participants and partners confirms the acceptability and feasibility of the community-based program.
ARE MEDICARE BENEFICIARIES WITH HEART FAILURE RECEIVING RECOMMENDED TREATMENT?
S.K. Dutcher, I.H. Zuckerman, G.B. Rattinger, P.T. Chhabra, S.S. Gottlieb, L. Simoni-Wastila, B. Stuart, 1. University of Maryland School of Pharmacy, Baltimore, Maryland, 2. University of Maryland School of Medicine, Baltimore, Maryland

Heart failure (HF) is one of seven chronic conditions identified as a target for medication therapy management (MTM) programs required under Medicare Part D in order to optimize treatment of older adults. This study aimed to describe evidence-based medication use and to identify factors associated with use in older Medicare beneficiaries with HF. This cross-sectional study used 2006-2007 data from the Centers for Medicare and Medicaid Services Chronic Condition Warehouse. The sample comprised Medicare beneficiaries with Parts A, B, and D coverage and with a diagnosis of HF with systolic dysfunction (ICD-9-CM 428.2x, 428.4x). Identification of evidence-based medications was based on published guidelines for treatment of HF with systolic dysfunction: angiotensin-converting enzyme inhibitors or angiotensin receptor blockers (ACE-or-ARB), and selected beta-blockers (carvedilol, bisoprolol, metoprolol succinate). A binary measure of medication use captured receipt of ≥1 prescription during 2006-2007. Modified Poisson regression models identified factors associated with medication use. The average age of 9,838 beneficiaries identified with HF was 72.3 ± 12.0 years; 60.7% were female and 80.4% were Caucasian. Comorbid conditions included atrial fibrillation (43.3%), chronic kidney disease (45.6%), chronic obstructive pulmonary disease (49.1%), and diabetes (55.6%). Most (77.1%) used an ACE-or-ARB, 56.7% received a selected beta-blocker and 47.6% received both an ACE-or-ARB and beta-blocker. Individuals with other cardiovascular comorbidities were more likely to receive both drug classes; older age and COPD were associated with lower use. Since room for improvement still exists, MTM programs should consider interventions to increase the use of evidence-based medications in HF patients.

THE IMPACT OF DIFFERENT TYPES OF EXERCISE ON ARTERIAL STIFFNESS IN OLDER ADULTS AT VERY HIGH CARDIOMETABOLIC RISK
K. Madden, C. Lockhart, D. Cuff, G.S. Meneilly, Medicine, UBC, Vancouver, British Columbia, Canada

BACKGROUND: The relationship between increased arterial stiffness and cardiovascular mortality is well established in older adults and in subjects with Type 2 diabetes. Short-term vigorous exercise interventions have been shown to reduce arterial stiffness in older adults with T2DM. We examined whether training type (aerobic training versus strength training) influences the improvement in arterial compliance in subjects with Type 2 diabetes. Short-term vigorous exercise intervention could be used as a form of treatment for older adults with Type 2 diabetes complicated by comorbid hypertension and hyperlipidemia. METHODOLOGY: A total of 45 older adults (mean age 72.3 ± 0.7 years) with diet-controlled or oral hypoglycemic-controlled T2DM, hypertension, and hypercholesterolemia were recruited. Subjects were randomly assigned to one of three groups: an aerobic group (6 months vigorous aerobic exercise, AT group, n=20) a strength training group (6 months strength training, ST group, n=15) and a control group (no training, C group, n=10). Exercise sessions were supervised by a certified exercise trainer three times per week, and a combination of cycle ergometers and treadmills was used. Arterial stiffness was measured as pulse-wave velocity (PWV) using the Complior device. RESULTS: There was a significant difference in the response to training (group * time) between the AT and NA groups for both radial (β = 0.011 and femoral (β = 0.017) PWV. This was primarily due to an improvement in the AT group after 3 months training as compared to control (p<0.001 radial PWV; p=0.001 femoral PWV), that was not maintained at the 6-month mark for either radial or femoral PWV (post-hoc analysis between groups at 3 and 6 months). DISCUSSION: Our findings indicate that in older adults with T2DM, long-term strength training resulted in no improvement in measures of arterial stiffness. Aerobic exercise resulted in an initial 3-month improvement in arterial stiffness, but this short term improvement became attenuated over the long term, likely due to the continuing effect of multiple cardiometabolic risk factors on vascular compliance.

SERUM 2-METHOXYESTRADIOL, AN ESTROGEN METABOLITE, IS POSITIVELY ASSOCIATED WITH SERUM HDL IN A POPULATION-BASED SAMPLE
C. Masi, L. Hawkley, J.T. Cacioppo, University of Chicago, Chicago, Illinois

Serum high-density lipoprotein (HDL) is inversely associated with coronary artery disease, ischemic stroke, and atherosclerosis in men and women. Among postmenopausal women, oral supplementation with conjugated equine estrogen increases serum HDL. Although the mechanism of this effect is not well understood, 2-methoxyestradiol (2-MeOE2), an estrogen metabolite, inhibits HMG-CoA reductase in vitro. A population-based sample completed surveys regarding demographic characteristics and use of antihyperlipidemic agents, including HMG-CoA reductase inhibitors (statins), niacin, bile acid sequestrants, and cholesterol absorption inhibitors. Serum was analyzed for estradiol and 14 estradiol metabolites (EM) using mass spectrometry. EM concentrations exhibited a positively skewed distribution and were therefore subjected to natural log (ln) transformation. Results included serum EM data from 51 men and 51 postmenopausal women. Four women were excluded because they were taking hormone replacement therapy. Preliminary analysis revealed no correlation between 2-MeOE2 and serum HDL in men so the current analysis includes only women (N = 40) with no missing demographic, medication, EM, or lipid profile data. Mean age was 57 years. An ordinary linear regression model revealed that serum ln 2-MeOE2 (β = 0.276, p = 0.043) and antihyperlipidemic agents (β = 0.307, p = 0.047) were positively associated with serum HDL when age, race/ethnicity, and body mass index were held constant. Because this study was cross-sectional, prospective analyses are needed to determine if 2-MeOE2 leads to increased serum HDL. A better understanding of this relationship could lead to new strategies for raising serum HDL and reducing the risk of cardiovascular disease, especially among postmenopausal women.

DOES RESOLUTION OF DEPRESSIVE SYMPTOMS ATTENUATE STROKE RISK?
P. Gilsanz, K. Patton, M. Glymour, 1. Harvard School of Public Health, Boston, Massachusetts, 2. University of Washington Medical Center, Division of Cardiology, Seattle, Washington

Background Emerging data suggest depressive symptoms predict stroke incidence. It remains unclear whether the mechanisms operate via long or short-term processes. This distinction is important for guiding patient treatment and identifying mechanisms. Hypothesis 1. Among individuals with elevated depressive symptoms at the prior interview, resolution of depressive symptoms predicts reduced stroke risk. 2. Among individuals without elevated depressive symptoms at the prior interview, new elevations of depressive symptoms predict elevated stroke risk. Methods Participants in the Health and Retirement Study (n=17,960) were interviewed every two years for up to 15 years. We examined whether patterns in depressive symptoms across two interview waves predicted onset of self or proxy reported first stroke (1,775 events) during the subsequent two year interval. Scores of 3+ on the 8-item Centers for the Epidemiologic Study of Depression were considered “elevated depressive symptoms.” All models were estimated using pooled logistic regression adjusting for sociodemographic characteristics and continuous symptom score from the prior wave, with confidence intervals (CIs) based on robust variance corrections. Results Among participants with elevated depressive symptoms at the prior interview wave, resolution of depressive symptoms predicted reduced odds of stroke onset (OR=0.66; 95% CI: 0.53, 0.82). Among participants without elevated depressive symptoms during the prior interview...
Objective assessment of physical activity and functional activities (λ=.42), exercise (λ=.26), caregiving (λ=.52) were significantly associated with mobility. Reported activities of daily living (λ=.42), locomotion (λ=.26), observed function (λ=.28), exercise (λ=.26), and caregiving (λ=.26) were not significantly associated with objective findings include 24 hour activity and functional performance based on a Barthel Index. Data analysis was done using Structural Equation Model and the Amos statistical program. The model fit the data based on a χ² 11.31, df=14, p=.66, a Normed Fit Index of .73 and a Root Mean Square Error of Approximation of .001. Reported activities of daily living based on the PAS-LTC which included activities of daily living, time spent in locomotion, exercise, caregiving and recreation and objective findings include 24 hour activity and functional performance based on a Barthel Index. Data analysis was done using Structural Equation Model and the Amos statistical program. The model fit the data based on a χ² 11.31, df=14, p=.66, a Normed Fit Index of .73 and a Root Mean Square Error of Approximation of .001. Reported activities of daily living (λ=.42), locomotion (λ=.26), observed function (λ=.28), exercise (λ=.26), and caregiving (λ=.52) were significantly associated with physical activity. Actigraphy (λ=.10) and reported recreational activities (λ=.11) were not significantly associated with physical activity.

Objective assessment of physical activity and risk of falls and fractures: Osteoporotic fractures in older men (MROS)
J.A. Cauley, S. Litwack Harrison, D.C. Mackey, K. Ensrud, E. Orwoll, P.M. Cawthon.

The relationship between physical activity (PA), falls and fractures in older adults is complex. Some studies suggest a U shaped association: the most inactive and most active people are at a higher risk. Many of the previous studies of falls and fractures relied on self-reported PA measures using activity questionnaires focusing on leisure time sporting activities. The association between objectively measured PA and risk of falls and fractures in older adults is uncertain. We performed objective measurements of daily energy expenditure and minutes of PA using a body monitoring system (Body Media) which included an activity based device called the SenseWear armband in 3088 men, average age 79 years; 9x%, white. Men wore the armband for ≥3 days. Falls and fractures were assessed every 4 months by phone or mail; fractures were confirmed with x-ray reports. We examined the risk of 1+ fall and ≥2 falls in the 12 months after the PA assessment. Over an average follow-up of 2.7 years, 150 (4.8%) men experienced an incident non-spine fracture, 842 (27.2%) men experienced > 1 fall and ≥2 falls 448 (14.5%). There was no association between falls and total energy expenditure (EE) or minutes of physical activity. In contrast, men with the lowest objective PA experienced a greater risk of non-spine fractures, (e.g., Q1 vs. Q5 HR= 1.66 (1.06, 2.59), p trend =<0.02). There was no evidence of a U shaped relationship between objective PA and fracture risk. Results suggest that increasing physical activity may prevent fractures in older men.

Factors associated with older urbanized adults’ walking inside and outside their neighborhood
L. Nyquist, S. Ford, M. Gardner, N.A. Gallagher.

Numerous studies have shown that regular physical activity provide important health benefits. Although walking is the most common form of physical activity among older adults, only about 25% walk on a regular basis. Our purpose is to examine factors associated with older, community dwelling adults’ time walking both inside and outside their neighborhoods. 413 adults aged 60-99 years residing in urbanized areas completed a survey by mail. 69% were female and 22% were African American. Measures included demographics, time walking inside and outside the neighborhood, neighborhood characteristics, health and functional status, and mobility-related efficacy measures. Mean weekly walking time was 2.57 hr. 22% reported no walking either inside or outside of their neighborhood, 23% walked only in their neighborhood, 14% walked only outside their neighborhood, and 42% walked in both areas. ANOVA was used to test differences in these walking groups; findings reported are significant at p<.05. Those not walking at all were oldest and those walking in both areas were youngest. There were no gender, race/ethnicity or education differences. Those walking in both areas more frequently used the bus. They also had fewer functional limitations. Neighborhood walkability measures were highest in those who walked in both areas and lowest in those who walked only outside the neighborhood. Mobility-related efficacy measures were lowest among those who did no walking. These findings indicate that urbanized older adults are not walking regularly. Confidence in mobility is associated with the amount of walking and should be the focus for future interventions.

Physical activity predicts reduced health service utilization
J.M. Jacobs, A. Cohen, J. Stessman, Geriatrics and Rehabilitation, Hadassah Hebrew-University Medical Center, Jerusalem, Israel

Purpose: Despite the health benefits of physical activity (PA), little evidence exists concerning its impact upon health service utilization (HSU). Methods: The Jerusalem Longitudinal Study (1990-2010) is a prospective study of a community-dwelling cohort, born 1920-21. Comprehensive assessment at age 78 and 85 included PA levels (sedentary<4 hours/week vs. active≥4 hours/week). HSU included hospitalization, emergency-room, family physician or community nurse (≥1 in the previous 12 months), and Home Help usage. Logistic regression analyses adjusted for gender, diabetes, ischemic heart disease, hypertension and self-rated health. Results: 520 subjects were assessed at both 78 and 85. PA was reported among 430/520 (82.7%) and 331/520 (63.7%) at 78 and 85 respectively. In cross-sectional analyses, adjusted Odds Ratios for PA at age 78 were associated with significantly decreased likelihood of HSU at age 78 for all the outcomes except hospitalization. Similar findings emerged at age 85 for all outcomes except doctors visits. Subjects were classified according to PA levels at both 78 and 85: Consistent (PA/PA), Decreasers (PA/Sedentary), Increasers (Sedentary/PA), and Low (Sedentary/Sedentary). Using consistent activity as a reference, low or decreasing levels of PA respectively were associated with increased hospitalization (OR 1.89% CI 1.09-3.6; OR 1.79% CI 1.04-2.8) and emergency-room use (OR 2.39% CI 1.24-4.3; OR 1.78% CI 1.11-2.8). No differences in OR’s were found between consistently active versus those becoming active at 85. Conclusions: Among the very old,
not only continuing but also initiating PA was associated with reduced HSU. This finding supports the encouragement of physical activity into advanced old age.

**LIGHT INTENSITY PHYSICAL ACTIVITY IS ASSOCIATED WITH INSULIN RESISTANCE IN JAPANESE OLDER WOMEN**

Y. Gando 1,2, H. Murakami 2, R. Kawakami 2, M. Higuchi 1, M. Miyachi 2, J. Waseda University, Saitama, Japan, 2. National Institute of Health and Nutrition, Tokyo, Japan

PURPOSE: High level of physical activity (PA) and moderate to vigorous intensity PA are beneficially associated with insulin resistance. However, it is unclear whether light PA is also associated insulin resistance. This cross-sectional study was performed to determine the relationships between amount of light PA determined with a triaxial accelerometer and insulin resistance in Japanese adults. METHODS: A total of 776 healthy men and women participated in this study. PA was measured by triaxial accelerometer worn for 2 weeks and summarized as light-intensity (1.1-2.9 METs), moderate-intensity (3.0-5.9 METs) and vigorous-intensity (>6.0 METs). Insulin resistance was evaluated by HOMA_R (FPG (mg/dL) xIRI (μUL/mL)/405). RESULTS: The daily time spent in light PA was associated with HOMA_R in older women ($r = -0.23, P<0.05$) only, whereas the daily time spent in moderate PA was associated with HOMA_R in young women ($r = -0.19, P<0.05$) and older both sexes (women: $r = -0.17, men: r = -0.32, P<0.05$). The daily time spent in vigorous PA was associated with HOMA_R in young men ($r = -0.15, P<0.05$) only. Stepwise multiple-regression analysis revealed that daily time spent in light PA ($β = -0.11$) and moderate PA ($β = -0.10$) and BMI ($β = 0.53$) were independent correlates of HOMA_R ($r = 0.58, P<0.05$) in women and daily time spent in moderate PA ($β = -0.18$) and BMI ($β = 0.47$) were independent correlates of HOMA_R ($r = 0.50, P<0.05$) in men. Conclusion: These cross-sectional data suggest that light intensity PA is beneficially associated with insulin resistance in older women.

**SESSION 50 (SYMPOSIUM)**

**ACTIVE GAMING FOR BALANCE IMPROVEMENT IN POST-STROKE AND FUNCTIONAL OLDER ADULTS**

Chair: D.E. Krotish, Division of Geriatrics, Palmetto Health, Columbia, South Carolina, University of South Carolina, Columbia, South Carolina

Discussant: D.E. Krotish, Division of Geriatrics, Palmetto Health, Columbia, South Carolina

Regular participation in physical activity is one of the most successful ways to improve quality of life, increase functional independence and prevent chronic disease in older adults with and without disabilities. In order to implement this behavior change, we need to identify alternative, innovative, long-term, economically feasible (Flynn et al., 2007) interventions and therapeutic approaches for older adults. The presentation’s aim is to explore an innovative intervention and therapeutic approach through examining effects of commercially-available gaming systems on balance, mobility and fear of falling in individuals with chronic stroke motor deficits and a healthy community-dwelling older adult. The two commercially-based platforms used are Nintendo Wii and Sony PlayStation 2. These gaming systems allow repetitive practice of activities to occur without the assistance of a rehabilitation specialist, augmented feedback is a component of the gaming environment (Light, 2003), the interactive interface maintains participant interest and motivation, and the system may be an affordable option for many individuals (Flynn et al., 2007). Specific games used address dynamic balance, speed, accuracy, general mobility, and weight shift; all of which are distinct limitations for many individuals post-stroke and precursors of functional limitation in healthy older adults. In this symposium the presenters will examine the history of gaming, define how off-the-shelf video gaming variables can be used in function, balance and mobility research with disabled and healthy community dwelling older adults, and discuss the results from a randomized single-blind control group and case study.

**ACTIVE GAMING FOR BALANCE IMPROVEMENTS POST-STROKE**

S. Fritz, University of South Carolina, Columbia, South Carolina

More than half of individuals post-stroke have residual movement disabilities, including reduced mobility and balance. Recently, a focus has been placed on the use of interactive gaming as a low cost and effective manner of treating movement disorders. This session will examine the history of gaming in rehabilitation and the results of a randomized, single-blind, control group study that examined the effects of commercially-available gaming systems (Wii and PlayStation) in a sample of 28 individuals with chronic motor and balance deficits following stroke. Participants were randomized to play one of two gaming systems and played one hour per day, four days per week, for a total of 20 hours with supervision. Both systems provide an interactive interface in which the system presents real-time movement of either the participant or the representative character on the screen. Following the intervention, significant improvements were measured in balance, walking speed, movement control, and endurance.

**WIIFIT & SPORTS: MEASUREMENT OF FUNCTIONAL RESEARCH VARIABLES, A COMMUNITY-DWELLING OLDER ADULT CASE STUDY**

M. Dombek, Physical Education & Athletic Training, University of South Carolina, Columbia, South Carolina

Extending older adults functional capabilities is important since loss of physical function results in dependence, disability and increased burden on our health care system and the families of older adults. This case study is based on data from one hour per day, two days per week, 20 hours of supervised WiiFit and WiiSports game play. Functional components of games will be presented with a discussion of variables that can be measured to track improvement. Benefits and limitations of using game produced feedback and scoring will be compared with other variable recording protocols. The appropriateness of pre and post-test measures, their discriminatory potential and ceiling effects in measuring participant functional status will be discussed. After attending this session, participants will be able to define how off-the-shelf active video gaming, specifically, WiiFit and WiiSports game variables can be used in function, balance and mobility research with community-dwelling older adults.

**SESSION 55 (PAPER)**

**INNOVATIONS IN AGE FRIENDLY COMMUNITIES**

**AGING WELL AT HOME: A DEMONSTRATION PROJECT TO PROMOTE AN AGING-FRIENDLY URBAN NEIGHBORHOOD**

J.G. Gonyea 1, K. Barnes 2, 1. Social Work, Boston University, Boston, Massachusetts, 2. Jewish Family and Children’s Service of Greater Boston, Boston, Massachusetts

The changing demographic of an increasingly older US population presents both opportunities and challenges for local communities. One key challenge is meeting the desire of most Americans to age-in-place or stay in their own homes as they grow older. Indeed, the successful aging paradigm has highlighted the importance of not only the immediate environment of home but also the physical and social environment of community on individuals’ well-being. Thus, there is a growing movement in the US and globally toward the promotion of aging-friendly or lifelong communities and an increasing number of pilot programs or initiatives. One such example is the Aging Well at Home Program.
AGING IMPROVEMENT DISTRICTS: A NEW MODEL OF LOCAL CHANGE

D.E. Block, R. Finkelstein, New York Academy of Medicine, New York, New York

As social networks and mobility diminish with age, the environmental, social, cultural and economic resources of neighborhoods often determine how active and independent the older adults who live there can remain. Aging Improvement Districts are a new model of bringing together all sectors of a neighborhood to implement no and low-cost improvements to better accommodate and benefit from older adults. With guidance from older adults, a neighborhood’s public agencies, businesses, cultural and religious institutions and health and social services can often make small shifts to better meet the needs of the aging population. This model was initiated in three diverse New York City neighborhoods in 2010 and 2011 and has demonstrated much success. The model is built around a four-part iterative process which involves: 1) community consultations; 2) coalition building; 3) the sharing of findings with community members; and 4) the implementation of solutions. A guidebook to facilitate other cities or neighborhoods in engaging in such a process is expected to be completed by the end of the year. The Aging Improvement District model is part of the larger Age-friendly New York City initiative, a partnership between the Office of the Mayor, the New York City Council and The New York Academy of Medicine. Age-friendly New York City, which promotes an “age-in-everything” lens for all aspects of city life and planning, grew out of and is a part of the World Health Organization’s Global Age-friendly Cities initiative.

SESSION 60 (SYMPOSIUM)

ALIGNING THEORETICAL CONSTRUCTS AND MEASUREMENT OF DISABILITY WITHIN THE STUDY OF AGING WITH DISABILITY

Chair: M. Putnam, School of Social Work, Simmons College, Boston, Massachusetts

This symposium presents a tiered discussion regarding the importance of aligning theoretical constructs of disability and measurement of aging with disability. Aging with disability (the experience of growing older with onset of disability in early or mid-life), remains a relatively new area of scientific study that spans across disciplinary fields. Subgroups of this population include persons diagnosed with polio, multiple sclerosis, traumatic brain injury, rheumatoid arthritis, intellectual disabilities, and other significant injuries. Scholarly discussions about how to bridge theoretical and conceptual models of disability are ongoing. To a lesser extent, dialogues about measurement have begun but substantial hurdles remain for researchers trying to advance research on aging with disability including forwarding a scientific rationale for studying cross-diagnosis populations, selection and validation of measures and identification of aging with disability populations, and translating new knowledge into practice and policy initiatives that support positive health and wellness outcomes for persons aging with disability. The three symposium presentations provide an introduction into this topic and field of study.

RATIONALES FOR ALIGNING THEORY, MEASURES, AND DISTINGUISHING AGING WITH DISABILITY POPULATIONS

M. Putnam, School of Social Work, Simmons College, Boston, Massachusetts

Calls have been made to gerontologists to adopt the International Classification Functioning, Disability and Health (ICF) to facilitate the study of disability across the life course. Similarly, advancements of ontologies for aging and disability service delivery are recommended as a means of standardizing data collection and facilitating knowledge transfer across regional and national contexts. On-going scholarly distinctions in theoretical approaches to framing the aging and disability experience contribute to difficulties in conceptualizing and studying the experience of aging with disability - from agreement on selection of measurement variables to assessment of global health and wellness outcomes. Rationales for distinguishing the aging with disability population (disability onset in early and mid-life) from the aging into disability population (disability onset in old age) include advancement of research, clinical practice, program development, and public policy design. Examples of areas where new knowledge is required are identified.

LEGISLATIVE AND PROGRAMMATIC INITIATIVES SUPPORTING THE NEED FOR MEASUREMENT ADVANCEMENT

M. Campbell, National Institute on Disability and Rehabilitation Research, Vienna, Virginia

Disability and Health objectives in Healthy People 2020 calls for improved opportunities for people with disabilities to be included in public health activities, receive timely interventions and services, interact in their environments without barriers, and participate in everyday life activities. These goals are complimentary but distinct from those identified for older adults that emphasize medical care, treatment, and reduction in unmet care needs. Discrepancies between theoretical con-
SESSION 65 (SYMPOSIUM)

EXPERIENCING OLD ATTITUDES: VARIED PERSPECTIVES ON OLD WORKERS IN EUROPE
Chair: S.A. Vickerstaff, SSPSSR, University of Kent, Canterbury, Kent, United Kingdom

The aim of this symposium is to enhance understanding of the varied attitudes towards old age, with particular reference to perspectives on older workers in work and in transition to retirement. The symposium draws upon a comparison of attitudes across Europe with specific examples drawn from the UK and the Netherlands. The topics include an overview of general attitudinal concepts, a study of 27 European countries produced for the Department for Work and Pensions in the UK, and a presentation on older workers in work and in transition to retirement. The symposium is complemented by a discussion of how to bridge aging and disability, with particular reference to perspectives of older workers and their views of retirement planning.

BABY BOOMER ATTITUDES TOWARDS CONTINUING WORK IN A RECESSION: THE GUILT OF OLDER WORKER EMPLOYMENT
E. Alden, School of Social Policy, University of Kent, Canterbury, Kent, United Kingdom

The benefits of continuing work are highly attractive to Baby Boomer workers who are seeking to redefine the transition to retirement. There are the financial benefits of continuing work, the social inclusion benefits, and the general view that these workers are continuing to gain fulfilment and contribute to society in a meaningful way. However, in a recession this can come at a price for younger workers wishing to enter the workforce and progress in their early careers. Explorations of attitudes towards old age, with particular reference to perspectives of older workers and their views of retirement planning.

IMPACT OF AGE NORMS AND AGEIST STEREOTYPES ON HIRING OF EARLY RETIREES IN THE NETHERLANDS: A MULTILEVEL ANALYSIS OF MANAGERS’ DECISIONS
K. Karpinska1, K. Henkens1, J. Schippers1, 1. Utrecht University, Utrecht, Netherlands, 2. Netherlands Interdisciplinary Demographic Institute, The Hague, Netherlands

Changing patterns of retirement transitions suggest that a growing number of older workers can opt for bridge employment, i.e., employment that occurs between career jobs and permanent retirement. Our study investigates the role of managers in the employment process of early retirees in the Netherlands. In particular, we focus on the effect of managers’ age norms and ageism attitudes on their employment decisions. A vignette study was designed to answer this question. Profiles of hypothetical retired job applicants were presented to the employers who were asked to make a specific hiring decision. The information on age norms and age stereotypes (collected a month before the vignette study was administered) was consecutively combined in the analysis. The results indicate that higher age norm (i.e., the age deadline defined as the age when an employee is too old to work) results in higher propensity of hiring an early retiree. Stereotypes, on the contrary, do not influence managers’ decisions.

OLDER WORKERS ATTITUDES TO AGE: IMPACTS ON RETIREMENT PLANNING
S.A. Vickerstaff, SSPSSR, University of Kent, Canterbury, Kent, United Kingdom

The factors which influence retirement timing are well rehearsed through survey research in a number of different countries: financial and pension position, health status, caring responsibilities, domestic circumstances, labour market factors and job satisfaction. Older workers attitudes and feelings about age have not figured so large in analyses which seek to understand retirement behaviour. In this paper findings from a British qualitative study designed to explore the interaction of the factors affecting retirement timing are used to examine how the older men and women in the sample thought about their own age and how they framed age as an issue in retirement timing. The third talk presents the various reasons that older workers choose to put off retirement and continue working, while exhibiting some guilt for this in regards to denying young workers. Finally, a multi-level analysis demonstrates manager views and their willingness to hire older workers for bridge employment before retirement.

PREDICTORS OF ATTITUDES TO AGE IN THE EUROPEAN SOCIAL SURVEY
H. Swift, Centre for the Study of Group Processes, University of Kent, Canterbury, United Kingdom

As populations age, in some countries faster than others, governments and policy makers are grappling with the question of how to change people’s perceptions and expectations about ageing so that societies can adapt to these changes. Here, we present key findings from the Age Attitudes and Experiences of Ageism Module in the 2008/9 European Social Survey (ESS), including respondents from 27 European countries (N = 54,986). Using multi-level modelling we examined how people’s demographic characteristics combine with different characteristics of the countries in which they live to affect their perceptions of older people. Taken together, the picture is one in which it is countries that have higher GDP per capita, those with lower state pension ages, and a higher proportion of people aged 65 and 70 that value autonomy holds the most positive view of older people. These findings point to some potentially important issues for policy, as well as for future research.
SESSION 70 (SYMPOSIUM)

THE COUPLES LIFE STORY PROJECT: A DYADIC APPROACH TO DEMENTIA CARE
Chair: B. Ingersoll-Dayton, School of Social Work, University of Michigan, Ann Arbor, Michigan
Discussant: R.S. Allen, University of Alabama, Tuscaloosa, Alabama

Dementia affects not only individuals with memory loss but their partners as well. When attempting to address dementia-related issues, it is important to use interventions that involve both members of the couple. This symposium focuses on a dyad-based approach to dementia care, the Couples Life Story Project (CLSP), which is intended to enhance couples’ relationships, communication, and quality of life. Through pilot testing, focus groups, and interviews with experts, the CLSP was developed as a way by which couples participate in a collaborative process to create a memory book that describes the story of their lives together. The first paper in the symposium provides an overview of the theoretical frameworks (e.g., strengths-based approaches, legacy therapy, life review, and communication theory) that were synthesized and undergird the intervention. The second paper highlights some of the therapeutic themes that emerged during the CLSP and may have broader applicability to dyadic interventions such as maintaining identity and enhancing involvement of the person with dementia. The third paper describes an evaluation of the effectiveness of the CLSP. Quantitative and qualitative data were analyzed to examine the extent to which the intervention is associated with changes over time. The final paper in this symposium examines the cultural context of the CLSP by comparing the varied ways in which it has been implemented in both the United States and in Japan. Video clips and case examples are included throughout the symposium to illustrate key points.

THEORETICAL CONTRIBUTIONS TO DYADIC DEMENTIA INTERVENTIONS
K. Scherrer, B. Ingersoll-Dayton, B. Spencer, University of Michigan, Ann Arbor, Michigan

Memory loss and dementia can have devastating effects, although research indicates that dyadic interventions ameliorate negative outcomes for both caregivers and care recipients. This paper synthesizes several theoretical approaches to dyadic interventions with couples where one partner has dementia and discusses the foundations of the Couples Life Story Project (CLSP). The CLSP is a five-week intervention that employs elements of life review and legacy therapeutic approaches as couples work with interventionists to recall important past events and create a photo/memory book that documents their relationship. Utilizing a strengths-based approach, interventionists highlight the positive aspects of the couple’s relationship. The CLSP also employs a communication component to cultivate the couple’s skills for communicating more effectively. We use video examples from intervention sessions to demonstrate these techniques. Synthesizing these theoretical approaches has created a unique dyadic intervention to aid couples struggling with memory loss.

THERAPEUTIC THEMES IN A COUPLES-ORIENTED DEMENTIA INTERVENTION
B. Spencer1, B. Ingersoll-Dayton2, L. Mabie2, K. Scherrer1, J. Turner
Geriatric Clinic, University of Michigan, Ann Arbor, Michigan, 2. University of Michigan, Ann Arbor, Michigan

The Couples Life Story Project was developed for couples where one partner has memory loss in response to the need for more dyadic approaches to help couples with this difficult journey. Interventionists worked with 18 couples over a five-week period to review and document their shared life together. A number of therapeutic themes have emerged with wider applicability to working with such couples. For some dyads, the concept of identity has been salient, with emphasis on the strengths of past roles as well as evolving identity within the relationship. Grief and loss issues experienced by one or both partners have surfaced and been explored with some couples. Creating a vehicle whereby each partner has a voice and can affirm the other in the past and the present is a hallmark of this strengths-based intervention. Video clips will illustrate some of these themes.

SESSION 75 (SYMPOSIUM)

GEROBEITY: THE COMING EPIDEMIC
Chair: S. Olshansky, University of Chicago, Chicago, Illinois

Obesity rates worldwide have doubled in the last three decades and the incidence is still rising at alarming rates in all age groups. Obesity has a major impact on human health and disease. Speakers in this session will focus body weight and composition trends in the geriatric population. Body composition trends from the Baltimore Longitudinal Study on Aging will be discussed. Nutritional causes of obesity in the aged will be addressed as well as the challenges of the health care system in dealing with obesity and consequent life expectancy.

The Gerontological Society of America
OBESITY AND FUTURE LIFE EXPECTANCY
not encountered in other populations.

While both weight-loss and joint replacement surgical therapies have provided. Data regarding differential outcomes for these procedures between total joint arthroplasty patients, and orthopaedic trauma patients are pro-
ciplines are discussed and examples from gastric bypass surgical patients,
erly obese is altering the profile of patients utilizing surgical services.

GEROBESITY IN THE HEALTH CARE SYSTEM
M.E. Matzko, Geisinger Clinic, Danville, Pennsylvania

The elderly and the obese represent two populations that place a sign-
ificant burden on the healthcare system. In the past, membership to
to these groups has primarily been exclusive; however, as the population continues to grow both older and heavier, a rise in the number of el-
erly obese is altering the profile of patients utilizing surgical services.
While standard of care therapies are routinely universally applied, there are specific considerations that should be addressed and/or modified for these individuals. Here, issues related to gerobesity across medical disciplines are discussed and examples from gastric bypass surgical patients, total joint arthroplasty patients, and orthopaedic trauma patients are pro-
vided. Data regarding differential outcomes for these procedures between the elderly obese versus elderly lean and young obese are also reported. While both weight-loss and joint replacement surgical therapies have improved the health and functional status of this group of individuals, both procedures are met with increased risk and peri-surgical challenges not encountered in other populations.

OBESITY AND FUTURE LIFE EXPECTANCY
S. Oshansky, University of Illinois at Chicago, Chicago, Illinois

Although life expectancy has risen steadily in most years for the last
century, recent trends in the U.S. in adult-onset and childhood-onset obesity threaten this long-term trend now, and for decades into the future. The magnitude of the effect could be large enough to produce declines in life expectancy at birth for the entire country, but certainly more rapid-ly for subgroups of the population with the highest prevalence. It is possible that birth cohorts in the U.S. from the 1980s and 1990s could experience shorter life expectancies than their parent’s generation. Here I will document the magnitude of the trend, explore the relationship between obesity and life expectancy, and discuss how these trends could influence longevity disparities already present by race and level of com-
pleted education.

SESSION 80 (PAPER)

PHYSICAL ACTIVITY, ANXIETY AND DEPRESSIVE SYMPTOMS PREDICT FUTURE EXECUTIVE FUNCTIONING DECLINES

Several studies have suggested that physical activity can minimize or prevent cognitive decline in older adults, however little research has examined whether it affects specific cognitive abilities. This study inves-
tigated the effect of weekly physical activity on change in Dementia Rating Scale-2 (DRS-2) subscales after six months. We also examined whether physical activity could account for additional variance beyond measures of anxiety and depression. This study utilized data from a larger, longitudinal study measuring late-life anxiety risk factors in older adults. Participants (N=152) were given various neuropsychological assessments at baseline and biannually over a two-year period. Measures used for this study included the Geriatric Depression Scale (GDS), Perceived Stress Scale, Positive and Negative Affect Schedule (PANAS), Spielberger Trait Anxiety Inventory and DRS-2. Standardized residual change scores were computed for each DRS-2 subscale by predicting six-month performance from baseline performance. Results: Signifi-
cant changes in the Initiation/Perseveration subscale at six-month fol-
low-up were significantly (p<.05) negatively associated with baseline GDS, Perceived Stress Scale, PANAS negative affect, and Spielberger Trait Anxiety (p’s=.026 to .004). An index of weekly physical activity predicted additional variance beyond these measures. Weekly physical activity appears to minimize 6-month changes in executive functioning, as measured by the Initiation/Perseveration scale on the DRS-2. The presence of depression and anxiety in participants at baseline was also predictive of declines on the Initiation/Perseveration scales. These findings suggest that although depressive or anxious symptoms may raise the risk of future decline in executive functioning in late life, weekly physical activity can reduce their impact.

SHARED EXERCISE BEHAVIORS, ADHERENCE, AND DISEASE BURDEN AMONG PATIENTS WITH TYPE 2 DIABETES
K.J. August, K.S. Rook, S. Kaplan, D. Sorkin, UC Irvine, Irvine, California

Regular exercise is an important health behavior for the successful self-management of type 2 diabetes. Engaging in regular exercise is especially difficult in later life, however, as evidenced by low rates of physical activity among older adults. Given spouses’ central role in their partners’ chronic disease management, spousal engagement in exer-
cise behaviors may help their diabetic partners overcome difficulties associated with engaging in regular exercise, and at the same time, relieve feelings of burden. The current study accordingly sought to examine how the correspondence between couples’ engagement in exercise behaviors was associated with patients’ reported difficulty in adhering to their prescribed exercise regimen and subjective disease burden. Data were analyzed from a sample of 143 non-Hispanic white (n=78) and Mexican American (n=65) older adults with type 2 diabetes and their

64th Annual Scientific Meeting 15
spouses. Among older whites, there was a significant degree of correspondence between couples’ exercise behaviors ($r=.24$, $p<.05$, patient $M=3.22$, spouse $M=3.64$), whereas among older Mexican Americans, there was not a significant degree of correspondence between couples’ exercise behaviors ($r=-.01$, $p=.94$, patient $M=3.86$, spouse $M=4.45$). Compared to patients who exercised alone, patients whose spouses also exercised regularly had less difficulty adhering to their exercise regimen (for white and Mexican American patients, both $p<.04$) and less subjective burden (for white patients only, $p<.05$), after adjusting for age, gender, education, and total illness burden. The findings from this study highlight the importance of shared exercise behaviors for couples managing diabetes.

**RELATIONSHIPS BETWEEN LATENT CHANGES IN PHYSICAL ACTIVITY AND COGNITIVE FUNCTION IN OLDER ADULTS FROM ELEVEN EUROPEAN COUNTRIES: MODERATING EFFECTS OF AGE, GENDER OR EDUCATION?**

M. Lindwall, B. Johansson, Department of Psychology, University of Gothenburg, Gothenburg, Sweden

This prospective study investigated the relationship between latent changes over two years in physical activity (PA) and cognitive function (CF) in 16,960 older adults (Mage = 63.58, SD = 9.19) recruited in 11 European countries. Data was drawn from the Survey of Health, Ageing and Retirement in Europe (SHARE) database. We also examined the moderating effects of age, gender and education in these relationships. Latent change score models and multiple group analyses using structural equation modelling (SEM) were used to analyse data. The latent factor of CF was measured by delayed memory, verbal fluency and numeracy at baseline (T1) and at follow-up (T2). PA was measured at T1 and T2 as frequency of moderate physical activity and vigorous physical activity. The measurement models of the latent factors of CF and PA at both T1 and T2 fitted data well, and displayed weak invariance across time and groups. For the full sample, there was a significant and positive correlation ($r=.217$, $p<.001$) between latent change in PA and CF. Differences across age-groups in the association of PA and CF latent change were marginally significant ($p<.054$). The PA and CF latent change association was stronger ($r=.356$, $p<.001$) in the oldest age group (70-79) compared with the youngest (50-59) age group ($r=.127$, $p<.009$). However, differences in the PA and CF latent change relationship were not significant across groups of gender or level of education. The results suggest that changes over time in PA and CF are related and most strongly related in the oldest.

**LONGITUDINAL PATTERNS OF PHYSICAL ACTIVITY MAINTENANCE AND RELAPSE IN OLDER POPULATIONS**

K.C. Carey, T. Prohaska, University of Illinois at Chicago, Chicago, Illinois

While much study has been devoted to initiation of physical activity (PA), less is known about maintenance and relapse among older adults who are already active. Longitudinal research is needed to assess the stability of PA with aging and correlates of continued PA. This study uses four waves (1996-2002) of a biennial cohort survey to identify a sample of older adults meeting PA guidelines at baseline and then construct their subsequent trajectories. Measures include PA status, demographics (education, gender, race, ethnicity), and time-varying characteristics (age, retirement, health, marital status). The baseline sample of 5,494 active older adults was primarily aged 55-64 (68%), white (83%), and educated (77% HS graduate or higher). Four patterns of PA were identified: maintenance, relapse, and reactivation following relapse. In all waves maintenance remained the largest category but decreased over time (67-41%). The proportion of relapsers was relatively constant across waves (33-34%). 49% of relapsers resumed PA; of those, 33% relapsed again. Additionally, the occurrence of life transitions was observed and linked to PA. Over time, the proportions of participants reporting partial or full retirement, widowhood, and fair/poor health all increased. Controlling for demographic characteristics, PA relapse was linked to poorer health and widowhood while retirement was associated with reactivation. Overall, substantial heterogeneity in the stability of PA is seen. The high rate of reactivation suggests that such interventions could meet with success. The shifts in PA coinciding with life transitions suggest opportunities for further study of the predictors of change in PA.

**THE EFFECT OF PHYSICAL ACTIVITY ON COGNITIVE ABILITY THROUGHOUT ADULTHOOD**

A.A. Bielak1, N. Cherbuin1, D. Bünce1,2, K. Anstey1. 1. Ageing Research Unit, Australian National University, Canberra, Australian Capital Territory, Australia; 2. Brunel University, West London, United Kingdom

It is well established that there are positive associations between physical activity and cognition in older adulthood, where higher physical activity at baseline is associated with a decreased risk of cognitive decline, mild cognitive impairment, and dementia (e.g., Abbott et al., 2004; Yaffe et al., 2001). However, few studies have investigated this relationship longitudinally with multiple concurrent assessments of both cognition and physical activity. Further, because nearly all evidence focuses exclusively on older adulthood, we do not know whether the effect of physical activity on cognition differs across adulthood. Using the PATH Through Life Study, we evaluated whether physical activity participation was associated with cognitive ability within 3 age cohorts (20-24, 40-44, 60-64 years at baseline) assessed on three occasions over 8 years ($n = 6,850$). Multilevel models indicated that the between-person differences in weekly hours of physical activity across the 8 years significantly predicted baseline ability on a fluid cognitive composite, controlling for education, physical and mental health, and mental and social activity. Greater average physical activity participation was associated with higher baseline cognitive ability ($\beta = .037$, $p<.001$). This effect did not significantly differ across age group, indicating the relationship between average physical activity and baseline fluid ability is the same across adulthood. Importantly, the amount of physical activity did not alter cognitive change over time. However, on occasions when individuals were more physically active than average, they tended to show slightly higher cognitive scores ($\beta = .011$, $p<.05$). Being physically active is positively related to cognitive ability, and this effect is similar across adulthood.

**SESSION 85 (PAPER)**

**MENTAL HEALTH, MORBIDITY, AND MORTALITY**

**CHILDHOOD PHYSICAL ABUSE LINKED TO LIFETIME SUICIDAL IDEATION: FINDINGS FROM A POPULATION-BASED STUDY**

E. Fuller-Thomson, T.M. Baker, S. Brennenstuhl, Faculty of Social Work, University of Toronto, Toronto, Ontario, Canada

In the United States, suicide is the 11th leading cause of death. Research suggests a link between adverse childhood experiences and suicidal ideation. A representative community sample from the Canadian province of Saskatchewan was used to investigate the gender-specific relationship between childhood physical abuse and lifetime suicidal ideation. The total unweighted sample size of those in Saskatchewan age 18 or older with complete data on abuse and suicidal ideation was 6,642 (females = 3,774; males = 2,868). The provincial-level response rate was 84.1%. The prevalence of childhood physical abuse was much higher among those who had seriously considered suicide than among their non-suicidal peers (males 17.8% vs. 3.1%; females 40.4% vs. 7.9%). Logistic regression analyses were conducted controlling for age and race in addition to each of the following potentially confounding factors: 1) adverse childhood conditions (ie. parental divorce, addictions...
DISABILITY AS A RISK FACTOR FOR PSYCHOLOGICAL DISTRESS AMONG ASIAN AMERICAN ELDERS
C.S. Huang, M.R. Crowther, G. Kim, 1. Department of Psychology, University of Alabama, Tuscaloosa, Alabama, 2. Center for Mental Health and Aging, University of Alabama, Tuscaloosa, Alabama

The population of older Asian Americans is rapidly growing and the need for identifying risk factors of poor mental health outcomes is urgent. Research shows Asian American elders demonstrate significant within-group differences in mental health status. However, little is known concerning the impact of disability on mental health status among diverse Asian American subgroups. The present study sought to examine psychological distress in five subcategories of Asian Americans aged 60 and older (n = 1,398): Chinese (n = 291), Japanese (n = 175), Koreans (n = 383), Filipinos (n = 149), and Vietnamese (n = 400). Data were drawn from the 2009 California Health Interview Survey (CHIS). Bivariate correlation and hierarchical multiple regression were conducted to assess the predictability of disability on psychological distress. Results show that after adjusting for socio-demographic characteristics and general health conditions, cognitive disability significantly predicts psychological distress in all five subgroups with the highest beta value found in the Filipinos (β = .352, p < .001). ADL disability also significantly accounts for psychological distress among all subgroups (β = .197, p < .05) except for Koreans. In addition, vision and hearing disability is found as an ethnic-specific risk factor for Filipinos (β = .183, p < .05). The current study brings incremental knowledge in understanding disability as a risk factor for poor mental health among the five older Asian American subgroups. The findings can be applied to enhance the overall psychological well-being of older Asian Americans by providing culturally-sensitive mental health services when disability strikes.

SESSION 90 (PAPER)

TECHNOLOGY AND HEALTH LITERACY

A QUALITATIVE ANALYSIS OF OLDER ADULTS’ SEARCH STRATEGIES FOR HEALTH INFORMATION ONLINE
A.E. Wiley, E.M. Agree, D.L. Borzekowski, Johns Hopkins School of Public Health, Baltimore, Maryland

Most research on search strategies relies on either post-hoc reconstruction or pattern discovery methods to analyze Internet use behavior. Little has been done to understand the motivations and decisions made by users while searching for information. As part of a larger study of Online Health Literacy, a sub-sample of participants aged 60 years and older was asked to narrate their thoughts and actions while using the Internet to find answers to a series of health-related search tasks. This paper analyzes the data obtained from these talk-aloud sessions with older participants and describes findings regarding the reasoning and logic behind participants’ actions and search strategies from these data. 35 subjects took part in the Talk Aloud sessions. Text analysis of session transcriptions was used to analyze subjects’ thoughts and perceptions, and video recorded during the sessions was coded to capture specific actions. Data suggest several strategies and obstacles common across subjects, including reliance on one or two specific sites to guide searches (even when subjects express dissatisfaction with site content) and an inability to use an unfamiliar interface (as evidenced by subjects typing search terms directly into the search bar when initiating a search).

and long term unemployment); 2) socioeconomic factors (ie. Income and education); 3) health behaviors (ie. recreational physical activity, smoking and alcohol use); 4) psychosocial stressors/chronic illnesses (ie. self reported daily stress, marital status, number of chronic health conditions); 5) mental health (ie. 12 month major depression, diagnosis of mood disorders and/or anxiety disorders). After full adjustment, childhood physical abuse remained significantly associated with suicidal ideation (OR women = 4.48, 95% CI = 3.32–6.04; OR men = 3.57, 95% CI = 2.08–6.14). These findings suggest childhood physical abuse is independently associated with suicidal ideation and highlights the importance of providing preventative treatment to abuse survivors.

SUICIDAL Ideation and SuiciDal AttempTs in Older Homeless Veterans

Current population estimates suggest that 75,000+ veterans are homeless on any given night and perhaps twice as many experience homelessness at some point during the course of a year. Veterans are overrepresented in suicides across all adult age groups, representing approximately 20% of the suicides in America. A sizable and growing minority (21%) of homeless veterans are age 55 and older. Several factors are known to be risk markers for suicide in the elderly, including depression, substance abuse, physical illness, decline in functional capacity, and social isolation. Although older homeless veterans might be predicted to be especially vulnerable to suicidal behaviors as a result of nutritional, traumatic, and healthcare factors, no studies have examined suicidal behaviors in this group. In this study we examine the frequency of suicidal ideation and suicide attempts in a large sample of older homeless veterans. The analyses are based on comprehensive intake, admission, and discharge data from the largest VA housing intervention program (Grant and Per Diem) during years 2003-2009. Using data collected from 435 service providers across the nation, the sample consisted of 10,141 older veterans. Univariate and logistic regression analyses were used to specifically address the frequency of suicidal behaviors, characteristics of older homeless veterans experiencing suicidal ideation or attempting suicide, the determination of predictors of suicidal behavior, and the impact of the presence of suicidal behaviors on housing intervention outcomes. Implications for focused evaluation of suicidal behaviors in older veterans are discussed.

Need and Unmet Need for Mental Health Care Among Elderly in New York City
W. Gallo, S. Li, M.C. Fahn, I. CUNY School of Public Health at Hunter College, New York, New York, 2. School of Medicine, New York University, New York, New York

Research suggests that untreated mental health problems are associated with such adverse outcomes as functional disability, diminished productivity and increased medical expenses. Yet there is limited descriptive evidence on whether older individuals living in urban settings have adequate mental health care. This study identified correlates of unmet mental health care need among participants of New York City senior centers. Using data from the Brookdale Demonstration Project Initiative on Healthy Urban Aging, a survey administered in 2008 to a sample of 1,870 senior center enrollees, we characterized unmet mental health need as: PHQ9 depression score indicating moderate or severe depression, but no receipt of psycho-therapeutic services. The results showed that over 28% of participants met the PHQ9 criteria for moderate to severe depression. Among these individuals, over 80% did not receive advice or care from a health professional (e.g. a psychiatrist, psychologist or social worker) in the previous 12-month period. Multivariate logistic analysis revealed that the use of mental health service was inversely associated with age and marriage, but positively related with physical disability. Our findings indicate that the mental health needs of the older urban adults are not adequately addressed.

SESSION 90 (PAPER)

TECHNOLOGY AND HEALTH LITERACY

A QUALITATIVE ANALYSIS OF OLDER ADULTS’ SEARCH STRATEGIES FOR HEALTH INFORMATION ONLINE
A.E. Wiley, E.M. Agree, D.L. Borzekowski, Johns Hopkins School of Public Health, Baltimore, Maryland

Most research on search strategies relies on either post-hoc reconstruction or pattern discovery methods to analyze Internet use behavior. Little has been done to understand the motivations and decisions made by users while searching for information. As part of a larger study of Online Health Literacy, a sub-sample of participants aged 60 years and older was asked to narrate their thoughts and actions while using the Internet to find answers to a series of health-related search tasks. This paper analyzes the data obtained from these talk-aloud sessions with older participants and describes findings regarding the reasoning and logic behind participants’ actions and search strategies from these data. 35 subjects took part in the Talk Aloud sessions. Text analysis of session transcriptions was used to analyze subjects’ thoughts and perceptions, and video recorded during the sessions was coded to capture specific actions. Data suggest several strategies and obstacles common across subjects, including reliance on one or two specific sites to guide searches (even when subjects express dissatisfaction with site content) and an inability to use an unfamiliar interface (as evidenced by subjects typing search terms directly into the address bar when initiating a search).
HEALTH LITERACY AND COGNITIVE PROCESSING SPEED AS PREDICTORS OF SUCCESSFUL ONLINE SEARCHES FOR HEALTH INFORMATION
E.M. Agree, D.L. Borzokowski, A.E. Wiley, Johns Hopkins School of Public Health, Baltimore, Maryland

As we age, we confront chronic health conditions and complex health insurance systems. Studies show that older people have more difficulty navigating the Internet for health information, but computer experience, health knowledge, and cognitive abilities are also important. In this study, we examine the relationship of education, health literacy, cognitive processing speed, and Internet experience to success in using the Internet to answer health-related questions. From 2009-2010, at Johns Hopkins and Stanford Universities, 346 subjects ages 35-90 performed online searches to answer eight health-related questions. A Rapid Estimate of Adult Literacy in Medicine (REALM), the WAIS-III Digit Symbol Substitution Test (DSST) of cognitive processing speed, health status, computer experience, and background information were collected. The sample is 50% female, most are highly educated (91% with a BA); use the Internet daily (85%); and have good health literacy (mean REALM=127). Logistic regression models were used to predict the probability of a correct answer on the search tasks. Results show that being female, higher education, frequent Internet use, prior health literacy, and processing speed significantly increase the odds of success. However, for more complex questions (e.g., locating arguments for and against over-the-counter genetic testing), where education and health literacy are included in the models, DSST is not significant. Findings confirm prior studies but suggest that age-related changes in processing speed may be less important than health literacy and education for tasks involving more subjective evaluation of complex material.

ACCESSIBILITY OF HEALTH-RELATED SOCIAL MEDIA SITES FOR OLDER ADULTS
I. Watkins, B. Xie, College of Information Studies, University of Maryland, College Park, Maryland

Social media sites are an increasingly important source of health information. Yet, little is known about the accessibility of health-related social media sites for older adults. This study examined high-traffic health-related social media sites for compliance with the Web Content Accessibility Guidelines (WCAG) 2.0 using Total Validator, an automated testing tool. Total Validator identifies areas of Web pages failing to employ sufficient design and authoring techniques for compliance with the success criteria for WCAG 2.0. Websites were selected from an initial list of 40 most visited health Websites generated using Alexa’s traffic rankings for health Websites. Three selection criteria were then applied to screen these sites: (1) focus on health information for the general public; (2) Web 2.0/social networking capabilities; and (3) volume of Website traffic. Fourteen sites met these three criteria and were included in the final sample of social media sites. Ten Web pages for each Website were tested for accessibility, including each site’s homepage and the page where users register to create a profile. The remaining eight Web pages were randomly selected from each site’s homepage. Major findings: out of the 140 Web pages examined, only 3 Web pages fully met the lowest level of WCAG 2.0 accessibility requirements. 98% of the sites do not meet at least one of the WCAG 2.0 accessibility criteria. Conclusions: the vast majority of the most visited health-related social media sites do not meet WCAG 2.0 accessibility requirements. As a result, older adults may experience difficulty utilizing health-related social media Websites.

HOW OLDER ADULTS USE INFORMATION TECHNOLOGY TO REDUCE CAREGIVER BURDEN

Ethical Technologies in the Homes of Seniors (ETHOS) was a three year study funded by the National Science Foundation to explore the privacy concerns of independently living older adults regarding home-based ubiquitous technologies. Data was collected in five phases during the study: focus groups, surveys, user trials, an in situ study, and another survey. During the in situ study, technology prototypes were installed in the homes of six study participants for six weeks. Four participants had paired technologies installed in the homes of their informal caregivers. Some participants were given a prototype that allowed them to control the sharing of their personal data with their chosen informal caregiver. A particular area of interest was the effect of the technology on the relationship between older adults and their caregivers. Several themes emerged from the quantitative and qualitative data about the technologies’ impact on participant/caregiver relationships: 1) communication patterns were maintained or improved; 2) perceived interpersonal closeness was maintained or improved; 3) although there are privacy implications, technology can increase awareness of daily activities and reduce caregiver burden; 4) older adults use technology to reduce their perception of caregiver burden. This last point suggests a previously unconsidered nuance to the use of in home technologies to reduce caregiver burden.

CO-DESIGNING AN INTEGRATED E-TUTORIAL TOOL TO IMPROVE OLDER ADULTS’ E-HEALTH LITERACY
B. Xie, T. Yeh, G. Walsh, I. Watkins, M. Huang, College of Information Studies, University of Maryland, College Park, Maryland

Older adults’ e-health literacy, or the ability to access and use reliable health information through electronic sources, is generally low. Improving older adults’ e-health literacy requires innovative instructional approaches and tools. Integrated e-tutorial displays instructions as an overlay on the actual Website. Evidence in the literature suggests integrated e-tutorial is more effective than paper- or video-based tutorial among younger people. Yet, relatively little is known about the effectiveness of integrated e-tutorial on the older population. This exploratory study began to explore the applicability of integrated e-tutorial to the older population, focusing on the content area of e-health literacy. A specific integrated e-tutorial, the Online Tutorial Overlay Presenter (OnTOP), was used to add an overlay to the NIHSeniorHealth.gov Website. Features of the overlay were then examined thoroughly in six 2-hour-long participatory design sessions with ten older adults during November 2010-March 2011. A range of participatory design techniques were used to elicit older adult participants’ preferences for design features of the OnTOP. These techniques included drawing on the board, participant voice recording and integration, peer instruction, layered elaboration and augmentation on paper prototyping. These participatory design techniques helped reveal common preferences among the participants. These preferences included: adding auditory instructions; and using images of everyday objects to replace unfamiliar abstract computer symbols (e.g., using the dollar bill image to replace the back symbol “<—” on a Web browser) to facilitate navigation. These findings helped improve design features of the OnTOP, which in turn may enhance older adults’ experience with health information Websites.

SESSION 95 (PAPER)
WORK AND RETIREMENT IN LATER LIFE
IT’S YOUR AGE, BABY, OR IS IT? A LOOK AT AGE DISCRIMINATION IN THE GREAT RECESSION
S.E. Rix, AARP, Washington, District of Columbia

Good data on the incidence of age discrimination are unavailable—employers are hardly likely to admit to engaging in discriminatory behavior, and charges filed with the EEOC are not themselves proof of age discrimination. Yet older workers say that they see discrimination all...
PERCEPTIONS OF INTENTIONAL AND UNINTENTIONAL AGE DISCRIMINATION

J. James1, S. McKechnie1, J. Swanberg2, E. Besen3, 1. Boston College, Chestnut Hill, Massachusetts; 2. University of Kentucky, Lexington, Kentucky; 3. Emmanuel College, Boston, Massachusetts

As older workers of today are less likely to exit the workforce in predictable ways, there is a need to understand their needs for learning, development, and promotion and act accordingly. The understanding of intentional and unintentional discrimination may be useful in examining the impact of discrimination on employee engagement, productivity, and other organizational outcomes. The purpose of this paper is to examine the relationship between employee perceptions of unfair treatment of older workers and employee engagement among workers of all ages in a retail workforce. In a sample of over 6,000 workers, ages 18-94, from a retail workforce in 352 stores across 9 regions of the U.S., we examine perceptions that older workers are less likely to be promoted using multi-level modeling. We also examine whether older workers were seen as fit for promotion and whether discrimination is: intentional (fit, but less likely to be promoted) or unintentional (unfit, and less likely to be promoted). Results indicate that perceived discrimination is related to lower levels of employee engagement among workers of all ages. Findings also suggest that there is a more negative relationship between intentional vs. unintentional discrimination, especially for older workers. The issue of age discrimination is a critical issue for employers and employees as older workers may not exit the workforce in predictable ways.

PRERETIREMENT WORK DISENGAGEMENT: EXAMINING THE ROLE OF PAST AND ANTICIPATED WORK CAREER EXPERIENCES

M. Danneman1, K. Henkens1,2, M. Kalmijn1, 1. Netherlands Interdisciplinary Demographic Institute (NIDI), The Hague, Netherlands; 2. Tilburg University, Tilburg, Netherlands

In both retirement and career literature it has been suggested that employees disengage from their work when approaching retirement. From a life course perspective, not only the anticipated work future, but also past work career experiences can be expected to be of importance for understanding variation in disengagement among older workers. However, empirical insights on relationships between career experiences and preretirement work disengagement are limited. This study aims at filling this gap. Given the aging workforce, achieving a better understanding of the preretirement process is highly relevant. Panel data containing life history information collected in 2001 (N=1634) and 2007 (N=652) among Dutch older workers, were analyzed to reach this aim. At both points in time respondents were asked several questions about their attitudes and perceptions regarding work investments and motivation. This offers the unique opportunity to construct a broad preretirement work disengagement measure and to study changes in disengagement over time. First, the results of both cross-sectional analyses and change-score analyses suggest that employees disengage more from their work when getting closer to retirement. Second, the results show that both mid-career voluntary job mobility (promotion and employer change) and anticipated future opportunities for mobility relate to a lower level of late-career work disengagement. In line with these cross-sectional results, the change-score analyses show that late-career mobility slows down the disengagement process. In general, these results suggest that mobility prevents older workers from disengaging from their job.

READINESS TO WORK PAST OFFICIAL RETIREMENT AGE: THE IMPACT OF LATE ADULT CAREER MOBILITY

H. Van Solingen1, K. Henkens1,2, 1. Social Demography, NIDI, The Hague, Netherlands; 2. Tilburg University, Tilburg, Netherlands

As in the US, more and more older adults in the Netherlands take up bridge employment after early retirement from their career jobs. This paper examines whether this type of late adult career mobility affects older adult’s work-retirement attitudes. Using data from a panel study on retirement behaviour in the Netherlands (N=1,611 older workers aged 50+ at baseline in 2001), conditional changes models are estimated to examine the effect of different types of career mobility on older adult’s readiness to work past official retirement age (65 year). We compare work-retirement attitudes of a) older adults who did not change status (i.e. working in the same career job in 2001 & 2007), with b) individuals that took up bridge employment (either as employee or in self-employment) and c) individuals that retired early but did not return to labor. The results indicate that older adults who took up bridge employment significantly more often changed their work-retirement attitudes in favour of working past the official retirement age. All in all this suggests that late career mobility may extend the older adults work life, even beyond official retirement ages.

A “THIRD AGE” OF THE LIFE COURSE? GENDERED TIME WORKING AND VOLUNTEERING, AGES 50 TO 75

P. Moen1, S. Flood1, V. Louis1, 1. University of Minnesota, Minneapolis, Minnesota; 2. Texas A&M University - Kingsville, Kingsville, Texas

The traditional retirement status passage in the U.S. is eroding and the new demography of aging is marked by postponement of the debilitating associated with old age, leading to what is increasingly called a “third age” marked by ongoing but reduced labor market and/or civic engagement. We draw on life-course concepts and data from the American Time Use Survey (2003-2009) to move beyond conventional models of retirement or labor force exit to examine both the odds of and time spent in paid and unpaid (volunteer) work for 5-year subgroups of American men and women ages 50-75. Four life course processes – social-locational context, biographical pacing, linked lives, and historical timing – are theorized to predict the likelihood and amount of time in public engagement. Full-time employment declines steadily over this age period; but, as predicted by third-age discourse, many continue public engagement through and even beyond their 60s by working part time, being self-employed, or volunteering. Women in the third-age years are less apt to be employed but more apt to volunteer than men, with volunteering and employment inversely related. Analysis of a subsample
SESSION 100 (SYMPOSIUM)

EAT? DRINK? BE MERRY?: LIFESTYLE FACTORS AND HEALTH OUTCOMES
Chair: L.C. Barry, Internal Medicine, Yale University School of Medicine, New Haven, Connecticut
Co-Chair: D.K. Miller, Indiana University, Indianapolis, Indiana
Discussant: M. Pahor, University of Florida Institute on Aging, Gainesville, Florida

Determining risk factors for health outcomes that may be amenable to preventive intervention, such as lifestyle factors, is important for optimizing physical and mental functioning in older age. Longitudinal epidemiologic studies are uniquely poised to evaluate the association between lifestyle factors, such as smoking and drinking, diet, and sleep, on important health outcomes in older persons. The Chicago Health and Aging Project (CHAP) enrolled 9,318 persons age 65 and older (1993 to 2005) from a biracial Chicago neighborhood, with follow-up interviews occurring every 3 years for up to 12 years. Begun in 1986, the Study of Osteoporotic Fractures (SOF) is a prospective cohort study following 9,700 initially healthy Caucasian women age 65 years or older, with clinical visits every 2 years. The Mini-Finland Health Examination Survey enrolled a nationally representative sample of 8,000 Finnish persons aged 30 or over (from 1978-1980), with 22-year follow-up among 1,278 of the participants. This symposium will describe the association between Mediterranean diet and depressive symptoms in the Chicago Health and Aging Project (Dr. Skarupski). Findings from the Study of Osteoporotic Fractures will include the relationship between sleep and functional decline (Dr. Spira) and the relationship between alcohol consumption and cognitive impairment (Ms. Hoang). Finally, results from the Mini-Finland Health Examination Survey (Dr. Stenhjem) will highlight lifestyle factors, including smoking and sedentaryness and their association with muscle strength decline. The discussion will focus on lifestyle factors associated with health outcomes, particularly physical and mental function, and future directions for research in longitudinal epidemiologic studies.

THE ASSOCIATION OF MEDITERRANEAN DIET WITH DEPRESSIVE SYMPTOMS AMONG OLDER ADULTS OVER TIME
K.A. Skarupski, C.C. Tangney, H. Li, D.A. Evans, M. Morris, Rush University Medical Center, Chicago, Illinois

Adherence to a Mediterranean diet has been linked to various health outcomes. We tested the prospective association between adherence to a Mediterranean-based diet (0-55 points) with depressive symptoms (0-10 points) in participants 65+ years from the Chicago Health and Aging Project (n = 3,502; 59% African American). In Poisson-response GEE models, greater dietary adherence was associated with a reduced number of newly occurring depressive symptoms (estimate = -0.002, SE = 0.001; p-value = 0.04) in up to 12 years of follow-up, after adjusting for age, sex, race, education, income, widowhood, antidepressant use, smoking, alcohol use, medical conditions, and cognitive function. That is, for every 5-point increase in the Mediterranean Diet Score, the annual rate of new symptoms was reduced by 0.064 points—a 14% reduction. Adherence to a diet high in vegetables, fruits, whole grains, fish, and legumes may protect against the development of depressive symptoms in older age.

OBJECTIVELY MEASURED SLEEP AND FUNCTIONAL DECLINE IN OLDER WOMEN

Sleep disturbance is common among older adults, but its impact on disability has not been well studied. We determined the association between poor sleep, measured by actigraphy, and incident instrumental activities of daily living (IADL) impairment in 817 women (mean age = 82 years). At baseline, participants completed actigraphy. IADL data were acquired at baseline and five years later. Women with the shortest total sleep time (lowest quartile) had a greater odds of incident IADL impairment (adjusted odds ratio (AOR) = 1.25, 95% confidence interval (CI) 1.20, 1.30) than those with the lowest total sleep time. Similarly, women in the lowest sleep efficiency quartile (spent the smallest proportion of time in bed asleep) had a greater odds of IADL impairment (AOR = 1.93, 95% CI 1.25, 2.97) than those with the highest sleep efficiency. Shorter and less efficient sleep are risk factors for IADL impairment among older women.

ALCOHOL CONSUMPTION OVER THE LIFE COURSE AND COGNITIVE OUTCOMES IN OLDER WOMEN
T. Hoang1, A.L. Byers1,2, D. Barnes1,2, P.M. Cawthon1,2, K. Yaffe1,2, I. San Francisco Veterans Affairs Medical Center, San Francisco, California, 2. Department of Psychiatry, University of California, San Francisco, San Francisco, California, 3. San Francisco Coordinating Center, California Pacific Medical Center Research Institute, San Francisco, California, 4. Department of Neurology, Department of Epidemiology and Biostatistics, University of California, San Francisco, San Francisco, California

Background: The association between moderate alcohol consumption and cognitive impairment (CI) in late-life is controversial with few studies considering life course approaches or oldest-old populations. Methods: We studied 1318 women, mean age 68.3(SD=2.8), enrolled in a 20-year prospective cohort study. Current alcohol use and use prior to baseline were self-reported at repeated visits, and incident CI determined at year 20. Results: Incident CI was not significantly different between nondrinkers, light, or moderate drinkers at baseline or year 16 (p=0.30, p=0.48). Women who reported drinking more prior to baseline and women who changed from nondrinking to drinking over the follow up period were at increased risk of CI even after adjusting for covariates (OR=1.30, 95% CI 1.02-1.66; OR=1.95, 95% CI 1.13-3.38). Conclusions: In this oldest-old cohort, greater alcohol use prior to baseline and increased use in late-life were associated with increased risk of CI over 20 years.

LIFE-STYLE FACTORS AS DETERMINANTS OF MUSCLE STRENGTH DECLINE OVER TWO DECADES
S. Stenholm1, K. Tiainen2, T. Rantanen1, P. Sainio1, M. Heliovaara1, O. Impivaara1, S. Koskinen1,1. National Institute for Health and Welfare, Turku / Helsinki, Finland, 2. University of Tampere, Tampere, Finland, 3. University of Jyväskylä, Jyväskylä, Finland

This study examines the effects of midlife lifestyle factors and their changes through 22 years of follow-up on handgrip strength change and handgrip strength 22 years later. Data are from 963 men and women aged 30 to 73 years at baseline participating in the population-based Mini-Finland Health Examination Survey (1978–80) and living in the 9 municipalities in which the handgrip strength measurement was taken.
War-time captivity: does resilience moderate its impact on well-being across the life course?

C. Park¹, A. Pless Kaiser², D. King³, L. King³, A. Spiro³, ¹. University of Connecticut, Storrs, Connecticut, ². VA Boston Healthcare System, Boston, Massachusetts

Earlier life trauma has detrimental effects on later life well-being. However, this impact varies, based on contextual and individual factors. In a cohort of Vietnam-era repatriated prisoners of war (RPWs), we examined whether resilience (operationalized as fewer elevations on MMPI scales) assessed at repatriation moderated the impact of captivity severity on well-being assessed nearly 30 years later. More severe captivity conditions were modestly related to poorer well-being in later life. However, resilience at repatriation buffered the impact of captivity severity on later PTSD symptoms, life satisfaction, and mental and physical health-related quality of life. For example, RPWs who experienced more torture but were relatively unaffected at repatriation had higher levels of mental health quality of life than those who experienced less torture but more distress at repatriation. Results suggest that coping effectively with captivity, as evidenced by reduced distress at repatriation, buffered its impact several decades later.

Session 105 (Symposium)

The stress, health, and aging research program: effects of military service on veterans’ life course

Chair: E.H. Davison, Women’s Health Sciences Division, National Center for PTSD, VA Boston and Boston University, Boston, Massachusetts

Discussant: C.M. Aldwin, Oregon State University, Corvallis, Oregon

The stress, health, and Aging Research Program (SHARP) at VA Boston studies the effects of exposure to combat and other stressful and traumatic aspects of military service on mental and physical health in aging veterans from an interdisciplinary, lifespan developmental perspective. These four papers represent current lines of research within the SHARP program. Park discusses the long-term impact of wartime captivity and torture upon repatriated Vietnam prisoners of war, and reveals that resilience may buffer the detrimental impact of captivity severity on later life posttraumatic stress symptoms and other aspects of wellbeing. Brady describes the development and validation of a short form of the Late-Onset Stress Symptomatology (LOSS) Scale, and discusses our evolving conceptualization of LOSS as a normative phenomenon for some aging combat veterans. Stellman presents data from a large survey of nurses deployed to Vietnam; describes relations among demographic factors, deployment-related stressors, and current mental and physical health status; and demonstrates that posttraumatic stress symptoms mediate relationships between warzone stress and other health outcomes in women veterans. Finally, Hilgeman examines the impact of combat exposure on narratives of combat veterans who recently received cancer treatment, and elucidates the unique risk and resilience factors that emerge from their narratives. Together, these papers demonstrate the value of a lifespan developmental perspective on the long-term health effects of military service.

PTSD mediates the impact of warzone stressors on health in women Vietnam veterans

J.M. Stellman¹, A. Pless Kaiser², A. Spiro³, ¹. Health Policy & Management, School of Public Health Columbia University, New York, New York, ². Boston University School of Medicine, Boston, Massachusetts, ³. Boston University School of Public Health, Boston, Massachusetts

We assessed the health and well-being of 983 Vietnam-era nurse veterans who had been deployed to Vietnam, a subset of a larger mailed survey of women members of the Vietnam Women’s Memorial Project, Inc. We examined their general health, mental health and physical function (SF-36), depression (PERI scale) and self-rated general health in relation to self-rated stress levels in Vietnam, current PTSD symptoms and age. PTSD symptoms and age were significant predictors of the health outcomes. Warzone work stress and military stress were not. However, both of the warzone stress scales significantly predicted PTSD and age did not. When PTSD was omitted, age and the warzone stressor scales independently predicted the health outcomes. These findings support PTSD as an important and enduring outcome of war-related stress and a mediator of the relationship between warzone stress and other health outcomes in women veterans.

From combat to cancer: risk and resiliency in veteran cancer survivors

M.M. Hilgeman¹, E. Archambault¹, R.L. Billings², J. Gosian³, M. Karel³, J. Moye², ¹. Tuscaloosa VA Medical Center, Tuscaloosa, Alabama, ². VA Boston Healthcare System, Boston, Massachusetts, ³. Harvard Medical School, Boston, Massachusetts, 4. Northshore Psychological Associates, LLC, Boston, Massachusetts

Almost 70% of patients report symptoms of cancer-related post-traumatic stress disorder during their cancer experience. This study examined the impact of combat exposure on cancer narratives of military veteran survivors who received treatment in the past 3 years. Forty-four male participants (M=66.2 yrs., 92% White/Caucasian, and 43% with previous combat) with diverse cancer diagnoses attended one of three focus groups. Analyses of transcripts revealed evidence of increased resiliency (“It didn’t bother me.”) in the South Pacific for 4 years) and exacerbation of PTSD-like symptoms (“When I was first diagnosed, a lot of Vietnam came back - a little stronger”) in those with combat history. Many discussed cancer-related PTSD symptoms regardless of combat exposure, particularly at diagnosis (“It’s like branded in your brain”). Combat status also revealed some variation in coping styles and thoughts.
about survival/mortality. Implications for mental health treatment and diagnosis in cancer survivorship will be discussed.

SESSION 110 (SYMPOSIUM)

WHEN TIME IS ON OUR SIDE: NEW PERSPECTIVES ON THE ROLE OF PAST AND FUTURE EXPERIENCES IN PSYCHOSOCIAL DEVELOPMENT

Chair: G.J. Westerhof, Psychology, Technology and Health, University Twente, Enschede, Netherlands

Discussant: S.K. Whitbourne, University of Massachusetts, Amherst, Massachusetts

There is increasing interest in the role of time in individual development across the lifespan. During their life, individuals repeatedly look back on their personal past and forward to their personal future. Reflecting on one’s past and anticipating one’s future provides a sense of identity, coherence, and purpose in life. It is thereby related to positive developmental outcomes, such as mental health and well-being. As there are still few studies addressing these issues, this symposium brings together three new approaches on the role of time in psychosocial development. The first paper uses an Eriksorian framework on identity development and studies the correlates of ego integrity as the outcome of a process of reviewing one’s past in later life. The second paper studies the balanced use of past and future in relation to age and positive outcomes of psychosocial development. The third paper presents the narrative foreclosure scale as a measure of stagnation of the life story which intrinsically relates time and identity. As part of the validation of this scale, it is also found to be related to the measures used in the first two papers: ego integrity and balanced time perspective. The symposium ends with a discussion on the promises and pitfalls in the study of time experience across the lifespan as well as possible routes for interventions.

EGO-INTEGRITY IN THE SECOND HALF OF LIFE

G.J. Westerhof1, D.P. McAdams2, E.T. Bohlemeijer1, 1. Psychology, Technology and Health, University Twente, Enschede, Netherlands, 2. Northwestern University, Evanston, Illinois

Relatively few empirical studies exist on Eriksor’s intriguing concept of ego-integrity. The present study examines ego-integrity, using the Northwestern Ego Integrity Scale (NEIS) in a Dutch study (55-95 years; N=163). The NEIS measures (1) ‘integrity’, i.e. drawing meaning from all life experiences and (2) ‘despair’, i.e. having regrets about the course of one’s life. Step-wise multivariate regression analyses show that ‘integrity’ is related to time perspective (reminiscence and hope) and mental health, whereas ‘despair’ is only related to personality characteristics (neuroticism and openness to experience). All relations hold in two age groups (55-74 versus 75-95 years). The study shows that the NEIS is a reliable and valid measure of ego integrity. As there is no evidence of age differences, ego integrity is an important concept across the second half of life. Given the pattern of relations, the promotion of meaning in life is an interesting target for psychosocial interventions.

TIME TO FLOURISH: TEMPORAL PERSPECTIVE AND WELL-BEING ACROSS THE LIFESPAN

J. Webster1, E.T. Bohlemeijer2, G.J. Westerhof1, 1. Langara College, Vancouver, British Columbia, Canada, 2. Psychology, Technology and Health, University Twente, Enschede, Netherlands

Little research is available on a balanced time perspective in older age. Balanced time perspective consists of using both one’s personal past and anticipated future to a relatively high degree. This study investigated the relationship of balanced time perspective with age, mental health, personality, and wisdom using the Balanced Time Perspective Scale (BTPS). Persons high on both past and future subscales of the BTPS are termed ‘time expansive’ (balanced); persons low on past and future ‘time restrictive’; ‘reminiscers’ are high on past but low on future; ‘futurists’ low on past but high on future. 512 Dutch adults (17–92 years) completed the BTPS and questionnaires on mental health, personality, and wisdom. As predicted, persons in the time expansive category scored higher on all three dependent measures. Less older than younger or middle aged adults are in the time expansive category. Implications are discussed within a lifespan perspective.

THE NARRATIVE FORECLOSURE SCALE: THE DEVELOPMENT AND PSYCHOMETRIC PROPERTIES OF A NEW INSTRUMENT MEASURING STAGNATION OF IDENTITY IN LATER LIFE

E.T. Bohlemeijer1, G.J. Westerhof1, G. Kenyon2, W.L. Randall2, 1. Psychology, Technology and Health, University Twente, Enschede, Netherlands, 2. St Thomas University, Fredericton, New Brunswick, Canada

Narrative foreclosure is a new sensitizing concept for studying stagnation of identity development in later life. It is defined as the conviction that no new interpretations of one’s past, nor new commitments and experiences in one’s future are possible that can substantially change one’s life story. The Narrative Foreclosure Scale (NFS) was developed to study this concept empirically. The NFS comprises two subscales: Past and Future. The psychometric properties were studied in two samples of older adults (n=247 and n = 220). Confirmatory factor analyses confirm that the scale consists of two distinct factors. Internal consistencies are sufficient to good. The validity is further confirmed by the relationship with demographics and other psychological constructs, such as personality, hope, reminiscence, ego-integrity, balanced time perspective, wisdom, depression, and positive mental health. It is discussed that diminishing narrative foreclosure may be an important process factor in life-review and narrative therapy with older adults.

SESSION 115 (PAPER)

AGING MUSCLE AND RELATED THERAPIES

LEUKOCYTE TELOMERE LENGTH IS ASSOCIATED WITH AGE-RELATED CHRONIC DISEASE BURDEN IN OLDER ADULTS

Background: Most studies of leucocyte telomere length (LTL) focus on diagnosed disease in one system. A more encompassing depiction of health is disease burden, defined here as the sum of markers of structure or function in different organ systems. We hypothesized shorter LTL is associated with greater age-related disease burden and less strongly with disease in individual systems or diagnosed conditions (cardiovascular disease, stroke, pulmonary disease, diabetes, kidney disease, arthritis, or depression). Methods: Cross-sectional study. LTL was measured by Southern blots of terminal restriction fragment length. Age-related disease included internal and common carotid intima-media thickness, lung vital capacity, white matter grade, serum cystatin-C, and serum fasting glucose; each graded 0 (best tertile), 1 (middle tertile), or 2 (worst tertile); and summed (0 to 10) to estimate disease burden. Of 419 participants randomly selected for LTL measurement, 236 also had disease burden assessed (mean (SD) age 74.2 (4.9) years, 42.4% male, 86.4% white, 13.1% black). Results: Mean (SD) LTL was 6312 (SE) = -87(37) bp, P=0.02). In adjusted models a SD higher disease score (β=107(46) bp, P=0.01), age (β=107(44), P=0.02), or carotid thickness (β=87(37) bp, P=0.02) was associated with shorter LTL, but diagnosed conditions or number of conditions were not associated with LTL. Disease score attenuated the effect of age on LTL by 35%. Conclusions: LTL was strongly associated with a characterization of disease burden across multiple physi-
SKELETAL MUSCLE C-JUN N-TERMINAL KINASE (JNK) IS RELATED TO SELECTED CYTOKINES IN OLDER ADULTS WITH TYPE 2 DIABETES (T2D): BASELINE CORRELATIONS OF THE GREAT2DO STUDY

Q. Guo, Y. Wang, Y. Mavros, D. Simar, A. K. Anderberg, M. Kay, N. A. Singh, M. A. Fiatarone Singh. 1. The University of Sydney, Sydney, New South Wales, Australia, 2. University of New South Wales, Sydney, New South Wales, Australia, 3. Tufts University, Boston, Massachusetts

Background There is evidence that c-Jun N-terminal kinase (JNK) is related to impaired insulin resistance. We hypothesized higher post-exercise skeletal muscle JNK would be related to lower adipose adiponectin and higher muscle/adipose TNFα, IL-6 and IGF-1 in older adults with T2D. Methods The Graded Resistance Exercise And Type 2 Diabetes in Older Adults (GREAT2DO) study was a randomized double-blind, sham-exercise controlled trial which assessed efficacy of power training in T2D. All participants performed a single bout of acute resistive exercise and biopsies were performed immediately afterwards at baseline assessment. Skeletal muscle and adipose tissue were obtained in the same biopsy. Muscle total and phospho-JNK were measured via Western Blots. All cytokines were measured via cytometric bead array. Results Results were available for 35 participants (67.2±5.8 years, 46% female). Higher muscle total JNK was related to higher muscle IGF-1 (r=0.641, p<0.001) and tended to be related to lower adipose HMW/adiponectin ratio (r=−0.465, p=0.060) and . Higher muscle phospho/total JNK ratio was related to higher muscle IL-6 (r=0.444, p<0.001) and IGF-1 (r=0.548, p=0.004). No significant correlations were found between JNK and TNFα or adipose IL-6 and muscle IGF-1. Conclusion This was the first study to analyze potential associations between skeletal muscle JNK and selected cytokines in T2D after acute exercise. The relationships between skeletal muscle JNK, IGF-1 and TNFα suggest that increased muscular JNK, IL-6 and IGF-1 might be a response to acute resistive exercise. Further studies are needed to confirm the consistency and clinical relevance of JNK associations we observed with inflammatory (IL-6) and anti-inflammatory (adiponectin) and their relationship to insulin signaling and glucose homeostasis.

COMPUTER-CONTROLLED LEG PRESS FORCES AND MUSCLE ACTIVATIONS: IMPLICATIONS FOR TRAINING OLDER ADULTS

B.W. Schulz, M.T. Gordon, S. Hart-Hughes, T. Bulat. 1. VA HSR&D/DRR&D Center of Excellence in Maximizing Rehabilitation Outcomes, James A. Haley Veterans’ Medical Center, Tampa, Florida, 2. Department of Mechanical Engineering, University of Michigan, Ann Arbor, Michigan

Background. Strength declines with age, limiting functional mobility and increasing fall risk in older adults. Resistance training can reverse these declines, but conventional methods are limited to the maximum forces that can be produced in shortening contraction (SC). Lengthening contractions (LC) can produce greater forces with lower perceived exertion and metabolic costs than SC, so training with greater LC loading has the potential to result in greater strength gains with lower relative effort. Methods. Maximal SC and LC force and surface electromyography data were collected for unimpaired younger and older males and females (7/group, total N=28) performing three maximal-effort trials at three speed profiles (corresponding to knee rotation angles of 15, 25, and 35 degrees) on a computer-controlled leg press. Results. Peak forces were 57% greater for younger adults and 20% greater for LC, but no significant differences were found by speed or in electromyography data. The percentage of improvement of LC relative to SC forces (LC potentiation) was not significantly affected by age, but was significantly greater (p<0.001) for faster contraction speeds when the entire force-position or force-time curve was analyzed, but not for the peak value alone. Trends of greater LC potentiation in females were present, primarily from the reduced LC potentiation of the younger males (younger males=13%, younger females=24%, older males=27%, older females=27%). Conclusions. Leg press strength training of healthy older adults that incorporates LC overloading is safe and may result in greater strength gains with comparatively less effort and perceived exertion than conventional training modalities.

ELECTRICAL STIMULATION: A CLINICALLY RELEVANT METHOD TO ENHANCE AGED SKELETAL MUSCLE HEALING AFTER CONTUSION INJURY

Background: Within the aged population, muscle tissue healing potential declines and is characterized by the deposition of non-contractile, fibrotic tissue and decreasing amounts of functional muscle. This study investigated the ability of neuromuscular electrical stimulation (ES-stim) to enhance aged skeletal muscle regeneration and force recovery after a severe injury. Methods: Mice were divided into 6 groups: Baseline controls (B, n=5), 3-Days injury (3D I, n=4), 3-Days Injury + ES-stim (3D I + ES, n=3), 9-Days Injury (9D I, n=9), 9-Days Injury + ES-stim (9D I + ES, n=8) and ES-stim only (ES) (n=5). Results: The addition of ES-stim significantly increased the specific peak twitch force of muscles following the 9 day protocol (116.13 ± 14.31 mN/CSA) when compared to the 9D I only group (67.20 ± 11.53 mN/CSA; p<0.03). Accordingly, ES-stim significantly increased the total number of muscle fibers (9D I + ES, 483.78 ± 52.97) and centrally located nuclei (284.48 ± 73.34) when compared to 9D I only muscles (341.19 ± 46.87, p<0.01 and 182.04 ± 42.36, p<0.01; respectively). Finally, skeletal muscle vasculature, as determined by the total number of CD31+ cells /field of view, was increased after 9 days of ES-stim (152.48 ± 29.47) when compared to 9D I only muscles (84.48 ± 5.34, p<0.01). No differences were observed when analyzing collagen I. Conclusions: The application of ES-stim may represent a clinically relevant method to rejuvenate the regenerative potential of aged muscle following a severe injury.

ASSOCIATION OF FREE-LIVING PHYSICAL ACTIVITY AND SEDENTARY BEHAVIOR WITH THE RED CELL DISTRIBUTION WIDTH

K. Patel, A. Koster, P. Caserotti, D. R. Van Domelen, T. B. Harris, National Institute on Aging, Bethesda, Maryland

Background: The red cell distribution width (RDW) quantifies heterogeneity in the size of circulating erythrocytes. Higher RDW values reflect greater variation in cell sizes and are strongly associated with increased mortality in various community-dwelling and patient populations. While studies have examined the acute effects of exercise on erythrocyte properties, the role of free-living physical activity in RDW has not been investigated. Methods: RDW was measured in 3,198 community-dwelling adults aged 50 and older participating in the 2003-2006 National Health and Nutrition Examination Survey. The proportion of time spent sedentary and in moderate to vigorous physical activity (MVPA) over 7 consecutive days were measured with uniaxial accelerometry. Multiple linear regression was used to assess associations with RDW. Results: The median RDW value was 12.7% [IQR=12.3-13.4%]. Compared to the lowest quartile of sedentary time, the following coefficients regressing RDW were adjusted for age, sex, ethnicity, education, hemoglobin concentration, mean cell volume and MVPA: second quartile, $\beta=0.03$ (p=0.585); third quartile, $\beta=0.13$ (p=0.015); and fourth quartile, $\beta=0.34$ (p<0.001). From the same model, the following coefficients compare the highest quartile of time spent in MVPA: second quartile, $\beta=0.03$ (p=0.474); third quartile, $\beta=0.16$.
(p=0.001); and fourth quartile, $\beta=0.25$ (p=0.0031). Further adjustment for multiple morbidities, mobility function, and hospitalization eliminated the effect of MVPA on RDW (p for linear trend across quartiles=0.105); however, the effect of sedentary behavior remained clinically and statistically significant (p<0.001). Conclusion: In this nationally representative sample, greater time spent sedentary was associated with increased RDW independent of physical activity level and other factors.

SESSION 120 (PAPER)

SUCCESSFUL AGING

LIVING LONG AND LIVING WELL: FACTORS ASSOCIATED WITH MAINTENANCE OF PHYSICAL FUNCTION AMONG OLDER WOMEN

J.E. Byles, R. Gibson, Faculty of Health, The University of Newcastle, Newcastle, New South Wales, Australia

Decline in physical function is a common feature of older age. However, decline is not uniform or linear. Among individuals of similar chronological age, some individuals appear to be resistant to decline in function while others appear more vulnerable. This paper presents factors associated with survival and maintenance of physical well-being among a large cohort of 12,432 women in the Australian Longitudinal Study on Women’s Health (aged 70–75 years at baseline), and explores factors that distinguish women who live long and with high levels of physical function. Across five surveys, there has been a marked decline in physical health scores for the cohort, as measured by Short Form (SF-36) health related quality of life sub-scales. However, while average scores declined, a large proportion of the women experienced minimal change in physical health scores over the 12 years. Using latent profile analysis, we identified four main patterns in the scores among those who survived and stayed in the study at Survey 4: consistently higher scores (61% of women); declining scores (11% of women); consistently low scores (25% of women); increasing scores (3% of women.). Among survivors who remained in the study, factors associated with maintaining high SF-36 scores include fewer clinical diagnoses, healthy weight, and a range of social and behavioural factors.

DIFFERENTIAL TRAJECTORIES OF HEALTH AND SUBJECTIVE PRIORITIES IN LIFE-SATISFACTION

M. Holzhausen1, C. Scheidt-Nave2, B. Gaertner1, A. Schneider1, P. Martus1, I. Charité - Universitätsmedizin Berlin, Berlin, Germany, 2. Robert Koch Institute, Berlin, Germany

Life satisfaction is one of the main components of subjective well-being and overall quality of life. It is assumed that differential components, domains or dimensions make up an overall judgment of satisfaction with life. Empirically, older adults display a wide variety of different priorities when asked to define determinants of their subjective well-being. Adaptation and selection processes contribute to the individual configuration of important life domains. In a sample of n=299 men and women aged 65+ years, participants answered a mixed-methods questionnaire, asking about subjective priorities regarding satisfaction with life. In the tool, participants freely name, rate, and weigh those domains that are most important to their overall life satisfaction. Simultaneously, a large array of instruments covering health, functional capacity, psychological and physical well-being, and social contacts was administered at baseline and 12-months follow-up. Depending on individual changes in health and functioning over time, differential shifts in prioritization could be observed. At the same time, overall ratings of life satisfaction were fairly stable, and did not correspond to the negative trajectories of health. The results are interpreted in the context of theoretical assumptions about selective optimization with compensation and adaptation to losses in old age. Implications for patient-centered interventions such as individual case-management in order to maintain quality of life and subjective well-being are discussed.

SUCCESSFUL AGING IN TRANSITION: CONTEMPLATING THE PATH TO LIVING WELL

G. Warner, S.E. Doble, S. Hutchinson, Dalhousie University, Halifax, Nova Scotia, Canada

In order to help seniors in their desire to remain in their own homes and communities, we need to consider not just whether they are capable of doing so but whether they will experience “successful aging.” In this study, we examined the perspectives of 11 older adults (53–89 years of age) who had recently been discharged home following an acute health crisis and subsequent stay on a rehabilitation unit in one of two small rural community hospitals. When participants were interviewed one and three months following discharge, they were asked to define “successful aging” and identify what would help them age successfully. Qualitative analysis involved iterative content analysis. Research codes identified by the research team evolved into themes which were reviewed to confirm their credibility and trustworthiness. Even though participants were confronted with losses and a need for adjustment, the concept of successful aging (i.e., a process of development and growth) was still relevant. Despite diverse abilities, the participants expressed a shared vision of what it means to age successfully. Their definition highlighted the importance of having something to do, having something to get up for and go to, getting out and mingling with others. The ability to participate in personally meaningful activities was a critical element. Health, personal attributes and external resources enabled them to engage in valued activities. Rather than being a condition of successful aging, good health was viewed as a facilitator that influenced the extent to which they experienced autonomy.

“WHAT DO YOU EXPECT OF AN 88 [YEAR-OLD] PERSON?” DISABLED ELDERS PERSPECTIVES ON SUCCESSFUL AGING

Background: Rowe and Kahn’s term “successful aging” is often operationalized by researchers to mean freedom from disability. Yet the perspectives of elders living with late life disability have not been well described. Methods: Using a qualitative grounded theory methodology, we interviewed a diverse sample (N=62, mean 2 ADL impairments) of Cantonese-speaking Chinese American, African American, Spanish-speaking Latino American, and European American elders who participate in On Lok Lifeways, a Program of All-inclusive Care for the Elderly (PACE). Through semi-structured interviews with open-ended questions, we explored the elders’ perceptions of what successful aging and being old means to them. Results: Themes related to aging were losing abilities, becoming dependent, and adapting to and accepting the effects of aging. Most participants felt that late-life changes that occur with aging were normal and inevitable. For these participants, losing independence was viewed as a natural part of aging that one must adapt to as part of a successful aging process. However, other participants, Latino-Americans in particular, held a negative view of losing abilities and, consequently, a negative view of aging. They did not feel they had aged successfully because they were dependent on others and “felt old.” Discussion: Most of these elders with late life disability felt they had aged successfully even while acknowledging feeling old. The concept of successful aging was closely tied to the elder’s acceptance of losing abilities and adapting to loss of independence as a normal part of the aging process, which, in turn, was influenced by ethnicity.

The Gerontological Society of America
ELDER'S STRATEGIES TO RECOVER AND MAINTAIN ATTRIBUTED DIGNITY
C. Jacelon, University of Massachusetts, Amherst, Massachusetts

Dignity is important for the well-being of elders. Many situations, particularly interactions with healthcare professionals threaten elder’s dignity. Vulnerable elders, like those with chronic health problems, are more at risk for alterations in their dignity than their healthier counterparts. However, little is known about how elders respond to threats to their dignity. Using grounded theory methods and audio recorded interviews with nine community dwelling elders who have chronic health problems, the researcher explored 1) Characteristics of situations in which the dignity of elders is threatened; 2) Strategies employed by elders in situations where their dignity is threatened; 3) Variation in strategies employed by elders to maintain or enhance their attributed dignity according to the characteristics of the elder; and 4) Similarities between strategies used by community-dwelling elders with chronic health problems and those used by acutely ill, hospitalized elders. Data were analyzed using the constant comparative method. Findings included identifying three types of strategies used by elders to maintain or restore attributed dignity when it was threatened. These included introspective, interactive, and active strategies. Although all individuals used all three types of strategies, each participant had a dominant style. Community-dwelling elders exhibited greater breadth in their responses to threatened attributed dignity than did their hospitalized counterparts. Understanding of the strategies used by community-dwelling elders with chronic health problems to maintain their attributed dignity will help healthcare providers develop interventions to protect the dignity of elders.

SESSION 125 (SYMPOSIUM)

DYSREGULATION IN COMPONENTS OF FRAILTY IN RESPONSE TO DYNAMIC STRESSORS
Chair: A. Cappola, University of Pennsylvania, Philadelphia, Pennsylvania
Discussant: L.P. Fried, Columbia University, New York, New York

One conceptualization regarding frailty is that it is a medical syndrome presenting with an identifiable phenotype associated with dysregulated energetics, predicts mortality and disability, and, etiologically, results from dysfunction in multiple physiologic systems and, potentially, underlyng biologic mechanisms. In theory, the vulnerability of frailty is a result of loss of complexity and effectiveness of physiologic responses, particularly manifested in the presence of stressors. To test this theory, we have conducted a series of nested substudies within the Women’s Health and Aging Study II, in which women 85-96 years have undergone multiple low level physiologic stressors, each separated by weeks to months from the others. We present data here from three of these substudies: 1. glucose tolerance testing with resting metabolic rate and metabolic biomarker measurements pre and post; and 2. Taste and swallowing testing with nutritional assessment; and 3. ACTH stimulation testing with assessment of fatigue and stress hormone measurements pre and post. We report here on associations of frailty status and specific components of frailty (waking speed, grip strength, weight loss, and fatigue) with objective measurements of the physiologic response to challenges that are safe to administer in this population. These findings support the potential value of low level stress testing to unmask vulnerability inherent in frailty and pathways by which specific frailty components may be affected.

METABOLIC RESPONSE TO ACTH AND FRAILTY AND FATIGUE IN OLDER WOMEN

The metabolic response to ACTH is poorly characterized in old-old adults and may provide insight into the physiologic response to stress. We performed a standard 250 mcg ACTH stimulation test in a home-based sub-study of 51 women aged 85-96 enrolled in the Women’s Health and Aging Study II who were not taking corticosteroids. We examined the cortisol, DHEA, and IL-6 responses at 0, 30, 60, and 120 minutes. No women were found to have adrenal insufficiency. In all women, the cortisol response to ACTH was prolonged, resulting in peak levels at 120 minutes, rather than the expected 30-60 minute timeframe. DHEA and IL-6 responses, along with their associations with frailty and responses to a standardized fatigue questionnaire will be presented. Our data demonstrate a robust cortisol response to ACTH challenge testing, but inadequate negative feedback in older women, resulting in prolonged exposure to cortisol.

TASTE AND SWALLOWING FUNCTION IN THE OLDEST OLD

Alterations in the perception of taste and changes in swallowing occur with aging, which may affect nutritional intake and the eating experience. We examined the ability of 48 women aged 84-95 enrolled in a sub-study of the Women’s Health and Aging II to perceive standardized low and high-concentration solutions of sweet, sour, salty, and bitter taste. We also performed a swallowing evaluation using the 3-ounce water swallow test. The low salt concentration sample was perceived by 51% of women. Identification of sour and bitter tastes were often confused, consistent with population norms. We also found that 70.8% of participants failed at least one of the three swallowing challenge trials. We will summarize the nutritional intake and weight trajectory of participants by taste and swallowing function. Recognized dysfunction in taste and swallowing is highly prevalent in the oldest old, clinically relevant, and may be easily detected via simple bedside testing.

METABOLIC RATE DYNAMICS AND FRAILTY CRITERIA: A WHAS II SUBSTUDY
C. Weiss², R. Varadhan¹, L.P. Fried⁴, A.Z. Moore³, A.R. Cappola¹, 1. Medicine, Johns Hopkins School of Medicine, Baltimore, MD, 2. Michigan State University, Grand Rapids, Michigan, 3. Johns Hopkins Bloomberg School of Public Health, Baltimore, Maryland, 4. Columbia University, New York, New York, 5. University of Pennsylvania School of Medicine, Philadelphia, Pennsylvania

Declines in energy levels and increased fatigue are important signs and symptoms of the geriatric syndrome of frailty. Changes in metabolism may play a critical role in understanding the pathogenesis of frailty. If metabolic rate is lower in frail older adults, compared to non-frail, it is likely downstream and follows muscle loss. Alternatively, it can be higher and indicate upstream cachexia-like wasting in frail older adults. We performed metabolic rate measurements at rest and after 75g of oral glucose and participation in a standardized protocol. Initial analyses of metabolic rate suggested increased heterogeneity in frailty. We now report principal components analysis reveals two qualitative relationships between metabolic rate dynamics and body weight. Each is associated with self-selected walking speed (multiple regression model p-values for each principal component, PC: PC1= .08; PC2= .04) and grip strength
FRAILTY AND HORMONAL REGULATION OF ENERGY METABOLISM

Frailty may be associated with weight loss and sarcopenia, but whether it is associated with abnormalities in mediators of energy metabolism is unknown. We have previously reported frailty-associated dysregulation in glucose and insulin responses after a 75-g glucose challenge in a study of 73 women (85-96 years) without known diabetes enrolled in the Women’s Health and Aging Study II. Here, we examined associations of frailty with free fatty acids, gut- (ghrelin, GLP-1) and adipocyte-derived hormones (leptin, adiponectin) at 0, 30, 60, 120, and 180-minutes after the 75-g glucose challenge. Frail versus nonfrail women were significantly more likely to be in the lowest tertile of fasting (p=0.02) and 120-min ghrelin (p=0.03) after age and BMI adjustment, with borderline significance for 180-min ghrelin (p=0.06) and integrated ghrelin area-under-the-curve (p=0.06). No significant differences were found for other hormones. Our findings suggest dysregulation of the orexigenic hormone ghrelin in the frailty syndrome.

RECRUITMENT STRATEGIES: TREATMENT FOR BREAST CANCER: TAILORING RECRUITMENT STRATEGIES

This is not a screen for elder abuse: lessons learned encouraging elderly in the community to participate in abuse research

C.E. Ziminski1, V.F. Rempusheski2. 1. Nursing, University of California, Los Angeles, Los Angeles, California, 2. University of Delaware, Newark, Delaware

Elders are unlikely to self-report elder mistreatment (EM). Barriers to reporting include fear of retribution, isolation, and dependency of the abuser on the elder. These same barriers to self-report of EM also may affect elders’ participation in research about EM. The aim of this study is to examine perceptions about definitions, barriers and reporting of EM in a sample of community-dwelling elders. The survey consists of three vignettes describing physically abusive situations, and was validated by a content expert panel of community elders. The sample (n=76) was recruited from local senior centers (89.5%) and meals on wheels (10.5%). During recruitment returned surveys were incomplete. Several strategies were implemented to increase participation, including information sessions, face sheets, distribution of surveys with certain activities and reading the surveys to participants. Though recruitment increased, surveys (n=43) still had missing data suggesting EM is a sensitive topic for the community elderly.

LATINOS AGING IN SKID ROW: BRIDGING NURSING SCIENCE AND SOCIAL JUSTICE

M. Ruiz, S.A. Escalante, A.O. Ramirez, UCLA, Los Angeles, California

Getting older has become a financial and physical hardship, as more Americans experience poverty and housing insecurity in older age. Although increasing numbers of racial/ethnic minorities deal with homelessness, little is known about older homeless Latinos. Using data from a pilot study conducted in the skid row area of Los Angeles, this presentation will describe pitfalls encountered by faculty and student research assistants in challenging neighborhoods. Strategies for gaining entry, trust, and for developing ongoing relationships with vulnerable communities will be shared. Qualitative data from audiotape interviews will serve to highlight recommendations for advancing aging research, advocacy, and health policy development.

RECRUITMENT AND RETENTION FOR AN EMPOWERING INTERVENTION FOR OLDER KOREAN PARTICIPANTS WITH DIABETES

E. Choi, I. School of Nursing, UCLA, Los Angeles, California, 2. Inje University, Busan, Republic of Korea

A successful research intervention requires successful recruit and retention of participants. This is particularly true when the intervention requires multiple sessions and a distant measurement of outcomes. It is even more true when the study involves individuals unique cultural group. The diabetes empowerment education program consisted of consecutive sessions for six weeks. HbA1c level was measured to evaluate the impact of the intervention 12 weeks after the six sessions were completed. All participants were Koreans. The study targeted community dwelling Koreans. This paper will describe unsuccessful and successful strategies for recruitment and retention. Particularly important strategies for Koreans were communication and interpersonal relationships for this group dialogue.

SESSION 130 (SYMPOSIUM)

RECRUITMENT AND RETENTION WITH TOUCHY TOPICS: ADVANCING NURSING SCIENCE WITH DIVERSE POPULATIONS

Chair. M. Ruiz, UCLA, Los Angeles, California
Discussant: E. Lee, UCLA, Los Angeles, California

Researching sensitive topics has become more challenging as nurse researchers strive to recruit and retain participants for research studies. Only limited existing research address complex sensitive topics, and few guide investigators on ways to approach, recruit, and retain participants from culturally diverse or hard to reach communities. In this symposium, presenters from diverse nursing backgrounds discuss strategies specifically focused on aging research. Gleamed from their research experiences, four presenters will describe strategies for enlisting participants in research studies that deal with complex and urgent issues as health crisis, socioeconomic, gender, and culture related challenges. Discussants will highlight the complexities of recruiting and retaining populations of older Koreans managing diabetes, seniors dealing with elder mistreatment, older women who recently completed treatment for breast cancer, and older homeless Latinos surviving in skid row. The symposium concludes with a discussion that ties the themes together, exploring future directions for aging research with diverse and vulnerable populations.

WOMEN ≥70 YEARS WHO RECENTLY COMPLETED TREATMENT FOR BREAST CANCER: TAILORING RECRUITMENT STRATEGIES

H. Pieters, School of Nursing, UCLA, Los Angeles, California

The median age for a new diagnosis of breast cancer is 61 years, but older women who have experienced the disease are sorely understudied. This presentation will describe the unexpected challenges with recruitment and retention of older women who completed treatment for early stage breast cancer within the past 3-15 months. Lessons learned in the field resulted in problem solving of the many unforeseen demands in participant recruitment. The presentation will focus on implications for future research.

SESSION 135 (PAPER)

EVIDENCE BASED EFFORTS TO IMPROVE LONG TERM CARE SERVICES

STATE LONG-TERM SERVICES AND SUPPORTS SCORECARD

S.C. Reinhard, B. Mollica, E. Kassner, A. House, Public Policy Institute, AARP, Washington, District of Columbia

This session will highlight findings from the State Long-Term Services and Supports (LTSS) Scorecard, the first performance measure...
BATHING IN FIVE NURSING HOMES

to collect information on their direct service workforce.

administration and follow-up with non-respondents, assuring confi-

nations in tailoring survey instructions to reflect state terminology for job

states in collecting the six recommended core direct service workforce

existing several national and state data sources provide some informa-

tion discusses the experiences of seven CMS State Profiling Tool grantee

and community based services, a consistent challenge has been that

states lack basic information about the direct service workforce pro-

viding these services. In 2009, the CMS National Direct Service Work-

force Resource Center collected input from several federal agencies and

states to develop a recommended set of minimum data elements. While

existing several national and state data sources provide some information

about these workers, no state currently collects this information across all

service settings and service recipient populations. This session discusses the experiences of seven CMS State Profiling Tool grantee states in collecting the six recommended core direct service workforce data elements, through surveys of employer agencies and independent providers, and to develop systems to continue tracking this information over time as part of the National Balancing Indictors Project. As part of the project, the Resource Center developed guidelines to assist states in tailoring survey instructions to reflect state terminology for job titles and service settings, pilot testing and survey refinement, survey administration and follow-up with non-respondents, assuring confidentiality, data entry, data analysis and reporting, and estimating costs. Based on the experiences of the initial seven states, a toolkit of information and resources will be developed to assist other states that seek to collect information on their direct service workforce.

ADAPTING EVIDENCE-BASED PROGRAMS TO YOUR

NEEDS: IMPLEMENTATION OF PERSON-CENTERED

BATHING IN FIVE NURSING HOMES

K. Revitt, Research, Foundation for Long Term Care, Latham, New York

Responding to stress experienced with traditional bathing techniques, Bathing Without a Battle (BWOB) was developed and tested for ten plus years. BWOB, a staff education program focused on a non-pharmacological bathing approach, decreased aggression while offering a better bathing experience for bather and person being bathed. The results were overwhelmingly positive, establishing BWOB as an evidence-based program that offers those with dementia a more relaxed, even pleasant, bathing experience without increasing bacterial levels. This presentation discusses how BWOB philosophy -flexible, creative, person-centered- enables agencies to adapt bathing techniques to meet resident and staff needs, addressing items on the new Quality Indicator Survey (QIS) that relate to choice in bathing. We will review five nursing home case study implementations through a project funded by the NYS Department of Health and managed by the Foundation for Long Term Care with BWOB Developer Joanne Rader and research evaluation from Brown University. Examples will demonstrate how this evidence-based approach was customized in grantee sites to sustain BWOB, thus incorporating its tenets into facility culture. The results of Brown University’s analysis on: physical agitation/aggression, comfort level and psychotropic medication use; and job satisfaction, turnover and injuries will be discussed. While evidence-based programs have established protocols, BWOB demonstrates that a program with flexibility as its foundation especially lends itself to successful translation. As one RN Supervisor responsible for training CNAs said, “I cannot think of one time it has not been successful because there is no right or wrong; it’s what the resident is comfortable with.”
SOCIAL WELL-BEING OF RESIDENTS IN EXTRA CARE HOUSING
L.A. Callaghan, Personal Social Services Research Unit, University of Kent, Canterbury, Kent, United Kingdom

One of the potential benefits of extra care housing is its ability to promote social interaction and activity participation through the provision of social activities, communal facilities and accessible, enabling design. One strand of the evaluation examined residents’ social well-being in 15 of the schemes. Findings indicated that, one year after moving in, most residents enjoyed a good social life, valued the social activities and events on offer, and had made new friends, suggesting that extra care housing can provide an environment supportive of older people’s social well-being. Some residents, however, reported feeling socially isolated, and barriers to social participation will be discussed alongside ways the schemes had attempted to overcome such barriers. Extra care villages appeared well suited to more active older people, and may offer social advantages over smaller schemes for some, but may not always suit more dependent residents.

COSTS AND COST-EFFECTIVENESS OF EXTRA CARE HOUSING
T.L. Baumker, Personal Social Services Research Unit, University of Kent, Canterbury, Kent, United Kingdom

The costs analyses followed key economic principles. Costs were measured comprehensively to include as many service components as possible, differences in cost between individuals were identified and explored, and costs were related to outcomes. The presentation will report total costs of extra care housing for the sample at six months, the component costs (capital, housing management, health and social care services, living expenses) and the results of a multivariate analysis of cost variation at the individual and scheme level. Equivalent information collected in studies of admissions to care homes in 1995 and 2005 was used to explore comparative costs and outcomes at six months. To achieve an unbiased comparison, statistically matched samples were extracted from the extra care and 1995 datasets. Using change in physical functioning as the primary outcome measure, the results suggested that there is a high probability that extra care is more cost-effective than residential care.

SESSION 145 (SYMPOSIUM)

NEW DIRECTIONS IN RESEARCH ON ELDER MISTREATMENT
Chair: M. Iris, Research, CJE SeniorLife, Chicago, Illinois
Co-Chair: K. Conrad, University of Illinois at Chicago, Chicago, Illinois
Discussant: S.M. Stahl, National Institute on Aging, Bethesda, Maryland

Elder mistreatment poses serious threats to the health and wellbeing of older adults, including increased mortality, higher risk of nursing home placement, and decreased quality of life. In addition, EM places increased burden on social and health care services. Yet despite several decades of research, we still know little about the efficacy of current interventions for EM, the associated costs, and what constitutes best practice. Furthermore, there is a dearth of research on effective EM prevention and screening strategies or interventions with abusers. A recent report on research issues in elder mistreatment, abuse, and financial fraud called for innovative multidisciplinary approaches in a number of arenas, including conceptual modeling of EM, development of appropriate outcome measures and interventions tailored to specific communities and populations, and prevalence measurement. This symposium provides a forum for presentation of results of innovative research methods and findings, as well as discussion of new directions and strategies for building a multidisciplinary approach to research on EM. Individual papers will discuss the use of a computerized decision support system to improve identification of abuse by type and increase substantiation rates; methods for studying conceptual models of EM among minority populations; strategies to improve EM screening and injury identification in clinical settings; new methods for incidence and prevalence studies; and policy innovations to support EM research and practice. Presenters will include researchers in EM from multiple fields, including medicine, measurement, the social sciences and public policy.

ELDER ABUSE COMPUTERIZED DECISION SUPPORT SYSTEM

Nationally, elder mistreatment and financial exploitation continue to be under-reported, resulting in inaccurate prevalence and incidence statistics, and increased suffering of older adults. Important systemic factors contributing to this problem include lack of valid, standardized assessment procedures, and state-specific definitions and scope of various types of abuse, neglect, and exploitation. Advances in assessment methodology and computer technology offer promising solutions to improve the identification and tracking of elder mistreatment and exploitation, as well as the reduction of some barriers related to the responsive assessment and delivery of services to victims. This presentation describes the development of EACDSS, an Elder Abuse Computerized Decision Support System, that uses standardized measures and short screening forms to assess elder mistreatment and exploitation, as well as expected system outcomes such as increased convenience and efficiency and improved quality of assessments. We will describe the EACDSS development process and conduct a simulated system demonstration.

METHODOLOGICAL CHALLENGES AND PREVALENCE VARIATION FOR ELDER MISTREATMENT IN COMMUNITY SETTINGS

Elder mistreatment is associated with premature morbidity and mortality. National Center on Elder Abuse estimates suggest that 2 million older adults are victimized annually, and many in repeated forms. However, there are still wide variations in the prevalence of elder mistreatment in community populations. There variations are in-part driven by the methodological challenges and differences in the definition, conceptual framework and populations studied. In this symposium, we will systematically review the literature to discuss the recent prevalence studies for elder mistreatment. We will also highlight the methodological differences within these studies that could have lead to the prevalence variations for elder mistreatment in community setting. Moreover, we will emphasize the additional methodological challenges when studying elder mistreatment in different racial/ethnic populations and how our group has leveraged the principles of community-based participatory approach to overcome these challenges. This symposium will synergistically complement other symposiums planned during this session.

MEASURING ELDER ABUSE IN A HIDDEN POPULATION: THE LOS ANGELES LATINO STUDY
K. Wilber, Z.D. Gassoumis, M. Riparetti-Brown, Univ. of So Calif., Los Angeles, California

We used Promotores as interviewers to assess the prevalence of elder abuse and neglect in a low income community of Latino elders, a population that may be hard to reach using traditional research approaches. Elder abuse was conceptualized and measured as conflict (psychological aggression, physical assault, and sexual coercion), caregiver neglect, and financial exploitation. Promotores going door-to-door interviewed 200 Latinos over age 65. The prevalence of all types of
abuse/neglect was 40.4%, which is much higher than other regional and national studies. Only 1.5% of the sample had reported abuse to Adult Protective Services (APS), which is comparable to the 1.8% of elders reported to APS as abuse victims from this community. This study highlights the importance of using culturally competent methods to ensure that older adults who may be unlikely to participate in traditional research studies are given a reasonable opportunity to be included in research on elder abuse.

**METHODOLOGICAL CONSIDERATIONS IN ELDER MISTREATMENT RESEARCH WITH ETHNIC MINORITIES**

L.L. Jervis, Anthropology, University of Oklahoma, Norman, Oklahoma

This presentation examines the identification and measurement of elder mistreatment among ethnic minorities, with examples from a research project on mistreatment among older American Indians. It focuses primarily on three issues: Differing conceptualizations and definitions of elder mistreatment; researcher access to communities and their willingness to participate in studies; and accuracy of participants’ responses —especially important with groups who have valid reasons to be distrustful of research given their histories of subjugation by the dominant society. Moral and practical dilemmas involved in determining abuse in situations where there is intracultural and/or intercultural uncertainty will be highlighted, as will the stakes involved in “getting it right.” From a methodological standpoint, the presentation suggests incorporating qualitative methods other than focus groups, exploring the usefulness of privacy enhancing survey technologies, and employing mixed methods that allow for triangulation of findings.

**SESSION 150 (POSTER)**

**CIVIC ENGAGEMENT, VOLUNTEERISM, AND EDUCATION**

**AN INVARIANT MODEL OF SUPPORT, JOB SATISFACTION, AND AFFECTIVE COMMITMENT AMONG MANAGERS OF OLDER VOLUNTEERS**

S.B. Maitland, B. Gottlieb. 1. Family Relations & Applied Nutrition, University of Guelph, Guelph, Ontario, Canada, 2. Department of Psychology, University of Guelph, Guelph, Ontario, Canada

Based on Cutrona and Russell’s (1990) formulations of optimal matching between types of support and supportive needs, as well as self-verification (Swann & Brown, 1990) and exchange (Blau, 1964) theories, we used SEM to develop a multidimensional measurement model of support specific to managers of volunteers. This unique sample was comprised of 314 managers of older volunteers (94% female) included 9% who were under 30 years of age, 25% were 30-40 years old, 32% were between 41-50, and 33% were 51-65 yrs old with 1% over 65. Dimensions in the model included: support gained from the organization, co-workers, volunteers, and the value-expressive nature of the work. This model of support significantly predicted the managers’ job satisfaction, which mediated the relationship between support and affective commitment, with value-expressive nature of the work being the strongest predictor. The measurement model was found to be invariant across managers with greater and less than 10 years of work experience. Latent mean differences revealed that more experienced managers demonstrated higher levels of volunteer attachment and expressive nature of their work. The findings highlight the importance of sources of workplace support that shore up employees’ valued identities.

**SECOND GENERATION SERVICE-LEARNING IN GERONTOLOGY: WHAT WORKS?**

P. Roodin, experience based education, sony ossweo, Oswego, New York

Service-learning in gerontology has become an important pedagogy, in use in undergraduate and graduate courses. This session will focus on a discussion of “What Works?” Participants will understand current best practices and outcome evaluations from a review of published research. By examining the strategies and instructional design adopted in highly successful or model programs, it will be possible to identify common characteristics or essential features. It will also be possible to examine the strategies that have not proven successful. By reviewing these data, it will also be possible to evaluate the assumptions underlying various models of service-learning. Some models provide service TO older adults, while others provide service WITH older adults as partners e.g., inter-generational service-learning. Exploring the assumptions in this and other models will provide insights into how service experiences are best identified and how service-providers/students can best work with older adults in different settings.

**PERCEPTIONS OF VOLUNTEERISM AND DECISIONS TO VOLUNTEER AMONG KOREAN OLDER ADULTS**

H. Shin, E.L. Csikai, N.S. Park, L. Roff. 1. The University of Alabama, Tuscaloosa, Alabama, 2. The University of South Florida, Tampa, Florida

Volunteerism has long been seen as a positive civic engagement activity for people of all ages in the Western countries. It has only recently taken on a similar importance in Korea and is being promoted by the government as a way that older adults can be productive in later life and meet the needs of a rapidly aging Korean society. Because the majority of research on Korean volunteerism is primarily descriptive, this study was designed to gain an in-depth understanding of the perceptions about and decisions to volunteer among older adults. A phenomenological qualitative study explored the lived experiences of Korean older adults about the phenomenon of volunteerism. Data were collected from thirty older adults, ages 60 and older, including 20 volunteers and 10 non-volunteers, who were recruited from one senior welfare center in Seoul and one community welfare center in Gwangmyeong City. Two volunteer decision-making process models: initial decisions to engage in volunteering and decisions to continue volunteering, emerged from the data. Background contextual factors (individual characteristics, cultural factors, personal life experiences) and a range of facilitators/barriers (including internal motives, attitudes about aging, definitions of volunteering and recruitment and supportive strategies) seemed to be linked to the decision-making processes. The results suggested that strategies and polices to recruit and retain volunteers must be further developed and targeted to each specific group. Policy change and media efforts to combat ageism may be helpful in recruiting new volunteers, while increased emotional support, ongoing training, and recognition programs may help with retention.

**KOREAN OLDER ADULTS’ PERCEPTIONS ABOUT VOLUNTEERING WITH OLDER ADULTS IN HEALTH CARE SETTINGS**

Because the aging population in Korea is growing rapidly, corresponding increases will be seen in the number of healthy older adults and older adults who need assistance with a range of health concerns. Senior volunteerism is being promoted by the Korean government as a promising way to engage older healthy adults in productive aging activities. Through these activities it may be possible to meet needs of older adults in various health care settings in a cost-effective way. However, little is known about older adults’ interest in volunteering with older adults in formal health care settings. In this phenomenological qualitative study, data were collected via semi-structured in-depth interviews with 30 community-dwelling older adults (ages 60-79) in two metropolitan cities in Korea. Four salient themes related to motivations to volunteer with older adults in health care settings emerged from the
data: attitudes about themselves; attitudes toward older care recipients; attitudes about health care settings; and volunteer investment for future care needs. Many participants were not confident in their abilities to be able to assist older adults and expressed reluctance to volunteer with older adults; believing that older care recipients would not want an older person helping them. They also described health care settings as places to avoid if possible. The data revealed that educational efforts should be targeted to dispel cultural misconceptions of aging and negative attitudes about health care settings. In addition, recruitment strategies must be designed to both support decisions to volunteer and recognize volunteers’ contributions to the community.

**CIVIC ENGAGEMENT PROGRAM FOR SENIORS LIVING IN EXTREME POVERTY: AN INTERVENTION AND COMMUNITY SOLUTION**

L.J. Stevens\(^{1,2}\), M. Min\(^{1}\), J. San Diego State University, San Diego, California, 2. Senior Community Centers, San Diego, California

Civic Engagement is a concept considered primarily for older adults in moderate to high socioeconomic status. Little is known how civic engagement programs would benefit vulnerable at-risk older adults. An innovative approach to improving social engagement among low-income older adults has been developed at a large senior wellness center in Southern California. The purpose of this study is to report on preliminary findings of the effects of a Civic Engagement (CE) program on seniors living in extreme poverty. The aim of the CE program is two-fold: addressing and acting on community needs, and increasing participants’ social engagement. The CE program provides weekly meetings, steering committees, community outreach, and political activism. This study assessed physical, mental, and social aspects of 18 CE participants by using qualitative and quantitative measures. They were primarily African American and Caucasian aged 60 or older, 72% living alone, and all living 100% below the poverty line. The level of physical and mental health as measured by SF12v2 were 45.3, and 38.9, substantially below 50. The level of social support from family and friends was very low, showing 21.33 from the Lubben’s Social Support Scale. Themes from qualitative measures indicated that most participants have experienced isolation and used involvement with this program as a way of overcoming this isolation. CE activity, involvement, and learning were imperative aspects enhancing participants’ social engagement. The impact and implication of an innovative solution on low-income older adults’ social engagement and unmet needs of a community will be discussed.

**AN EXAMINATION OF HOSPICE VOLUNTEERS’ MOTIVATION AND POLITICAL ORIENTATION**

K. Kirilova, G.Q. Zhan, Kennesaw State University, Kennesaw, Georgia

The number of elderly citizens in the United States continues to grow. Older population presents new challenges, as increasing numbers require the need of extra formal and informal care. Hospices provide emotional, medical, physical, and spiritual support for this vulnerable population. One of the important aspects of the hospice is the volunteers. They promote compassionate care. Hospice volunteers’ motivation plays a major role in the quality of services provided, and it also affects the training and recruiting procedure of the volunteers. Previous research showed that the hospice volunteers expressed a high level of intrinsic motivation (altruism). Research also shows that political orientation and altruism are correlated. Based on these previous findings, our study examines the relationship between the type of motivation in a group of hospice volunteers in the southeastern part of US and their political orientation. This poster will present systematic analyses of the different types of motivation found in our participants, and the types of political preferences they have. It will also report the results on any relationship between our participants’ motivation and political preferences. After reading the poster, the conference participants will have a better understanding of the type of motivation embedded in hospice volunteers, and will also understand how political preferences can affect the type of motivation in volunteers. The findings may have implications for recruiting and training of hospice volunteers, thus improving the quality of the care.

**IT’S GOING TO HELP ME HELP SOMEONE ELSE: USING CBPR TO DEVELOP A PEER MENTORING PROGRAM FOR AFRICAN AMERICAN CAREGIVERS**

A.D. Robinson, School of Social Work, University at Buffalo, Buffalo, New York

Well-documented health disparities are exacerbated by caregiving among African Americans, who rely more on informal supports and care for their elders at home longer than their white counterparts. Peer-to-peer interventions are an evidenced-based mechanism for addressing health disparities by building on the natural strengths of the community and social networks to reduce health risks related to the burdens associated with caregiving demands. The purpose of this study was to use community based participatory research methods to develop and pilot a peer-to-peer mentoring program for African American caregivers uniquely suited to their needs and strengths. Thirty experienced caregivers were asked in a semi-structured, focus group interview to identify information, resources, and training needs as well as content delivery methods. Discussions were audio-recorded, transcribed, and analyzed for themes. A second focus group was held for member checking the draft curriculum. The resulting 4-session, 8-hour curriculum addressed the mentoring role as well as caregiving-specific knowledge, skills, and resources needed by mentors. Five caregivers participated in pilot testing the training program. Preliminary qualitative analysis suggested gains in participant knowledge and satisfaction with the program. Other emergent themes suggested extant mentoring activity prior to training and the identification of patient advocacy skills as a critical focus of mentoring. This pilot study is a first step toward determining the feasibility and utility of peer mentoring as a mechanism for building community capacity to address caregiving-related burden and resultant health disparities among African American caregivers through information sharing, skill building, and support.

**SESSION 155 (POSTER)**

**COGNITION, DEMENTIA, AND MENTAL HEALTH**

**THE RELATIONSHIP BETWEEN SUBJECTIVE MEMORY AND AFFECT IN BLACK AND WHITE OLDER ADULTS WITH CIND AND DEMENTIA**

N.M. Reed, Gerontology, Georgia State Univ, Atlanta, Georgia

This secondary data analysis of the Health and Retirement Study – Aging, Demographics, and Memory Study (ADAMS) examines the relational differences between black (n=81) and white (n=303) older adults in subjective cognition, depression, and anxiety, according to cognitive impairment with no dementia (CIND) and dementia status. With a cross-sectional design, this study consists of 384 older adults between ages 72-105. Participants completed the Mini-Mental State Examination to measure general cognition. Anxiety and depression were measured by the Neuropsychiatric Inventory (NPI). Subjective memory was measured by the Health and Retirement Study (HRS) Self-report Memory Questionnaire. Independent t-tests and Pearson correlation analysis were employed to determine differences between the black (CIND=43, dementia=38) and white (CIND=187, dementia=116) groups. Results demonstrated that blacks reported slightly worse subjective memory than whites in both cognitive groups. Whites in both groups had significantly better general cognition; anxiety/depression were significantly related in blacks and whites with CIND and moderately related in dementia groups. Subjective mem-
ory and gender were slightly related in blacks in the dementia group and subjective memory and age were related in whites in the dementia group.

**LIFE DOMAINS AFFECTED BY A DIAGNOSIS OF DEMENTIA ACROSS TIME**

S.M. Zoller, B. Carpenter, Psychology, Washington University in St. Louis, St. Louis, Missouri

A diagnosis of dementia can have a significant impact on the lives of patients and caregivers. The disease can transform multiple domains of life, and its reach can expand as the disease progresses. In this study we followed 65 patients and caregivers for one year after the patient’s new dementia diagnosis. We tracked self-reports of which life domains were affected, comparing perceptions within dyads. Patients and caregivers were consistent about which life domains were most altered. 39% of patients and 55% of caregivers reported that living with dementia had affected their relationship with their partner; 17% of patients and 35% of caregivers said dementia had affected their social life; 35% of patients and 42% of caregivers said living with dementia had affected their mental health. Across time, an increasing proportion of caregivers but decreasing proportion of patients reported changes in their lives due to dementia. Within dyads, there was substantial disagreement about whether the disease had an impact on their relationship. Over time that disagreement grew, with more patients (39%) concerned about the relationship impact relative to caregivers (4%). These results suggest that dementia has a broad impact in the first year of living with the disease, affecting multiple domains of life, and affecting them differentially for patients and caregivers. Individual relationship to the disease and related roles and responsibilities may account for the discrepant, but consistent, impact relative to caregivers (4%). These results suggest that dementia has a broad impact in the first year of living with the disease, affecting multiple domains of life, and affecting them differentially for patients and caregivers. Individual relationship to the disease and related roles and responsibilities may account for the discrepant, but consistently substantial impact of dementia. Sharing perceptions of the disease within couples might enhance positive adjustment to a new dementia diagnosis.

**EVALUATING THE ASSOCIATION BETWEEN BEHAVIORS AND NURSING HOME PLACEMENT FOR PERSONS WITH ALZHEIMER’S**

C.N. Porter, M. Lane, D. Davis, C. Cormann, K. Sarsour, K. Kahle-Wrobleski, 1. University of South Carolina, Columbia, South Carolina, 2. Eli Lilly and Company, Indianapolis, Indiana

Multiple factors influence placement of a person with Alzheimer’s disease (AD) into a nursing home. The purpose of this cross-sectional case-control study was to characterize the influence of behavioral disturbances (BD) on nursing home admissions (NHA). This poster describes the basic methodology of the study. The sample was drawn from the South Carolina Alzheimer’s Disease Registry. 41,069 persons were identified with AD as being eligible for the study. Individuals were identified as study cases if they had entered a nursing home within six months of study initiation or as study controls if they remained in the community but were nursing home eligible. Study eligibility was confirmed by an initial caregiver/patient report of a physician diagnosis of AD that was verified through other registry data sources via ICD-9-CM codings of AD (ICD-9-CM Code 331.0) or Pre-Senile Dementia due to AD (ICD-9-CM Code 290.1). In addition to information from the nursing home eligibility assessment, a telephone survey was conducted with caregivers that included the Neuropsychiatric Inventory, Zarit Burden Inventory, and other validated tools. A caregiver was defined as a person spending at least 4 hours per day at least 4 days per week with the person who has AD. The sample included 363 cases and 342 controls matched on age within 5 years, race, gender and closest assessment within 120 days. Interview response rate was 72%. Analysis of the association between behaviors and nursing home placement using this population and design are discussed.

**PERSONHOOD IN DEMENTIA AND THE LONG-TERM CARE ENVIRONMENT: AN EVOLUTIONARY CONCEPT ANALYSIS**

M. Clapsadle, A.H. Burfield, University of North Carolina at Charlotte, Charlotte, North Carolina

The concept of personhood in health care is well recognized as person-centered care becomes the new standard of care. However, this concept is not well developed in the context of persons with dementia; a growing population with a variety of needs. Clarification and further development of the concept of personhood in the context of dementia and long-term care is needed, as well as a more holistic understanding of its use by discipline. Utilizing Rodgers’ evolutionary concept analysis methodology and thematic content analysis, research based literature on personhood as perceived by older adults with dementia have been reviewed and analyzed. The philosophical underpinnings of the concept were also reviewed through a systematic literature search. In addition, an exemplary case of the concept in action is presented with the evolution of personhood throughout the course of dementia.

**THE IMPACT OF THE RESIDENT’S COGNITIVE STATUS ON NURSING HOME STAFF KNOWLEDGE OF PERSONHOOD**

L. Compere, B. Buron, Nursing, University of Arkansas, Fayetteville, Arkansas

Preservation of personhood, the root of individual identity, is essential to the progressive movement of person-centered dementia care. Unfortunately, it is difficult for nursing home staff to truly know a resident’s identity, including likes/dislikes/interests when residents suffer from progressive cognitive and communication deficits often associated with dementia. The purpose of this research is to explore the correlation of two factors (resident cognitive status, and nursing staff characteristics) with nursing staff knowledge, and hence preserved personhood among nursing home (NH) residents living with dementia (RLWD). The research will involve 90 nursing staff and 36 residents from three similar NHs. Nursing staff participants will complete self-administered questionnaires to indicate their occupational role, education, length of employment, and number of past employments in NHs. They will also complete questionnaires to assess knowledge of individual resident participants, consistently under their care, in three areas: resident’s family, past jobs/careers, and past and current dislikes/likes/interests. The Brief Interview for Mental Status (BIMS), a section on the Minimum Data Set 3.0, will be used to categorize residents into varying degrees of cognitive impairment. Bivariate correlation will be used to evaluate the degree of relationship between resident cognitive status and staff characteristics with nursing staff knowledge about RLWD in their care. Findings from this study will add to the existing research in personhood and person-centered care. The results may contribute to excellence in the future of dementia care giving through the identification of ideal caregiver qualities to best preserve future resident personhood among the inevitable progressive dementia disease.

**EXAMINATION OF THE MONTREAL COGNITIVE ASSESSMENT (MOCA): FINDINGS FROM THE ALABAMA VETERANS RURAL HEALTH INITIATIVE**

The Montreal Cognitive Assessment (MoCA; Nasreddine et al., 2005) has emerged as a promising cognitive screening instrument that addresses weaknesses of other tools by increasing sensitivity for mild cognitive deficits. However, question about optimal cut-off scores has
Objective. Religious involvement (RI) has generally been associated with lower risk for depression, though some studies find a positive association. Additionally, most studies have focused only on frequency of church attendance. We investigated association between ten RI behaviors and subsequent depression risk, including examination of moderating effects of gender and prior depression history (PDH). Methods. In a population-based sample of 1,355 non-demented older adults, depression was measured with a modified Diagnostic Interview Schedule, capturing PDH as of baseline, and first-onset of a depressive episode over a subsequent seven-year period. Cox regression was used to model time to depression onset, as a function of total RI and each individual RI behavior engaged in more often than weekly. Covariates included: age, education, social contacts, functional disabilities, marital status. Results. Engagement in five or more (vs. zero) of the RI behaviors was associated with 62% reduction in depression risk, but only for those without PDH (HR=0.38, 95%CI: .18-.79). Frequent church attendance (HR=0.56, 95%CI: .38-.83), personal scripture reading (HR=0.71, 95%CI: .52-.97), meditation (HR=0.76, 95%CI: .55-1.05), and direct experiences of God (HR=0.60, 95%CI:. 38-.94) were each associated with lower risk for depression, regardless of PDH. Giving volunteer service to others was also inversely associated with depression, but only for female subjects (HR=0.39, 95%CI: .22-.71). Conclusions. A number of religious behaviors are associated with reduced risk of subsequent depression among older adults. Results suggest that both public and private religious engagement may be protective, affording the potential for some beneficial effects even among less ambulatory individuals.

MEASURING HOPE IN INDIVIDUALS IMPACTED BY COGNITIVE IMPAIRMENT

Hope has been explored as an important construct related to coping and adaptation at times of great loss or suffering. While hope has been explored across several disease processes, there is less understanding of its meaning among individuals with cognitive impairment and their family caregivers. This exploratory study of a secondary dataset (N=99) aims to examine the psychometric properties of the Herth Hope Index (HHI) among individuals with cognitive impairment (mild cognitive impairment and early dementia), their family caregivers, and healthy controls with no cognitive impairment. The sample was predominantly female (61.0%) and white (86.7%). The HHI had high internal consistency (Cronbach’s alpha = .87) and all items had high corrected item-total correlations. Using principal components analysis, the HHI had a one-dimensional structure that explained 45.31% of the variance. Among a subsample of individuals with cognitive impairment and healthy controls (n=59), hope score was significantly negatively correlated with scoring on the Hamilton Rating Scale for Depression (r = .26, p = .048) and positively correlated with satisfaction with support from family and friends (r = .51, p <.001). Hope scores were not correlated with insight into illness or performance on neurocognitive testing. More work is needed to understand how hope is conceptualized within this population, as it may be an important coping mechanism when faced with a progressive illness such as dementia.

REGIONAL VARIATION IN THE EFFECT OF RACE ON DEPRESSION: RESIDENCE IN EARLY LIFE VS. CURRENT RESIDENCE

J. Brown1, S.M. Lynch1, 1. Sociology and Gerontology, Miami University, Oxford, Ohio, 2. Princeton University, Princeton, New Jersey

Substantial research includes U.S. region as a predictor in models of health-related outcomes. The implicit basis for inclusion of regional predictors is cultural variation across these diverse contexts such as the prominence of fried food in Southern cooking. Other sources of regional disparities, however, are largely ignored. For example, the history of racial prejudice is different across U.S. regions, and this difference in geo-historical context likely heightens stress for racial minorities, especially for African-Americans. Additionally, whether one is socialized into contexts where race is historically more salient or whether one currently resides in such regions may relate to health outcomes differently. We use HRS data from 1998-2008 to longitudinally model regional effects on depressive symptoms in whites and African-Americans using three different measures: (1) current region, (2) birth region, and (3) school-age region. We find birth and school-age region are most important in differentiating health across regions. Implications are discussed.

SPECIAL SERVICE UTILIZATION BY DEPRESSED HOME-BOUND ELDERLY

N. Kusmaul1, C. Podgorski1, Y. Connelli2, 1. University at Buffalo, Buffalo, New York, 2. University of Rochester, Rochester, New York

Frail older adults who do not receive necessary supportive services are at high risk for depression, and symptoms of depression have been linked to higher utilization of health and mental health care. Social isolation, medical co-morbidity and physical impairment are positive predictors of depression but are also barriers to obtaining care. The purpose of this project was to determine whether the quantity and types of social services used by community-dwelling older adult care management clients differed by severity of depression symptoms as measured by the Patient Health Questionnaire (PHQ-9). This study included 162 clients ≥ age 60 who accessed care management services. Care managers (CM) assessed each client’s service needs at intake. The PHQ-9 was administered within two weeks of intake and then again after 30 days. Service utilization between intake and follow up PHQ-9 included the number of interactions between care manager and client, contact type (phone or in-person), and the types of service referrals made by them.
OLDER ADULTS AND PERCEPTIONS OF BURDEN TO OTHERS

Evidence suggests perceived burdensomeness (PB) may be an important mediator of depressive symptoms and suicide ideation among community-dwelling older adults (Jahn, Cukrowicz, Linton, & Prabhu, 2011). However, the literature regarding PB in later life has largely focused on those with advanced medical illness (e.g., Wilson, Curran, & McPherson, 2005), with limited information regarding PB in older adults who are not dealing with a terminal illness. This study investigated PB among a community sample of older adults, using a 10-item burden subscale derived from the Interpersonal Needs Questionnaire (INQ: Joiner et al., 2009). Participants (N = 230, M age = 73.0 years, SD = 6.92, age range: 64–96) completed the INQ, Geriatric Anxiety Scale, Patient Health Questionnaire, Geriatric Suicide Ideation Scale, Beck Hopelessness Scale, RAND 36-Item Health Survey, and Sense of Belonging Inventory. PB had medium-to-large positive correlations with anxiety (r = .40), depression (r = .50), suicide ideation (r = .51), and hopelessness (r = .42) and negative correlations with physical health (r = -.22), and belonging (r = -.54). Simultaneous multiple regression assessed the relative contribution of each predictor variable. The total variance explained by the overall model was 38.2%, F(6, 203) = 22.54, p < .001. Depression was the only significant positive predictor (β = .24, p < .01), whereas belonging was the only significant negative predictor (β = -.31, p < .001). Results provide basic information regarding the correlates of PB among community-dwelling older adults and suggest PB should be assessed clinically.

THE RELATION OF EGO-INTEGRITY TO MENTAL HEALTH IN OLDER ADULTS WITH MODERATE DEPRESSIVE SYMPTOMS

S. Lamers, G. Westerhof, J. Korte, E.T. Bohlmeijer. Psychology, Health & Technology, University of Twente, Enschede, Netherlands

In Erikson’s theory of psychosocial development, the psychosocial issue of the last life-stage is centered on ego-integrity versus ego-despair. This psychosocial issue is based on life-review and the assumption that older adults reflect upon their past. Integrity involves feelings of meaning and acceptance, whereas despair involves feelings of regret about the course of one’s life. This study examines the relation of ego-integrity to mental health in a sample of Dutch older adults with moderate depressive symptoms (40-82 years; N = 174). This study uses the baseline data of an RCT on the effectiveness of life-review therapy as guided self-help. The Northwestern Ego Integrity Scale was used to measure ego-integrity and ego-despair. Both positive mental health, using the Mental Health Continuum-Short Form, and psychopathology, using the Brief Symptom Inventory were measured. Results show that higher integrity and lower despair are related to higher positive mental health, with the strongest relations for integrity. Despair is positively related to psychopathology. Moderator analysis of ego-integrity and age to psychopathology shows that integrity is also negatively related to psychopathology, but only in the youngest age group of 40-55 years. The results remain when controlled for age, gender, educational level and subjective health. In conclusion, both ego-integrity and ego-despair are related to mental health in older adults with moderate depressive symptoms. This suggests that promotion of ego-integrity by increasing feelings of meaning and acceptance in one’s life might be an effective target in interventions to increase older adults’ mental health, such as in life-review therapy.

THE TRAJECTORY ANALYSIS OF DEPRESSION AND LIFE EVENT: USING LATENT CLASS GROWTH MODELS

T. Nakata, Hokusei Gakuen University, Sapporo, Japan

The aim of this study is to examine the differences in depression trajectories and life events as factors among elderly Japanese people. It is said that one of the health problems among later life is depression. To examine the individual trajectories in depression, panel data is needed in the strict sense, though cross-sectional data is sometime applied. Therefore latent class growth models, which can deal with count variables, for estimating developmental trajectories using SAS PROC TRAJ was applied. This study employed the National Survey of the Japanese Elderly, from wave I (1987) to wave IV (1996), which was conducted by Michigan University and Tokyo Metropolitan Institute of Gerontology. The independent variable was a shortened version CES-D scale, which was measured by seven items. Age was used as a dependent variable. Dummy variables of occupational status and marital status, which were used as life events, were time varying covariates. This indicated retirement and loss of spouses. Education and gender are used to identify the factors for time fixed factors. The results of this analysis are as follows; 1) Dividing into three classes was adequate through the goodness of fit tests. 2) While the first class showed stable low depression, the others increased. 3) Gender was significant for the group division, but education was not. 4) Occupational and marital status were not significant in the third significant. These results show that there exists a gender difference in depression and life events always do not have impact on the mental health.

LIFE-REVIEW THERAPY FOR OLDER ADULTS WITH MODERATE DEPRESSIVE SYMPTOMS: A PRAGMATIC RANDOMIZED CONTROLLED TRIAL

Although there is substantial evidence for the efficacy of life-review as an early treatment of depression in later life, the effectiveness in its natural setting has not been studied and most trials included relatively small sample sizes. Therefore, the present study evaluates a life-review therapy intervention in a large, multi-site, pragmatic randomized controlled trial. Compared with care-as-usual (n=102), the life-review therapy intervention (n=100) is effective in reducing depressive symptoms, at post-treatment, and three months follow-up, and for the intervention condition also at nine months follow-up. Moreover, the likelihood for a clinically significant change in depressive symptoms was significantly higher. In addition, small significant effects were found for symptoms of anxiety and positive mental health. To identify groups for whom the intervention is particularly effective, moderator analyses were carried out (on demographics, personality, reminiscence functions, clinically relevant depressive and anxiety symptoms, and past major depressive episodes). These analyses showed only two significant moderators, the personality trait extraversion and the reminiscence function boredom reduction. Qualitative analyses on the clients’ perspective showed that that it is not only the integration of life experiences itself that makes the intervention effective. Social aspects are of equal importance. Furthermore, even participants who did not profit with respect to depressive symptoms experienced relief. To summarize, this study shows the
effectiveness of life-review therapy as an early intervention of depressive symptomatology in ecologically valid circumstances which is applicable to a broad target group.

DEPRESSION AS A RISK FACTOR FOR SURVIVAL AFTER A DEMENTIA DIAGNOSIS

J.Y. Jang1, N.L. Pedersen2, M. Gatz2, J. Psychology, University of Southern California, Los Angeles, California, 2. Karolinska Institutet, Stockholm, Sweden

The objective of the present study was to investigate the association between co-morbid depressive symptoms and the duration of survival in patients with dementia. The sample included 383 individuals from the Study of Dementia in Swedish Twins (HARMONY), who received a diagnosis of dementia following a complete clinical work-up. In order to establish statistical independence, we randomly eliminated one twin from any dementia-concordant pair. Each twin had a study informant who reported the twin’s neuropsychiatric symptoms on the Neuropsychiatric Inventory (NPI). The difference between the age at death and the age of onset provided the duration of survival. Simple t-tests revealed no significant sex and zygosity differences in the number of years the twins lived after the onset of dementia. A multiple linear regression model, including sex and age of onset as covariates, found a significant negative relationship between the NPI Depression score and the duration of survival (p<.05). This finding offers some evidence that co-morbidity of depression in patients with dementia may have adverse effects on survival. Further research may help us to understand the importance of emotional health in progression of dementia and longevity of people who suffer from the disease.

THE COMPLEX RELATIONSHIP BETWEEN SOCIAL SUPPORT AND DEPRESSION: THE SIGNIFICANCE OF PATIENT SATISFACTION AND MEDICATION ADHERENCE

C. Bolkan1, L. Bonner1, D.G. Campbell1, A. Lanto1, L. Rubenstein1,2,6, E. Chaney1, J. Washington State University, Vancouver, Vancouver, Washington, 2. Department of Veterans Affairs, Health Services Research and Development Center of Excellence, VA Puget Sound Health Care System, Seattle, Washington, 3. University of Montana, Missoula, Montana, 4. Department of Veterans Affairs, Health Services Research and Development Center of Excellence, VA Greater Los Angeles Healthcare System, Los Angeles, California, 5. University of California, Los Angeles School of Medicine, Los Angeles, California, 6. RAND Health Program, Santa Monica, California, 7. University of Washington, Seattle, Washington

The relationship between social support and depression has received considerable research attention, however, the factors that mediate this relationship are poorly understood. We examined baseline indicators of social support with depression and antidepressant adherence outcomes 7- and 18-months later in a sample of 761 VA primary care patients with depression (mean age = 60). Although baseline tangible social support was linked to lower depression at 18 months (p = .02), it was not significantly associated with medication adherence. We used logistic regression to examine the relationship between patients’ satisfaction with their VA providers’ involvement of family members in their care and three dichotomous indicators of medication adherence. Higher satisfaction with family involvement at baseline was significantly associated with worse adherence on all indicators at 7- and 18-months. In an attempt to clarify these findings, we found that 50% of the 434 participants who were “somewhat” to “very satisfied” with family member care involvement also reported that providers involved family members “very little” to “not at all” in their care (X2 (12) = 152.6, p < .001). This suggests the possibility that depressed patients’ satisfaction with limited family involvement may contribute to negative treatment adherence. It may also be that more depressed patients are less amenable to reaching out to others, thus experiencing sustained depressive episodes.

Additional research is needed to clarify these findings before causal conclusions can be drawn. Better understanding of the treatment impact of family involvement in care may particularly benefit aging patients who experience social isolation.

DEPRESSION AND MORTALITY AMONG THE OLDEST OLD

Y. Rottenberg, J.M. Jacobs, J. Stessman, Geriatrics and Rehabilitation, Hadassah Hebrew-University Medical Center, Jerusalem, Israel

Purpose: The causal relationship between depression and mortality is complex, and among the oldest old the association between depression and mortality has yet to be validated. Methods: The Jerusalem Longitudinal Study (1990-2010) is an historical prospective study of a representative community-dwelling cohort, born 1920-21. At age 85 comprehensive assessment of physical, functional, and psychosocial domains was performed (n=1124). Depression was defined as ≥2 by the 5 items Geriatric Depression Scale. Mortality data were collected from age 85-90. Proportional hazards models controlled for social, functional and medical confounders, in addition to gender. Results: A total of 354 subjects (31.5%) died throughout 5-year follow-up. Depression prevalence was 30.0% (n=337) at age 85. During the 5-year follow-up, among depressed subjects 38.6% (130/337) died versus 33.1% (174/527) among non-depressed subjects (p=0.0001). Depression was associated with mortality in the social model (HR=2.03, 95%CI:1.57-2.62) after controlling for financial status, marital status and loneliness, and the functional model (HR=1.35, 95%CI:1.05-1.73) which controlled for physical inactivity, frequency of leaving the house, and ADL dependence. However, after controlling for medical variables (diabetes, IHD, hypertension, cancer, smoking, dementia, joint or back pain and poor self-rated health), the association between depression and mortality was not significant (HR=1.28, 95%CI:0.98-1.67). Furthermore, the association was further attenuated in the combined model, which included all the above confounding variables (HR=1.14, 95%CI:0.87-1.49). Conclusions: The association between increased 5-year mortality and depression at age 85 became insignificant after controlling for medical comorbidity, suggesting that the oldest old may be resistant to the negative effects of depression.

HEALTH PREDICTORS OF CES-D-8 DEPRESSION IN THE LONGITUDINAL DATA OF THE HEALTH AND RETIREMENT STUDY

R.F. Kennison1, J. Cox2, J. Psychology, Calif State Univ Los Angeles, Los Angeles, California, 2. Veterans Administration Sepulveda, Los Angeles, California

Diseases, such as diabetes and arthritis, are known to predict depression in older age but their effects on depression in middle adulthood are less clear. To assess this question, longitudinal data of the CES-D-8 depression scale (N = 24,000) from the Health and Retirement Study was analyzed with two-piece spline models from ages 45 to 99. Based on the results from an exploratory multivariate adaptive regression splines (MARS) analysis, the change point was fixed at age 71. Predictors of the intercept and splines included self-reported: back problems, lung disease, arthritis, diabetes, high blood pressure, heart disease, cancer, stroke, gender, and education. Declines in depression score were observed from ages 45 to 71 while increases were observed from ages 71 to 99. With the exception of cancer and high blood pressure, all of the predictors affected the intercept. Predictors of the 45 to 71 age spline were back problems, arthritis, diabetes, gender, heart disease, and education. Predictors of the 71 to 99 age spline were back problems, lung disease, arthritis, diabetes, high blood pressure, stroke, gender, and education. Heart disease and cancer did not reliably predict depression. While many of the same diseases were found to predict both age splines, vascular diseases only appeared as predictors of the older age spline.
HEAVY FOCUS ON INDEPENDENCE MODERATES THE RELATION BETWEEN DEPRESSIVE SYMPTOMS AND SUICIDAL BEHAVIOR IN YOUNGER AND OLDER ADULTS

P. Bamonti, P. Prentice, E.C. Price, J.J. Gregg, T. Fallen, A. Fiske, West Virginia University, Morgantown, West Virginia

Identification of older adults at risk for suicide is crucial for prevention efforts. Depression is a known predictor of late life suicide; however only a minority of depressed older adults engage in suicidal behavior, suggesting other factors are contributing to risk. Investigating the factors that moderate the depression-suicide relation may offer information for intervention and prevention efforts. Previous research has focused on the influence autonomy has on well-being in late life. Autonomy is a cognitive style characterized by a heavy emphasis on personal independence and need for control. More autonomy has been associated with more severe depression and suicidal behavior. However, it remains unknown whether autonomy modifies the relation between depression and suicide. The purpose of the current study was to examine the association between autonomy and suicidal behavior in younger and older adults. In particular, we hypothesized that autonomy would moderate the relation between depression and suicidal behavior. 79 community dwelling adults (60 years and older) completed paper and pencil questionnaires including the Personality Style Inventory-II, the Center for Epidemiological Studies Scale - Revised, and the Suicide Behaviors Questionnaire-Revised. 474 adults (age 18-31) completed the same questionnaires via web-based survey. The relation between depression and suicidal behavior differed as a function of autonomy scores in both younger (β = .151, SE = .001, p < .001) and older adults (β = .258, SE = .001, p = .022), whereby autonomy amplified the relation between depression and suicidal behavior. Future research is needed to investigate how autonomy functions to enhance the association between depression and suicidality.

EFFECT OF SOCIAL CAPITAL AND PERSONAL AUTONOMY ON THE INCIDENCE OF DEPRESSIVE SYMPTOMS IN THE ELDERLY

A. Salinas, B. Manrique-Espinosa, M. Tellez-Rojo Solis, I. Bojorquez-Chapela, National Institute of Public Health, Cuernavaca, Morelos, Mexico

Background: Depressive symptoms (DS) in the elderly are associated with an increased risk of developing other health problems. Autonomy and social capital could be protective factors against the occurrence of DS in this population. The aim of this study was to estimate the effect of social capital and personal autonomy on the DS in older people (OP) living in poverty. Methods: Longitudinal study of elderly participants in the impact evaluation study of a non-contributory pension program -70 y más- in México. For this study we selected the group of OP without significant depressive symptoms at baseline. Personal autonomy, social capital indicators and covariates were measured at baseline. Using the Geriatric Depression Scale the incidence of DS was assessed in the follow-up measurement. The effect of social capital and autonomy on the occurrence of DS was estimated by using a multilevel logistic regression model. Results: Of the various indicators of personal autonomy, not being functionally dependent, and being able to read/write were associated with lower risk of DS. A higher level of social capital at baseline was associated with lower incidence of DS in women (OR=0.73, p<0.01), while for men there was no significant association (OR=1.04, p=0.69). Conclusion: Personal autonomy and social capital proved to be protective factors against the onset of depressive symptoms in OP. It is necessary to explore more precisely which are the most important aspects of this relationship.

SESSION 165 (POSTER)

DISABILITY, REHABILITATION, AND ASSISTIVE TECHNOLOGIES

EVALUATION OF SELF-EFFICACY AND THE USE OF COMPENSATORY STRATEGIES DURING DAILY TASKS AMONG PRE-CLINICALLY DISABLED OLDER ADULTS

The objective of the current study was to expand upon knowledge of characteristic changes which accompany transitions in functional ability by assessing associations among self-efficacy and the use of compensatory strategies during common daily tasks in pre-clinically disabled older adults. One hundred thirty-five older adults (68.5 ± 6.98) were categorized as pre-clinically disabled after reporting having no difficulty, but modifying the method or frequency with which they perform daily tasks. Participants then reported to a laboratory setting where task modifications and self-efficacy were objectively evaluated. Univariate analyses revealed significant associations among self-efficacy and task modification (Spearman correlations: 0.20-0.48, p < 0.05). Multivariate logistic regression adjusting for age, obesity and gender indicated that low self-efficacy [Odds Ratio (OR): 1.7, 95% Confidence Interval (CI): 1.2-2.3] was positively associated with a high number of task modifications (≥ 6 modifications). Our results offer insight into the multidimensional changes associated with early signs of disability. Specifically, the results suggest self-efficacy is associated with the degree of modifications older adults use to compensate for functional impairments.

THE ROLE OF GENDER IN LATE-LIFE CHANGES OF OBJECTIVE AND SUBJECTIVE MARKERS OF PHYSICAL FUNCTIONING

Extant research reports that women often experience and suffer from disability more than men. This study aims at examining gender differences in late-life changes across several subjective and objective markers of functionality and explores the contributing roles of demographic characteristics as well as indicators of physical health, cognitive, and social functioning. Applying growth curve models to data pooled across four Swedish studies of more than 1,000 participants aged 70-100+ over up to nine years, we modeled gender differences in trajectories of objective (grip strength) and subjective markers of functioning (self-reported Activities of Daily Living, ADL). Our results revealed that women showed considerably lower grip strength and also reported more ADL limitations than men. Although men tended to experience stronger declines in grip strength longitudinally, the vast gender differences were maintained over time. Physical health and cognitive resources were both associated with shallower change trajectories and were found to reduce, but not completely eliminate the earlier seen disadvantages for women. We conclude that the particular physical health challenges reported for women across adulthood continue to be evident in late-life trajectories of objective and subjective markers of functionality. Our discussion considers the contributing roles of biological factors and socially constructed gender roles.
THE PARTICIPATION RESTRICTION PATHWAY: A NEW MODEL OF DISABILITY
K. Latham, University of Florida, Gainesville, Florida

Drawing from previous models of disability including the International Classification of Functioning, Disability, and Health (ICF) and the Disablement Process as well as empirical studies, this research presents a new model of disability called the Participation Restriction Pathway (PRP). There has been resistance among U.S. aging researchers in adopting the ICF model even though the concepts and language utilized represents a shift away from negative health outcomes toward positive outcomes. The ICF language emphasizes levels of functioning and presents the opportunity to have an internationally agreed upon taxonomy for functional health. However, there are major critiques of the ICF model that have prevented leading U.S. disability scholars in favoring the adoption of the ICF. For example, U.S. researchers have noted that the ICF model lacks a specified pathway and is not dynamic. Another critique of the ICF stems from the terminology itself, critics have commented on the insufficient clarity among the domains of activity and participation. The PRP addresses the major criticisms of the ICF model and furthers our understanding of contextual factors (i.e., environmental and personal factors) on functional health outcomes.

TRAJECTORIES OF OBJECTIVE AND SUBJECTIVE MARKERS OF PHYSICAL FUNCTIONING PREDICT INSTITUTIONALIZATION AND MORTALITY

Objective and subjective markers of physical functioning are known predictors of key successful aging outcomes, including institutionalization and mortality. Although research also documents considerable overlap between objective and subjective functional assessments, little is known about the unique and independent predictive effects of either marker. It is also an open question whether changes in physical functioning contribute additional effects over and above functional status. To examine those questions, we utilize data pooled across four Swedish studies of more than 1,000 participants aged 70-100+ and target level and two-year changes in objective functional health indicators (grip strength; lung function) and subjective functional health indicators (Personal Activities of Daily Living, ADL; Instrumental Activities of Daily Living, IADL). Covarying for the effects of demographic characteristics, results from Cox proportional hazard regression models revealed that level and short-term changes in both objective and subjective markers of functional health independently predicted hazards of institutionalization and mortality. Specifically, better grip strength and fewer IADL limitations as well as shallower decline in grip strength and fewer increases in IADL limitations were each associated with a lower risk of becoming institutionalized or deceased. We conclude that both objective and subjective markers of functional health differentially and independently predict key outcomes late in life and recommend that both constitute key information to be included as assessments of functional ability in research and practice alike.

EXAMINING THREE DESIGNS OF A ROBOTIC NIGHTSTAND FOR OLDER ADULTS AND REHABILITATION PATIENTS
M. Mossey1, J.O. Brooks2, T. Smolenetzov3, S. Healy2, K.E. Green1, J. Walker1, J. Manganelli1, J. Clemson University, Clemson, South Carolina, 2. Greenville Hospital System, Greenville, South Carolina

This study aims to explore the desired and needed characteristics of items and functions as they pertain to an automated nightstand. Creating a user-centered “smart” nightstand could potentially aid aging in place. With the help of architects and engineers, three cardboard nightstand prototypes were built. Older adults (n=39) and current rehabilitation hospital patients (n=10) were interviewed to examine their preferred features regarding the three prototypes. Participants were asked to choose their preferred feature from the three nightstands (forced-choice) as well as rate how much they like each feature on a scale from 1 to 5. Some of the most popular features across both older adults and patients include having a large magazine rack (97% of older adults, 90% of patients) and a large extendable tray from the nightstand (92% of older adults, 86% of patients). Older adults and patients also showed similarities in features they disliked, such as having a lip only around part of the nightstand, as opposed to all around (5% of older adults, 0% of patients). There were also differences between preferences; older adults preferred the larger sized nightstand (74%) whereas only 10% of patients preferred the larger size. Their needs and preferences are important to understand for potentially creating a nightstand that can aid future generations to age in place.

INSUFFICIENT HELP FOR ADLS DISABILITIES AND MEDICARE EXPENDITURES
D. Yu1, H. Xu2, P. Stallard1, L.P. Sands1, B. Craig1, K. Covinsky1, J. Thomas1, 1. Purdue University, West Lafayette, Indiana, 2. Indiana University School of Medicine, Indianapolis, Indiana, 3. Duke University, Durham, North Carolina, 4. Nursing, Purdue University, West Lafayette, Indiana, 5. University of California, San Francisco, San Francisco, California

BACKGROUND. Insufficient help for ADL disabilities is associated with self-reports of health consequences. Prior research has not determined whether these self reports are associated with increased health care expenditures. METHODS. Medicare claims were linked to survey data from the community component of the 2004 National Long-term Care Survey (NLTCSC) for 2,313 respondents who had at least one ADL difficulty and were enrolled in fee for service during 2004-2005. Average half-year per capita expenditures were calculated and compared for those who reported that they had insufficient versus sufficient help for their ADL disabilities. RESULTS. Seventy four percent were aged 75 or older, 68% were female, 89% were white, 39% lived alone, 36% were married, 75% had arthritis, 27% had diabetes, 9% had cancer, 55% had heart disease, 9% had stroke, 9% had emphysema, 19% had cognitive impairment, and 4% died in the half year. The percentages of having 1, 2-4, and 5 ADL disabilities were 29%, 54%, and 17% respectively. Twenty-three percent reported insufficient help for at least 1 ADL disability. Those with insufficient ADL help had average half-year expenditures that were $1805 higher than those with sufficient ADL help (p=0.0072). CONCLUSION. Future research is needed to determine whether resolving insufficient ADL help is associated with reductions in Medicare expenditures.

BASELINE FUNCTIONAL DISABILITY PREDICTS DEMENTIA RISK EVEN AFTER CONTROLLING FOR COGNITIVE STATUS
E.B. Fauth1, S. Schwartz2, K. Smith2, J. Tschanz2, T. Ostbye2, C. Corcoran1, M.C. Norton1, 1. Family, Consumer, and Human Development, Utah State University, Logan, Utah, 2. University of Utah, Salt Lake City, Utah, 3. Duke University Medical Center, Durham, North Carolina

Late life disability in Activities of Daily Living may be caused by underlying cognitive and/or physical impairment. It is expected that ADL impairment related to cognitive deficits would be related to risk for dementia, but less is known about the role of underlying physical impairment and frailty in dementia risk. The current study examines whether impairment in Personal Activities of Daily Living (PADL) and Instrumental Activities of Daily Living (IADL) is related to developing dementia, after controlling for cognitive ability. Participants from the population-based Cache County Study (N=4615) were assessed in four triennial waves, beginning with the Modified Mini-mental State Exam (3MS). 724 cases of incident dementia were identified through in-depth cognitive assessment, ending in expert consensus diagnosis.
ABSTRACT

Abstaining from alcohol over the lifespan and functional decline in old age

K. Ahaec1, I. Kåreholt2, P. Allebeck1, 1. Department of public health, Social medicine, Karolinska Institutet, Stockholm, Sweden, 2. Karolinska Institutet, Aging Research Center, Stockholm, Sweden

This study examined the odds for functional decline (mobility limitations) for people abstaining from alcohol earlier in life. A representative Swedish sample (n=2500) of people aged 47 to 86 at the last follow-up were followed in five waves over three decades. The relationship between having become less mobile, i.e., running, stairs, or walking limitations, between last waves and abstinence in the four preceding waves were examined with logistic regression models. Results indicated that functional decline during last decade was above all predicted by having become an abstainer in the decade before – between the two preceding waves. When regressions took this change into account, being abstainer at wave one or two. Results were similar with or without adjustments for birth-year and gender. While abstinence both preceded and predicted functional decline in this study, it is still possible that the found relationship is spurious. E.g., if health deteriorates before it becomes evident as functional decline, it may possibly also explain why people became abstinent in the period before functional decline. The study confirms the relationship between abstinence and poor health found by earlier research. Further study of alcohol consumption and functional ability in old age is needed.

UNDERSTANDING AGING PATIENTS’ NEEDS IN A REHABILITATION HOSPITAL ROOM

J.O. Brooks1,2, S. Healy1, J. Psychology, Clemson Univ, Clemson, South Carolina, 2. Greenville Hospital System University Medical Center, Greenville, South Carolina

To improve patient satisfaction and improve staff efficiency, it is important for hospitals to have an understanding of patient needs. This study sought to evaluate the reasons why patients use the call light button as well as requests made during hourly rounding. Hourly rounding is the process where a hospital employee checks on each patient in their room once an hour to see if they have any needs. Volunteers for this study consisted of 47 patients in a rehabilitation hospital. The patients’ mean age was 57 years (up to 92 years). A total of 96 data points were collected and grouped into seven categories: actions for alarms (e.g., turn off bed alarm), actions for room (e.g., change television station), actions for bed (e.g., move bed position), information requests (e.g., medication administered that day), item requests (e.g., hospital gown), medical professional required (e.g., bathroom assistance), and other (e.g., assistance with visitor’s cot/chair bed). When combining across all types of requests, the number of requests by each category was highest for medical professional required (n = 52), followed by item requests (n = 21), and actions for alarms (n = 9). Knowing why patients need assistance may improve outcomes, quality of care, reduce costs and allow designers to effectively incorporate the needs of the patient. As the patient population continues to age it is important to consider how these needs may be similar to patients needs when they leave the facility whether patients age-in-place or live in a variety of facilities.

WHAT PREDICTS ASSISTIVE DEVICE USE AMONG OLDER ADULT VETERANS?

K.A. Pressler1, K. Ferraro2, N. Chumbley2, S. Black2, 1. Center on Aging and the Life Course, Purdue University, West Lafayette, Indiana, 2. Roudebush Veterans Affairs Medical Center, Indianapolis, Indiana

The purpose of this study is to identify predictors of assistive device use among older adult male veterans using both quantitative and qualitative data. Assistive devices include items such as walkers, wheelchairs, raised toilet seats, etc. Quantitative data are from the 1994, 1999, and 2004 waves of The National Long Term Care Survey (NLTC). A total of N=870 veterans were interviewed at baseline and followed over time. Negative binomial regressions predicting count of assistive devices controlled for demographic variables, health factors, disability, and previous use of assistive devices. A total of N=35 veteran respondents were recruited to participate in an in-depth interview after being trained on using a prescribed assistive device at a VA Medical Center’s Physical Medicine and Rehabilitation Clinic. Qualitative respondents were questioned on their familiarity and opinions of assistive devices and asked to identify members of their social network who use devices. Qualitative respondents were interviewed four months later to identify whether they currently used or abandoned the assistive device they were prescribed. Quantitative results reveal that age, education, disability, previous use of devices, and obesity were significant and positive predictors of assistive device use in 2004. Among qualitative respondents, preliminary results reveal that family and friends play a significant role in the decision to adopt, use, or abandon devices, specifically, mobility devices such as walkers, canes, and wheelchairs. Findings from this study will inform the development of interventions to improve appreciative adoption and abandonment of assistive devices by older adult veterans.
research can be used to inform health care practitioners of the demographic, graphic, health, and social factors that influence veterans use of assistive devices over time.

SESSION 170 (POSTER)

FITNESS, PHYSICAL ACTIVITY, AND EXERCISE IN OLD AGE

TAI CHI VERSUS STANDARD BALANCE EXERCISES ON OLDER ADULT EFFICACY IN EMOTIONS. BALANCE AND MOBILITY

L. LaDue, Bethany Renewal Center, Lincoln, Nebraska

Every year nearly 60% of older adults fall causing injury, hospitalization, and even death. The research problem addressed in this study was to find an exercise program that improves balance, mobility efficacy, and emotional well-being to aid in reducing the incidence of falls. The purpose of the study was to compare tai chi and a traditional balance exercise program with two groups of older adults 65 and older. In addition, the study addressed whether or not these older adults would continue their exercises after the initial instruction. The research question addressed the efficacy of each intervention to improve balance, mobility efficacy, emotional well-being and exercise adherence. Data was collected at pretest, 10 weeks and 14 weeks. Using a (time) x 2 (group) mixed-model analysis of variance design, baseline and postintervention measures of outcome variables were compared: treatment group was the between-subject variable and testing period was the within-subject variable. Data analysis revealed no statistically significant results for mobility efficacy or anxiety. The data did reveal significant results for home exercise program minutes per day. In addition, objective balance showed statistically significant results. The results for time (week 1, 10 and 14) for depression and home exercise practice did not reach statistical significance when corrected for a Type-I error. The results of this study identify ways that can assist older adults in reducing hospital admissions from unexpected falls and depression-related illnesses. In addition, these interventions are simple to learn, cost-effective, and easy for older adults to continue independently.

THE ASSOCIATION OF NATURAL ELEMENTS AND TRAIL USE BY OLDER ADULTS

A.E. Price1, J.A. Reed2, S. Long2, A.L. Maslow2, S.P. Hooker3, L. Traywick4, J.A. Reed1. 1. College of Education & Health Professions, Sacred Heart University, Fairfield, Connecticut; 2. Health Sciences, Furman University; Greenville, South Carolina; 3. Prevention Research Center, University of South Carolina, Columbia, South Carolina; 4. R. Stuart Dickson Institute for Health Studies, Carolinas HealthCare System, Charlotte, North Carolina

Promoting trail use could be an effective strategy for increasing physical activity among older adults. This study examines the association between natural elements (i.e., season, weather, temperature) and older adults’ trail use. A rail-trail in South Carolina was evaluated using the System for Observing Play and Recreation in Communities. There were 1053 observations of older adults engaging in physical activity on the trail over 16 quarterly observation periods (2005-2009). The majority (74.2%) were observed walking; 25.9% were observed in vigorous activity. Older adults were most often observed using the trail in the spring (40.1%), sunny weather (76.8%), and moderate temperatures (56.2%). The odds of observing older adults walking on the trail rather than engaging in vigorous activity were higher in sunny weather (OR=3.32, 95% CI=1.51, 7.27) or cloudy (OR=1.73; 95% CI=0.77, 3.92) compared to rainy, and greater in low temperatures (OR=2.42; 95% CI=1.22, 4.79) rather than high (adjusting for season, time period, gender, and ethnicity). The odds of observing older adults engaging in vigorous activity versus walking were highest in rainy weather and high temperatures. Professionals promoting trail use among older adults should consider: 1) providing suggestions for alternative activities when weather conditions are unfavorable, 2) environmental changes, such as shaded rest spots and water fountains along the trail, to maintain use by older adults in high temperatures, and 3) providing information about safely engaging in physical activity on the trail during adverse weather for older individuals who use the trail despite less optimal weather conditions.

FACTORS UNDERLYING LACK OF USE OF VOLUNTEER LAY HEALTH LEADERS FOR A COMMUNITY-BASED EXERCISE PROGRAM IN ARKANSAS

L. Washburn1,2, L. Traywick1, 1. University of Arkansas Division of Agriculture, Hot Springs, Arkansas; 2. University of Arkansas Division of Agriculture, Little Rock, Arkansas

The University of Arkansas Division of Agriculture uses the Family & Consumer Sciences County Faculty of the Cooperative Extension Service to deliver “StrongWomen,” a community-based strength training program for middle-aged and older women. Fifty-six of Arkansas’ 75 counties have offered the program. At the time of data collection, 68 groups were active in 37 counties. Of those, 21 were led by county faculty and 47 were led by volunteers. In an attempt better understand why more faculty were not utilizing lay volunteer health leaders, IRB approval was obtained to perform a qualitative descriptive study with 19 faculty, six of whom utilized volunteers to teach the exercise class and 13 who did not. The results showed that the counties where volunteer lay health leaders were not being utilized was not due to lack of volunteers willing to be trained, but due to the faculty themselves being unwilling—sometimes unconsciously—to allow lay leaders to take leadership of the program. Additional supporting themes include the faculty assumption that class participants would not want to lead, perception that the exercise group needed them present for the class to continue, professional validation received from teaching the class, and expression of personal desire to continue leading.

SOCIAL NETWORK TYPES AND HEALTH RELATED BEHAVIORS: EVIDENCE FROM AN AMERICAN NATIONAL SURVEY OF OLDER ADULTS

S. Shiovitz-Ezra, H. Litwin, the Hebrew University of Jerusalem, Jerusalem, Israel

The construct of social network type takes into account the complexity of the interpersonal environment in late life by incorporating a composite of network characteristics. Despite its analytical and practical potential, however, there is still only limited research that utilizes this construct. Moreover, there is hardly any research exploring the associations between social network type and health-related behaviors that have the potential to influence morbidity, disability and mortality. The aim of the present study is to fill this gap by exploring the relationship between network type and three realms of health-related behaviors: health-promoting behavior (engaging in physical activity), health-damaging behavior (alcohol consumption), and health-related help-seeking (using alternative medicine). We hypothesize that respondents embedded in socially resourceful network types will engage more frequently in health-enhancing behavior whereas respondents embedded in network types characterized by lesser social capital will engage more frequently in risky behavior. Data from the 2005-2006 NSHAP (the National Social Life, Health & Aging Project) wave were used to derive five network types among the respondents aged 65 and older: “Friends; “Diverse”, “Congregant”, “Family” and “Restricted” networks. Findings from multivariate logistic regression conducted for each health behavior outcome separately underscored that people embedded in less resourceful network types are at greater risk for alcohol abuse and physical inactivity net of the effects of sociodemographic and health correlates. More mixed findings were found in regard to using alternative medicine. The current examination emphasizes the importance of social network type in relation to health promotion among older people.
LIVING (WELL THROUGH) INTERGENERATIONAL FITNESS AND EXERCISE (LIFE) PROGRAM: A LOGIC MODEL APPROACH

J. Margrett, S. Francis, W. Franke, M. Peterson, K. Strand, Dept. of Human Development and Family Studies, Iowa State Univ, Ames, Iowa

Physical inactivity among older adults is a growing public health issue that, if not addressed, will lead to increased incidence of chronic disease and disability translating into lower quality of life and increased health care costs. Most older adults do not engage in adequate physical activity despite physical, cognitive, and psychological health benefits. Rural-residing older adults are at greater risk due to limited access. In response, a multidisciplinary team developed the LIFE Program for rural congregate meal sites. A logic model approach guided program development. Logic models, although not currently widely used in gerontological research, are useful in aiding program development and evaluation due to the explicit identification of resources, products, and outcomes. Using preliminary data from the LIFE Program, this presentation focuses on the utility of a logical model in the planning, implementation, and dissemination of a community-based prevention and intervention program targeting older adults.

OLDER ADULTS’ DAILY ACTIVITY AND EVERYDAY MEMORY: A 10-DAY DIARY STUDY USING FITBIT® TRACKERS

S. Stahl, J.H. Patrick, Morgantown, West Virginia

Research has shown that aerobically based exercise is associated with improvements in working memory (Colcombe & Kramer, 2003). A small, but growing, area of research has examined the relationship between physical activity and cognition from an everyday perspective. A primary goal of the current study was to examine how older adults’ daily activity was associated with everyday memory at a within-person level. Participants were ten (men = 7; women = 3) healthy older adults ( Mage = 64.10 years; SD = 3.28) who supplied self-report and objective data. Using Palm® pilots, participants recorded their daily activities and memory problems for ten days, while wearing a Fitbit® motion tracker that recorded their engagement in light, moderate, and vigorous activity. On average, adults experienced two memory failures and engaged in 30 minutes of activity per day. Results indicate a negative relation between daily activity and memory failures, such that older adults committed fewer memory failures on days they self-reported more daily activity ( r = -.41). We also compared older adults’ self-reported activities (via the Palm® pilot) to their objective measures (via the Fitbit®) of activity. Paired-sample t-tests indicate that older adults underestimated the amount of time they spent in moderate activity ( M self report = 33min; M objective = 59min) ( t(9) = 5.55, p < .01). Findings are discussed within a life-span perspective and focus on ways to use technology to better inform health promotion programs in late life.

OBJECTIVELY MEASURED PHYSICAL ACTIVITY AND BONE HEALTH IN OLDER WOMEN

H. Park, S. Park, Y. Kwon, E. Kim, T. Komatsu, 1. Tokyo Metropolitan Institute of Gerontology, Tokyo, Japan, 2. Dong-A University, Busan, Republic of Korea, 3. Tokyo University of Technology, Tokyo, Japan

The present study aimed to examine the relationship between baseline physical activity and the risk of osteoporosis. Subjects were free-living aged 67-84 years (113 women). Step count and physical activity intensity were measured continuously by accelerometer for 1 month. Bone mineral density (BMD) was determined by dual energy X-ray absorptiometry at baseline and each year-end. ANCOVA at 1st-2nd measurements or Cox regression analysis assessed independent relationships between baseline physical activity and year-end value BMD or the risk of osteoporosis, after controlling for baseline BMD, age, body mass, years since menopause, calcium intake, and alcohol consumption. BMD increased with increasing baseline physical activity, the relationship being more marked for moderate intensity than for step count. However, when data were categorized into physical activity quartiles, final BMD values were not significantly greater in persons exceeding counts of around 6,900 steps/day and/or moderate intensity of around 16 min/day. A multivariate-adjusted Cox regression model predicted that during the 2 years, individuals (especially women) who engaged in <7,000 steps/day and <15 min/day of activity at moderate intensity were, respectively, 1.4–2.2 and 2.0–3.3 times more likely to sustain fractures than those participating in >10,000 steps/day and >30 min/day of moderate intensity. The bone health of older women is associated with both the step count and the moderate intensity of habitual physical activity. To conserve bone health, elderly people should be encouraged to take at least 7,000 steps/day and/or spend at least 15 min/day at moderate intensity.

USE OF PREVENTIVE CARE BY ELDERLY IN NEW YORK CITY

G. Bayaz-Ozturk, W. Gallo, M.C. Fabs, CUNY School of Public Health at Hunter College, New York, New York

Although there is general evidence that individuals living in poverty are significantly less likely to receive preventive health care, research specifically targeted to older populations is limited. This study assesses the relationship between poverty and preventive care use among older adults in New York City. We analyze data from the 2008 Health Indicators Project, a sample of 1,870 participants of New York City senior centers. We focus on two outcomes, which are uncovered or partially covered by Medicare: self-reported dental and eye examinations. The outcome variables are binary coded. Poverty level is dummy coded, based on a three-level (<100% [ref.], 100% - 200%, ≥200%) categorical variable that we construct by comparing size-adjusted household income to Census Bureau thresholds for poverty. We fit logistic regression models to identify the association of poverty level on receiving dental and eye care, controlling for various demographic factors and health conditions. Results indicate that higher income levels monotonically increase the likelihood of obtaining preventive dental care. The association between poverty level and preventive eye care is significant only for the intermediate (100% - 200%) income level, which may reflect partial coverage by Medicare. This study presents evidence that elderly people are constrained by their income level in obtaining dental and eye care (as opposed to covered preventive services), which may result in lower utilization of these services and ultimately lead to worse health outcomes.

SOCIAL RELATIONSHIPS AND LONG-TERM CHANGES IN PHYSICAL ACTIVITY AFTER DIAGNOSIS OF HEART DISEASE

We investigated whether several aspects of social relationships are predictive of changes in physical activity following a first time diagnosis of coronary heart disease ( N = 321). Data were for ages 50 and over from the Canadian National Population Health Survey, a representative, longitudinal health survey collected biannually. Piecewise latent growth curves that modeled changes in energy expenditure prior to reported diagnosis and up to 8 years after diagnosis indicated that physical activity did not increase after diagnosis on average. Subsequent models investigated whether frequency of contact, criticisms, overly demanding behavior, and perceived availability of emotional, tangible, informational, confidant, and companionship support from family and friends predicted individual variation in physical activity changes after controlling for age, sex, education, and income. Although those with higher levels of available tangible, confidant, and companionship support were more active at baseline, no positive aspects of support were related to changes in activity before or after diagnosis. Those reporting...
more criticisms, however, showed declines in activity prior to diagnosis and increases in activity following diagnosis. These findings may suggest that criticism from family and friends before diagnosis may stem from sedentary behavior but may act as an impetus for physical activity after heart disease diagnosis.

AN ANTHROPOLOGICAL APPROACH TO EVALUATION RESEARCH: THE EXERCISE AND DEMENTIA PROJECT
M.A. Perkins, Saint Louis University, St. Louis, Missouri

Anthropological evaluation research that focuses on the process of an intervention as it is learned, modified, and performed within the context of everyday life of its participants can complement more traditional standardized evaluations of outcome and can help to explain the magnitude of change resulting from a given program or therapy. The Exercise and Dementia Project illustrates an anthropological contribution to the development and evaluation of a gerontological intervention: family-supervised physical activity programs for persons with mild dementia. An interdisciplinary team (occupational therapists, physical therapist, and medical anthropologist) developed and evaluated individualized physical activity programs for 30 persons with mild dementia and their primary family caregivers. Analysis of exercise diaries, in-depth follow-up interviews, and focus groups with family exercise supervisors revealed unanticipated barriers and incentives to performance of and adherence to the program, ad hoc modifications made by the exercise supervisors, criteria established by family supervisors to assess adequacy of exercise performance, introduction of technical devices to enhance the program, participants’ general perceptions of the program and its impact on daily functioning, and participants’ suggested changes. Anthropological evaluation research can provide insight into the manner in which the activities of an intervention are integrated into everyday life and the meaning and value of interventions from the perspectives of its participants. (Funded by the Alzheimer’s Association).

OLDER ADULTS’ PERCEPTION OF THE BENEFITS ASSOCIATED WITH INTERVENTION-BASED VIDEO GAME PLAY
L.A. Whitlock1, T. Patterson1, A. Trujillo1, A. McLaughlin1, M. Gandy2, J.C. Allaire1, 1. Psychology, North Carolina State University, Raleigh, North Carolina, 2. Georgia Institute of Technology, Atlanta, Georgia

There exists growing evidence for the successful use of video games as tools for cognitive improvement, with one recent study showing improvements in task switching, working memory, visual short-term memory and reasoning for older adult participants in a game-based intervention (Basak, Boot, Voss, & Kramer, 2008). However, the success of video games as tools in real-world cognitive interventions for older adults depends on adoption of the technology among the target population. When older adults decide whether to adopt a new technology they tend to take a benefit-driven approach where they are willing to overcome costs, such as usability issues, when the perceived benefit is high enough (Melenhorst, Rogers, & Bouwhuis, 2006). A previous model was proposed to explain adherence or non-adherence to therapeutic interventions via participant characteristics, motivational components, and facilitating conditions such as social engagement (Whitlock, McLaughlin, & Allaire, 2010). The current work expands on the model with findings from two game-based cognitive interventions comprising 64 older adult participants (age: M = 77.54, SD = 8.04), incorporating qualitative data from Likert-scale surveys, open-ended questionnaire responses, and ~15 hours per participant of audio recordings during game play. For example, a participant comment about enjoying friendship with her game partner during the intervention provided evidence for the facilitating condition of social engagement. Discussion also covers differences in benefit perception between participants with varying characteristics and future directions for increasing older adult adoption of technology for therapeutic interventional purposes.

DISPARITIES IN HEALTH STATUS AND HEALTH CARE ACCESS AND USE BETWEEN OLDER AMERICAN INDIANS AND ALASKA NATIVES AND NON-HISPANIC WHITES
G. Kim1, A.N. Bryant1, R. Goins2, C.B. Worley3, D.A. Chiriboga1, 1. Center for Mental Health and Aging/Department of Psychology, The University of Alabama, Tuscaloosa, Alabama, 2. West Virginia University, Morgantown, West Virginia, 3. University of South Florida, Tampa, Florida

Given the paucity of research with older American Indians and Alaska Natives (AIANs), the present study compared the characteristics of health status and health care access and use among older AIANs to those of non-Hispanic Whites (NHWs). Data were drawn from the 2009 California Health Interview Survey, with a total of 17,156 adults aged 60 and older (198 AIANs and 16,958 NHWs) analyzed. Results show that in general, older AIANs had poorer physical and mental health conditions and health care access and use than NHWs. AIANs were more likely than NHWs to have poor self-rated health (p < .001), a greater number of chronic diseases (p < .001), and higher disability (p < .05). AIANs reported higher levels of psychological distress (p < .01) and had higher prevalence of serious psychological distress (p < .05) than NHWs. With respect to health care access and use, AIANs were less likely than NHWs to see a medical doctor (p < .01) and to have a usual source of medical care (p < .001). Also, AIANs were more likely than NHWs to delay getting needed medical care (p < .05) and report difficulty understanding the doctor at their last visit (p < .01). These findings highlight the vulnerability and unmet health care needs of older AIANs. More research on the older AIAN population is clearly needed to document their health care needs, which may be the first step to reduce health disparities.
WHAT ARE COPING STRATEGIES TO DEAL WITH DEPRESSION AMONG OLDER KOREAN CANCER SURVIVORS? SOCIO-CULTURAL COMPARISON OF TWO REGIONS OF THE U.S

Studies have consistently shown cancer diagnosis and treatment to be associated with increased depression. However, research that directly examines the coping strategies to deal with depression of elderly minority cancer survivors is sparse. Addressing that gap, this study examines coping strategies that used among older Korean immigrant cancer survivors. To investigate strategies to cope with depression among this group, our qualitative study utilized face-to-face, in-depth interviews: 10 individuals from the state of New York (NY) and 10 from Minnesota (MN). Each interview was digitally audio-recorded and transcribed verbatim in Korean. Grounded theory was employed to analyze the data, using Atlas ti 5.0. Each analysis of the MN and NY interviews revealed two common primary internal depression coping strategies: (1) reliance on religion through prayer and belief; (2) positive outlook—avoiding negative thoughts. With regard to external depression coping strategies, the analysis of the two regions showed three shared external depression coping strategies: (1) utilization of mental health services, (2) social support and network; and (3) health management by exercise and diet. Religion, social support, and mindset control emerged as most frequent strategies to deal with depression from both locales. By contrast, analysis implied a regional difference with regard to two external depression strategies: meeting with pastor or priest and easy accessibility of community facilities. These findings suggest that specialized programs or practices for effective coping with depression of cancer survivors should consider regional features.

DIFFERENCES IN DIABETES MELLITUS RISK FOR OLDER BLACK, WHITE AND MEXICAN AMERICANS

A.R. Quinones1,2, J. Liang1,4, W. Ye1, J. Public Health & Preventive Medicine, Oregon Health & Science University, Portland, Oregon; 2. Veterans Administration Medical Center, Portland, Oregon; 3. University of Michigan, Ann Arbor, Michigan; 4. Institute of Gerontology, Ann Arbor, Michigan

There is extensive evidence of elevated risk of diabetes mellitus accruing to minorities in the US. However, information regarding incident diabetes mellitus among older individuals is more limited, particularly those involving Mexican Americans over an extended period of time. This research examines the risk of developing diabetes mellitus among older Americans for a period of up to 11 years. It focuses on self-reported diabetes mellitus incidence changes over time for white, black and Mexican Americans. Data came from 14,783 respondents of the Health and Retirement Study who report being diabetes-free at baseline with up to five repeated time intervals (1995-2006). Discrete-time survival models adjusting for socioeconomic, time-varying health status and behavior differences are used to analyze ethnic variations in the probability of developing diabetes for older adults. The risk of new diabetes increased in 1995-2006, with 11% cumulative incidence for all respondents. For black Americans, the 11-year cumulative incidence is 11.4%, while the incidence increases from 0.01 in the initial interval to 0.03 in the final intervals. In contrast, the 11-year cumulative incidence for Mexican Americans is 10%. Examining the period-by-period risk for Mexican Americans reveals a more than doubling from 0.02 in the initial to 0.05 during the final time interval. These results suggest that increasing diabetes mellitus incidence for Mexican Americans persists through adjustment for differences in health behaviors, socioeconomic status, demographic characteristics and changing health status. Relative to white Americans, Mexican Americans have a significantly elevated risk of diabetes throughout the 11-year period of observation.

THE ROLE OF ACCULTURATION AND PERCEIVED RACIAL DENSITY IN DEPRESSIVE SYMPTOMS AMONG HISPANIC OLDER ADULTS

K. Kwag, Y. Jang, D.A. Chiriboga. Aging and Mental Health Disparities, University of South Florida, Tampa, Florida

The present study examined how Hispanic older adults’ depressive symptoms varied according to acculturation status and/or perceived density of Hispanics in their neighborhood. Using data from the Sacramento Area Latino Study on Aging (SALSA), participants (N = 1,054; mean age = 71.23) were classified into three groups of acculturation (Hispanic-oriented, bicultural, and Anglo-oriented) and two groups of neighborhood (Hispanic-dominant neighborhood and Hispanic-isolated neighborhood). Hierarchical regression models of depressive symptoms were estimated by entering demographics, health-related variables, acculturation, perceived racial density, and an interaction term for acculturation and perceived racial density. In addition to the direct effects of acculturation (Hispanic-oriented; β = .09, p < .05) and perceived racial density (Hispanic-isolated neighborhood; β = .07, p < .05), the interaction between them (β = .09, p < .05) was found to be significant. Findings indicate that depressive symptom scores are highest among Hispanic-oriented individuals who lived in Hispanic-isolated neighborhoods. Discussion draws on the idea of the social capital available in neighborhoods, with Hispanic-oriented older adults being more likely to encounter barriers for formal and informal resources in racially isolated neighborhoods. Findings have implications for the allocation of mental health services.

A PILOT STUDY OF THE REVISED SPANISH VERSION OF THE RAPID ESTIMATE OF ADULT LITERACY IN MEDICINE-SHORT FORM (REALM-SF)

J. Rengifo Nevarez1, P. Alvarez3, Y.M. Tzuang2, D. Gallagher-Thompson2, 1. Palo Alto University, Palo Alto, California, 2. Stanford University, Stanford, California

In the U.S., low health literacy (HL) has been identified as a contributor to poor health. Currently, the most widely used measure of health literacy is the Rapid Estimate of Adult Literacy in Medicine (REALM). It is a word recognition and pronunciation tool used in health care settings and has been highly correlated with other measures of HL. It is easy to administer and only takes 2-3 minutes to complete. However, two limitations of the REALM are noted: 1) it has only been available in English; 2) it only tests recognition and pronunciation of medical words and, thus, has limitations as a measure of the full concept of HL. To address the limitations, we created a Spanish version of the REALM-SF and administered it to 156 monolingual and bilingual Spanish-speaking Latino caregivers of dementia patients in California. The revised version contains an additional component that required participants to recognize the definitions of the words. Latino caregivers were recruited from San Diego, Santa Cruz, Salinas, and Sacramento, CA. These family caregivers ranged in age, educational level, gender, and number of years living in the U.S. Preliminary results show that the Spanish REALM-SF is valid in measuring health literacy, with the added component being the ability to determine whether caregivers understood the meanings of the words fully. The project team believes that the latter is crucial in testing health literacy more accurately. Further research is needed to validate this revised REALM-SF with the broader Latino population.

RACIAL DIFFERENCES IN THE RELATIONSHIP BETWEEN LEVEL OF RURALITY AND DEPRESSION

J.A. Zimmerman, B.T. Mast, University of Louisville, Louisville, Kentucky

There has been little study of how rural/urban residence relates to differences in depression rates and severity. This study investigated variables associated with depression across four county levels of rurality, ranging from urban to rural among 3,996 individuals from the Duke
EPESE study. Level of rurality was measured by the USDA Economic Research Department’s rural-urban continuum codes, a 9-tiered system. Mean depression score (modified CES-D) and the prevalence of depression (CES-D score > 9) did not differ significantly between the four county codes. However, there were important differences by race. The most rural code had a significantly greater prevalence of Black residents (73.51%) compared to the three other county codes (49.12% - 57.12%; χ² (1) = 79.59, p < 0.001) and overall, Black participants reported more depressive symptoms than White participants (F (18, 3953) = 3.38, p < 0.001). However, a three-way loglinear analysis indicated a significant highest-order interaction: Race x Code x Prevalent Depression (χ² (3) = 7.62, p = 0.046), such that rates of prevalent depression increased as rurality increased for White participants (highest rates in most rural counties), but decreased as rurality increased for Black participants (lowest rates in most rural counties). This finding suggests individual characteristics, such as race, need to be investigated to understand the relationship between rural/urban status and depression. In addition, this finding may suggest a racial disparity in terms of depression for Black older adults living in more urban locations, but not necessarily for those living in rural settings.

SOCIOCULTURAL SUPPORT MODEL FOR HEALTHY AGING FOR OLDER IMMIGRANTS: PERSPECTIVES FROM THE UNITED STATES, SWEDEN, AND JAPAN

K. Hoshino, University of California, Berkeley, Berkeley, California

1. Purposes: Using qualitative analyses of the interview with experts in gerontology, the author examines the commonalities and differences between sociocultural support models for older adults and immigrants in the United States, Sweden, and Japan. Next, the author proposes policy implications, and finally, a Sociocultural Support Model is presented. 2. Methods: The participants were eight researchers in the United States, Sweden, and Japan. The author conducted in person interview according to a semi-structured interview protocol concerning his/her model and finding. 3. Results and Discussions: 1) Commonalities and Differences: As a result of a content analysis, a conceptual structure was proposed which included four Dimensions and twenty Categories: The Physical, Social, Psychological, and Spiritual Dimensions. In the United States underdeveloped immigration policies contributed to the meddle of life expectancy, people’s negative attitude towards aging and end of life. In Sweden the well-developed policies affected higher life expectancy, and people’s neutral attitude towards aging and end of life. In Japan the developing policies influenced high life expectancy, and people’s neutral attitude towards aging and end of life. 2) Policy Implications: The content analysis of the policy implications led to a conceptual structure which included six Dimensions: (1) History, (2) Law, (3) Economy, (4) Social Network, (5) Education, and (6) Research. Considering historical patterns, we should develop culturally sensitive health care and immigration policies and culturally generationally sensitive social programs as well as lifelong education programs for professionals. 3) Sociocultural Support Model: A Sociocultural Support Model for Healthy Aging was demonstrated which included four Dimensions and twenty Categories, and was a comprehensive multidimensional unique model. 4. Acknowledgements: I would like to thank Professor Steven H. Zarit, Professor Andrew Scharlach, Professor Gerdt Sundstrom for their contributions.

FOTONOVELA: A CULTURALLY COMPETENT APPROACH TO PROVIDE HEALTH EDUCATION TO LATINO CAREGIVERS REGARDING ALZHEIMER’S DISEASE AND ASSOCIATED DEMENTIAS (ADAD)

P. Alvarez1, J. Rengifo Nevarez1, Y.M. Tsuang2, J.M. Holland2, D. Gallagher-Thompson1, Stanford University, Stanford, California

Latinos are one of the largest and fastest growing populations in the United States. Thus, it is imperative to identify effective approaches to educate them about Alzheimer’s disease and associated dementias (ADAD). The fotonovela, which translates to “photo novel”, appears to be a culturally acceptable method to reach out to a population that often relies on the media to obtain their basic health information. The simple language and visually captivating images narrate the day-to-day events of a family living with ADAD. A total of 156 Latino caregivers of older persons with dementia were recruited from four major cities in California (Sacramento, Salinas, Santa Cruz and San Diego). They differ in ages, gender, education level, and number of years living in the U.S. The control group (n=66 completers) received traditional pamphlets currently offered by the Alzheimer’s Association. The intervention group (n=88 completers) received the 20-page fotonovela. All participants received four monthly follow-up phone calls after baseline interview to assess the value and impact of both educational methods. Preliminary analysis found a higher dropout rate in the control group and a lesser tendency toward reading the material multiple times and sharing it with friends and family, compared to those who received the fotonovela. This suggests that caregivers were more interested in reading the fotonovela than the traditional pamphlet. All data collection is now complete; outcomes (e.g., depressive symptoms and self-reported stress) will be compared between the 2 conditions over time and will be available to present at the GSA meeting.

DEPRESSION INTERVENTIONS AMONG MINORITY OLDER ADULTS: A SYSTEMATIC REVIEW ACROSS 20 YEARS

D. Fuentes, F. Aranda, School of Social Work, University of Southern California, Los Angeles, California

Treatments for depression exist, and numerous studies have reported that pharmacological and psychosocial interventions are efficacious among older adults. However, there is a dearth of research that reports depression treatment outcomes for racial and ethnic minority older adults. Thus the efficacy of such interventions remains unclear for this population. The objectives are to: (1) identify depression treatment studies tested with samples of racial/ethnic minority older adults in the U.S.; (2) appraise depression outcomes and level of evidence for the studies meeting systematic review criteria; and (3) describe cultural considerations or modifications made to the depression treatments. Five electronic databases were systematically searched to identify empirical research published in the U.S. between 1990 and 2010 that describe depression treatment outcomes for older adults by racial/ethnic group or for a sample of older adults that are primarily (i.e., at least 50%) racial/ethnic minorities. Of 80 unduplicated articles on depression treatment outcomes in U.S. minority adults, only six met all inclusion criteria. Of these, four examined the integration of depression care into primary care or home care settings. Six interventions included individualized or group therapy, either as a single intervention or as part of a larger menu of services. Based on a small subgroup of depression treatments, our results show that racial and ethnic minority older adults experience favorable treatment outcomes in interventions with varying degrees of cultural adaptations or modifications. It is imperative to increase the participation of minority older adults in depression treatment research for significant group comparisons to be made.

RACIAL/ETHNIC DIFFERENCES IN PREDICTORS OF SELF-RATED HEALTH: FINDINGS FROM THE SURVEY OF OLDER FLORIDIANS (SOF)

N. Park1, Y. Jang2, B. Lee2, D.A. Chiriboga1, 1. School of Social Work, University of South Florida, Tampa, Florida, 2. University of South Florida, Tampa, Florida

The single self-rated health (SRH) question, “how would you rate your overall health?,” has been widely used in health outcomes studies, serving as a powerful indicator of general health and well-being. Focusing on racial/ethnic differences and with group variations, the present study examined how SRH was influenced by socio-demographic characteristics (age, gender, education, marital status, and income),
health (chronic conditions and functional disability), and social resources (family support, religious attendance, and—for two Hispanic groups—English proficiency) among diverse racial/ethnic groups. The data source was the Survey of Older Floridians, a statewide sample of Whites (n = 503), African Americans (n = 360), Cubans (n = 328), and non-Cuban Hispanics (n = 241) who were age 65 and older. A hierarchical regression model was used to estimate the effects of each block of variables and interactive effects on SRH. On average, Whites had the most favorable perceptions of health followed by African Americans, non-Cuban Hispanics, and Cubans. Health variables were consistently significant predictors of SRH across all groups. For Whites, religious attendance had a positive effect on SRH and the effect was more prominent for those with advanced age. For African Americans, older age worsened the effect of functional disability on SRH. For Cubans, older age reduced the effects of chronic conditions and English proficiency decreased the effects of functional disability on SRH. Lastly, English proficiency lessened the effect of chronic conditions on SRH for non-Cuban Hispanics, and its benefit was more salient among men.  

10-YEAR TRENDS IN HEALTH DISPARITIES-RELATED GRANTS FUNDED BY NATIONAL INSTITUTE ON AGING (NIA)  
G. Kim, C.S. Huang, J. DeCoster, Center for Mental Health and Aging/Department of Psychology, The University of Alabama, Tuscaloosa, Alabama  
There have been significant efforts to close the gaps in health status and health care between racial/ethnic minorities and majorities. Federal funding agencies such as National Institutes of Health (NIH) and Centers for Disease Control and Prevention (CDC) have paid special attention to fund programs reducing or eliminating health disparities. The present study sought to examine the characteristics of health disparities-related grants funded by National Institute on Aging (NIA) in the past 10 years. Objectives were (1) to understand 10-year funding trends in health disparities-related grants funded by NIA; (2) to identify moderators associated with 10-year funding trends in NIA-funded health disparities-related grants; and (3) to use this information for future NIA grant submission for health disparities-related topics. Our primary data source was the NIH Research Portfolio Online Reporting Tools Expenditures and Results (RePORTER) system. Data obtained from the RePORTER were merged with data from the Carnegie Classification of Institutions of Higher Education. Descriptive analysis and generalized linear model (GLM) were conducted to examine the 10-year funding trends. Results show that NIA funding for health disparities research has increased over time during the past 10 years. Significant moderators were type of mechanism (R & P), type of institution (Very high research vs. other), region or states (Southeast), having a medical school (Yes), and historically Black colleges/universities (No). The findings highlight NIA’s current efforts to reduce health disparities among older adults, and gerontology researchers may find this information very useful for their future grant submission.  

PERCEIVED DISCRIMINATION AND PSYCHOLOGICAL DISTRESS IN MINORITY CAREGIVERS: MODERATING EFFECTS OF RACE AND RELIGIOUS COPING  
D. Stevens, M.K. Higgins, Nell Hodgson Woodruff School of Nursing, Emory University, Atlanta, Georgia  
Background: Fifty million Americans provide care to chronically ill family members. Substantial evidence supports that caring for chronically ill, older adults can have negative mental and physical health consequences. Minority caregivers may be at greater risk because of pre-existing psychosocial adversities like discrimination. Little is known about the relationship between perceived discrimination and psychological distress in minority caregivers, and the potential mitigation of religious coping. The purpose of this analysis was to explore the relationship of discrimination, psychological distress, with caregiver status and religious coping. Methods: The data were drawn from the National Survey of Midlife Development in the United States (MIDUSII), conducted in 2004-2006 (N=2342). Correlations procedures were conducted with demographic characteristics (age, gender, race, caregiver status) with perceived discrimination and psychological distress. Multivariate regression analyses were conducted and interaction effects were tested to explore the influence of religious coping and discrimination on psychological distress. Results: Women, minorities, and caregivers had higher psychological distress scores. Perceived discrimination was positively correlated with psychological distress and preserved its independent effect on psychological distress after controlling for potential confounders. While the data showed a moderating effect of race and discrimination on psychological distress, the effect of religious coping was not significant. Discussion: The findings indicate a significant relationship between discrimination and psychological distress. Minority caregivers may be at particular risk for compounding stressors and subsequent negative health outcomes. Conclusions: Data support the argument that discrimination needs to be considered as a psychosocial risk factor for minority caregivers of older adults.  

HEALTH AND HEALTH CARE CONCERNS AMONG OLDER IMMIGRANTS AND REFUGEES IN ST. LOUIS: A CROSS-CULTURAL STUDY OF CHINESE AND BOSNIAN ADULTS  
L.M. Willoughby, H. Matsuo, D. Tao, C.M. Brown, M. Gao, M. Gracic, Saint Louis University, St. Louis, Missouri  
The health of older adults is a key area of study in gerontological research, yet comparisons across different immigrant populations remain lacking. The goals of this pilot study were to examine the health care concerns of community-dwelling older adults in the St. Louis area Chinese and Bosnian communities who arrived in the U.S. at 18 years or older in reference to a sample of older adults who were born in the U.S. Individuals from the Chinese and Bosnian communities were selected because of their distinctive group differences in terms of entry to and length of stay in the U.S., community structure, and cultural backgrounds. Thirty-five individuals, ages 65 years or older (M=73.9), completed questionnaires and participated in focus groups that were conducted separately for each group by gender. Quantitative data were analyzed using parametric and nonparametric methods, when appropriate. The results from the questionnaires indicated differences in subjective health ratings and some aspects of activities of daily living between the groups. An examination of the qualitative data from the focus groups revealed clear group differences with respect to health concerns, use of traditional medicine, positive and negative experiences with the U.S. health care system, and needs, with prominent gender differences noted. These results provide valuable information about the unique and common health needs and concerns across two distinct immigrant populations.  

ASSOCIATION OF GERIATRIC SYNDROMES WITH ACUTE HEALTH CARE USE IN OLDER HOMELESS ADULTS  
R. Brown1, M. Blurel2, D.K. Kiely3, S.L. Mitchell1, 1. Beth Israel Deaconess Medical Center, Boston, Massachusetts, 2. Hebrew SeniorLife, Boston, Massachusetts, 3. Boston Healthcare for the Homeless Program, Boston, Massachusetts  
The average age of the US homeless population is increasing faster relative to the general population. One-third of homeless adults are currently aged 50 and older, increased from 11% in the early 1990s. Limited research in older homeless persons suggests that they suffer premature aging-related health problems compared to the general population. It is unknown if geriatric syndromes also have earlier onset. Geriatric syndromes, including cognitive impairment and falls, are associated with higher mortality, disability, and acute healthcare use. However, aging research demonstrates that geriatric syndromes are often amenable to relatively simple interventions. While delivering standard
treatments to homeless patients can be challenging. Geriatric syndromes cannot be addressed if they remain undetected. Thus, a better understanding of geriatric syndromes in homeless elders is a necessary first step to improve their health. We therefore determined the prevalence of common, treatable geriatric syndromes in 250 homeless elders in Boston-area shelters, and prospectively examined the association between the total number of syndromes and acute health care use over 12 months. **IMPLICATIONS:** This study is the first to rigorously examine geriatric syndromes in older homeless adults. Information about the prevalence and outcomes of geriatric syndromes is necessary to understand the health problems facing a growing segment of underserved older Americans. This study provides the foundation for future research by advancing methodologies to study this vulnerable population, and providing preliminary data to develop an intervention to improve health outcomes in homeless elders.

**SESSION 180 (POSTER)**

**HEALTH AND WELL-BEING OF THE OLDEST OLD**

**INFLUENCE OF SOCIAL PROVISIONS AND PRIVATE RELIGIOUS ACTIVITY IN THE AFTERMATH OF EXPERIENCING A MAJOR DISASTER: THE UNDERLYING DYNAMICS OF LIFE SATISFACTION AT 100 AND BEYOND**

A. Bishop, G. Randall. *Human Development and Family Science, Oklahoma State University, Stillwater, Oklahoma, 2. Bradley University, Peoria, Illinois*

The purpose of this investigation was to examine the multiplicative influence that a major disaster (MD), social provisions (SP) and private religious activity (PRA) has on the life satisfaction (LS) of long-lived persons. Data originated from a pilot of examination of N=154 community-dwelling centenarians (M=101; SD=1.71) residing in Oklahoma. Hierarchical regression analyses using pair-wise deletion (N=150) was employed, while controlling for the influence of confounding variables including age, sex, education, and perceived health status. Key study variables of interest as well as all possible interactions (MDxSP, MDxPRA, SPxPRA, MDxSPxPRA) were then examined relative to their associated influence on LS. The final model explained 31% of the variance in LS. Relative to control variables, perceived health status maintained a significant positive association with LS (β = .35; p < .001). This suggests that centenarians who view their health positively also feel greater satisfaction with life. Evidence of a significant three-way interaction MDxSPxPRA also emerged (β = -.18; p < .05). It appears that the degree to which centenarians possess social resources and engage in private religious activity may help diminish the noxious influence of a major disaster on life satisfaction in extreme old age. Implications related to the dynamics between experiencing a major disaster, levels of social provisions, and levels of private religious activity on the life satisfaction at 100 years of age and beyond are addressed.

**RESOURCES AND SELF-RATED MENTAL HEALTH AMONG OLDEST-OLD ADULTS: FINDINGS FROM THE GEORGIA CENTENARIAN STUDY**

J. Cho, P. Martin, M. MacDonald, L. Poon. *Iowa State University, Ames, Iowa, 2. Kansan State University, Manhattan, Kansas, 3. University of Georgia, Athens, Georgia*

This study investigated the effect of the reference point of self-rated mental health items on the relationship between resources and oldest-old adults’ subjective mental health from two different perspectives (self- and proxy reports). One hundred and ninety two octogenarians and centenarians from the Georgia Centenarian Study participated in the study. Two different self-rated mental health measures with different points of reference (global vs. self-comparative) were used from two different perspectives (self- and proxy reports). Blocked multiple regression models (linear and logistic) revealed different resources associated with self-rated mental health depending on the mental health reference point. For self-reports, social resources, functional capacity, and conscientiousness and the interaction between social resources and conscientiousness significantly related to global mental health, whereas functional capacity and neuroticism were significantly associated with self-comparative mental health. For proxy-reports, functional capacity, perceived economic status, and neuroticism were strongly associated with global mental health, whereas only perceived economic status was related to self-comparative mental health. The findings suggest that the reference point and different perspectives of mental health among oldest-old adults are important. The results have implications regarding the phrasing of mental health questions and indicate that the reference point is another consideration when evaluating the quality of life among very old people.

**DO THE FACETS OF OPENNESS TO EXPERIENCE AND NEUROTICISM PREDICT LEVELS OF FATIGUE AMONG OCTOGENARIANS AND CENTENARIANS?**

The purpose of this study was to investigate the effects of NEO personality facets on fatigue. Using the Georgia Centenarian Study, 321 proxies’ evaluated personality and fatigue levels of centenarians and octogenarians. Blocked multiple regression analyses were computed and results suggest that, after controlling for gender, age, ethnicity, and depressive symptoms, two facets of Openness to Experience, Fantasy and Aesthetics, were positively related to total fatigue, β = .35, t(310) = 2.35, p < .01, respectively, whereas Actions and Ideas were negatively related, β = -.27, t(310) = -.36, p < .01, and β = -.23, t(310) = -.22, p < .01, respectively. The facets of Fantasy, β = .26, t(310) = .63, p < .01, was positively related and Feelings and Ideas, β = -.36, t(310) = -.38, p < .01, were negatively related to mental fatigue. Next, the Neuroticism facet Vulnerability positively related to total fatigue, β = .45, t(310) = .90, p < .01. Impulsiveness and Vulnerability, β = .19, t(310) = .52, p < .01; and β = .58, t(310) = 6.59, p < .001, were positively related to mental fatigue. Participants higher in Impulsiveness and Vulnerability experienced higher levels of mental fatigue. In conclusion, higher levels on Fantasy, Aesthetics, Impulsiveness, and Vulnerability were associated with higher levels of total fatigue; whereas Actions and Ideas were associated with low levels of total fatigue. In addition, Fantasy, Feelings and Ideas, Impulsiveness, and Vulnerability were associated with higher levels of mental fatigue.

**DISTAL AND CONTEMPORANEOUS INFLUENCE OF TRAUMATIC EVENTS ON THE WELL-BEING OF CENTENARIANS**

P. Eckert, A. Bishop, K. Schwerdtfeger. *Oklahoma State University, Stillwater, Oklahoma*

Data for this studied included N=154 centenarians (M = 101.01, SD = 1.72) residing in Oklahoma. The primary purpose of this study was to explore how reported lifetime traumatic experiences of extremely long lived persons influence well-being. A key objective was to identify the association between distal and proximal occurrence of cumulative lifetime trauma on current life satisfaction, depressive affect, and loneliness. Participants reported experiencing an average of 2.07 (SD = 2.07) traumatic events during their lifetime. After controlling for age, gender, education, and marital status, cumulative traumatic events encountered before age 30 (β = -.22, p < .01) as well as after age 80 (β = -.19, p < .05) were negatively associated with life satisfaction. In particular, past and recent traumatic events decrease life satisfaction among centenarians. Cumulative trauma experiences after age 80 also maintained a direct positive association with depressive affect (β = .18,
This suggests that greater number of trauma experiences occurring in old-old age increases depressive symptoms. No significant associations emerged relative to loneliness. Results indicate that lifetime trauma has a distal as well as contemporaneous influence on life satisfaction at 100 years of age and beyond, whereas depressive affect among centenarians appears to emerge from more recent trauma experiences. Evidence from this study has implications relative to guiding how geriatric health professionals and practitioners address quality-of-life among long-lived trauma victims.

EXAMINING LIKELIHOOD OF OPTIMAL LIFE SATISFACTION AT 100 AND BEYOND
C.R. Hixson, A. Bishop, Oklahoma State University, Stillwater, Oklahoma

Data for this investigation originated from pilot study of N = 154 centenarians (M = 101.01, SD = 1.72) residing in Oklahoma. Logistic regression analyses were computed to assess the association of sociodemographic characteristics, physical and mental health covariates, and psychosocial influences to optimal life satisfaction. Gender (OR = 0.12, 95% CI [0.01, 0.99]) and education (OR = 0.67, 95% CI [0.46, 0.99]) were significant socio-demographic indicators. In particular, women were less likely than men to report optimal satisfaction with life. However, centenarians reporting lower educational achievement were more likely to be optimally satisfied with life compared to those with a high educational background. Relative to co-occurring influences, cumulative lifetime trauma (OR = .06, 95% CI [.39, .92]), co-morbidity (OR = 0.31, 95% CI [0.1, .97]), and perceived health (OR = 0.24, 95% CI [0.08, 0.71]) were associated with decreased odds of experiencing optimal life satisfaction. After controlling for the influence of socio-demographic and mental and physical covariates, extraversion (OR = 1.15, 95% CI [1.04, 1.28]) and perceived economic status (OR =1.69, 95% CI [1.04, 2.73]) emerged as key psychosocial influences of optimal life satisfaction. It appears that cumulative lifetime trauma, multiple health impairments, and poor health perceptions reduce the likelihood of feeling optimally satisfied with life at 100 years of age and beyond; yet centenarians who are sociable and maintain positive perceptions about their current economic state are more likely to view life as optimal. Results from this study have implications relative to recommendations on how aging service providers can enhance quality-of-life among long-lived persons.

PROXY REPORTS ON ETHNIC DIFFERENCES IN DEPRESSION BETWEEN OCTOGENARIANS AND CENTENARIANS
J.B. Baenziger1, A. Aneja1, G.D. da Rosa1, P. Martin1, L. Poon2, J. Iowa State University Gerontology Program, Ames, Iowa, 2. University of Georgia, Athens, Georgia

The purpose of this study was to investigate ethnic differences in depression using the Georgia Centenarian Study (Poon et al., 2007). Three-hundred and six proxies reported depression levels of octogenarians and centenarians using the Cornell Scale for Depression in Dementia (Alexopoulos et al., 1988). This study included 240 Caucasians (78%) and 66 African-American (22%) centenarians from the state of Georgia. ANOVAs were conducted to compare the effect of ethnicity on five domains of depression. Analyses were conducted separately with centenarians by combined age groups. For proxy reports of African-American centenarians, mean scores (M = 1.87, SD = 1.76) were significantly higher than Caucasian mean scores (M = 1.23, SD = 1.29) on behavioral disturbance, F(1, 147) = 4.53, p = 0.035. Proxy reports for the combined age groups suggested that African-Americans had higher levels of behavioral disturbance compared to White centenarians.

DEPRESSION AMONG THE ELDERLY is considered as a major issue with considerable implications at the individual and public health level. Although the prevalence of major depression is small in advanced age, depressive symptoms and subclinical depression are widely present. Which factors are responsible for depression in the elderly is less well-known. In the present study, we investigated a subsample of the Heidelberg Centenarian Study with respect to predictors of depression, by including personal resources (i.e., job training, health, cognition, social network, and extraversion) as well as meaning in life as an existential construct. The sample had on average only low levels of depression measured with the 10-item Geriatric Depression Scale; one third of the participants, however, had low to moderate levels of depression. A structural equation model was used to test direct effects of resources as well as meaning in life as a mediator between resources and depression. In this model, health was the only resource that had a direct effect on depression; meaning in life had the strongest effect. Indirect effects were found for extraversion and job training. Findings suggest that resources are less important for individual levels of depression compared to existential constructs such as meaning in life, which parallels findings on subjective well-being. Nevertheless, in contrast to well-being findings, health had a substantial role. Thus, loss of health may have a stronger impact on quality of life when considering negative aspects such as depression than indicated by work on the well-being paradox.

CARdiovascular Predictors of COgnitive Health IN THE OLDEST-OLD: THE FRAMINGHAM STUDY
I.N. Miller, J.J. Himmali, A. Beiser, J.M. Murabito, S. Seshadri, P.A. Wolf, R. Au, Boston University, Boston, Massachusetts

The oldest old are now the fastest growing population in the world, but research on the cognitively intact oldest old is particularly limited. Are there predictors of intact cognition in extreme age? Cardiovascular risk factors in old age have been linked to poorer cognitive performance, but it has been suggested that a different relation may exist between cardiovascular risk factors and cognition in this extreme age group. Participants included 191 women and 105 men ages 80+ from the Framingham Heart Study Original cohort who were free of clinical dementia. We evaluated how cardiovascular risk at young-old age (73.1±3.3 years) impacted successful cognitive aging in the 9th and 10th age decades (85.2±3.4 years). After adjusting for premorbid intelligence (using WRAT 3 Reading scores) and gender, the absence of diabetes was related to better visual memory (WMS Visual Reproduction, 0.83±0.40, p = 0.039); this relationship was not significant when adjusting for educational attainment. Interestingly, the presence of CVD was related to better performance on executive functioning (Trails B – Trails A; 0.39±0.15, p = 0.012 when adjusting for WRAT 3; and 0.34±0.16, p = 0.037 when adjusting for educational attainment); results that could be attributed to a survival effect or post-CVD event healthy lifestyle changes. Because adult onset diabetes is a modifiable disease, aging individuals may benefit in reducing risk for diabetes as they work toward healthy cognitive aging.

SESSION 185 (POSTER)

KEEPING IT GOING: ACTIVITY AND SUCCESSFUL AGING

THRESHOLDS FOR PARTICIPATION AMONG THE ELDERLY
T. Koskimäki1, A. Karisto1, 1. University of Helsinki, Helsinki, Finland, 2. Doshisha University, Kyoto, Japan

The aim of the research is to study recreational activities and social participation of elderly and people in their third age. In particular, the
aim is to study the possible thresholds or constraints to participation. These include characteristics of living environment, one’s physical capabilities, material resources and so called cultural thresholds, based on individual (but socially constructed) tastes and distastes. The activities studied range from high culture to popular culture and beyond. They are considered as one expression of one’s life style. The data consists of extensive longitudinal survey data from a Finnish research project on ageing and well-being, GOAL, Good Ageing in Lapland Region (n=2815 at the baseline). The information is gathered from men and women in three birth cohorts (born 1926-30, 1936-40, 1946-50). The main research method employed is multiple correspondence analysis (MCA). Using MCA makes it possible to map the studied variables into a two-dimen-
sional biplot graph and thereby visualize the information of cross-tab-
ulations between all the studied variables. According to the study, both the tastes and different kinds of individual and environmental resources define the variety of activities of people in older age cohorts. Thresh-
holds of environment can be more difficult to surpass in certain situa-
tions of life, for example after spousal loss. Environmental and physi-
cal thresholds are subject to change more easily compared to cultural thresholds which may be more profound.

CREATIVE INTENTION, PARTICIPATION IN CREATIVE & CULTURAL ACTIVITIES, AND QUALITY OF LIFE IN OLDER ADULTS LIVING IN THE COMMUNITY
A.N. Hui1, D. Yeung1, S. Cheng1, C. Sue-Chan1, D. Hui1, K. Chan1, J.D. Jackson1, J.S. Burnett1, D. Hui1

The present study aimed at investigating the relationship among intention of creativity, participation in creative cultural activities and quality of life in an older population. In light of the Theory of Planned Behavior, it was hypothesized that social norm of creativity, perceived control of creativity, social axiom for creativity and perceived creative self efficacy were significant predictors of intention of creativity, participation and monthly expenses of creative cultural activities, as well as quality of life. Participants included 95 individuals (21 Male and 74 female; aged 60 or above) all living in the community. Hierarchical multiple regression analyses had indicated that perceived control and creative self efficacy were significant predictors explaining 25% of the variance in explaining creative intention after controlling for gender and educational attainment. Quality of life in older adults was significantly predicted by their participation in taking part in creative and cultural activities explaining 17% of the variance. Implications on enhancing creative self efficacy and engaging older adults in creative and cultural activities will also be discussed.

LONGSTANDING OCCUPATION: A CORRELATE OF WELL-BEING AND SUCCESSFUL AGING IN LATE LIFE
R. Stevens-Ratchford, Occupational Therapy and Occupational Science, Towson University, Towson, Maryland

Background. Longstanding occupation can contribute to successful aging in older adults by promoting function and well-being across the life course (Franklin & Tate, 2009). Objective. I used mixed methods (Peddle & Tashakkori, 2009) to examine the relation between longstanding occupation, well-being and successful aging in a sample of 30 community-dwelling seniors. Longstanding occupations are activities in which individuals have devoted time and effort for a prolonged period. Continuity of participation is the duration or continued participation in an activity. The meaning of activity is the value of the activity. Successful aging is ongoing health and well-being, continued high cognitive and physical function, and engagement with life (Rowe & Kahn, 1999; Stevens-Ratchford, 2008). Method. I used cross sectional survey procedures to collect data on the continuity and the meaning of four domains of longstanding occupation: life management, productive activity, leisure activities, and social participation. The Longstanding Occupation Measure (LSOM; r=.81) measured continuity and meaning of activity. The Successful Aging Profile (SAP; r=.84) measured successful aging. Descriptive and correlational analyses determined frequencies and percent-
ages of participation and correlations among longstanding occupation, successful aging, and well-being. Results. The majority of the sample [[172 62.6%)-(199 72.3%)] reported 40-60+ years of participation in one-five activities in each of the four occupational domains. The participants reported a positive value/meaning of longstanding occupations (range=44-263; mean=182.43; SD=41.82). Conclusion. These older adults had participated in numerous life management, productive, leisure, and social activities across their life courses.

LONGSTANDING OCCUPATION: FACTORS OF SUCCESSFUL AGING
R. Stevens-Ratchford, Occupational Therapy and Occupational Science, Towson University, Towson, Maryland

Objective. I used mixed methods (Peddle & Tashakkori, 2009) to examine the relation between longstanding occupation, well-being and successful aging in a sample of 30 community-dwelling seniors. Longstanding occupations are activities in which individuals have engaged for prolonged periods. Successful aging is ongoing health and well-being, high cognitive and physical function, and engagement with life (Rowe & Kahn, 1999). Well-being is a complex physical, mental, and social state of overall contentment (Hao, 2008). Method. The study used correlational and qualitative procedures to examine four domains of longstanding occupation: life management, productive, leisure, and social participation. The Longstanding Occupation Measure (LSOM; r=.81) measured continuity and meaning of
activity. The Successful Aging Profile (SA; \(r=.84\)) measured successful aging. The Satisfaction with Life Scale (SWLS) (Diener, Emmons, Larsen, Griffin, 1985) and the Quality of Life Scale (QOLS) (Burckhardt, Woods, Schulz, & Ziebarth, 1989) measured well-being. The Occupation Successful Aging Interview Guide collected data on experiences of longstanding occupation, successful aging, and well-being. Quantitative data was collected first, and followed by three interviews. Results. Analyses revealed two themes: (a) Longstanding occupation is a correlate of well-being and health living; and (b) Longstanding occupation promotes successful aging. The LSOM was positively related to the SAP \((r=0.51^*\)), QOLS \((r=0.46^*\)), and SWLS \((r=0.47^*\)). Conclusion. For these participants longstanding occupation perpetuated engagement with life promoted their successful aging and well-being across the life course.

**ACTIVITY PARTICIPATION, LIFE STYLE, AND HEALTH STATUS OF OLDER ADULTS IN SOUTH KOREA**

E. Lee\(^1\), J. Lee\(^2\), J. Social Work, University of North Carolina Charlotte, Charlotte, North Carolina, 2. Boston College, Chestnut Hill, Massachusetts

Objectives: Population aging in South Korea poses a grave challenge to the task of improving the quality of lives of older citizens whose health status has been challenged by various socioeconomic and demographic shifts. Previous studies have shown a strong positive relationship between activity participation and quality of life among older adults. Yet, less attention has been focused on examining determinants of specific activity participation. This study examined factors related to a variety of activity participation in social clubs, self-development, and labor force. Methods: The nationally representative sample of community dwelling older adults aged 55+ \((n=6,688)\) was drawn from the Wave II of the Korean Longitudinal Study on Aging (KLoSA), and conducted in 2008. Three separate logistic regressions were undertaken to assess the effect of sociodemographics, lifestyle \((e.g., \text{smoking, drinking, and exercise})\), and health status on a variety of activity participations. Results: Determinants of participation in social clubs and labor force were age, income, drinking, exercise, self-rated health, and depression. While marital status, religion, and cognition were significant predictors for social club activity participation, gender and education predicted labor force participation. Major determinants of self-development activity were educational attainment, exercise, and depression. The results revealed that lower depression and regular exercise were predictive of all three types of activities. Discussion: In order to encourage activity participation among community dwelling older adults, gerontologist should develop community-based interventions to promote physical activity and reduce depression. Other implications for practice, policy, and research were discussed.

**PERCEIVED BENEFITS OF OLDER ADULTS’ PARTICIPATION IN PERFORMING AND CREATIVE ARTS PROGRAMS**

L.S. Noelker, M. Rose, Katz Policy Institute, Benjamin Rose Institute on Aging, Cleveland, Ohio

Engagement in meaningful activity is an important element of quality of life for older adults. Yet, little evidence exists about the perceived benefits of novel types of activities, such as performing and creative arts programs, which have creative and social components likely to appeal to older adults. To gain a better understanding of older adults’ reasons for joining and continuing to participate in arts programs, focus groups were conducted after a two-month creative arts program \((n=8)\) in a museum and a two-month dance program \((n=6)\) at a senior center. Although the two groups differed with respect to location, ethnic composition, and type of arts activity, a content analysis of verbatim transcripts by two independent coders yielded several common themes. These included: interest in staying active, opportunities for personal growth, a sense of accomplishment, and social engagement. For example: “You have to exercise your brain and your body.” “I liked being creative.” “My artistic skills improved.” “…really fun to do and…something new that I learned.” “You never know what you can do until you try.” “…I came back because of the camaraderie of the group.” Differences between the groups’ responses were found related to each program’s artistic content, the cultural aspects of the African-American dance program, and the physical and public performance aspects of dance. Findings about the reasons older adults give for joining and continuing to participate in performing and creative arts programs can be used to improve translation and dissemination of arts programs, as well as uptake and adherence.

**THE EFFECTS OF NUMBER OF ACTIVITIES AND AFFECT ON QUALITY OF LIFE IN ADULT DAY CENTER PARTICIPANTS**

B. Getz, S. Meeks, Department of Psychological and Brain Sciences, University of Louisville, Louisville, Kentucky

The purpose of the study was to determine if Activity theory (Harris & Bodden, 1978) or Socioemotional Selectivity theory (Carstensen, 1998) predicted the relationship between activity level and quality of life (QOL) in Adult Day Centers. Activity theory suggests that the number of activities that are engaged in is related to QOL, while Socioemotional Selectivity theory suggests that the number of activities engaged in is only related to QOL if the activities that are engaged in provide emotional fulfillment. Twenty-seven participants at Adult Day Centers were observed for five minutes a day over a two week period. The Apparent Affect Rating Scale (Lawton, Van Haitsma, Perkinson, & Ruckdeschel, 1999) was used to measure affect. Information on the type of activity being engaged in, the location of the activity, and the client’s level of participation was also observed. The Quality of Life-Alzheimer’s Disease Scale (Logsdon, Gibbons, McCurry, & Teri, 2002) was used to assess QOL. No relationship between the number of activities engaged in and QOL was found, suggesting that Activity theory is not supported. There was also no relationship found between level of alertness and pleasure displayed while engaging in activities and QOL. A linear regression showed that anger, number of solitary activities engaged in, sadness, number of medications, and family presence were significant predictors of QOL suggesting that QOL is related to expression of negative affect, engagement in group activities, and family presence in adult day centers. These findings are more consistent with Socioemotional Selectivity theory than Activity theory.

**THROUGH AGING EYES: ENVIRONMENTAL GERONTOLOGY THROUGH PHOTOVOICE**

A. Johnson, S. Spencer, University of South Carolina, Columbia, South Carolina

The purpose of this project was to explore environmental gerontology using PhotoVoice methodology. Environmental gerontology is a growing field dedicated to understanding the environmental factors that can affect older adults. PhotoVoice is often used when working with vulnerable and underserved populations as a way to have their voices heard through photographs. Participants aged 65 years and older were recruited from an urban area of the Southeastern U.S. and given disposable cameras to photograph aspects of their environment which might inhibit or facilitate activities of daily living. Cameras were collected after one week and a follow-up interview was scheduled to collect in-depth qualitative information about the photos. Results showed that participants focused on images of their home modifications, such as ramps, handrails, and various types of hospital equipment. During the interviews, participants described how these items helped maintain their independence. Participants also documented and discussed how they used professional housing and lawn services when were no longer physically able to perform certain daily tasks. These images and the participants’ commentary indicated that as one ages, the environment becomes a very different place. Older adults adapt to these changes...
either by modifying their environment or by changing the way in which they interact with it. Understanding the perceptions of older adults can inform communities about what can be done to improve quality of life in older adulthood. Results also indicated that in order to preserve independence in late life, older adults must have continued access to medical supplies and assistive technology.

LEISURE ACTIVITY PARTICIPATION AND LEISURE SATISFACTION AMONG OLDER PEOPLE: DOES THE SOCIABILITY OF PARTICIPATION MAKE A DIFFERENCE?  
P. Lu, Graduate Institute of Social Work, National Chengchi University, Taipei, Taiwan

Background: The factors related to leisure participation have been well-documented in the literature. However, the factors related to leisure satisfaction among older adults remained relatively unexplored. This study investigated whether the satisfaction with leisure participation among older people in Taiwan differs by the sociability. The sociability was referred to the involvement of others in engaging activities. Methods: Data comes from a national representative sample of Taiwanese older people (N=1308: aged 65 and over). Hierarchical regression analysis was applied to capture the effect of sociability on leisure satisfaction. Findings: 1. Poor physical health and disability are negatively related to leisure satisfaction, education level and income are positively related to leisure satisfaction. 2. The more types of activities the respondents engaged, the higher the satisfaction. 3. Having controlled for the effects of individual characteristics and types of leisure activity, sociability was positively related to satisfaction. 4. The age effect becomes insignificant after we controlled the effect of individual characteristics, types of leisure activity, and sociability. Conclusions and Implications: The results support the importance of social component of leisure experiences of older adults. The activity specialists should take such "sociability" issue into consideration when designing programs.

HUMAN HAPPINESS: THE TRIUMVIRATE OF EUDEMONIA, POSITIVE PSYCHOLOGY, AND THE CREATIVE PROCESS  
T. Abramson1, P.B. Schmidt2, 1. Center for Gerontology and Geriatrics, NYIT, Old Westbury, New York, 2. Bunker Hill Community College, Boston, Massachusetts

Eudemonia, happiness and human flourishing based on engagement, philosophical wisdom, and finding a higher good in life, is one central concept which can be linked to the circumstances of older adults that allow them to exert control. Research indicates that involvement in arts programs can help older adults build and sustain resilience. Such participation has a positive impact on overall health, loneliness, and morale — all of which reflect important health promotion and disease prevention effects. The fact that these positive outcomes develop, despite the increasing risks associated with old age, clearly links elder arts participation with resilience and capacity for creativity. Langer’s research indicates that opportunities for mindful learning are effective in increasing older adults’ intellectual and creative adventurousness. Seligman’s research supports the nurturing of genius and talent throughout the lifespan to make life more fulfilling. Tal ben Shahar’s research emphasizes the value of learned optimism and how to live life meaningfully through emotional and physical challenges. Creative endeavors provide a context for continuous self-invention that fosters adaptation and allows individuals to thrive in circumstances that are challenging and difficult. The creative process embodies our natural desire for change moving us from stagnation to adjustment to recovery. Human strength and resiliency transforms the deep universal human experience of loss and trauma. Emotional healing is transformative and provides creative solutions to living our lives. Our mental health and immunological systems improve with hope and optimism, which can be learned throughout the lifespan and embodied as lifestyle factors in later life.

THE CREATIVE INTENTION INFLUENCED BY AGE, SOCIAL NORM AND CREATIVE SELF EFFICACY  
A.N. Hui1, D. Yeung2, S. Cheng3, C. Sue-Chan2, K. Chan1, D. Hui1, 1. Applied Social Studies, City University of Hong Kong, Hong Kong, 2. Hong Kong Institute of Education, Hong Kong, Hong Kong, 3. Hong Kong Baptist University, Hong Kong, Hong Kong, 4. Chinese University of Hong Kong, Hong Kong

Older adults are seldom perceived as consumers of creative products and services. Does creativity only appeal to the younger population? The present study examined the effect of age on taking part in creative activities and making a creative intention. Participants included 1241 adults from 4 different age groups. Results indicated that social norm and axioms toward creativity, and creative self efficacy were significant predictors for creative intention. Monthly expenses on creative activities were also significantly predicted by social norm and axioms toward creativity. Age was found to be a significant moderator. Implications on age integration in formulating policy on creative and cultural industries were discussed.

I AM ACTIVE: EFFECTS OF A PROGRAM FOR PROMOTING SUCCESSFUL AGING  
N. Mendoza Ruvalcaba, A. Elva Dolores, M.J. Arias-Merino, J. Cuesta Contreras, I. Diaz-Garcia, Universidad de Guadalajara, Guadalajara, Mexico

Introduction: I AM ACTIVE is a program designed to encourage successful aging in people 60 years and over, through improved physical activity, healthy nutritional habits and cognitive functioning, that promotes better quality of life. The objective of this study is to assess the effectiveness of this program. Methods: Randomized Controlled Trial. Participants were n=69 healthy elderly attending community centers divided in two groups (experimental group n=36, control group n=33, no differences in age, gender, education), the first took part in the program during sixteen sessions of 2 hours twice a week, the second remained in a wait list. The program consisted in theoretical-practical sessions of physical exercise including balance, flexibility and strength, nutrition habits and cognitive training. A pre-post battery included Tinneti Scale, manual dynamometer, goniometer, Mini Nutritional Assessment, anthropometric measures, Digit Symbol-Coding and Backward Digit Span (WAIS-III), self-efficacy measures, Quality of Life Index. Mean differences and effect size was calculated. Results: After the program, in the experimental group were found positive and significant outcomes in the different domains of successful aging compared with control group. Physical activity: balance (p<.05, Cohen-d=.32), range of motion in arms (p<.05, Cohen-d=.56), strength (p<.05), and self-efficacy for conducting regular physical activity (p<.01, Cohen-d=.76). Nutrition: self-efficacy for improving nutritional habits (p<.001, Cohen-d=.61). Cognitive: operative memory (p<.05, Cohen-d=.25), processing speed (p<.001, Cohen-d=.63), and self-efficacy for improving the memory (p<.01, Cohen-d=.75). Conclusion: Findings show that the program promotes an enhancement in domains of successful aging (physical activity, nutritional habits and cognitive functioning) in healthy elders.

CLASSIFICATION BY LEISURE ACTIVITIES OF JAPANESE ELDERLY PEOPLE AND RELATIONSHIP WITH PERSONALITY: FROM THE SONIC STUDY  
M. Ogawa1, Y. Ishioka2, Y. Gondo3, Y. Masui1, K. Kamide2, K. Ikebe3, Y. Arai1, R. Takahashi1, 1. Tokyo Metropolitan Institute of Gerontology, Tokyo, Japan, 2. Osaka University, Osaka, Japan, 3. Keio University, Tokyo, Japan

Leisure activities in old age are important for successful aging. In the present study, we classify the elderly people who participated in the leisure activities and clarify the characteristic of personality in each group. Firstly, we performed cluster analysis for the data of 408 people aged from 69 to 71 years old. People chose all things to participate among 11 kinds of activities (physical activities, crafts, game playing,
TV watching, social activities with close social partners, group-centered public activity, religious activities, developmental activities, experimental activities, technology use and travel). As a result, three groups emerged. First group was involved in many activities and average of the activity was 8.6. Second group was involved in some activities especially TV watching, social activities with close social partners, experimental activities and technology use, and average was 5.6. Third group was doing few activities and average was 3.5. Secondly, we examined the characteristic of personality in each group. Neuroticism, Extroversion, Openness and Conscientiousness were significantly different. The first group was higher score of Extroversion, Openness and Conscientiousness, and lower score of Neuroticism than other groups. The second group and third group were lower score of Extroversion and Openness and higher score of Neuroticism than the first group. The second group was same level of Conscientiousness as the first group. This result indicate that personality influence leisure activities in which elderly participating in Japan.

**SESSION 190 (POSTER)**

**MEANINGS AND MEASURES OF SUCCESSFUL AGING**

**GLOBAL MEANING AS A MEDIATOR OF STRESSFUL LIFE EVENTS, REGrets IN LIFE, AND HEALTH IN OLDER ADULTS**

G.T. Reker, Psychology, Trent University, Peterborough, Ontario, Canada

Global meaning has been identified as an important personal resource in confronting the challenges brought on by life’s changing circumstances. A person high on global meaning has a clear life purpose, a sense of direction, strives for goals consistent with life purpose, feels satisfied with past achievements, and is determined to make the future meaningful. Empirical studies have clearly demonstrated that global meaning is an important variable in the buffering of stress and the enhancement of physical, psychological, and mental well-being. The purpose of this study was to assess the mediating role of global meaning in the relation between stressful life events and outcome measures of mental and physical health. One hundred and forty-six older adults (54+ years) completed measures of stressful life events, global meaning, existential regret, life satisfaction, depression, and physical health. Using structural equation modeling, it was found that global meaning partially mediated the relationship between life stress, existential regret, and mental well-being (depression, life satisfaction). A mediating effect was not found for physical health. Model fit in all instances was good with CFI's exceeding the cut-off point of .90. A causal interpretation from stressful life events to global meaning to existential regret and mental well-being outcomes was strengthened by the finding that reverse causal mediation effects were not significant. The results support previous findings with the construct of global meaning and underscore the need to include existential variables in the conceptualization and assessment of psychosocial adaptation in the later years.

**MEANINGS OF A GOOD OLD AGE: QUALITY OF LIFE OF OLDER ADULTS WHO RECEIVE HOME AND COMMUNITY BASED SERVICES**

A. Choi1, S. Wallace1, K.G. Kietzman1, E. Durazo2, J. Torres2, A. Benjamin2, C. Mendez-Luck2, 1. Department of Interdisciplinary Studies, California State University Dominguez Hills, Carson, California, 2. UCLA Center for Health Policy Research, Los Angeles, California

Drawing on a sample of qualitative interviews from a study of low income, disabled California older adults, this paper examines how community dwelling older adults who receive home and community based services (HCBS) define a “good old age.” In much of the prevailing literature, a good quality of life has been tied to positive health outcomes, however the data collected for this research suggests that health outcomes may not be the only determinant of a good old age. Data were collected on older adults (age 65 and over) who utilize long-term home care services and supports and suffer from a wide range of physical and mental disabilities. In-depth, face-to-face interviews were conducted with the older adult. Utilizing grounded theory, data were independently coded by at least two researchers. The results of thematic analyses suggest that older adults did not necessarily define good old age in the context of health outcomes. Instead, a good old age was defined in the context of independent living and social networks and the public programs that make it possible for older adults to live on their own.

**THE ASSOCIATION OF SOCIAL CAPITAL WITH QUALITY OF LIFE AMONG ELDERLY KOREAN IMMIGRANTS**

B. Kim, L.B. Maradik Harris, UCLA, Los Angeles, California

**BACKGROUND:** This study aimed to explore the factors that affect quality of life among elderly Korean immigrants in Los Angeles County. In particular, it aimed to explore how the socioeconomic characteristics and social capital of the elderly Korean immigrants affect their quality of life. **METHODS:** The subjects of this study were 205 elderly Korean immigrants who were living in Los Angeles County at the time of the study. Quality of life was measured using an 8-item questionnaire and the social capital was measured by norm, trust, partnership in community, information sharing, and participation in community. Also, personal, familial, and human capital traits were introduced as socioeconomic features of each of the respondents. This study conducted descriptive statistical analyses and multiple regression analyses to explore the determinants of quality of life for the elderly. **RESULTS:** The results of this study showed us that various socioeconomic and social capital attributes, subjective health condition, employment status, income, subjective economic status, trust, and partnership in community were statistically significant predictors of quality of life for elderly Korean immigrants in the full model. Elderly who were employed, had higher income, who felt healthier and wealthier, and who experienced more trust and partnership in their communities enjoyed higher quality of life than their counterparts. **IMPLICATIONS:** The study delivered some policy and practice implications that more policy and program considerations should be made for elderly Korean immigrants to strengthen their social capital as well as human capital in order to improve their levels of quality of life.

**SELF-REGULATION AND EUADIMONIC WELL-BEING ACROSS ADULTHOOD**

L.D. Frazier, M. Barreto, Psychology, Florida International University, Miami, Florida

We developed a conceptual model to examine the developmental self-regulatory pathways that lead to optimal eudaimonic well-being across adulthood. Adults (N = 590) between the ages of 17 and 94 (Mage = 44.59; SD = 23.62) participated in this cross-sectional study. Findings show that the model predicts interactions among age, hoped-for possible selves, age-sensitive developmental processes (i.e., goal adjustment, optimization), and psychological well-being. Results showed direct effects of self-regulatory processes on well-being. Goal adjustment was more strongly predictive of higher well-being than was optimization or hoped-for selves. Goal adjustment and optimization also influence well-being indirectly through hoped-for possible selves. There were significant age differences in the indirect effects of goal adjustment on possible selves and well-being, such that, by age 55, these pathways disappear, and the role of future self-representations diminish. These findings indicate that the role of the possible selves in regulating self-motivated development changes across the adult lifespan.

**IN THEIR OWN WORDS: AN EXAMINATION OF SUCCESSFUL AGING THROUGH FOCUS GROUPS**

M. Troutman, UNC Charlotte, Charlotte, North Carolina

There remains a paucity of research on successful aging in minority older adults. Southern older adults, particularly Black individuals,
have been largely overlooked, yet are at great risk for not aging successfully due to health and socioeconomic disparities. The purpose of this study was to describe successful aging in the words of Black and White persons who self-identify as successful aging, and to analyze the variations and commonalities between Southern-dwelling Black and White older adults' descriptions of characteristics associated with successful aging. Sixty-five Black and White older adults participated in race-specific focus groups of 6-8 participants each. The researcher facilitated each group session guided by a set of questions on successful aging, within the context of her theory of successful aging. Audiorecorded sessions were transcribed verbatim and subject to content analysis by the researcher and two more senior research consultants. Four central themes were found: connecting and relating-spirituality, friends and social, and spouse (subthemes); temporality-impressions of the past, family and history, present experiences as teacher, future generations and the desire to teach/testify (subthemes); perception and interpretation- mental and cognitive, adjusting (subthemes); and activity-mobility, independence, exercise, and nutritional (subthemes). Participants validated content from the researcher’s theory-based Successful Aging Inventory, and their focus group discussions yielded content areas from which foci for interventions aimed at promoting successful aging in Southern-dwelling Black and White older adults can be derived.

VIVA! A SUCCESSFUL AGING PARADIGM
J.M. Gaines, K.A. Marx, K.L. Burke, J.M. Parrish, The Erickson Living Foundation, Catonsville, Maryland
Responses of 364 participants (mean age 80.8; sd = 5.9; range 64-98 yrs) in a longitudinal study were examined at baseline via 24 individual measures of physical, psychological, and social well-being to identify naturally occurring clusters of older adults. Factor analyses of these measures yielded 3 factors (Physical, Psychological and Social) and a factor score for each. Using these scores, a hierarchical cluster analysis was performed resulting in three clusters: Typical Agers (n = 324); Balance Impaired Agers (n = 32); Cognitively Impaired Agers (n = 8). Each participant rated how successfully s/he was aging on a scale of 0 (not successfully) to 10 (very successfully). Self-ratings by Balance Impaired Agers were significantly lower (M = 7.39) than those of Cognitively Impaired Agers (M = 7.75) and Typical Agers (M = 8.18). Cluster groups were compared over three years using annually-derived factor scores. Typical Agers demonstrated a slight decline in physical status and social status, with a slight improvement in cognitive status. Balance Impaired Agers showed a distinct improvement from Baseline to Yr 1, after being informed of balance difficulties at baseline. Thereafter, they experienced a similar, though lower level, functional trajectory as the Typical Agers. The Cognitively Impaired Agers varied highly in regard to their observed changes in physical and social well-being over time. However, their performances re: the psychological factor more uniformly declined over time, and remained consistently lower than that of the other two groups.

THE OLDER THEY ARE, THE LESS SUCCESSFUL THEY BECOME? FINDINGS FROM THE GEORGIA CENTENARIAN STUDY
J. Cho1, P. Martin1, L. Poont 2, 1. Iowa State Univ; Ames, Iowa; 2. University of Georgia, Athens, Georgia
This study examined whether oldest-old adults are successful agers. Three-hundred and twenty-one octogenarians and centenarians of Phase III of the Georgia Centenarian Study participated in this study. A first model examined Rowe and Kahn’s successful aging model (1989) including the probability of disease, physical or cognitive capacity, and engagement with life. All three components were applied to assess how many oldest-old adults satisfied all three criteria. The result showed over 10% of octogenarians (15.1%) and none of centenarians satisfied all three components of successful aging. Consequently, a second alternative model, focused on psychosocial aspects including three different components: self-rated health, perceived economic status, and happiness. Different from Rowe and Kahn’s successful aging model, a total of 62.3% of octogenarians and 47.5% of centenarians satisfied all three components of the alternative model of successful aging. This result suggests that additional criteria of successful aging should be considered thereby expanding the concepts and multidimensional aspects of successful aging among oldest-old adults.

WHAT MAKES KOREAN BABY BOOMERS HAPPY?
K. Eun1, H. Cho1, J. Lee1, S. Joo1, J. Kim1, G. Han1, 1. Seoul National University, Seoul, Republic of Korea; 2. Chonnam National University, Gwangju, Republic of Korea; 3. Ewha Woman’s University, Seoul, Republic of Korea
Korean baby boomers are usually defined as those who were born between 1955 and 1963. Facing retirement, Korean baby boomers may not be happy because they are not well prepared for the life after retirement physically, materially and materially. Many boomers still feel happy. We are interested in the conditions that make boomers happy. At the beginning of this research, we investigate how happy they feel in daily life. Then, we explore what conditions make them much happier. Above all, individual socio-demographic conditions such as sex, age, education, marital status, employment status, income and religion can be related to the happiness of baby boomers. Another factor is health status. Physical and mental health status is expected to be closely related to the happiness of baby boomers. Also, family characters such as family size, burden to support children and elderly parents, and satisfaction in the relationship with family members can affect the happiness of baby boomers. The last condition to affect the happiness of boomers is social capital. The happiness of baby boomers can vary by interactions with family members, relatives, friends and so on in daily life. Data for this research come from the Korean Baby Boomer Panel Survey which was first conducted in 2010. 4,668 baby boomers born between 1955 and 1963 were interviewed in this survey. An exploration of the conditions affecting happiness of boomers is made by the comparison of models which step-wisely contain factors such as individual characters, health status, family characters and social capital.

RELATIVE IMPORTANCE OF SUCCESSFUL AGING DOMAINS AND QUALITY OF LIFE
Y. Young, Department of Health Policy, Management and Behavior, State University of New York at Albany School of Public Health, Rensselaer, New York
Objectives. This study quantifies the relative importance of successful aging domains (i.e., physiological, sociological, and psychological health) and Perceived Quality of Life (PQoL). Methods. A sample of 302 independent living older adults were randomly selected from a retirement community. Three domains of successful aging were (a) physiological (i.e., diseases, functional impairment), (b) sociological (i.e., engagement with life), and (c) psychological (i.e., emotional vitality). Perceived Quality of Life (PQoL) score ranges from 0 to 10 with higher scores indicate greater satisfaction with life. Multivariate linear models quantify the association between the successful aging domains and PQoL. Results. The mean age was 82 years (range 66-97), 71% were female, and 99% White, with an average of 15 years of education. Multivariate results indicated that residents with high scores in sociological domain had a 1.6 point higher PQoL score (p<0.001) than those with lower sociological scores. Similarly, those with higher psychological and physiological scores, respectively, had 1.3 point (p<0.002) and 0.4 point (p<0.001) higher PQoL scores than their counterparts. When stratifying by age, the same order of importance was observed particularly in the 85+ group: sociological (diff=1.7 point, p<0.001); psychological (diff=1.3 point, p<0.005); but the effect of physiological domain diminished (diff=0.3, p=0.19). Discussion. Preliminary results suggest that sociological domain of successful aging has the largest effect on PQoL, followed by psychological and the lease

50 The Gerontological Society of America
The present research concerned the development of the Woo Resilience Scale (WRS) based on a strength-based model of resilience with the emphasis on the residual strengths of each unique older adult. In Study 1, an item analysis of the responses of 228 older adults (aged 55 and over) suggested the creation of a 32-item measure. Exploratory factor analysis (N = 113) yielded 6 factors: Adaptive Coping, Spiritual Transcendence, Personal Meaning, Positive Social Interaction/Support, Proactive Coping, and Taking Charge. The WRS was found to correlate positively with measures of successful aging and emotional intelligence, but negatively with alexithymia. In Study 2, confirmatory factor analysis supported the replicability of the 6-factor structure of both the 32-item WRS and the revised 36-item WRS. In Study 3, psychometric properties of the WRS were assessed using both the classical test theory (CTT) and item response theory (IRT) approaches. From the CTT perspective, subscales of the WRS are highly reliable and convergent validity of the WRS was suggested through its positive associations with measures of resilience, hardness, successful aging, meaningfulness, optimism, life satisfaction, task-oriented coping, mindfulness, and spirituality, and through its negative associations with measures of depression and emotion-oriented coping. From the IRT perspective, the WRS subscale items fit the Rasch (rating scale) model and demonstrated item invariance across gender. Overall, the results suggest that the WRS is a valid and reliable multidimensional measure of resilience in older adults. The potential utility of the WRS in clinical practice and research are discussed.

THE CONTRIBUTION OF DAILY LIFE ACTIVITIES TO AGING WELL
K. Kim1, Y. Lee2, 1. Indiana University, Bloomington, Indiana, 2. University of Toledo, Toledo, Ohio

Daily life activity refers to activities that older adults engage in every day which promote life satisfaction, health, and well-being in old age (Hawkins, 2011). It has been well established that daily activities (e.g., physical, leisure, volunteer, and paid activity) are related to health outcomes, well-being, and mortality risk for older adults (Agahi & Parker, 2005, 2008; Burke, Marlow, Lento, 2010; Janke, Payne, & Van Puymbroeck, 2008; Krause, 2006; Talbot, 2007). A little research, however, has been done about what activities are assessed and what activities contribute to aging well or successful aging. The purpose of the study was to examine the relationship between daily life activity and aging well. More specifically, the study investigated what activities constitute daily life activity for older adults. It also examined how these activities are related to aging well. The study used secondary data from Aging Well: A Study of Adult Well-Being, which was part of the Global Aging Initiative (2004). Data includes individuals ranging in age from 50-92 years. This study used structural equation modeling to test the relationship between daily life activity and aging well. The study found that productive activity, social network based activity, and leisure activity contributed to aging well. Social network based activity was the strongest contributor among daily life activities. The study identified what activities represent daily life activity. It also what activity has the most influence on well-being for older adults.

MULTIPLE LIFESTYLE DOMAINS AS CONTRIBUTORS OF VALUATION OF LIFE
D.W. Coon1, M.K. Keaveny1, J. Gavin2, K. O'Connor2, L.R. Evans2, W.J. Niren2, 1. College of Nursing & Health Innovation, Arizona State University, Phoenix, Arizona, 2. Banner Sun Health Research Institute, Sun City, Arizona

As the number of older adults will double by 2030 (AoA, 2008), understanding the important lifestyle factors that influence successful aging is warranted. The current study examines predictors of Valuation of Life (VOL; e.g., Jopp et al., 2008; Lawton et al., 2001; Moss et al., 2007) to understand lifestyle domains that contribute to the oldest-olds (aged 80 and above) appraisal of life. Method The current study draws on participants, aged 80 and over, from the Learning from our Elders project. Structured interviews encompassed multiple lifestyle domains: cognition, emotional well-being, physical health, and social support. Domain variables correlating with VOL (ps ≤ .05) were entered into a hierarchical multiple regression. Results Participants (N = 330) were on average 91.2 years old (SD = 6.2), female (61.8%), widowed (59.7%), highly educated (67.3%), and reported good physical health (53.3%). Multiple lifestyle domains significantly correlated with VOL (ps ≤ .05) including: physical health, activity, emotional well-being, and personal agency domains. The final model predicted 53% of the individual variation in VOL, with personal agency accounting for the most variance (22.8%), versus sociodemographics (2.7%) and activity (9.0%). Discussion In contrast to prior models, this study demonstrates the important role of personal agency and suggests potential lifestyle factors for intervention with the oldest-old, including enhancing physical activity and increasing personal agency. Finally, a limitation stems from the homogeneity of the current sample, suggesting future research explore models of VOL among more diverse populations.

FREE TO BE: DOES OLDER AGE FACILITATE AUTHENTICITY?
A.T. Franzese. Elon University, Elon, North Carolina

Authenticity—the idea of being one’s true self—may be a construct of self that is not equally accessible across the life course. Authenticity may be a result of freedom that may come with the aging process. This research empirically addresses the question of whether older adults are more authentic than younger adults, emphasizing how social structural factors and individual differences work together to influence behavior. It is hypothesized that older adults will report more authentic behavior than younger adults. The associations between age, authenticity, and expectations about authenticity are explored in data from approximately 200 survey respondents and interview data from two dozen interviews. Results indicate that quantitatively, there is a slight difference in authentic behavior levels reported by younger and older adults in the direction hypothesized. Qualitative findings, while consistent with the quantitative results, suggest that there is a shared view and expectation among younger and older adults alike that with increasing age comes greater freedom to behave authentically. This research explores the sources of that belief within cultural representations of aging and popular media as well as the possible benefits of that belief at both the individual and societal levels. Most importantly, this research suggests that a gift of aging is the expectation that one can be more authentic.

SESSION 195 (POSTER)

PERSONALITY, COGNITION, HEALTH AND LONGEVITY

RELATIONSHIPS BETWEEN PERSONALITY, HEALTH FACTORS, AND HEALTH-RELATED BEHAVIORS IN CENTENARIANS
K. Kato1, R.A. Zweig1, G. Atzmon2, N. Barzilai1, 1. Ferkauf Graduate School of Psychology at Yeshv University; Bronx, New York, 2. Albert Einstein College of Medicine at Yeshv University; Bronx, New York

This study examined the relationship of personality to health factors, biological markers (e.g., blood lipid levels and genotypes), and health-related behaviors in high and low functioning groups (HFG, n=75, and LFG, n=166) of Ashkenazi Jewish centenarians (total N=241, age 95 to 107) from the Longevity Genes Project at the Albert Einstein...
College of Medicine. Personality was assessed by the Personality Outlook Profile Scale-Revised (POPS-R), consisting of two domains, Positive Attitude Towards Life (PATL: optimism, easygoing, laughter, and introversion/outgoing) and Emotional Expression (EE: expressing emotions openly and not bottling up emotions). Other health factors were assessed by the Centenarian Questionnaire which includes Mini-Mental Status Examination (MMSE), Geriatric Depression Scale (GDS), and questions about health history. Results showed that after adjusting for demographic variables PATL was positively associated with MMSE ($R^2=.06$, $p<.05$ in HFG and $R^2=.03$, $p<.05$ in LFG) and that EE was positively associated with MMSE ($R^2=.03$, $p<.01$ in LFG. PATL was also negatively associated with mental distress ($R^2=.28$, $p<.001$ in HFG and $R^2=.05$, $p<.05$ in LFG) and associated with selective health-related behaviors (e.g., social activity, hobbies, and relaxation). Further mediation analysis demonstrated a significant mediation effect of relaxation on the relationship between PATL and MMSE and mediation effects of hobbies and relaxation on the relationship between PATL and GDS in LFG. Findings suggest that personality may be protective of cognitive/mental functioning in advanced age, and health-related behaviors may partially explain this mechanism; however, these findings merit further study.

THE EFFECTS OF PERSONALITY AND HEALTH ON COGNITIVE PERFORMANCE IN AFRICAN AMERICAN OLDER ADULTS
A. Aiken Morgan1, J.C. Allaire2, K.E. Whitfield1, 1. Duke University Medical Center, Durham, North Carolina, 2. North Carolina State University, Raleigh, North Carolina, 3. Duke University, Durham, North Carolina

Previous research has suggested the importance of health, specifically cardiovascular health, on late life cognitive performance in African American elders. However, fewer studies have explored the influence of personality factors in the relationship between health and cognitive function. The objective of this study was to examine the effects of personality and health on cognition among a sample of 291 community-dwelling African American elders (mean age = 67.2 [SD = 8.6]). Participants were recruited as part of the Baltimore Study of Black Aging (BSBA) and were administered 8 cognitive measures of working memory, attention, spatial ability, general intellectual ability, and semantic memory, and the NEO Personality Inventory. Multiple linear regression analyses were conducted, controlling for age, education, and sex in step 1; personality indices were added as predictors in step 2, while self-reported cardiovascular health was added in step 3. Results showed that participants higher on openness scored better on progressive matrices, figure rotations, and the California Verbal Learning Test (CVLT) ($p < .05$). Individuals higher on agreeableness performed better on alpha span and the CVLT. However, those scoring higher on neuroticism and conscientiousness performed more poorly on the CVLT and progressive matrices ($p < .05$). When self-reported cardiovascular health was added to the models, it significantly predicted performance on progressive matrices and the CVLT ($p < .05$). These findings suggest the importance of accounting for individual differences in both personality and health when understanding predictors of late-life cognitive function.

LOW CONTROL BELIEFS AS A RISK FACTOR FOR MEMORY: ANXIETY AND COGNITIVE INTERFERENCE AS MEDIATORS
S. Agrigoroaei, M. Lachman, Brandeis University, Waltham, Massachusetts

There is evidence that low control beliefs can be a risk factor for poor cognitive functioning, but little is known about the mediators of this association. This study focused on the relationship between control beliefs and memory with the aim of testing two possible mechanisms: anxiety and cognitive interference. Based on previous empirical evidence, we predicted a three-path mediation model: lower control beliefs are associated with higher anxiety and anxiety impairs memory performance by reducing inhibitory control, thus increasing the likelihood of intrusive off-task thoughts. We used data from 152 adults, aged 22 to 84, who participated in a study on memory. Control beliefs, state anxiety, and cognitive interference were assessed by self-report. Two measures of episodic memory, a categorizable word list recall task and a paired associates task, were administered. We analyzed the mediation chain using the joint significance test approach which requires a set of three regression models (Taylor et al., 2007). Consistent with past work, while controlling for age, sex, and verbal abilities, we found a significant positive association between control beliefs and memory. As predicted, analyses revealed a significant three-path mediation model. Low control beliefs were associated with higher levels of state anxiety. Furthermore, higher anxiety was tied to higher levels of cognitive interference, which in turn significantly impaired memory performance on both tasks. The findings are discussed in the context of cognitive aging, with a focus on ways to improve memory by targeting control beliefs, state anxiety, inhibitory control, and minimizing distraction during cognitive tasks.

THE ROLE OF AFFECT IN ATTENTIONAL FUNCTIONING FOR YOUNGER AND OLDER ADULTS
S. Noh12, M. Larcom12, D. Isaacowitz12, 1. Psychology, Brandeis University, Waltham, Massachusetts, 2. Volen National Center for Complex Systems, Waltham, Massachusetts

This study examined the relationship between positive and negative affect and the functioning of attention, as well as the role of age in this relationship. Younger (n=42, 18-29 yrs) and older (n=43, 63-91 yrs) adults completed the Attention Network Test (Fan et al., 2002), which assesses the efficiency of alerting, orienting and executive control. Results indicated that negative affect was associated with increased alerting only for younger adults, thus making them more sensitive to incoming stimuli. There was no relationship between affect (positive or negative) and orienting. Negative affect was associated with reduced executive control for both younger and older adults, but positive affect was only related to reduced executive control for older adults. Thus, older adults showed impaired executive control in both positive and negative mood states. These results indicate that affect modulates the efficiency of attention differently in different age groups.

DO OLDER ADULTS MODULATE THEIR MOOD IN THE SERVICE OF PROCESSING GOALS?
P. Dennis1, E.P. Popham1, T.M. Hess1, L. Emery2, 1. Psychology, NC State University, Durham, North Carolina, 2. Appalachian State University, Boone, North Carolina

According to the positivity effect (PE), older adults, in contrast to younger adults, attend to and recall positive affective information to a greater extent than negative affective information. Considering that PE appears to be limited to scenarios in which older adults exercise a deliberate (as opposed to an automatic) choice regarding how many processing resources to allot to various stimuli, PE likely reflects a voluntary focus on positive affective information, presumably for the purpose of sustaining positive mood. Consequently, if older adults are asked to privilege accurate processing, PE should disappear. In fact, older adults may be willing to sacrifice positive mood in the service of facilitating more detailed processing, which is enhanced by negative mood. To test this hypothesis, 196 community-dwelling participants, evenly represented by younger (20-44), middle-aged (45-64), and older adults (65-89), viewed a series of negative, positive, and neutral pictures. Half of the participants were instructed to view the pictures “as if they were watching TV” (incidental condition), whereas the other half was aware that their memory for the pictures would be tested later (intentional condition). As a measure of mood modulation, participants ranked their preference for reading positive, negative, or neutral news articles prior to viewing the pictures. Preliminary results indicated that PE was evi-
PERSONALITY FACTORS IN THE LONG LIFE FAMILY STUDY (LLFS)

S.L. Andersen1, J. Huntly1, L. Feldman1, N. Solovieff2, T.T. Perls1, 1. Geriatrics, Boston University Medical Center; Boston, Massachusetts, 2. Boston University School of Public Health; Boston, Massachusetts

Objective: To evaluate the role of personality in familial longevity. Methods: Data were collected for two domains, neuroticism and conscientiousness, of the 5 factor NEO in the first wave of data collection of the LLFS cohort for 717 male and 886 female subjects in the proband generation, 1018 male and 1387 female offspring generation participants, and 418 male and 374 female spouses of offspring (LLFS controls). Results: Mean neuroticism scores for all male LLFS subjects including controls ranged from 11.7 to 13.9 and 14.2 to 16.0 for female subjects. These mean scores were lower than published normative data (from manual, PAR) for males (17.6) and females (20.5). Mean conscientiousness scores were similar amongst all groups including normative data with values ranging from 33.7 to 36.3 for males and 34.5 to 37.1 for females. Conclusions: Low neuroticism is associated with emotional stability and a favorable response to stressful events. Our results suggest that low neuroticism and the ability to handle stress is a key phenotype of familial longevity. In this sample the spousal controls also had lower levels of neuroticism than published normative data. Other studies have shown that those with higher levels of neuroticism are more likely to separate or divorce indicating that our spouse control group may be biased toward lower neuroticism. In addition, high neuroticism is associated with greater mortality and therefore those spouses with higher neuroticism may have died before the study period.

EXAMINING CONSCIENTIOUSNESS ITEMS AND LATE-LIFE HEALTH USING A COUPLE-LEVEL APPROACH

L.L. Vie1, M.L. Kern1, C.A. Reynolds1, H.S. Friedman, 1. University of California, Riverside, Riverside, California, 2. University of Pennsylvania, Philadelphia, Pennsylvania

Conscientiousness is predictive of subjective and objective health outcomes; the important question is why such associations exist. Specific facets (e.g., self-control, responsibility, order) and contextual influences (e.g., spouse personality) may be informative for understanding processes linking personality and health. Using a couple-level approach in a four-decade prospective archival design, we examined specific aspects of self and spouse conscientiousness and relations with old age physical health, in a sub-sample from the lifespan Terman Life Cycle Study (N = 341 married couples). In 1940 (mean age = 30), participants and spouses rated their own personalities. From these items, measures corresponding with the Big Five were previously developed and validated. Using each of the seven items of conscientiousness, we grouped couples into one of three priori groups: (a) high-high (both members of a couple gave a higher conscientious response); (b) low-low (both members gave a lower conscientiousness response); and (c) mixed (mismatch between the spouses). We expected that the high-high group would report the best health later in life (mean age = 76), followed by participants in the mixed group, and then participants in the low-low group; and this pattern was found for six of the seven items. Contrast t-tests were significant for “definite purpose” (p = .04), with a trend for “thrift and careful” (p = .06), indicating that purposeful couples stayed healthiest. Thus, future work should continue to examine matches between persons and their key social contacts, focusing on facet-level relations between personality and late life healthy aging.

PERSONALITY OUTLOOK PROFILE SCALE-REVISED (POPS-R)

K. Kato1, R.A. Zweig1, G. Atzmon2, N. Barzilai2, Z. Nir1, 1. Ferkauf Graduate School of Psychology at Yeshiva University, Forest Hills, New York, 2. Albert Einstein College of Medicine at Yeshiva University, Bronx, New York, 3. Recanati School for Community Health Professions at Ben Gurion University, Beer Sheba, Israel

The Personality Outlook Profile Scale (POPS) is a measure of personality factors and health-related behaviors associated with longevity which was originally developed by the Longevity Genes Project at the Albert Einstein College of Medicine. This study developed the POPS-Revised (POPS-R) through examining the construct, internal consistency, and concurrent validity of the POPS-R with the Life Orientation Test-Revised (LOT-R) and NEO-Five Factor Inventory (NEO-FFI). The results of the principal component analysis using the sample of N=243 Ashkenazi Jewish centenarians (age 95 to 107) generated two domains, Positive Attitude Towards Life (PATL: optimism, easygoing, laughter, and introversion/outgoing) and Emotional Expression (EE: expressing emotions openly and not bottling up emotions), and these domains showed adequate levels of internal consistency (α=.65 and .62 respectively). Subsequently, this study examined the concurrent validity of the POPS-R in the groups of self-reports of centenarians (n=19), informant-reports of centenarians (n=26), and self-reports of centenarians’ children (n=27). The results showed that PATL was associated positively with extraversion (r=.82, p<.001), conscientiousness (r=.53, p<.05), and negatively with neuroticism (r=-.51, p<.05) in the self-report group of centenarians. In the informant report group of centenarians, results showed that PATL was associated positively with dispositional optimism (r=.75, p<.001), extraversion (r=.70, p<.001), and negatively with neuroticism (r=-.66, p<.001) and that EE was associated positively with extraversion (r=.45, p<.05). Findings support adequate levels of internal consistency and suggest that the POPS-R appears to measure facets of optimism and emotional expressiveness.
of optimism, extraversion, conscientiousness, and emotional stability (the inverse of neuroticism) in centenarians.

SESSION 200 (POSTER)

PSYCHOMETRICS IN AGING AND HEALTH

PRELIMINARY EVALUATION OF A BRIEF OUTCOME SCALE TO MEASURE EFFECTIVENESS OF AN AT-HOME PSYCHOTHERAPY PROGRAM

Introduction: Home-based psychological services are becoming increasingly popular in geropsychology. This study examined the effectiveness of an at-home psychotherapy program using a brief outcome measure. Method: Participants (N = 21) were older adults (M age = 68.86 years, SD = 6.65) receiving at-home psychotherapy services. The Outcome Rating Scale (ORS; Miller & Duncan, 2000) was administered at each session. The ORS contains four subscales which are summed to comprise the total score: Overall, Individually, Interpersonally, and Socially. Results: The internal consistency of the ORS ranged from poor (Session 1; Cronbach’s α = .09) to good (Session 7; Cronbach’s α = .89). ORS scores significantly increased from Session 1 (M = 16.84, SD = 5.83) to Session 2 (M = 25.96, SD = 8.25), t(13) = -2.74, p = .02, with a large effect size (Cohen’s d = 1.28). Changes in ORS scores between sessions beyond Session 2 were not significant. The change in ORS scores from Session 1 to Session 7 was not significant, t(12) = -1.19, p = .26. Discussion: Results may indicate that the ORS is not appropriate for use in this demographic, that the underlying structure has more than one dimension, or that some items fit poorly with this unique population (e.g., measuring functioning at work or school). Results may also indicate that while psychotherapy initially results in increased well-being (e.g., expectancy effects), this stabilizes over time. Additionally, more than seven treatment sessions may be needed to detect significant change in a significantly impaired home-bound sample.

PSYCHOMETRIC EVALUATION OF THE GERIATRIC ANXIETY SCALE IN A CLINICAL SAMPLE OF OLDER ADULTS

A. Mueller, D.L. Segal, A. June, Psychology, University of Colorado at Colorado Springs, Colorado Springs, Colorado

Introduction: The Geriatric Anxiety Scale (GAS; Segal et al., 2010) is a 25-item self-report anxiety assessment measure designed for use with older adults. The GAS possesses both convergent and divergent validity in community-dwelling samples (Yochim et al., 2011). Preliminary results for the psychometric properties of the GAS in a clinical sample were positive, but constrained by a small sample size. This study sought to further examine the psychometric properties of the GAS in a larger clinical sample of older adults receiving outpatient psychotherapy services. Method: Participants were older adults (N = 92; M age = 69.10, SD = 7.78, range = 60-87, 73.9% female, 85.9% European American) seeking psychotherapy services at a community mental health clinic. They were administered the GAS and Geriatric Depression Scale at intake. Results: Reliability of the GAS total score was excellent (Cronbach’s α = .93), and the reliability of each subscale was good: Somatic (α = .82), Cognitive (α = .86), and Affective (α = .82). GAS total score was significantly correlated with age (r = -.25), GDS total score (r = -.71), and Global Axis of Functioning (r = -.46). It was not significantly correlated with education. GAS total score did not significantly differ between men and women, t(80) = -1.49, p = .14. Discussion: Consistent with other studies, the GAS demonstrated good internal consistency as well as convergent and divergent validity within this clinical sample. Future studies should examine the psychometric properties of the GAS, including its factor structure, in more diverse samples.

THE DEVELOPMENT OF AN ATTITUDE SCALE FOR FACILITATOR OF COGNITIVE INTERVENTION FOR THE ELDERLY

F. Miyamae1,2, N. Yatomi1, 1. Yokohama National University, Yokohama, Kanagawa, Japan, 2. Tokyo Metropolitan Institute of Gerontology, Tokyo, Japan, 3. Institute of Gerontology, The University of Tokyo, Kashiwa, Chiba, Japan

OBJECTIVE: The facilitator of a cognitive intervention program for elderly must help participants to establish a cognitive behavior habit by themselves. In order to elicit participant’s behavioral changes, it seems important for facilitator to be sociable, analyze the participant’s interpersonal situation and respect their self-determination. This study examined to development of an attitude scale for facilitator of cognitive intervention. METHODS: The subjects were 106 people who participated in a facilitator training program for cognitive intervention (mean age=42.4, SD=12.0). They were required to answer the questionnaire consisted with 30 items. Each items represents the question reflecting one of 3 dimension of attitude trait; Sociable, Analytical, Respect self-determination. RESULTS: The confirmatory factor analysis showed that the three factor model had a sufficient fitness index (χ²=91.87, df=85, GFI=.900, AGFI=.859, RMSEA=0.28). The three model had a higher fitness than the two factor model did (Δχ²=4, Δdf=46.48, p=.01), although the correlation coefficient between the two factors, Analytical and Respect self-determination, were moderately correlated (r=.649). The Cronbach’s alpha of each subscales were .697 to .885. CONCLUSION: These results suggested that this newly developed scale had adequate factorial validity and reliability to measure three traits.

RELIABILITY AND VALIDITY TESTING OF THE MARS-MFS AMONG COMMUNITY-DWELLING OLDER ADULTS

J.S. Carmasin, S.V. Rowe, B.T. Mast, Psychological and Brain Sciences, University of Louisville, Louisville, Kentucky

The Memory Awareness Rating Scale – Memory Functioning Scale (MARS-MFS) was developed to assess awareness of cognitive functioning in older adults with early Alzheimer’s disease (AD). To our knowledge, the MARS has not been studied in non-demented samples, where data might provide earlier opportunities for intervention. The current study examined 72 community-dwelling older adults (mean age = 68.64 years, SD = 7.79 years) from the Study of Thinking and Relationships (STAR). Each subject completed several measures, including the self-report MARS-MFS and the Hopkins Verbal Learning Test-Revised (HVLT-R), while an informant completed the informant MARS-MFS. Reliability testing was also performed on both the self-report and informant versions of the MARS-MFS. The MARS-MFS was highly reliable among both participants (alpha = .80) and informants (alpha = .92). 36.1% of subjects (n = 26) showed a positive MARS-MFS discrepancy (higher reporting than the informant), while 63.9% of subjects (n = 46) showed a negative MARS-MFS discrepancy (lower reporting than the informant). Performance on the HVLT-R Delayed Recall predicted self-report MARS-MFS ratings (R-sq = .236, p = .018) but not informant ratings (R-sq = .045, p = n.s). Self-report and informant ratings were not significantly correlated. These results suggest that the MARS-MFS is a highly reliable measure of cognitive awareness among community-dwelling older adults and that verbal memory ability is predictive of cognitive awareness in this population. These findings highlight a need for further investigation of awareness among non-demented elders.
IN EVERY OBSTACLE THERE IS AN OPPORTUNITY: RELIABILITY TESTS ON A BEHAVIORAL COPING SCALE
H. Lee, H. Ewen, Miami University, Oxford, Ohio

Little research has addressed the typical coping behaviors and the efficacy of those behaviors among older adults. Classic literature on coping efficacy has led to the domains of problem-focused and emotion-focused typologies (Lazarus & Folkman, 1984). This presentation reports findings on a new scale developed specifically for older adults based upon commonly reported strategies from qualitative narratives of older adults experiencing stressful life events. Twenty-six reported behaviors and ratings of the effectiveness of these coping behaviors has resulted in five independent factors which converged in eight iterations: Being Active (.86), Avoidance (.78), Denial (.70), Soul Searching (.80), and Leisure Distraction (.69). The scales item-total relationships and proposed strategies for content validity will be presented and discussed, as well as caveats for scale use and implications for future studies on coping with life stress among older adults.

VALIDITY OF THE DUTCH HONOS 65+
M. Veerbeek1, R.C. Oude Voshaar2, A. Pot1,1. Program on Aging, The Netherlands Institute of Mental Health and Addiction, Utrecht, 0, Netherlands, 2. University Medical Center Groningen, Groningen, Netherlands, 3. VU University, Amsterdam, Netherlands

Background: The Health of The Nation Outcome Scales for Older Adults (Honos 65+) Is Internationally Used to Evaluate Outcome of Mental Health Care. The Aim of This Study Is to Test Internal Consistency of The Dutch Version Of The Honos 65+ and Its Purposed Sub-scales, As Well As Construct Validity for a Variety Of Diagnostic Groups. Method: Data Were Gathered As Part Of The Mental Health Care Monitor Older Adults (MEMO), a Large-Scale Monitor to Assess Quality Of Care in the Netherlands. The Sample Consisted of The Honos 65+ At Intake of 767 Patients Attending The Outpatient Clinic of Old Age Psychiatry of 14 Mental Health Care Organizations Throughout the Country. Results: Internal Consistency of The Honos 65+ Was Reasonable, Although Its One-Dimensionality Is Not Clear. Subscales to Evaluate Outcome of Care Could Not Be Identified. Construct Validity Appeared To Be Good for a Variety Of Diagnostic Groups. Also a Medium and Significant Negative Correlation Was Found With the Global Assessment of Functioning (GAF). Conclusion: To Evaluate Outcome Of Care, the Individual Items of the Honos 65+ Should Be Used Preferably.

APPLES VS. ORANGES: MMSE SCORES NOT EQUIVALENT TO MOCA OR SLUMS IN AN OLDER VETERAN SAMPLE
B. Mossberger, 1. Veterans Admin. Med. Ctr., Indianapolis, Indiana, 2. Indiana University School of Medicine, Psychiatry Department, Indianapolis, Indiana

Recent years have witnessed the advent and increased use of alternative cognitive screening instruments. With this development has come the inevitable comparison of the newer measures with the Mini Mental Status Exam (MMSE), long considered the “standard” in mental status screening. The present study examined scores on the MMSE with those of two other screens, the Montreal Cognitive Assessment (MoCA) and the St. Louis University Mental Status (SLUMS), among 111 patients (mean age 74.94 years) to whom more than one of these instruments was administered. First, all three measures were found to correlate significantly with GAF ratings. Second, among patients who completed two measures, scores were significantly correlated for all pairings (i.e., MMSE/MoCA, MMSE/SLUMS, and MoCA/SLUMS). Finally, pairwise t-tests found a significant difference in mean scores, with MMSE consistently yielding higher total scores than either MoCA or SLUMS – which did not differ significantly from one another – among patients who completed two measures. This latter finding, in particular, leads to the conclusion that neither MoCA nor SLUMS, while similar to each other, should be interpreted as being equivalent to MMSE ratings in screening for cognitive status. Further implications and research suggestions are offered.

PERFORMANCE OF APPOINTMENT TASKS SCALE (PATS): A STAFF-RATED INSTRUMENT FOR ASSESSING OLDER ADULTS’ PERFORMANCE OF EVERYDAY TASKS

When assessing neuropsychological deficits among older adults, there is often a need to acquire informant data regarding their performance of everyday tasks. Despite its importance in establishing appropriate diagnoses and treatment plans, such information is often difficult for busy practitioners to obtain. The Performance of Appointment Tasks Scale (PATS) is a newly developed staff-rated instrument designed to aid practitioners in gathering more objective data about older patients’ ability to carry out simple behavioral tasks. In particular, the PATS assesses an individual’s: (1) capacity to organize and execute a plan for arrival and departure to an appointment (PATS #1), (2) ability to understand and follow instructions (PATS #2), and (3) speed/efficiency with regard to cognitive processing (PATS #3). In the current study, approximately 60 older participants (60+ years) will be rated by at least two staff members on the PATS and will also be given a comprehensive neuropsychological battery. Preliminary analyses with 15 participants suggest acceptable inter-rater reliability on the PATS. In addition, early findings indicate strong associations between PATS #1 and semantic memory (r = .70, p = .012); between PATS #2 and processing speed (r = .59, p = .017), ability to inhibit irrelevant information (r = -.53, p = .033), executive functioning (r = .60, p = .014), and semantic memory (r = .63, p = .027), and between PATS #3 and processing speed (r = .59, p = .017). Implications of these findings for improving the health and wellness of older adults will be discussed.

THE CULTURE CHANGE ATTITUDES AND KNOWLEDGE SCALE
L. Jacobs, A. Snow, P. Parmelee, L.D. Vinson, Psychology, University of Alabama, Tuscaloosa, Alabama

The culture change movement has sparked the development of several measurement tools designed to assess the extent to which an organization has adopted culture change. Yet, there is a lack of knowledge regarding long-term care employees’ knowledge of and attitudes toward culture change. The purpose of this study was to describe the development of a new questionnaire designed to capture awareness of culture change: the Culture Change Attitudes and Knowledge (CCAK) tool. The initial step in the development of the CCAK began with a systematic literature review using relevant social science publication databases and websites. A collection of preliminary items were developed to assess staff knowledge of and attitudes toward critical constructs that were identified in the review. These items were piloted with approximately 20 nursing and direct care staff at a local nursing home. Based on the results of the pilot, a preliminary tool consisting of 39 items was developed (CCAK1). The second stage of the study included administering the CCAK1 to a group of Veteran Affairs (VA) conference attendees (N=70) representing three VA Medical Center Community Living Centers in the Southeastern service network. Analyses revealed that reliability was adequate at α = .788. Six items were edited creating a second version with 37 items (CCAK2). Finally, the CCAK2 was administered to attendees (N=150) during a VA Cultural Transformation Conference. After performing a factor analysis, seven items that proved problematic were omitted, resulting in a 30-item measure. This final version (CCAK3) had excellent reliability, α = .895.
UNDERSTANDING PHYSICIAN-PATIENT DIFFERENCES IN GLOBAL RATINGS OF HEALTH
E.L. Idler1, J. Daugherty1, E.A. Leventhal1, H. Leventhal2, 1. Sociology, Emory University, Atlanta, Georgia, 2. Rutgers University, New Brunswick, New Jersey, 3. University of Medicine and Dentistry, New Brunswick, New Jersey

Global ratings of health incorporate health status information relating to diagnoses, functioning, diagnoses, and other dimensions of health. They are significant predictors of mortality in representative population-based samples, for reasons that remain unclear after two decades of research. In clinical samples, global ratings are often included in multi-item measures of health-related quality of life. However, physician-reported global ratings are rarely collected, despite their potential importance for tracking patient health; they may provide an important alternative perspective that could be used to understand the consistent criterion validity of global self-ratings. The Processes of Illness Management (PRiM) study (N=378 participants) was performed to examine physician-patient relationships and chronic disease management. Patients completed questionnaires before and after primary care visits in a large urban teaching hospital. Physicians and residents completed questionnaires following the visit. A subset of patients (N=140) had their visit audio-recorded and transcribed. We examined these qualitative data for patient or physician references to overall health and references to biomedical, functional, or psychosocial issues. Our findings showed that 1) patient and physician global health ratings agreed 38.6% of the time; 2) in discrepant cases, physicians more often gave the higher “optimistic” rating; 3) references to overall health were more common among “optimistic” than “pessimistic” patients; 4) references to overall health were more common for “optimistic” than “pessimistic” physicians; 5) “optimistic” patients made more references to psychosocial aspects of health than “pessimistic” patients. Representations of health in the clinical setting reveal the context for the formation of global ratings of health.

SESSION 205 (POSTER)
SUCCESSFUL AGING AND HEALTH
HIGHER MEDICAL MORBIDITY BURDEN IS ASSOCIATED WITH EXTERNAL LOCUS OF CONTROL
D.E. Henninger1, H.E. Whitson1, H. Cohen1, D. Ariely2, 1. Duke University Medical Center, Durham, North Carolina, 2. Duke University, Durham, North Carolina

OBJECTIVES: Locus of control (LOC) is a psychological construct reflecting the degree to which one perceives circumstances to be controlled by personal actions (internal LOC) versus outside factors (external LOC). Because LOC could influence a patient’s medical decision-making and health behaviors, our objective is to describe the association between an increasing number of co-existing conditions and LOC in older adults. DESIGN: Cross-sectional study using survey data from the North Carolina Established Population for Epidemiologic Studies of the Elderly (NC EPESE) dataset. PARTICIPANTS: Community-dwelling older adults aged 68 and older (N=3,212). MEASUREMENTS: Ten common medical conditions were assessed by self-report. LOC was measured by standard questionnaire. Analyses adjusted for demographics, functional status (self-reported activities of daily living), cognition (Short Portable Mental Status Questionnaire), and depression score. RESULTS: A higher number of chronic conditions was associated with external LOC (β=0.37, p<0.001). This relationship persisted after adjustment for age, race, sex, functional status, cognition, and depression (β=0.17, p<0.0001). Most individual conditions were not associated with LOC, although vision impairment (p=0.001) and arthritis (p=0.05) were associated with more internal LOC. The relationship between increasing number of conditions and external LOC was stronger among females (β=0.19, p<.0001) than males (β=0.12, p=0.0290). CONCLUSIONS: These results suggest that medically complex patients tend to exhibit a more external LOC, meaning that they perceive little personal control over circumstances and environment. Clinicians should be aware of this tendency, as external LOC may impede an older adult’s willingness to engage in the considerable task of managing multiple chronic conditions.

HOW DO TRAJECTORIES OF SELF-RATED HEALTH AND LIFE SATISFACTION INTERFACE OVER TIME?
H. Hsu1, J. Liang2, 1. Department of Health Care Administration, Asia University, Taichung, Taiwan, 2. University of Michigan, Ann Arbor, Michigan

Objective: Although there is close cross-sectional association between self-rated health (SRH) and life satisfaction (LS), there is little understanding how their trajectories are linked over time. This research aimed to analyze how multiple trajectories of SRH and LS were associated with one another among older Taiwanese. Methods: Data came from a six-wave longitudinal study of a national sample of some 4049 individuals ages 60 and over in Taiwan between 1989 and 2007. Group-based trajectory analysis was used to identify trajectories in waves 1-3 (1989-1996) and waves 4-6 (1999-2007) separately. Then trajectories identified during 1989-1996 were used to predict those identified during 1999-2007. Results: For both 1989-1996 and 1999-2007 periods, four SRH groups (i.e., low, medium, improving, and declining) and two LS groups (i.e., high and low) were identified. Relative to those with low SRH in 1989-1996, individuals with medium, improving, and declining SRH trajectories were more likely to have a trajectory of high LS in 1999-2007. In contrast a trajectory of high LS was negatively correlated with medium SRH trajectory in 1999-2007. Discussion: There are multiple trajectories of SRH and LS. There is some evidence that trajectories of SRH and LS are reciprocally linked.

SUCCESSFUL AGING, DEPRESSION, AND RESILIENCY IN OLDER ADULT
J.M. Gaines, K.A. Marx, K.L. Burke, J.M. Parrish, The Erickson Living Foundation, Catonsville, Maryland

Background/Objectives: Up to 30% of older adults report depressive symptoms. Such symptoms may limit their self-evaluation of the extent to which they are aging successfully. We investigated whether resiliency moderated the relationship between self-reported depressive symptoms and self-evaluation of successful aging. Methods: 90 older adults (mean age = 78.9, 65% female) provided self-ratings of successful aging (SA) at the time they completed two standardized measures: (1) Geriatric Depression Scale (GDS) and (2) Resilience Scale. Results: Consistent with prior research, higher levels of reported depressive symptoms were associated with lower self-ratings of successful aging. Among older adults with medium and high levels of resiliency, this observed relationship between depressive symptoms and successful aging was moderated such that successful aging scores were higher in the presence of higher depression scores. This moderation effect was not present in those with low levels of resiliency. Discussion: These findings suggest that inclusion of an assessment of resiliency may allow a practitioner to target older adults at a higher risk for depressive symptomatology that may adversely impact an older adult’s self-evaluation of successful aging.

PSYCHOLOGICAL ASPECTS RELATED TO PHYSICAL FUNCTIONALITY
F.J. Prerost, S. Song, Family Medicine, Midwestern University, Downers Grove, Illinois

This study was designed to empirically examine the association between sense of purpose in life as a remediating effect on medical burden among older adults. Wellness has been discussed repeatedly in the psychology literature (Reker & Peacock, 1981); yet, its definition remains elusive (Roscoe, 2009). The concept is often equated with “pur-
pose in life,” “well-being,” and “quality of life” (Roscoe, 2009). 120 consenting male and female patients ages 65-97 were recruited for participation from an inpatient rehabilitation unit at a large metropolitan hospital. Patients with cognitive impairment secondary to dementia, delirium and stroke-related deficits were excluded. Two medical consultants scored the participants on the Cumulative Illness Rating Scale for Geriatrics (CIRS-G), a measure of medical illness burden based on physical examinations, review of symptoms, and laboratory testing. All participants completed the Life Attitude Profile (LAP), a multidimensional measure designed to assess the degree of existential meaning and purpose in life; and Meaning in Life Questionnaire (MLQ), a measure of the presence of meaning in life and the search for meaning in life. Results showed that significant relationships existed between the severity index on the CIRS-G and measures of goal seeking (r = 0.23, p < .05) and striving for meaning (r = 0.21, p < .05) on the LAP. Factor analysis suggested that the MLQ had limitations for use with an older adult population. Further research may be needed to identify any other factors that help to explain illness severity such as hereditary vulnerability and smoking history.

SUCCESSFUL AGING FOR HIV+ WOMEN
S. Deren, S. Strauss, College of Nursing, New York University, New York, New York

It is estimated that approximately 50% of people living with HIV/AIDS in the US will be aged 50 or older by 2015. Women are increasingly represented in this aging HIV+ group: the proportion of new infections among women increased from 8% in the early 1980s to the current 27%. Aging women living with HIV/AIDS (WLWHA) are primarily minority; 79% of WLWHA at the end of 2005 were African-American or Hispanic. Although substantial declines in HIV/AIDS mortality have resulted from advances in antiretroviral treatments, women and minorities are less likely to be receiving these medications. Factors related to health disparities among older WLWHA have been identified in the literature. For example, almost half of older WLWHA report high levels of depressive symptoms and current alcohol or illegal drug use, and these have been related to poor treatment adherence. Using the Rowe and Kahn tripartite theoretical framework of successful aging - disease management, functionality and engagement in life - multi-level influences on successful aging among WLWHA will be described. Issues that are particularly salient for WLWHA include individual-level factors (e.g., comorbid conditions such as depression, substance abuse, PTSD), social/structural level influences (e.g., stigma, disclosure concerns, social support) and cultural factors (e.g., trust in health care providers and gender role expectations). This paper will summarize the multi-level influences on successful aging in this population that have been identified in the literature, and that must be addressed in research efforts and health care initiatives undertaken to reduce health disparities among aging WLWHA.

SESSION 210 (POSTER)
TECHNOLOGY: APPLICATIONS AND IMPLICATIONS

REMOTE CONTROLLED TELE-PRESENCE IN SENIORS’ HOMES: A PILOT STUDY OF FEASIBILITY AND ACCEPTANCE
K. Wild1, N. Larimer1, S. Maxwell1, P. Kearns2, J. Kaye2, 1. OHSU Dept. of Neurology, Portland, Oregon, 2. OHSU Dept. of Biomedical Engineering, Portland, Oregon

Telemedicine research has established the acceptability of remote health care among elderly populations. However in most cases the technology provides a limited interface between the target and recipient of transmitted information. The remote tele-presence described here represents a new approach toward obtaining important health information while providing a means of social engagement for older adults without leaving the home. This pilot study tested the feasibility and acceptance of a remotely controlled robot with video communication capability in a sample of independently living older adults. We investigated the attitudes and preferences of seniors, and those of family or friends who communicated with them via the device. Eight persons 65 years of age or older and living alone in their own homes were enrolled in the study. Subjects completed a questionnaire following their two-day experience with the remote controlled device. Identified friends or family members were also asked questions about their interaction with the study participant via the device including positive and negative aspects of appearance, communication, driving experience, and privacy issues. Responses indicated that the majority of older adults had highly positive experiences with the robot and had little difficulty with its operation. One participant with mild cognitive impairment remained confused about its purpose and asked to have the device removed after one day. Remote users, who were friends or adult children of the participants, were more likely to test the mobility features (e.g. driving the robot about the senior’s residence), and had several suggestions for additional useful applications.

THE EMOTIONAL RESPONSES OF OLDER ADULTS TO NEW TECHNOLOGY
K. Kim, L. Malavasi, A. Schwingel, W. Chodko-Zaiko, B. Lindley, University of Illinois, Urbana, Illinois

Understanding the perceptions and emotions of older adults when they encounter new technology is important. Although learning to use and adopt new technology can often provide a significant benefit, many older adults decline to adopt new technologies due to feelings of anxiety and discomfort they experience when exposed to unfamiliar items. This study was designed to explore the perceptual and emotional reactions of four older adults to a number of commercially available products. Participants were invited to examine four devices, two TV remote controls and two commercially available step counters. For both the TV remotes and the step counters, a very simple and a very complex version of each type of item were provided. Participants were invited to inspect each item carefully and then complete a Product Personality Profiling Questionnaire (McDonagh, Brusebergh & Haslam, 2002) which assessed their initial reaction to each item. Next each participant participated in a 60-90 minute semi-structured interview. All interviews were transcribed and analyzed. Three dominant themes emerged from data; (1a) It is easy, this is for me, (1b) It is too difficult, (2) I am smart, I can figure it out, and (3) I do not need this: Why should I care? Themes 1a and 1b confirm that older adults often gravitate towards simple and familiar version of technology. Themes 2 and 3 provide evidence of a more nuanced perspective. Some seniors have high levels of self-efficiency and believe themselves to be capable of using and understanding new technology but they do not always see the need to change. Previous experience, exposure frequency, socio-economic status, and education level were factors that appeared to differentiate between older adults who were likely to be “early adopters” and those who were not. Technology design and interface, and appropriate technological education as also emerged as factors that might influence technology anxiety and perceived complexity. Our findings contribute to our understanding of the complexities underlying older adult’s emotional responses to new technology.

SUSTAINING HEALTHY LIFE: 3D BODY SCANNING TECHNOLOGY AS A HEALTH-RISK PREVENTION TOOL
Y. Lee, Iowa State Univ, Ames, Iowa

Weight gain throughout an individual’s lifetime leads to changes in body composition which has resulted in the need for accurate measurements of body shape and dimensions to assess the relationship between health risk and body shape. Anthropometric measurements using a tape measure have been used for assessing future risk to health,
as increased circumference of the waist vs. hip is associated with greater chronic disease rates later in life. These circumferences and ratios have been correlated to health risk over time, and have fallen in and out of favor for their utility in identification of future chronic disease development. This study explores the accuracy of body measurements gathered from trained observers employing a tape measure compared with those generated by the 3D body scanner. Findings indicated that significant differences existed between circumference measurements calculated by the body scanner and those gathered from a tape measurement. This research indicates that utilization of the body scanner as an anthropometric measurement tool for the assessment of health risk has tremendous benefits to sustain older adults’ healthy life. In conclusion, the 3D body scanner has potential application in the prevention, treatment and monitoring of diseases that are related to obesity via the provision of accurate circumference measurements. Visual inspection of the 3D figure generated by the body scanner could also provide useful in research examining posture modification and body image. Investigations involving examination of the 3D body image could have intervention significance from both a disease as well as a psychological health risk perspective.

USING SKYPE TO ENHANCE OLDER ADULT SOCIAL NETWORKS
M.S. Heinz, N. Kelly, P. Martin, H. Yang, J. Wong, Human Development and Family Studies, Iowa State University, Ames, Iowa

Throughout the lifespan, and particularly in older adulthood, social relationships are a key component to psychological health and wellbeing. However, due to multiple factors (e.g., mobility problems, rural isolation, and long distances between friends and family), older adults may have difficulty maintaining their social networks over time. This study assessed Skype usage of seven older adults residing in an independent apartment complex over a period of ten days. Participants contacted research assistants using Skype during a specified time-period each day. Over the ten-day period, four of the residents called in all ten times, one participant called in nine times, and two of the participants called in seven times. The length of the conversations via Skype ranged from one minute and thirty-seven seconds to ten minutes and fourteen seconds. The Skype conversations, which primarily served as a “check-in,” ranged from one minute and thirty-seven seconds to ten minutes and fourteen seconds. Results from this study showed that older adults were successful in using Skype and incorporating such technology into their everyday lives. For most participants, initial hesitations were easily overcome (e.g., privacy concerns) and many expressed enjoyment of use and the intention to continue Skypeing. Skype demonstrations, personal tutorials, and clear step-by-step instructions likely all influenced successful participant Skype use. At a time in which older adults may be experiencing changes (e.g., widowhood and increased health problems), electronic social relationships may reduce the impact of such challenges. This poster conveys the potential of Skype to supplement older adults’ social connections.

EVALUATION OF DIFFERENT TECHNOLOGIES: DOES GENERATION AND PERSONALITY MATTER?
K. Classen1, F. Oswald2, H. Wahl1, 1. Heidelberg University, Institute of Psychology, Heidelberg, Germany; 2. Interdisciplinary Aging Research, Faculty of Educational Sciences, Goethe University Frankfurt, Frankfurt am Main, Germany

This ongoing dissertation project aims at identifying the role of personality related factors (e.g. neuroticism, openness, self-efficacy) regarding the attitudes toward and evaluation of technology. Furthermore, the assumption is made that cohort differences between technology generations such as the mechanical generation and the household appliance generation may exist in terms of technology attitudes and evaluation. The internationally renowned Technology Acceptance Model (TAM; version 3) was applied as theoretical background. The study focuses on three technological devices, echoing the areas of care and prevention, household tasks, and leisure activities: (1) a sensor mat featuring an alarm option in case of falls as well as turning on the bedside lamp when getting up, (2) a robotic vacuum cleaner and (3) a video game console. Preliminary data analysis includes 235 participants aged 60 to 99, representing the two technology generations mentioned above. Findings support the notion that the evaluation of the three technological devices is clearly different, with the sensor mat scoring highest in the dimensions perceived usefulness and perceived ease of use. No generation differences appeared in terms of the intention to use the three technological devices. However, the younger generation had a higher intention to use all of the three devices in the future. Regarding personality related factors, higher neuroticism was related with more perceived distance to technology and higher self-efficacy comes along with openness toward innovativeness. Findings underscore that both a psychological and a generation related view is in place, when variability in technology acceptance is the research target.

BRINGING TECHNOLOGY HOME: ACCEPTABILITY AND FEASIBILITY OF A COGNITIVE TRAINING PROGRAM FOR INDIVIDUALS WITH DEMENTIA
S. Orsulic-Jeras, C.J. Whitlatch, J.D. Johnson, S. Schwartz, Benjamin Rose Institute on Aging, Cleveland, Ohio

There is growing evidence to support the potential usefulness of computer-based cognitive training programs to slow the natural cognitive decline that occurs within a healthy aging population. As a result, there has been an attempt in recent years to adapt these programs for use with individuals with dementia (IWDs). Many cognitive training programs are designed to improve working memory, selective attention, memory recall, eye-hand coordination, and overall processing speed. The goal is to build “spare capacity” allowing IWDs to continue to function at a high level even if neural damage occurs. This poster examines the acceptability and feasibility of a computer-based adaptive cognitive training program with 46 community-dwelling IWDs. Participants were provided a laptop computer or used their own computers in order to complete cognitive training tasks for an hour per week for 3 months. Training tasks included “cognitive exercises” for attention, working memory, long-term episodic memory, and decision making. The MindFit™ cognitive training program was user-friendly (with both text and auditory tutors) and adapted task difficulty across all the cognitive domains based upon earlier performance. Family caregivers were instructed on how to assist IWDs and project staff were available by phone to answer questions and provide support. Discussion will include: 1) a description of specific barriers and challenges unique to implementing a technology-based intervention in the home; 2) the role these barriers played in the intervention process and potential effects on study outcomes; and 3) case-specific examples detailing how to address and reduce these barriers.

MEDIA USE, COMPUTER EXPERIENCE, AND SUCCESSFUL ONLINE HEALTH SEEKING AMONG OLDER ADULTS
D.L. Borzekowski, A.E. Wiley, E.M. Agree, Johns Hopkins Bloomberg School of Public Health, Baltimore, Maryland

As technology evolves, people of all ages are adopting and using new media. But how willing are those in the oldest groups to use media, and are they successful, especially when they are looking for important health and medical information? To better understand how older adults use the Internet to get health information, this laboratory-based study examined, among adults from Maryland and California, one’s success in finding accurate online health information. We explored if and how one’s gender, age and previous use of new media helped predict one’s success. Also, we considered how one’s attitudes regarding adoption of new media was related to successfully finding online health information. Among our 334 participants, media ownership and use was high. 

The Gerontological Society of America
Practically all the participants (98%) had home access to the Internet and on average, participants spent 27.5 hours/week online. One’s attitudes towards new media were significantly associated with time spent online, but not one’s age or gender. Controlling for gender, age, and one’s attitudes about using technology, one’s use of a computer at his or her place of employment significantly predicted success in finding accurate health information.

**COMPUTER PROTOTYPE FOR DAILY HEALTH MONITORING AMONG INDEPENDENT-LIVING OLDER ADULTS**

The aim of this study was to test a prototype of the web-based daily health diary with end users who are age 70 or older, with specific focus on older adults’ abilities and compliance rate in their usage for everyday health monitoring. A website was developed for this purpose and eight participants (three women and five men) agreed to test the web-based health diary questionnaire over ten consecutive days. The website was designed to evaluate participants’ general computer skills and usage as well as monitor everyday self-rated health, nutritional consumption, physical activity, and cognitive function. All the responses that older adults submitted on the computer platform were sent to a centralized server on campus for further statistical analysis. Preliminary analyses indicate that older adults typically reported being confident or neutral about their computer skills. On average, they reported using computers everyday. There were 25% of the participants who completed the health diary questionnaire every day during the ten-day trial period, whereas 75% of the participants completed the questionnaire from a range of one to nine days. All participants completed the questionnaire on the first day, but 62.5% to 87.5% of the participants completed the questionnaire on any other of the nine remaining days. Among all the responses, 68.2% of them were reported in the morning. The results of this study suggest that a web-based computer platform can be used as a distal health monitoring device and as communication systems with health professionals and family members of independently living older adults.

**TECHNICAL EXPERIENCE IN OLDER ADULTS’ TECHNOLOGY USE**

B. Williger, F.R. Lang, Institute of Psychogerontology, Erlangen, Germany

Technical innovations provide new potentials for independent living, health, and mobility in aging societies. However, older users often do not adopt new technical solutions of everyday challenges. Our work builds on an ecological framework of the dynamic interplay between technical innovations and older users acknowledging age-related changes of older adults’ capacities, resources, needs, and recent technology experience. Human factors research focuses on general aging processes and their implications for the design of technical products. However, it is not well understood, how older adults’ usage behavior unfolds over time when interacting with technology. In a two-year longitudinal study, we asked 101 older adults (M = 68.29, SD = 5.21) with different levels of technical expertise to regularly test and evaluate technical products and prototypes. Older adults with technical expertise, who were frequently confronted with new technologies, reported more frequent use of modern technologies after the intervention. In contrast, older participants with little prior technical expertise did not change in usage behaviors, and reported a temporal increase of skepticism towards technology within the first year. Results show that especially those older adults that reported technical expertise profit from experiences with technical environments. Further research will need to clarify possible mediation and moderating effects of individual characteristics (e.g. cognitive mechanics, affect, self regulatory) on technology usage behavior in later adulthood.

**SPECIAL RELATIONS, COGNITION AND TECHNOLOGY: THEIR ROLE IN DESIGNING A P2P PLATFORM FOR ELDERLY PEOPLE**

J. Yanguas1, B. Morales1, U. Diaz1, D. Facal1, A. Garcia1, P. Doikos2, N. Passas1, E. Urdaneta1, J. R+D, Fundación Ingema, San Sebastian, Spain, 2. Athens development Agency, Athens, Greece, 3. University of Athens, Athens, Greece

Indicators of social isolation and cognitive decline pose health risks and reduce quality of life in elderly persons. Information and communication technologies have a potential role in improving social networks and cognitive performance. In an attempt to fulfill these needs, the PeerAssist project, funded by the AAL Joint Programme, promotes a P2P platform supporting virtual communities to assist independent living. We applied it to both Spanish and Greek elderly users a questionnaire divided in different domains, including: familial situation (“objective” and “perceive frequency of contact”), social relationships, leisure activities, perceived health status, satisfaction with life, cognitive (WAIS’s Digit Symbol Subtest) and motor abilities (Gibson’s Spiral Test), subjective memory complaints (MAC-S), and technological expertise (including use of a computer and interest in talking to relatives or meeting new people via Internet). Valid responses were collected for 20 participants in Gipuzkoa, Spain (8 men and 12 women, 57 to 78 years, average age=66.35; S.D.=6.532) and 18 in Athens, Greece (9 men and 11 women, 67 to 76 years, average age=71.70; S.D.=2.67). Quality of social contacts was higher and memory complaints lower in the group of participants who would like to talk to others via Internet; both cognitive and motor performance were better in those who had used a computer. Intentions to use internet for social support seems related to subjective, psychological dimensions of the aging process.

**BELIEFS AND ATTITUDES OF THE ELDERLY TOWARDS NEW TECHNOLOGIES**

E. Urdaneta, M. Gonzalez, A. Etxaniz, R. Vaca, X. Ansorena, J. Yanguas, R+D, Fundación Ingema, San Sebastian, Spain

BACKGROUND: The User Acceptance of a Device Depends not Only on the Accessibility and Usability of the System, but Also on the Previous Pre-conceptions of the User. AIM: The Aim of the European Project GUIDE, “Gentle User Interfaces for Elderly People”, is to Develop Multimodal Intuitive User Interfaces Capable of Intelligently Adapting to the Individual Needs of Users with Different Kinds of Mild Impairments. In the Context of this Project a Study about Elderly People’s (EP) Feelings and Attitudes towards New Technologies Was Carried Out. METHODOLOGY: 33, Spanish, EP (Average Age: 70.97; SD: 7.7; 75.7% Female), Were Assessed by Means of an Ad-hoc Likert-type Scale Questionnaire Which Evaluated the Beliefs and Attitude Towards the Information and Communication Technology (ICT). RESULTS: Most of EP pointed out that They Need to Use ICT (62.2%); should be Open-minded to ICT (90.9%); Have the Necessary Skills to Use ICT (66.7%). They Disagreed with the Following Ideas: Only Young People Are Able to Use ICT (85.3%); It Is Not Very Important for Elderly People to Use ICT (85.8%); It Is Very Difficult for EP to Feel Comfortable Using ICT (69.7%); EP Cannot Use Any Technology Tool Even After Being Taught (69.7%); EP Have Problems to Properly Use ICT (66.7%); EP Should Be Reluctant of Using ICT (90.9%); EP Forget How to Use the New Tool (48.5%) CONCLUSIONS: It seems that Elderly People Acknowledge the Advantages that ICT can Offer them and, at the Same Time, they Are Willing to Use Them.

**A PILOT STUDY OF COMPUTER MEDIATED FLOW AMONG OLDER ADULTS ENROLLED IN A 6 WEEK BRAIN FITNESS COURSE**

T. McCallum, Psychological Sciences, Case Western Reserve University, Cleveland, Ohio

The term ‘flow’ refers to a state of consciousness that occurs when individuals are deeply involved in an enjoyable activity. Flow is characterized by a balance between the challenge presented by the task and
the individual’s level of skill; clear task goals and feedback; concentration on the task; a sense of control; the merging of action and awareness; a partial loss of self-consciousness; and a distorted sense of time. Though the last decade has yielded a great deal of literature exploring the relationship between flow states and computer usage, few studies include older adults. At the same time, numerous studies have examined the utility of computerized brain fitness games designed to improve different aspects of cognition among older adults and found few lasting cognitive effects. This pilot study examined computer-mediated flow in a group of older adults to determine if flow states could consistently be reached. Eight female older adults between the ages of 58 and 72 were enrolled in a brain fitness computer course. The course met for one hour a week for six weeks. The participants engaged in various computer games designed to enhance memory, attention, visuo-spatial abilities, executive function, and language skills. Participants completed a modified version of the Flow Scale (Pearce, 2004) following each session. While varying in amount, all participants reported experiencing every element of flow. These preliminary results suggest that more research is needed to examine if older adults can consistently reach flow states by using computerized brain fitness programs.

USING THE HOME COMPUTER AS A SAFETY CHECK-FOR OLDER ADULTS
J.B. Baenziger, P. Martin, W. Hsieh, H. Yang, Iowa State University Gerontology Program, Ames, Iowa

Gerontechnology is a burgeoning field in gerontology. This presentation summarizes findings from a focus group held after applying a home computer as a daily check-in device. During the application session, older-adult residents were asked to contact researchers for 10 consecutive days using a web-site and a SKYPE check-in procedure. After simply reporting to the web site, participants were sent a daily cartoon. Focus groups revealed three important themes: security, routine, and rewards. First, one important advantage to using the check-in component was that the social director would know everybody in the apartment building was well. Second, residents noted that the check-in should occur on a daily basis for consistency of knowing that residents were safe or not. A third point was made that residents enjoyed reading the comic strip each day so it did give residents something to look forward to. Overall, the check-in system was a noticeable benefit in the view of the residents for both pleasure and safety reasons.

PERCEIVED USEFULNESS OF COMPUTERS IN THE SUPPORT OF HEALTH RELATED ACTIVITIES
R. Best, K. Arredondo, Florida State University, Tallahassee, Florida
While 24.9% of older adults and 8.2% of younger adults self describe their health as “fair” or “poor” (CDC, 2009), only 29% of older adults reported searching online for health information compared to 71% of younger adults (Pew, 2010). This study examines if self-reported measures of health among older adults relate to perceptions of the importance of various health related activities to quality of life and if computers and the internet are useful in supporting those activities. As part of the Computer Preference & Usage Questionnaire distributed by the Center for Research and Education on Aging and Technology Enhancement (CREATE), two hundred and twenty-nine participants ages 60-94 (M = 74.3) answered questions pertaining to the importance of nine health related activities to their quality of life and the usefulness of computers in supporting those activities. After controlling for education, income, computer use, and frequency of computer use, self-reported health rating significantly predicted the importance of creating medication reminders, β = −.198, and managing illnesses, β = −.191, to quality of life. Self-reported health rating trended in the opposite direction for predicting perceptions of the usefulness of computers in supporting the creation of medication reminders, β = .115, p = .083, and managing illnesses, β = .129, p = .055. Decreasing health ratings were found to be related to an increase of the importance of creating medication reminders and managing illnesses, but a decrease in the perception of the usefulness of computers and the internet in supporting those activities.

USABILITY OF FIRST-PERSON VISION AMONG OLDER ADULTS AND THEIR SPOUSES
J.T. Matthews1, M. Hebert2, M. Devyver2, A. Dodds1, L. Person Mecca1, S. Beach1, R. Schulz1, 1. School of Nursing, University of Pittsburgh, Pittsburgh, Pennsylvania, 2. Carnegie Mellon University, Pittsburgh, Pennsylvania

First-person vision technology (FPV), known as “inside-out” perception, offers a novel method for gathering objective audio and visual data that depicts individuals’ performance of their activities of daily living. To evaluate preliminary usability of FPV, we visited 15 older adults (M=76.6; SD=7.2 years; 60% female; 87% white) at home, 7 of whom lived with spouses (M=75.9; SD=8.9 years; 77% female; 100% white). The older adults wore a FPV eyeglass clip while performing randomly-ordered, household tasks (e.g., retrieving items from a cupboard, setting the table, showing where daily medications were kept). On a scale from 1 to 10, older adults found the FPV device easy (M=7.73; SD=2.43) and not exceptionally confusing (M=3.27; SD=2.60) or anxiety-producing (M=4.47; SD=3.48) to learn to use. They considered it moderately attractive (M=4.40; SD=2.56), and few would be embarrassed to be seen using it (M=3.47; SD=3.09). Though study participants expressed little reservation about wearing the device at home, they were largely unwilling to wear it outside the home. Several older adults and spouses were baffled by the notion of using FPV to “hear and see,” from the wearer’s perspective, when he or she has difficulty performing a task, ultimately to enable activation of assistance or guidance as needed. Less than one-third of household tasks performed were detectable on video, and audio capture was poor. This most important early finding prompted us to redesign the FPV device to include a fisheye camera and upgraded audio components, resulting in marked improvement in its field of view and audio capture.

VIABILITY OF A FACE RECOGNITION AID FOR THOSE WITH EARLY ALZHEIMER’S DISEASE

Advanced Medical Electronics Corp. (AME) has developed a facial recognition device for people with mild dementia. It provides memory cuing by displaying on a wristwatch the name and relationship of the person whose face is recognized. The study purpose was to explore the viability of the device for persons with dementia by answering the following question: What were caregivers’ (of loved ones with dementia) overall impressions of the device as a means of aiding their loved ones in facial recognition? Second, what features of the device would promote adoption of the technology to aid facial recognition in a social context? Methodology: Caregiver participants (N=12) were recruited by community fliers to three different focus groups held in July, 2010. A script was used to facilitate discussion in a recorded focus group. Recordings were transcribed, and coded for theme analysis via two independent coders. Results: Four, consistent themes emerged. Participants felt the device would 1) be useful to their loved ones, 2) aid in facial recognition, 3) likely be purchased, and 3) interestingly, perceived as a means to decrease caregiver burden.
Session 215 (Poster)

Workforce Issues in Long-Term Care

Small-Scale, Homelike Dementia Care Environments: Effects on Nursing Staff

S.M. Zwakhalen, H. Verbeek, E. van Rossum, G.I. Kempen, J. Hamers, I. Maastricht University, Maastricht, Netherlands, 2. Centre of Research on Autonomy and Participation, Zuyd University of Applied Sciences, Heerlen, Netherlands

Long-term dementia care is increasingly organized in small-scale homelike care facilities. Nursing staff employed in these facilities have different (e.g. more integrated) roles and tasks compared to staff employed in traditional larger facilities. This study investigates the effects of working in small scale living facilities on staff’s job satisfaction and motivation. In a quasi-experimental study, two types of long-term institutional nursing care conditions were included: 28 small-scale living facilities and 21 regular psychogeriatric nursing homes wards. At baseline and at follow-ups after 6 and 12 months nursing staff was assessed using self-report questionnaires. A total of 305 employees were enrolled in the study: 114 working in small-scale living facilities (intervention group) and 191 in regular wards (control group). The primary outcomes were job satisfaction and work motivation. Data were analyzed using multi-level analysis. Groups were comparable on baseline characteristics, except that nursing staff working in small-scale living facilities was employed shorter and was more often women compared with staff working in regular wards. In the total group of employees no significant differences was found on job satisfaction and work motivation. Subgroup analysis showed that staff working in the most typical small scale living facilities was more satisfied and motivated than staff working in most typical regular wards. On the main outcome measures job satisfaction and work motivation no convincing effects were found. Differences in the subgroup analysis suggests that the degree of small scale organizational climate may affect outcomes.

Nursing Home Administrators’ Personality Styles and CMS 5-Star Ratings

K. Osbaldiston, R. Osbaldiston, J. Henning, C. Mallard, T. Harris, I. Eastern Kentucky University, Richmond, Kentucky, 2. Predictive Results, Orange Park, Florida, 3. PI Worldwide, Wellesley Hills, Massachusetts

There are approximately 17,000 nursing homes in the US, and practically all of them have a nursing home administrator (NHA) who is responsible for running the facility. And every one of these nursing homes is rated by the CMS 5-star rating system. It has been well-established that there are relationships between workers’ personality styles and job performance, but is there a relationship between the NHA’s personality style and the CMS ratings? The answer to this question is yes! The Predictive Index (PI) is a measure of personality styles that was developed for use in the workplace, and it measures six personality traits (dominance, extraversion, patience, formality, decision making, and response level); the PI has been validated in dozens of studies with hundreds of different types of jobs and tens of thousands of employees. For this study, 107 nursing home administrators completed the PI and provided their CMS rating. We correlated PI scores with CMS ratings, taking into account three control variables: cost of living, tenure at the facility, and amount of control over staffing levels. The PI was an effective predictor of CMS ratings, and it was twice as strong as other personality measures at predicting job performance. From this research, we can identify the ideal personality profile of the best NHA, and we can make recommendations about what things NHA might want to work on to improve their leadership skills. Making modifications to one’s personality style is a very low-cost treatment that could have very large rewards.

Association of Selected Employee Benefits with Full-Time Home Health Aide (HHA) Overall Job Satisfaction

A.L. Essex, A. Bercovitz, M. Sengupta, Division of Health Care Statistics, National Center for Health Statistics, Hyattsville, Maryland

While demand for HHAs is increasing, recruitment and retention remain a challenge. We examined selected benefits reported by the employer and whether benefits are associated with overall HHA job satisfaction. Linked, cross-sectional data from the 2007 National Home and Hospice Care Survey (agency reported benefits) and the 2007 National Home Health Aide Survey (HHA reported job satisfaction) were analyzed. In a sample of 2,111 full-time HHAs, 90% were extremely (52%) or somewhat (38%) satisfied with their jobs. Most agencies reported offering: paid days off (94%), pensions (79%), health insurance (74%), and education reimbursement (65%). HHAs offered and not offered these four benefits were compared using t-tests to determine the percentage difference in the level of satisfaction. No significant differences were found by whether employers offered “paid days off” or “health insurance.” Fifty-six percent of HHAs offered pensions were extremely satisfied compared with 39% who were not offered pensions (p<.001). Sixty-one percent of HHAs offered education reimbursement were extremely satisfied compared with 37% who were not offered education reimbursement (p<.001). However, 7% of HHAs offered pensions were dissatisfied compared with 24% who were not offered pensions (p<.001). Five percent of HHAs offered education reimbursement were dissatisfied compared with 23% who were not offered education reimbursement (p<.002). Multivariate analyses are planned to understand the association between a series of benefits and job satisfaction, adjusting for HHA demographics and agency characteristics. Findings from this study will clarify the association between employment benefits and HHA job satisfaction.

Relation of Turnover and Stay Rates to EBP Adoption: Results from the Multilevel Translation Research Application in Nursing Homes (MTRAIN) Intervention Study

P. Mobily, A. Bossen, K. Lane, M. Stolder, J. Specht, J. Russell, D.A. Reed, I. Nursing, University of Iowa, Iowa City, Iowa, 2. University of North Carolina, Chapel Hill, North Carolina

National turnover rates from nursing homes (NH) range from 75-100% (Donohue, 2010; Wunderlich & Kohler, 2001). High turnover destabilizes the organization and makes innovation nearly impossible. Turnover and stay rates were collected for one year in 48 Iowa nursing homes as part of the MTRAIN intervention study. The average turnover rate was 26% and the average stay rates were 72.5% at 12 months. Stay rates more accurately reflect stability in an organization (Price & Mueller, 1986). While turnover rates in MTRAIN NHs were relatively low compared to national rates, they still were troublesome to the implementation of evidenced based practice. In addition, director of nursing (DON) turnover rates were low, but some individual nursing homes showed high turnover. DON turnover was significantly negatively correlated with DONs’ perceptions of their leadership style (p=.031), indicating that the lower they rated their own leadership style, the more they tended to leave positions. Staff ratings of their supervisor’s behavior showed a significant negative association; the lower the rating of supervisory behavior, the higher the turnover rates (p=.042). DON turnover was significantly correlated to general staff turnover (p=.000), which is consistent with the findings that leadership turnover begets staff turnover (Castle, 2005). Staff of NHs with higher staff turnover showed high variance in perceptions of EBP (pain: p=.002) use, reflecting lack of continuity in perceptions of EBP use (lack of innovation). Stay rates rather than turnover rates along with DON turnover more accurately reflect facilities’ ability to adopt innovation.
ASSISTED LIVING DIRECT CARE WORKER PERCEPTIONS OF INTERACTIONS WITH RESIDENTS WITH DEMENTIA: A QUALITATIVE ANALYSIS

Purpose: Assisted Living is a fast growing residential care option for older adults, over 50% of whom have dementia and 75% of those with dementia have behavior issues that can impede care. Direct Care Workers (DCW) provide the majority of care to residents in assisted living. This study used video vignettes as a standardized method to evaluate DCW perceptions of interactions with residents exhibiting behavioral issues. Methods: 31 DCWs viewed a series of 4 video vignettes, involving interactions between a DCW and a resident with dementia. DCWs were asked a series of questions following each scene to gather data about perceptions. Data was analyzed via framework analysis to identify major themes and patterns among the participants. Results: Perceptions appear tied to outcomes. 100% of DCWs felt interactions with positive outcomes went well. Over 90% of DCWs focused on the resident if there was a poor outcome and approximately 40% acknowledged both participants in a positive outcome. DCW responses were multi-dimensional and demonstrated a high degree of concrete responses (>75%) versus abstract concepts. DCWs were able to recognize appropriate response actions (90%); however they were unable to generate such strategies (<66%). Conclusion: Results demonstrate use of video vignettes paired with interview questions as a successful method for assessment of DCW perceptions; this method has been discussed but not empirically validated in this group. Implications for training include capitalizing on the awareness of outcomes, encouraging focus on DCW actions, and moving forward to teach response strategies that lead to positive outcomes.

SUPPLEMENTING THE DIRECT CARE WORKFORCE: CAN NON-WORKING, EXPERIENCED AIDES FILL THE GAP?
J. Deichert, K. Kosloski, L. Holley, University of Nebraska at Omaha, Omaha, Nebraska

The federal program for systems change encourages states to provide supports for chronically impaired older adults who wish to remain in the community rather than be institutionalized (Folkemer & Coleman, 2006). This movement has put increasing pressure on the supply of home care workers, where serious shortages already exist (U.S. DHHS, 2003), and placed an increasing emphasis on recruiting and retaining home care aides. One overlooked resource is the population of persons who have worked as home care aides in the previous 5 years, but currently are not working. The Census Bureau’s American Community Survey shows that in 2009, there were approximately 216 thousand former home care workers. This represents about 17% of the existing workforce and provides a pool of potential, experienced workers. This paper looks at the characteristics of this potential pool of workers. People leave the workforce for a variety of reasons. We found that 42 percent of this group was receiving Social Security, other retirement income, or Supplemental Security Income. We, therefore, focused our study on the remaining population – approximately 125,000 potential workers. Compared to current workers, this group was more likely to be poorer (receive food stamps, be below poverty, and have lower incomes), have someone in the household younger than 18, have a disability, be native born, 25 to 34 years old, female, and White, non-Hispanic. These characteristics have direct implications for programs that can be designed to mobilize this “reserve” workforce.

SESSION 220 (POSTER)
CHRONIC DISEASES

SKELETAL MUSCLE MASS IN ELDERLY HEART FAILURE PATIENTS: COMPARISON BETWEEN SYSTOLIC AND DIASTOLIC HEART FAILURE AND CORRESPONDING SIGNIFICANCE IN EXERCISE CAPACITY
K. Kim, S. Park, H. Yoo, C. Kim, Seoul National University Bundang Hospital, Seongnam-si, Republic of Korea

Background: Exercise intolerance is a common symptom of heart failure and has a detrimental impact on the quality of life. Skeletal muscle atrophy has been considered an important contributor to exercise intolerance; however, most studies have been conducted in patients with advanced systolic heart failure. Methods: We studied 39 ambulatory heart failure patients (age: 77.9±6.5, male: 17 (43.6%)) and 39 age- and gender-matched, community-dwelling, elderly subjects. Clinical, laboratory, and echocardiographic evaluations were performed. Dual-energy X-ray absorptiometry was performed to assess the body composition. Exercise capacity was measured by a six-minute walk test. Comprehensive geriatric assessments were also performed to evaluate comorbidity, medication, physical function, cognitive function, and nutritional status. Results: Skeletal muscle mass of heart failure patients showed no differences when compared with that of age- and gender-matched control subjects in any part of the body or in the whole body. Although, diastolic heart failure patients showed lower levels of skeletal muscle mass than systolic heart failure heart failure patients, no significant difference was identified in either systolic or diastolic heart failure patients compared with respective age- and gender-matched control groups. The six-minute walk distances showed no difference between the groups (257.2±117.8 m in diastolic heart failure group versus 302.7±109.4 m in systolic heart failure group, p=0.226). Conclusion: Although skeletal muscle mass has been known to be an independent factor associated with exercise capacity in advanced heart failure patients, skeletal muscle mass was not decreased in ambulatory, elderly heart failure patients when comparing age- and gender-matched control subjects.

EXPLORING CONCEPTUAL RELATIONSHIPS IN A LIFE COURSE HEART FAILURE SELF-CARE MODEL

Background: Older adults with heart failure (HF) conduct daily self-care to maintain physiologic stability. A conceptual Life Course Model of Patient Characteristics suggests that self-care impacts quality of life but findings on this are mixed. Purpose: To explore the relationship between self-care and quality of life in older adults with moderate to severe HF Methods: Self-care was measured with the Self-care of Heart Failure Index (SCHFI). Health related quality of life (HRQOL) was measured with the Minnesota Living with Heart Failure Questionnaire. Pearson’s correlations, independent sample t-tests and linear and logistic regression modeling were used. Results: In 207 adults (age- M 72.9, SD 10.9), NYHA Class III (82%), significant linear associations were found with self-care impact on quality of life (HRQOL) was found with the Minnesota Living with Heart Failure Questionnaire. Pearson’s correlations, independent sample t-tests and linear and logistic regression modeling were used. Results: In 207 adults (age- M 72.9, SD 6.3), NYHA Class III (82%), significant linear associations were observed between self-care confidence and total (r=0.21; p=.002), physical (r=0.189; p=.006), and emotional HRQOL (r=-0.201; p=.004). No significant correlations were found with self-care maintenance or management. Patients with HRQOL total scores better than average had higher confidence scores than patients with worse than average HRQOL scores (58.7±19.20 vs. 52.80±19.58, p=.028). Confidence was an independent determinant of total (Bs=-3.191; p=.002), physical (Bs=-2.346; p=.002), and emotional (Bs=-3.182; p=.002) HRQOL controlling for other SCHFI scores, age, gender, and NYHA class. Each one-point increase in confidence was associated with a decrease in the likelihood that patients had worse (above median) HRQOL scores (OR=0.980

The Gerontological Society of America
CARDIAC REHABILITATION: FACTORS AFFECTING UTILIZATION AMONG MEDICARE BENEFICIARIES AND DISPARITIES IN UTILIZATION BETWEEN MALE AND FEMALE BENEFICIARIES

S. Bhoolota, M. Razavi, D.S. Shepard, Brandeis University, Waltham, Massachusetts

A research team at Brandeis University led by Shepard, PI, conducted a longitudinal study to evaluate Medicare’s Lifestyle Modification Program Demonstration (LMPD). They found through a claims data analysis of 600,000 Medicare beneficiaries, that although CR has been demonstrated to improve outcomes after a cardiac event such as acute myocardial infarction or cardiac surgery, only one in five eligible Medicare beneficiaries utilized this benefit. They identified some of the factors associated with utilization of CR, and demonstrated the variation by State (Suaya et al, 2008). In tandem, the first author of this abstract (Bhoolota) led the implementation and analysis of a survey of Medicare beneficiaries composed of Medicare beneficiaries who utilized CR and a matched control group who did not (n=1001). Using the Andersen model of healthcare utilization and controlling for need through a clinical algorithm, the multivariate analysis identified statistically significant enabling and pre-disposing factors that were associated with utilization of CR in the entire sample. Next a sub-analysis was conducted that demonstrated statistically significant differences in enabling factors among men and women, but not in predisposing factors. Next, organizational factors that influenced the rate of CR utilization in hospitals that offered the benefit were studied. Putting these quantitative and qualitative results together provides a template for interventions to increase the utilization of CR in general, and in women in particular. Given the increasing numbers of elderly with chronic cardiovascular conditions, interventions to prevent avoidable morbidity and premature mortality such as CR provides, can both improve quality and reduce costs.

LIVING WITH HEART FAILURE IN LONG TERM CARE: EXPERIENCES OF RESIDENTS AND THEIR FAMILY MEMBERS

S. Kaasalainen, P. Strachan, G. Heckman, McMaster University, Hamilton, Ontario, Canada

Background: Heart failure affects almost a third of residents who live in long term care, yet little research has been conducted that examines the experiences of residents and their family members related to heart failure management. The purpose of this study was to explore the perceptions of LTC residents and their family members about their experiences in managing residents’ HF along with related barriers and facilitators to their care management. Methods: An exploratory descriptive design was used to collect data from seven LTC residents and seven family members. Data were analysed using thematic content analysis. Findings: Both residents and family members described their experiences trying to manage residents’ advancing HF in LTC. Although their understanding of the disease itself appeared limited, particularly for the residents, they described it in the context of symptom management. Residents often struggle with managing their HF symptoms while suffering from other comorbidities as well, which complicated their treatment decisions. Residents and family members communicated with many health care providers about managing their HF symptoms but worked through the nurse mostly when problems arose or decisions needed to be made. Finally a number of facilitators and barriers were identified that influenced how resident care was managed with a large emphasis on the need for individualized care. Conclusions: The findings from this study contribute to our understanding of how residents and family members manage residents’ heart failure in long term care. These findings may be helpful in designing interventions aimed at improving care management practices in long term care, ultimately improving the quality of life for long term care residents and their family members.

OLDER ADULT OSTEOARTHRITIS PAIN MANAGEMENT RESULTS FROM THE NATIONAL AMBULATORY MEDICAL CARE SURVEY

D.D. McDonald, School of Nursing, University of Connecticut, Storrs, Connecticut

Recommended initial osteoarthritis pain treatment for older adults includes exercise and acetaminophen, and avoidance of non-steroidal anti-inflammatory analgesics (NSAIDs). The aim was to describe physicians’ prescription of recommended initial osteoarthritis pain treatments for older adults. A secondary data analysis of the 2008 National Ambulatory Medical Care Survey (NAMCS) was conducted. The final sample consisted of 128 office visits by people age 60 or older with documented osteoarthritis and painful joint listed as a reason for the visit. Major analyzed variables included reason for visit, diagnoses, health education for exercise, and analgesic prescriptions. Of the 28,741 NAMCS office visits, 9,314 were by adults age 60 or older. 871 of those visits involved a painful joint, and 128 were by people with documented osteoarthritis. Only 21 (16.1%) were prescribed exercise and/or acetaminophen and not prescribed NSAIDs. NSAIDs were the most frequently prescribed analgesics n = 36 (28.1%). Analgesics of any type were prescribed during 52 (40.6%) of the visits. No complementary alternative medicine was prescribed. Weight reduction was discussed during 5 (3.9%) visits. Osteoarthritis may be under-diagnosed, under-reported, or over shadowed by co-morbid medical conditions. Older adults with persistent osteoarthritis pain are at increased risk for adverse events from prescribed NSAIDs. Safe and effective multimodal pain treatments need to be prescribed for older adults with persistent osteoarthritis pain. Referral to a rheumatologist or pain management specialist should be considered when pain intensity remains moderate or greater.

MANAGING OSTEOARTHRITIS: COMPARISONS OF CHAIR YOGA, REIKI, AND PAIN EDUCATION GROUPS

J. Park1, R. McCaffrey1,2, D.J. Dunn1,2, R.L. Goodman1,2, 1. Florida Atlantic University, School of Social Work, Boca Raton, Florida, 2. Florida Atlantic University, College of Nursing, Boca Raton, Florida

This pilot study examined the effect of chair yoga and reiki on managing osteoarthritis pain and improving physical function and emotional health. In this pretest/posttest randomized control trial, 30 (≥ 55 years) diagnosed with osteoarthritis were randomly assigned: (a) Group 1 attended semweekly 45-minute chair yoga sessions for 8 weeks (16 sessions); (b) Group 2 attended weekly 30-minute individual reiki session for 8 weeks; (c) Group 3 (control group) met bi-weekly for 8 weeks (4 sessions) of education about treating osteoarthritis pain. Four participants dropped out; 26 participants (10 in Group 1, 9 in Group 2, 7 in Group 3) completed the same survey three times: before the intervention, mid-intervention (4 weeks), and end of intervention (8 weeks). One week after the intervention, a focus session for each group was conducted. Participants were 20 women (77%) and 6 men (23%), with a mean age of 79 years (SD=8.8); a majority (73%, n = 19) reported having had chronic pain for more than a year. In the focus group session, participants in the yoga group reported reduced pain intensity, improved mobility and blood circulation, and reduced stress and sleep problems; participants in the reiki group reported reduced stress and increased relaxation but no change in pain intensity. Repeated measures will be conducted to compare the group mean scores within and between groups on all three test occasions. Post hoc analysis will be used to measure differences in mean scores. Study results will be presented during the GSA poster presentation.

64th Annual Scientific Meeting 63

THE STABILITY OF COPING STRATEGIES IN OLDER ADULTS WITH OSTEOARTHRITIS AND THE ABILITY OF THESE STRATEGIES TO PREDICT CHANGES IN DEPRESSION, DISABILITY, AND PAIN

N.G. Regier, P. Parmelee, T.L. Harralson, University of Alabama Center for Mental Health and Aging, Tuscaloosa, Alabama, 2. Polaris Health Directions, Langhorne, Pennsylvania

Older adults with chronic pain such as osteoarthritis (OA) tend to develop cognitive and behavioral strategies to cope with their pain. Research has identified many styles of coping with chronic pain, but the literature on how and why individuals might adjust their preferred strategies over time is scarce. Consequently, this study looks at how coping with OA predicts long-term well-being and how coping changes over time. Participants were 369 Philadelphia-area residents with physician-diagnosed knee OA. Depressive symptoms were assessed using the Center for Epidemiologic Studies Depression scale; arthritis-related pain and disability were measured by the Arthritis Impact Measurement Scales II. Coping strategies were represented by 57 items drawn from the Coping with Illness measure and Coping Strategies Questionnaire. All assessments were administered at baseline (T1) and 24-months follow-up (T2). Data analysis proceeded in three phases: (1) Exploratory factor analysis of the 57 coping items yielded a 5-factor underlying structure (stoicism, faith, emotional expression, fantasy, self-blame); (2) Confirmatory factor analysis tested the fit of the factor structure from T1 at T2; (3) Regression analysis examined the relationship of the T1 factor structure to predict change in depression, disability, and pain from T1 to T2. Coping strategy at T1 predicted change in depression from T1 to T2. Changes in pain and disability were predicted by T2 coping strategy. Coping strategy shifts were associated with changes in pain and disability over the two-year period. Findings are discussed in terms of stability and change in coping style in adjustment to chronic pain.

AN INDIVIDUALIZED INTERVENTION TO IMPROVE SYMPTOM MANAGEMENT IN OLDER HEART FAILURE PATIENTS

Heart failure (HF) negatively affects older patients’ lifestyle quality (QOL), but early initiation of HF self-management reduces complications and hospitalizations and helps to maintain QOL. A key to preventing HF complications is early recognition and treatment of HF symptoms. But patients’ beliefs about symptoms (their cause, consequence, controllability) may interfere with correct recognition of symptoms and appropriate self-care. The aim of this pilot feasibility study was to examine the effects of an individualized, representationally symptom management intervention (HR-IRIS) on symptom distress and quality of life. Fifty three older (mean age =75.3) persons diagnosed with HF classification II or III as determined by the New York Heart Association’s functional classification system were randomly assigned to an intervention group or wait-list control group. The telephone-delivered intervention was conducted by a registered nurse and consisted of a symptom assessment, representationa interview (eliciting symptom beliefs), and development of symptom management goals and strategies. Symptom distress (severity, interference) ratings were taken at baseline, 2, 4, 6, 8 and 16 weeks; QOL (SF36: physical functioning, social functioning, and role limitations physical subscales) at baseline, 8, and 16 weeks. GLM analysis, controlling for gender, indicated a significant intervention effect on symptom distress, and a trend for physical quality of life. Symptom distress improved in the intervention group and worsened in the control group. An individualized, telephone-delivered nursing intervention has potential to reduce symptom distress by improving symptom management in older persons with HF.

A COMPARISON OF CKD EPIDEMIOLOGY FORMULA WITH OTHER FORMULAS FOR THE DETERMINATION OF CALCULATED CREATININE CLEARANCE IN THE OUTPATIENT ELDERLY

K. Alagakrishnan, A. Senthilselvan, Medicine, University of Alberta, Edmonton, Alberta, Canada, 2. School of Public Health, University of Alberta, Edmonton, Alberta, Canada

BACKGROUND: In elderly as serum creatinine is not accurate in estimating renal function, calculated creatinine formulas are used in clinical practice to assess chronic renal failure. AIM: To compare recently introduced CKD epidemiology formula with other calculated creatinine formulas in the elderly. METHODOLOGY: An outpatient chart review was conducted on consecutive elderly patients aged ≥ 65 years over a 9-month period. Data regarding age, gender, cognitive status, clock drawing, weight, height, and serum creatinine were collected. Pearson’s correlation coefficient, Bland-Altman plot, and kappa statistics were used for statistical analysis. RESULTS: Of the 197 subjects in the study, 72% were cognitively impaired or had dementia. Using the CKD Epidemiology formula 35% of the patients had stage 3 renal disease (GFR < 60 ml/min); 36% using the MDRD formula; 48% using the CG/BSA formula and 48% using the Wright formula and 18% using the Mayo clinic formula. There was a high correlation between the CK EPI and MDRD (Pearson correlation coefficient, 0.97, P < 0.0001), CG/BSA formulas (Pearson correlation coefficient, 0.91, P < 0.0001), Wright formula (Pearson correlation coefficient, 0.84; P < 0.0001) and Mayo clinic formula (Pearson correlation coefficient, 0.84; P < 0.0001). However, agreement determined by paired samples was weak within the four formulas. CONCLUSION: The diagnosis of having stage 3 chronic kidney disease both in normal and cognitively impaired elderly depended on the formula used. With the CKD Epidemiology formula, discordance of (+1 mL/min) was seen between the MDRD, with CG/BSA formulas (-9ml/min), with Wright formulas(-12ml/min) and with Mayo Clinic formulas(+13ml/min) for estimating GFR.

A SYSTEMATIC REVIEW OF EVIDENCE ON MEDICATION THERAPY MANAGEMENT (MTM) PROGRAMS’ EFFECTIVENESS FOR OLDER ADULTS

S.J. Shoemaker, A. Pozniak, S. Ball, Health Policy Practice, Abt Associates, Inc., Cambridge, Massachusetts

Medication Therapy Management (MTM) programs aim to improve medication use and reduce adverse events in high-risk populations by having a health care professional – usually a pharmacist – examine all of a patient’s medications to identify, resolve and prevent medication-related problems. Under Medicare Part D, prescription drug plans are required to offer MTM to eligible beneficiaries. The objective of our study was to examine the evidence of MTM programs’ effectiveness in ambulatory settings on the economic, clinical, and humanistic outcomes for older adults, and to outline the implications of our findings for Medicare Part D and health reform. Using PubMed, we conducted a systematic review of the peer-reviewed literature on MTM programs for elderly populations. Our initial search returned 1,253 articles of which 189 examined MTM; of those fifteen evaluations or research studies examine outcomes in older adults and are being reviewed by three senior-level doctorate researchers. The review process will be completed by May 2011, but our preliminary findings indicate that there is robust, rigorous evidence (e.g., randomized controlled trials) as well as less rigorous but relevant findings on the effect of MTM on important outcomes among the elderly. We will present the complete findings of the systematic review of the evidence on MTM programs effectiveness on economic, clinical and humanistic outcomes in older adult populations. Additionally, we will discuss the policy implications of our findings as they relate to Medicare Part D and, more broadly, health reform.
COGNITIVE IMPAIRMENT AND SELF-CARE AMONG PATIENTS HOSPITALIZED FOR DECOMPENSATED HEART FAILURE
A. Hajduk1, D. Lessard1, C. Emery1, F. Spencer2, R.J. Goldberg1, J. Saczynski1, 1. University of Massachusetts Medical School, Worcester, Massachusetts, 2. McMaster University, Hamilton, Ontario, Canada

Background/Aims: Heart failure (HF) is an increasingly prevalent chronic disease that requires extensive self-care to control symptoms and prevent hospitalization. Cognitive impairment (CI) may impact the ability to initiate and maintain HF self-care activities. We examined the association between CI and HF knowledge, self-care confidence, and adherence to self-care activities in patients hospitalized with acute HF. Methods: 575 patients with acute HF (mean age=72 years, 45% female) were interviewed from 2007 to 2010 for information regarding HF knowledge, confidence in ability to perform self-care activities, and adherence to self-care regimens. CI in 3 domains (memory, processing speed, executive function) was assessed using standardized measures. Results: 79.3% of patients were impaired in at least one cognitive domain. Compared to patients without CI, those with high levels of CI were significantly older (77 vs. 65 yrs), more likely to be male, (61% vs. 45%), and less formally educated (12.8% vs. 57.6% college graduates). Compared to unimpaired patients, patients with high levels of CI had lower HF knowledge (13.5 vs. 14.7, 20-point scale) and confidence in carrying out self-care regimens (15.5 vs. 17.6, 32-point scale). However, mean adherence to self-care activities was significantly higher among patients with high CI (27.4 vs. 31.1, 60-point scale, all p’s<0.05). Conclusions: CI is associated with lower HF knowledge and confidence in self-management practices but greater adherence to self-care regimens. Further investigation into the role that caregivers play in the management of HF in cognitively impaired patients may clarify these findings.

STRUCTURE AND PROCESS COMPONENTS ASSOCIATED WITH DISABILITY MAINTENANCE/IMPROVEMENT IN A PRIMARY CARE AFFILIATED HOME VISITING NURSE INTERVENTION
D.V. Liebel, B. Friedman, B. Powers, N.M. Watson, University of Rochester, Rochester, New York

Objectives: To perform a process evaluation of a primary care affiliated home visiting nurse intervention reporting beneficial disability outcomes to determine which intervention components were associated with disability maintenance/improvement. Methods: Secondary analysis of data on 238 community-dwelling Medicare beneficiaries with disability in parts of New York State, West Virginia, and Ohio. Data were obtained from patient interviews, a Computer Assisted Nursing Documentation Index, and a Nurse Activities List. Structure and process variables were examined in descriptive, correlational, bivariate, and logistic regression analysis. Results: The sample had a mean age of 77.1 years and 30.3% was male. Participants reported dependence in a mean of 2.0 ADLs and difficulty in 2.8 ADLs. Virtually all participants received home visits and medication management, 89.5% engaged in goal setting, 83.2% attended at least one physician-patient-family-nurse conference visit, at least 79.8% were involved in disease management, and 32.4% received visiting nurse visits while they were in healthcare facilities. The number of physician-patient-family-nurse conference visits was associated with maintenance/improvement in ADL dependence (p=0.017). In logistic regression analysis greater probability of maintenance/improvement in ADL dependence was associated with number of disease management activities (p=0.001), physician-patient-family-nurse conference visits (p=0.03), health information materials (p=0.06), and home visits (p=0.065). Higher likelihood of maintenance/improvement in ADL difficulty was associated with number of goals (p=0.077). Conclusion: Several structure and process variables in a primary care affiliated home visiting nurse intervention were found to be associated with maintaining/improving disability for community-dwelling beneficiaries with disability. Associations should be examined in further research.

EFFECTS OF STROKE ON FUNCTIONAL RECOVERY AMONG OLDER ADULTS WITH HIP FRACTURE (HIREFIX)
R.O. Mathew1, W. Hsu1, Y. Young1, 1. Albany Stratton VA Medical Center, Albany, New York, 2. Department of Epidemiology and Biostatistics, State University of New York at Albany School of Public Health, Rensselaer, New York, 3. Department of Health Policy, Management and Behavior, State University of New York at Albany School of Public Health, Rensselaer, New York

Introduction. As a complicating factor, stroke predisposes to bone loss especially in weight bearing bone such as femur. This study compares functional independence measure (FIM) trajectory among hipfx patients with or without prior history of stroke (self-reported) and their long-term care (LTC) needs. Methods. Data were collected in 268 community-dwelling older adults age 65 or older with unilateral hipfx at admission and prior to discharge from postacute rehabilitation, then at 2, 6, and 12 months(m) following discharge. Mixed-effect model quantifies FIM functional recovery patterns between stroke and non-stroke groups, adjusting for potential confounders. Results. 17% had history of stroke prior to hipfx. Proportion of males (41.3% vs. 23.4%, p=0.01) and co-morbidities (mean 4.1 vs. 3.2, p<0.001) were greater in the stroke group. All patients demonstrated the greatest degree of recovery in the mobility functions (Locomotion and transfers) in the first 2m following postacute rehabilitation. Multivariate results revealed both groups had functional recovery over time; the stroke group had worse recovery in all 6 FIM domains. At 1-year patients with prior history of stroke required supervision or some direct assistance > 25% of the time in locomotion, self-care and transfers (FIM score <6); those without stroke only required supervision in locomotion. Discussion. Rehabilitation following hipfx is often incomplete when there is a prior stroke history and long-term personal assistance is needed, which should be planned for pre-acute rehab discharge. Efforts that maximize functional recovery during the first 2m following hipfx may reduce resource use and foster functional independence.

EFFECTS OF HEARING & VISUAL IMPAIRMENTS ON FUNCTIONAL INDEPENDENCE AMONG OLDER ADULTS WITH HIP FRACTURES
Y. Young1, W. Hsu1, 1. Department of Health Policy, Management and Behavior, State University of New York at Albany School of Public Health, Rensselaer, New York, 2. Department of Epidemiology and Biostatistics, State University of New York at Albany School of Public Health, Rensselaer, New York

Introduction. This study examines the effects of vision/hearing impairments on functional recovery among older adults with hip fracture. Methods. A one-year longitudinal data were collected in 208 elderly hip fracture patients within 72 hours of admission to and prior to discharge from postacute rehabilitation and thereafter at 2, 6, and 12 months following postacute rehabilitation discharge. Functional Independence Measures (FIM) were used to assess functional recovery. Self-reported Vision/hearing impairment was obtained via in-person interviews. Mixed-effects analyses quantify differences on FIM functional recovery between impaired and non-impaired vision/hearing groups while adjusting for covariates. Results. The adjusted mixed-effects estimates showed that patients with impaired vision/hearing had notably different functional recovery patterns and significantly worse overall FIM function (p<0.001) than their counterparts in all 6 FIM functions. For locomotion function at 1-year, no vision/hearing impaired group required supervision (mean FIM = 5.7), while patients with impaired vision/hearing needed 25% human assistance (FIM = 4.2). In addition to needing human assistance in locomotion assistance, patients with impaired vision/hearing also required supervision in transfers (FIM = 4.4).
5.3), and sphincter control (FIM mean = 5.5). Discussion. Visual and hearing impairments decrease functional independence and quality of life may be compromised. An increase in medical evaluation during postacute rehabilitation and use of special devices/equipment may maximize rehabilitation effects and could potentially improve functional independence.

OLDER ADULTS USE OF PHARMACOLOGIC AND NON-PHARMACOLOGIC PAIN MANAGEMENT: THE MOBILIZE BOSTON STUDY
C.L. Stewart, S.G. Leveille, R.H. Shmerling, E.J. Samelson, J.F. Bean, P. Schofield, 1. Center of Academic Primary Care, University of Aberdeen, Aberdeen, United Kingdom, 2. College of Nursing and Health Sciences, University of Massachusetts Boston, Boston, Massachusetts, 3. Division of General Medicine and Primary Care, Beth Israel Deaconess Medical Center, Boston, Massachusetts, 4. Harvard Medical School, Boston, Massachusetts, 5. Institute for Aging Research, Hebrew SeniorLife, Boston, Massachusetts, 6. Spaulding Rehabilitation Hospital, Boston, Massachusetts

Successful pain management among older persons is often elusive. This study describes the prevalence of pharmacological and non-pharmacological pain management in older adults with chronic pain. We studied 599 persons aged ≥70y in the population-based MOBILIZE Boston Study who reported chronic pain using the Brief Pain Inventory (BPI) at baseline. Average age was 77.8y, two-thirds were female and 77% were white. 49% of participants currently used analgesics and 68% currently used ≥1 non-pharmacologic pain management strategies (modified Pain Management Inventory), including 37.6% using both analgesics and non-pharmacologic methods. Exercise was the most commonly reported non-pharmacologic method (49.7%). Any analgesic use was associated (p<0.0001) with being female, moderate-severe pain and mobility limitation. Lower self-efficacy for pain management was moderately associated with analgesic use (p=0.042). Elders reporting moderate-severe pain, high pain interference and those of non-white ethnicity were more likely than their peers to utilize non-pharmacologic methods (p<0.0001). After multivariable adjustment, greater pain severity (p<0.001) and less education (p=0.04) were associated with any use of non-pharmacologic methods. Substantial differences among older persons in their use of individual strategies were observed. For example, heavier persons were less likely than normal weight persons to exercise for pain management (p=0.005). In general, more older adults reported using non-pharmacologic pain management than analgesics. Pain severity appeared to be the most influential factor associated with either modality. While further research is required to understand reasons behind use, clinicians should consider both the range of strategies available and the medical and psychosocial factors that might influence adherence to pain management recommendations.

OLDER BREAST CANCER SURVIVORS’ SYMPTOM BELIEFS AND BARRIERS TO SYMPTOM MANAGEMENT
T. Tougas, J. Egan, S.M. Heidrich, School of Nursing, UW-Madison, Madison, Wisconsin

Older breast cancer survivors (BCS) are faced with managing some-what ambiguous symptoms related to breast cancer, its treatment, and conditions related to aging. Beliefs about symptoms may influence how symptoms are managed. The purposes of this study were to (1) describe older breast cancer survivor’s beliefs about symptoms based on the dimensions proposed by the Common Sense Model (CSM) of illness, (2) to describe barriers to symptom management, and (3) examine relationships of beliefs and barriers to symptom distress (severity, interference, effect on mood) and quality of life (purpose in life, SF-36 Physical and Mental). Participants were 47 BCS, aged 65+, who participated in a randomized clinical trial of a symptom management intervention. Baseline open-ended interviews about symptoms were conducted by nurses and were audio-recorded, transcribed and coded into the domains of the CSM and barriers to symptom management by two independent raters (agreement = 95%). Support was found for the CSM domains of Identity (symptoms), Consequences, Cause, and Control, but not Time-line. Nine categories of barriers to symptom management were described. CSM domains were significantly correlated with each other. Symptom interference was significantly related to beliefs about cause and worse consequences. More barriers to symptom management was significantly related to more symptom interference and more negative mood from symptoms. Higher Purpose in life and SF-36-Physical were significantly related to more beliefs about Control. These findings indicate partial support for the Common Sense Model and suggest avenues for targeted symptom management interventions to improve quality of life.

FRACTURE-INDUCED CHANGES TO SPINAL CURVATURE INCREASE THE RISK OF FUTURE VERTEBRAL FRACTURE
A. Bruno, D.E. Anderson, J. D’Agostino, M.L. Bouxsein, J. Harvard-MIT Division of Health Sciences and Technology, Boston, Massachusetts, 2. Center for Advanced Orthopaedic Studies, Beth Israel Deaconess Medical Center, Boston, Massachusetts, 3. Department of Orthopedic Surgery, Harvard Medical School, Boston, Massachusetts

Age-related vertebral fractures (VFx) occur in one-third of women over 50, leading to marked pain and disfigurement. The presence of a VFx significantly increases the risk of incurring subsequent VFx’s, but the mechanisms underlying this elevated risk are unknown. We hypothesized that a prevalent VFx increases risk of future VFx by altering spinal geometry and compressive loading. To test this, we used a biomechanical model of the spine to simulate the effect of a VFx at T12 on spinal loading in a representative 66-y-old woman (ht = 167 cm, wt = 69.4 kg) for three body positions: upright standing, 30° forward flexion, and a 20° lateral bend. Mild, moderate, and severe anterior wedge fractures were simulated by reducing the height of the anterior face by 20%, 30%, and 40% respectively. These geometric changes were implemented in our model, and the compressive loads at vertebral levels T6-L5 were estimated and compared to a model with no fractures. We found that a prevalent fracture increased compressive loading for all body positions, and that more severe fractures resulted in larger increases in loading. The most significant increases were observed in the thoraco-lumbar junction, with a VFx at T12 increasing compressive force at L1 45-90% for upright standing, 12-22% for forward flexion, and 9-17% for lateral bending. These results indicate that alterations in spine biomechanics due to the presence of a VFx may contribute to the ‘vertebral fracture cascade’, and that interventions to restore normal spine geometry may lessen the risk of future VFx.

DIABETES IN OLDER ADULTS: RESULTS FROM NHANES 2003-2008

National estimates suggest that more than one fourth of persons aged 65 or older have diabetes. To better understand diabetes-related statistics in this age group, we analyzed data collected from older adults who participated in the National Health and Nutrition Examination Survey (NHANES) from 2003 to 2008. Findings extrapolated to the U.S. population indicate that 13.9% of persons age 65 or older are taking anti-diabetic medications. Of those not taking these medications, 48.5% have fasting plasma glucose (FPG) values between 100 mg/dl and 125 mg/dl (in the pre-diabetes range), and 11.3% have FPG values > 125 mg/dl/dl (in the diabetes range). Of note, 75.6% of individuals in this latter group had never been told that they had diabetes, nor even that they were borderline for the condition. With respect to those older adults whose FPG values were > 125 mg/dl and were never told that
Understanding these events can ultimately lead to enhanced protocols incorporating diabetes complications. Alters blood glucose levels (malglycemia) in older adults with cancer.

**ALTERED BLOOD GLUCOSE (MALGLYCEMIA) IN OLDER ADULTS WITH CANCER**

M.J. Hammer, G.D. Melkus, College of Nursing, New York University, New York, New York

Individuals age 65 and older comprise 54.2% of annual cancer incidence with a median age at diagnosis of 66 years old. Nearly 27% of all individuals age 65+ have diabetes and up to 18% of patients with cancer have pre-existing diabetes. Additionally, the American Cancer Society and American Diabetes Association issued a joint statement detailing epidemiological evidence for diabetes as a risk factor for cancer. Although a contributing factor, patients with cancer are at increased risk for altered blood glucose levels (termed malglycemia) even without a history of diabetes. Older adults with cancer are particularly at risk for malglycemia which can lead to adverse outcomes including infections and non-malignancy related death. Furthermore, older adults undergo the process of cellular senescence and specific to the immune system, immunosenescence. Malglycemic states further impair immune function through creating an overabundance of molecular oxygen (superoxide) which leads to excess reactive oxygen species causing oxidative stress. Oxidative stress activates transcription factors including NF-KB, STAT3, and HIF1-alpha which trigger proinflammatory cytokine expression. Prolonged proinflammatory cytokine expression from malglycemia causes interferences with normal cell signaling, which impedes immune cells from their ability to detect and arrest aberrant cell formation and eliminate foreign microorganisms. Older adults with cancer are at particular risk for this deleterious pathway due to nutritional imbalances, medications, decreased physical activity levels, and stress. Understanding these events can ultimately lead to enhanced protocols for better glycemic control and in turn, reduced rates of both cancer onset and adverse outcomes in older adults with cancer.

**ONCOLOGISTS’ END OF LIFE TREATMENT DECISIONS: HOW MUCH DOES AGE MATTER?**

M. Bluhm1, M.J. Silveira1, C.M. Connell1, R. De Vries1, N. Jaza1, K.E. Bickel1, 1. University of Michigan School of Public Health Department of Health Behavior & Health Education, Ann Arbor, Michigan, 2. University of Michigan Medical School Department of Internal Medicine, Ann Arbor, Michigan, 3. University of Michigan Medical School Department of Obstetrics & Gynecology, Ann Arbor, Michigan, 4. University of Michigan Medical School Department of Internal Medicine - Hematology/Oncology, Ann Arbor, Michigan

Compared to younger patients, older cancer patients often receive less treatment, resulting in poorer outcomes. Despite this notable disparity, few studies have explored oncologists’ perspectives on how patient age influences their decisions about prescribing treatment. In-depth qualitative interviews were conducted with 17 oncologists to assess factors that influence decisions about chemotherapy for patients with incurable cancer. Transcripts of recorded interviews were coded line by line and analyzed with NVivo software, using qualitative methods to identify themes. All oncologists identified patient age as a factor in their decisions to offer chemotherapy. Oncologists believed that older adults were not as likely to want or tolerate treatment compared to younger patients and that the circumstances of older patients were not as emotionally compelling. Qualitative analysis of in-depth interviews can result in a rich understanding of how patient age influences oncologists’ decisions about cancer treatment that cannot be achieved with other methods. It can also prompt reflection and discussion of those influences on quality of care at end of life and may serve as an essential first step toward policy and practice change. Future research examining oncologists’ beliefs and attitudes about older cancer patients may suggest new opportunities for improving cancer care.

**GERIATRIC SCREENING OF OLDER BREAST CANCER PATIENTS – A PILOT PROJECT**

M.D. Denkinger1, T. Nikolaus1, M. Hasch2, A. Gerstmayr2, K. Hancke2, 1. Agaplesion Bethesda Hospital, Ulm, Germany, 2. Womens hospital Ulm university, Ulm, Germany

Background: We have set up a pilot study to address the value of different screening methods to predict toxicity, function and disability in older breast cancer patients. Methods: 79 consecutive patients over the age of 65, suffering from breast cancer were included. Patients were assessed before treatment and 2-3 months after radiotherapy or chemotherapy was finished. Different geriatric assessment tools were used to determine functional status (VES-13, EORTC scales, performance assessments). Cognitive status, comorbidity and others were measured. Endpoints were toxicity, disability (LLF1DI) and quality of life (EORTC-QOL). Results: Patients were 70 years old (65-86). Tumors were mostly T1 or T2 (94%), 15% were estrogen- and progesterone-receptor negative, 49% were HER2/neu negative, 75% were lymph-node negative and none of the tumors had distant filiae at time of diagnosis. When comparing patients 75 years and older with those between 65 and 75 years, frequency and dosage of radiotherapy and chemotherapy and tumor characteristics were equally distributed. Functional assessment revealed more deficits in the older age group. However, functional and activity measures increased in older people as compared to a decrease in the younger age group after treatment. This could not be explained by comorbidity, number of medications in bivariate analysis. Both parameters are increased in the older age group. The EORTC function and symptom scales performed better than the other scales above. Further analyses will be presented at the conference. Conclusion: ADL-type physical function measures seems to be a good parameter for toxicity and disability of older breast cancer patients.

**CORRELATES OF UNTREATED PAIN AMONG OLDER ADULTS WITH SYMPTOMATIC OSTEOARTHRITIS**

K.L. Lapane1, S. Yang1, R. Jawahar1, M. Sands2, C. Eaton2, 1. Epidemiology and Community Health, Virginia Commonwealth University, Richmond, Virginia, 2. Memorial Hospital of Rhode Island, Pawtucket, Rhode Island, 3. Brown University, Providence, Rhode Island

Background: Osteoarthritis (OA) is a leading cause of disability among elderly adults. Management of knee OA is largely palliative, including both complementary and alternative medicine (CAM) and conventional pharmacological medications. Objectives: To estimate the extent to which older adults with symptomatic OA do not receive treatment for symptoms and to identify correlates of undertreatment. Methods: Using data from Osteoarthritis Initiative, we identified 772 older adults (age 60+) with symptomatic and radiographically confirmed OA. Trained interviewers collected comprehensive information on both CAM and conventional medications for managing OA symptoms. Patients were considered under-treated if they reported symptoms in more than half days in the past month, but did not report use of either CAM or conventional medications. Logistic regression identified correlates of undertreatment. Results: One in five older adults did not receive any treatment, but reported frequent symptoms in the past month. CAM (55.5%) was as commonly used as conventional medications (51.6%) to manage symptoms. Glucosamine (32.9%), chondroitin (30.6%), and NSAIDs (30.8%) were most commonly used. No association between race/ethnicity, obesity, and old age was observed. College graduates were least likely to be under-treated relative to those with a high school education.
or less (Adjusted Odds Ratio: 0.59, 95% Confidence Interval: 0.36-0.98). Older adults with multijoint arthritis were at reduced risk for lack of treatment (Adjusted Odds Ratio: 0.61; 95% Confidence Interval: 0.41-0.92). Conclusions: The proportion of older adults experiencing symptoms of OA, but not receiving treatments is non-trivial. Why patients forgo use of therapies needs to be explored.

SESSION 225 (POSTER)

EXERCISE AND PHYSICAL THERAPY

PHYSICAL ACTIVITY ASSESSMENT IN OLDER ADULTS: A COMPARISON OF ACCELEROMETER FINDINGS AND SELF-REPORT

Background. When physical activity (PA) is measured by self-report, results are often over-reported. Accelerometers are recognized as a valid and objective tool to assess PA in free-living people. Purpose. This study examined the relationship between self-reported frequency and duration of PA and accelerometer data on older adults. Method. In this cross-sectional design, fifty nine older adults wore accelerometers for 1 week. Accelerometer findings were compared to the CHAMPS questionnaire. The Actical® accelerometer, worn on the waist, measured ambulatory movement summed as min/wk of light, moderate, and vigorous PA and total energy expenditure. CHAMPS data were: caloric expenditure/week in all activity and moderate-intensity activity as well as frequency/week in all activity and in moderate-intensity activity. Spearman rank correlation analyzed relationships between the measures. Acceptable significance was set at .05. Results: Using CHAMPS data, 2.9 (SD=4.0) episodes of moderate PA/wk were reported, falling short of 2007 ACSM-AHA recommendations to engage in moderate PA 5 times/wk. With the Actical®, participants spent a mean 317.3 (SD=195.8) minutes in moderate PA/wk, exceeding 2008 National PA Guidelines for moderate activity of 150 min/wk. Correlations were significant between scores for the CHAMPS calories expended in moderate PA and (a) Actical® total energy expenditure (r2=.399) and (b) Actical® moderate PA min/wk (r2=.450). Conclusions. The associations between self-report and objective measures of PA show that they are measuring similar facets of activity.

SAFETY OF ONE REPETITION MAXIMUM TESTING IN COMMUNITY-DWELLING ELDEERS: THE MOBILIZE BOSTON STUDY

M.M. Gagnon1, T. Aransky1, D.K. Kiely1, L. Lipsitz1,2, J.L. Leveille2, J.F. Bean1, 1. Institute for Aging Research, Hebrew Senior Life, Boston, Massachusetts, 2. University of Massachusetts, Boston, Massachusetts, 3. Spaulding Cambridge Outpatient Center, Cambridge, Massachusetts, 4. Beth Israel Deaconess Medical Center, Boston, Massachusetts, 5. Harvard Medical School, Boston, Massachusetts

Lower extremity strength is important for maintaining mobility and preventing falls in older adults. One repetition maximum (1RM) testing is a reliable and valid method of measuring strength. However, debate exists regarding the safety of 1RM testing among community-dwelling elders of varying functional abilities. The MOBILIZE Boston Study is a population-based cohort of 764 Boston area community-dwelling older adults, median age = 78y, 64% female, and 15% with fair or poor self-rated health. In the baseline clinic assessment, participants completed 1RM testing via a standardized protocol using a double leg press. American College of Sports Medicine criteria were utilized to screen for medical contraindications before testing: 143 participants were thus excluded. Of the 621 participants who met testing criteria: 562 (90%) completed the test and 59 (10%) refused. Participants were assessed for safety/injuries by trained nurses during the testing and by telephone within 5 days after testing. Among participants who completed the test, 545 (97%) reported no adverse effects either immediately or within days after testing. Of the 17 (3%) who reported adverse effects, all reported transient musculoskeletal soreness that resolved within several days, without interfering with daily activities. Participants who rated their health fair to poor were no more likely to report adverse effects than those who reported better overall health. Our study results indicate that following a standardized protocol, 1RM testing for the assessment of lower extremity strength can be conducted safely in a population-based sample of older adults.

HIGH-SPEED POWER TRAINING IN OLDER ADULTS WITH KNEE OSTEOARTHRITIS

S.P. Sayers, K. Gibson, Physical Therapy, University of Missouri, Columbia, Missouri

PURPOSE: To compare the effects of high-speed power training and slow-speed strength training on muscle performance and function in older adults with knee osteoarthritis (OA). METHODS: 29 participants (8m, 21f; Age=67.4±7.3 yrs) were randomized to high-speed power training (HSPT) at 40% one-repetition maximum (1RM) (n=11; 3x12-14 repetitions), slow-speed strength training (SSST) at 80%1RM (n=9; 3x8-10 repetitions) or control (CON; n=9; stretching) 3 times/week for 12 weeks. Leg Press (LP) 1RM, peak power (PP), peak power velocity (PPV) and a battery of mobility-based functional tasks were obtained at baseline and 12 weeks. Rating of perceived exertion (RPE) was assessed during exercise. Muscle performance, function and RPE changes were evaluated using analysis of variance and t-tests. Significance was accepted at p<0.05. RESULTS: Changes in 1RM and PP in HSPT (1RM:419±211; PP:202±124) and SSST (1RM:405±148; PP:133±134) were greater than CON (1RM:103±178; PP:39.1±123) (both p<0.02), but not different from each other (both p>0.47). Changes in PPV were greater only in HSPT (0.14±0.18) compared to SSST (-0.04±0.12) (p=0.04). Function did not improve in HSPT and SSST compared to CON (all p>0.05), but RPE was lower in HSPT (12.4; “light to somewhat hard”) compared to SSST (15.6: “hard to very hard”) (t[18]=3.8, p=0.001) despite similar work output between groups (HSPT=7304±2129; SSST=7247±1936; t[18]=0.6, p=0.95) . CONCLUSIONS: HSPT showed greater success at increasing movement speed in older adults with knee OA than SSST, but did not improve function. Because RPE was lower, HSPT may be a more appealing form of exercise to maintain exercise behavior in this population.

EFFECTS OF INTENSIVE EXERCISE INTERVENTION ON ALZHEIMER'S PATIENTS - A RANDOMIZED, CONTROLLED TRIAL

K.H. Pitkala, M. Laakkonen, M.M. Raivio, R.S. Tilvis, H. Kautiainen, T.E. Strandberg, General practice, University of Helsinki, University of Helsinki, Finland

Objective: To study the effectiveness of intensive exercise rehabilitation on physical and cognitive functioning of home-dwelling Alzheimer (AD) patients. Material and methods: 210 AD patients were recruited from central Alzheimer drug register in Finland in 2008-2009. The patients were randomized into three arms: 1) days-care group-based exercise (DCGE) (four hours twice/week in day center) 2) tailored home-based exercise (HE) (one hour twice/week for one year) 3) control group (CG). Patients were assessed with Functional Independence Measure (FIM) for physical functioning and clock drawing test for cognitive functioning. Results: Three randomized groups were well balanced at baseline. Patients’ mean age was 78 years, and 39% were females. Two in three of AD patients suffered from moderate or severe dementia. At baseline mean FIM-total points were 70.6 in DCGE, 69.7 in HE, and 69.7 in C. All groups deteriorated during the follow-up year but the HE group significantly slower. At 12 months decline in HE arm was -6.8 points (95%CI -3.6 to -9.9) whereas the respective figure in the DCGE...
was -10.1 (95%CI -8.8 to -13.5) and in CG -13.8 (95% -10.5 to -17.1.) The difference in decline in FIM motor points was significant whereas the difference in decline in FIM cognitive points was not significant between the groups. The HE group improved in clock-drawing task (change 0.5(95%CI 0.06 to 0.09) whereas the C group declined -0.2 (95%CI -0.7 to 0.2) (p=0.029). Conclusions: Intensive tailored home-based exercise has beneficial effects on AD patients’ physical functioning and cognition over one year.

GROUP EXERCISE IMPROVES QUALITY OF LIFE IN OLDER ADULTS INDEPENDENT OF CHANGES IN THEIR PHYSICAL PERFORMANCE

W.M. Valencia Rodrigo1, F.A. Andrade2, L. Oropesa2, D.C. Stanziano3, L.M. Salgueiro1, J.R. Dahn1, B.A. Roos1,2, H. Florez1,2, 1. University of Miami Miller School of Medicine, Miami, Florida, 2. Miami Veterans Affairs Healthcare System - GRECC, Miami, Florida, 3. South Florida Veterans Affairs Foundation for Research and Education. (SFVAFRE), Miami, Florida

Our aim was to assess the impact of adherence to exercise and physical performance (PP) on health-related quality of life (HRQoL) among older adults participating in a group exercise intervention. Methods: A quasi-experimental study was conducted in community-dwelling older adults (n=151, 66.7±6.4 years, 96.7% men, 41.7% non-Hispanic white, and body mass index (BMI) 35.4±6.4 kg/m²) enrolled in the MOVE! Weight Management Program at Miami Veterans Affairs Healthcare System. Based on attendance to Enhance Fitness, a 1-hour group exercise intervention 3x/week, participants were divided into 2 groups: good adherence (GA, n=79, 37±6 sessions, ≥50%) or poor adherence (PA, n=72, 7±7 sessions, <50%). HRQoL was assessed with the Short-Form-36 (SF-36). PP was assessed using hand grip (HG), arm curl (AC), chair stand (CS), and 8-foot walk (8FW). Results: At baseline, GA and PA groups were similar on demographic, anthropometric, PP and both SF-36 summary measures: physical component summary (PCS) (59.7±23.5) and mental component summary (66.1±25.0). Baseline PCS did not correlate with HG and AC, but did with CS (r=0.18, p=0.02) and 8FW (r=-0.24, p=0.01). After 4 months and compared to PA, the GA group achieved greater improvement only in PCS (6.7±1.9 vs. 0.5±1.9, p=0.02), which was independent of demographic factors, depression, fatigue, changes in weight and PP. Conclusion: Improvements in HRQoL are associated with exercise adherence and independent of changes in PP. Social interaction among the participants and with research personnel may have played a role. We recommend studies that evaluate similar interventions in the community.

IMPACT OF HIGH-VELOCITY TRAINING ON FUNCTIONAL FITNESS AND MUSCULAR POWER OF ELDER ADULTS

M. Powers1, M. Gray2, K. Garver1, 1. University of Central Oklahoma, Edmond, Oklahoma, 2. University of Arkansas, Fayetteville, Arkansas

The purpose of this 52-week pilot study was to examine changes in functional fitness and muscular power following high-intensity, low-velocity resistance training (HV) and low-intensity, high-velocity resistance training (LV). Nineteen adults over the age of 75 were randomly assigned to a LV or HV group. Both groups trained two days per week using free-weight resistance. HV completed 24 weeks of LV before transitioning to HV. Outcomes assessed were three tests from the Senior Fitness Test (chair stand, arm curl, and 8-foot up-and-go) and functional chair stand power conducted at baseline, 24 weeks, and 52 weeks. Repeated measures ANCOVA were conducted with the baseline score serving as the covariate. Due to the sample size, percent change was calculated. Results indicated no significant effects for any outcome measure. We did observe a trend toward significance in the group-by-time interaction for the 8-foot up-and-go test (p = .10) and the chair stand test (p = .15). For the 8-foot up-and-go test, HV improved performance (2.5%), while LV experienced reduced performance (3.8%). For chair stand, HV experienced a 7% decrease in the number of chair stands performed, while the performance of LV was unchanged. These results indicate little difference between LV and HV training in functional fitness and power. Despite the small sample size, this study is important. To our knowledge, it is the first to incorporate functional high-velocity training for this duration among adults over the age of 75. We recommend that this pilot study be replicated with a larger sample size.

THE EFFECT OF AGE ON PHYSICAL ACTIVITY LEVELS AND QUALITY OF LIFE IN BREAST CANCER SURVIVORS

M.J. Benton1, M.C. Schlairle1, D.R. Gibson2, 1. College of Nursing, Valdosta State University, Valdosta, Georgia, 2. Valdosta State University, Valdosta, Georgia

With early diagnosis and treatment, breast cancer survival rates are now greater than 50%, the number of breast cancer survivors is growing, and quality of life is increasingly important. As healthy adults age, greater physical activity is associated with greater quality of life. It is unclear how aging affects this relationship in women who have survived breast cancer. This cross-sectional study evaluated the effect of age on the relationship between physical activity and quality of life in 20 breast cancer survivors (42-84 years). Physical activity levels were self-reported as hours per week spent in “light,” “moderate,” and “vigorous activities” with an overall rating of “not active,” “somewhat active,” “active,” or “very active.” Physical-activity related quality of life was measured with the Vitality Plus Scale. Upper and lower body strength was measured using chest (10RM) and leg press (1RM). Functional ability was assessed with the 30-second Arm Curl and Chair Stand tests. Age, BMI, strength, and functional ability had no relationship to physical activity levels or quality of life. However, time since diagnosis was positively associated with overall physical activity (P<0.05), and overall physical activity was positively associated with overall quality of life (P<0.05). Physical activity levels were also strongly related. Women who reported regular light activity were more likely to report moderate activity (P<0.001) and those who reported moderate activity were more likely to report vigorous activity (P<0.001). These findings demonstrate the benefits of physical activity in breast cancer survivors. Clinicians should counsel women to be physically active without regard to age.

TAI CHI AND DUAL TASK COST IN OLDER ADULTS WITH MOBILITY DIFFICULTY

B.L. Roberts, M. Marsiske, L. Altman, L. Thomas, University of Florida, Gainesville, Florida

Usual daily activities require simultaneous coordination of motor and cognitive tasks. Interventions to improve this ability must include simultaneous motor and cognitive interactions. Tai chi, a mind-body exercise, is such an intervention that involves allocation of attention to complex motor movements and cognitive tasks to coordinate tai chi movements, mental relaxation and imagery. To assess the effects of one hour of tai chi three times a week for 16 weeks, 46 adults ≥70 years of age and older (mean=76) with difficulty climbing a flight of stairs or walking a ¼ mile were randomly assigned to no-contact control or tai chi. Participants completed >75% of tai chi sessions. Balance was the motor task because it improves with tai chi and is essential for daily activities. Participants stood on a foam pad placed on a force plate for this task. Spontaneous speech was the cognitive task, and the participant answered a question for 3 minutes. Each task was done alone (single task condition) and together (dual task condition). Dual task cost was the difference in task performance when done in the single and dual task conditions. The interaction effects between time (pretest and posttest) and intervention (control and tai chi) from repeated measures ANOVA revealed little change in dual task costs.
for balance in either group (p=.67) while dual task costs for the speech task increased more in the tai chi group (p=.02). Tai chi may increase ability to give priority to balance tasks but at the expense of cognitive tasks.

CROSS-SECTIONAL STUDY OF ELDERLY PEOPLE IN RELATION TO PLASMA HEAT SHOCK PROTEIN 72 LEVELS

Tokyo Metropolitan Institute of Gerontology, Tokyo, Japan, 2. The University of Tokyo, Chiba, Japan, 3. Nippon Sport Science University, Tokyo, Japan, 4. Harvard Medical School, Beth Israel Deaconess Medical Center, Boston, Massachusetts

Heat shock protein 72 (Hsp72), an intracellular chaperone, has been identified in the extracellular milieu, where it is clear that eHsps play a role as pro-inflammatory immune effectors. There is an age-related decrease in eHsp72, but centenarians are an exception in that they have increased eHsp72, suggesting that higher eHsp72 leads to healthy outcomes later in life. The present study was designed to assess the plasma levels of eHsp72 in elderly people, and to investigate its potential interaction with elderly-specific syndromes. A total of 665 elderly people (male, n=264, 73.5 ± 6.0 years; female, n=395, 73.4 ± 6.3 years) participated in an official medical health examination, including psychological and physical fitness test. Significant increases in age, log TNF-alpha, and Beta2-MG, and decreases in height, weight, muscle volume, grip strength, and hemoglobin were observed with the highest tertile of eHsp72. Height, weight, skeletal muscle volume, grip strength, walking speed, and hemoglobin were negatively associated with eHsp72. Higher eHsp72 levels in patients with stroke (cerebral infarction), myocardial infarction, and cancer were found compared to those in the healthy control. Additional adjustment for these diseases on eHsp72 levels, partially reduced the association between eHsp72 and sarcopenia factors such as skeletal muscle mass, grip strength, and walking speed, suggesting that underlining the diseases would not have confounded the association of sarcopenia with eHsp72. Our results revealed that eHsp72 in plasma is linked to sarcopenia.

EFFECT OF HOME-BASED ROWING TRAINING BY RESISTANCE TUBE ON TRUNK MUSCLES IN ELDERLY MEN

M. Asaka, A. Hasegawa, H. Kawano, S. Sakamoto, M. Higuchi
Waseda University, Tokorozawa, Saitama, Japan

The trunk muscles play an essential role in stabilizing the body and/or making various movements in activities of daily living. Therefore, it is important to prevent the age-related decrease of trunk muscles for elderly people. The purpose of this study was to examine the effect of the home-based rowing training using resistance tube on trunk muscles in elderly untrained men. Nineteen elderly untrained men (70.7±3.3yr, 163.3±4.3cm, 61.6±6.4kg) were assigned to either a tube-rowing training group (n=8) or control group (n=11). Those in the tube-rowing training group underwent the home-based rowing exercise by using resistance tube three times a week for 3 months, and each training session consisted of 2 sets of 10 minutes of tube-rowing workout. The average achievement rate of training was 97%. The cross-sectional areas (CSAs) of trunk muscles were measured by MRI at the baseline and post 3 month-training. There were no differences between the two groups for all the baseline measurement values. In the training group, the CSAs of total trunk muscles, rectus abdominis, and psoas major significantly increased by 4%, 9%, and 9%, respectively (P<0.01~0.001). No changes were observed for all the CSA values in the control group. These results were similar to the rowing exercise training by using rowing ergometer in our previous study. This study suggested that home-based rowing training by resistance tube remarkably increases trunk muscles, especially rectus abdominis and psoas major in elderly untrained men.

THE EFFECT OF 6 WEEKS OF WII BALANCE TRAINING ON MEASURES OF STATIC AND DYNAMIC BALANCE OF OLDER ADULTS: A CASE STUDY

K. Caillouet, B. Desai, P. Schuler, T. Huffman, A. Leja
University of West Florida, Pensacola, Florida

Purpose: This research assessed the effects of six weeks of Nintendo’s Wii Fit Balance Training on measures of static and dynamic balance. Methods: Two community dwelling older adults (91 years/78 years) volunteered for this study. Participant 1 was healthy with no functional limitations; participant 2 had severe left-sided weakness due to stroke. Pre- and post-training assessments included 3 components of the Fullerton Advanced Balance (FAB) Scale (measures of static balance; 0=lowest score, 4=highest score) and the 8 foot up-and-go test (dynamic balance; measured in seconds). The training phase consisted of two sessions a week for a total of 6 weeks, each session lasting 25-30 minutes. During each session participants were instructed to play 3 different balance training games (Ski Slalom, Table Tilt, and Balance Bubble) each lasting approximately 5 minutes with 2 minutes rest in between them. Results: Participant scores were as follows: Standing with feet together; participant 1: pre-0; post-4; participant 2: pre-0, post-3; reaching forward; participant 1: pre-4; post-4; participant 2: pre-3, post-4; standing on foam; participant 1: pre-3, post-4; participant 2: pre-0, post-3; 8 foot up-and-go: participant 1: pre-5.73, post-5.85; participant 2: pre-26.47, post-28.85. After 6 weeks of training both participants showed improvements on the selected measures of static balance while their dynamic balance showed no change (participant 1) or a slight decrease (participant 2). Conclusion: Six weeks of Nintendo’s Wii Fit Balance Training improved selected measures of static balance but not dynamic balance for the two older adults in this study.

THE EFFECTS OF NINTENDO WII FIT ON GAIT SPEED, BALANCE AND FUNCTIONAL MOBILITY ON IDIOPATHIC PARKINSON’S DISEASE: A CASE STUDY

K.K. Zettergren, M.S. Antunes, J.M. Canhao, C. Lavallee
Physical Therapy, Quinippiac University, Hamden, Connecticut

A 69 year old male with a diagnosis of idiopathic Parkinson’s disease participated in eight weeks of Nintendo Wii fit training. The subject ambulated independently community distances with bilateral straight canes, but was unable to drive. Pre-test/post-test assessments included: 1) The Timed Up and go (TUG), 2) The Berg Balance scale, 3) Self selected gait speed (with canes), 4) Fall history, and 5) Geriatric Depression Scale (GDS). The subject participated in bi-weekly, 60 minute training sessions with the Nintendo Wii Fit gaming system. Sun salutation, half moon and chair pose were used each session as a warm up. The subject then performed several of the following activities: Penguin slide, torso twists, obstacle course, island cycling, rhythm parade and balance bubble. At the onset of the study, easier activities were chosen (ie: Penguin slide, torso twists). As the subject progressed functionally and became more familiar with the gaming technology, more difficult activities were added (rhythm parade, balance bubble and island cycling). After eight weeks, the subject’s Berg balance score improved from 31 to 42 (35% improvement), the TUG decreased from 36.5 seconds to 24.1 seconds (34% improvement) and self selected gait speed improved from .26 m/s to .37 m/s (42% improvement). The subject showed no change on the GDS, however, initial scores were at the ceiling. The Nintendo Wii Fit may be a viable alternative to independent exercise programs for people diagnosed with idiopathic PD. Further research is needed to examine the possible uses of the Nintendo Wii Fit.

ASSOCIATIONS BETWEEN PHYSICAL AND COGNITIVE DIMENSIONS AFTER FITNESS TRAINING IN FRAIL AND NON-FRAIL OLDER ADULTS

F. Bobeuf, F. Langlois, M. Vu, M. Kergoat, L. Bherer
CRIUGM, Montréal, Quebec, Canada

Aging is associated with changes in physical and cognitive dimensions, which may lead to poor quality life. Recent studies reported that
high level of physical fitness is associated with better cognitive perfor-
mancess. The present study assessed the relationship between physi-
cal capacities and cognition performances prior to and after a 3-month
fitness training program in frail and non-frail individuals. Thirty-six
participants (24 non-frail/12 frail) were engaged in a 3-month training
program (3 times/week, 1 hour/session) including aerobic, strength and
flexibility exercises. Pre-/post-test included battery of physical and cog-
nitive tests. At baseline, significant relationship (p < 0.01) was observed
between speed of processing and mobility (TUG-T) in non-frail indi-
viduals. TUG-T was found to be predictive factor of speed processing
(R2 = 0.381). In frail participants, executive functions were positively
 correlates (p < 0.01) with maximal gait-speed but negatively with physi-
cal endurance (6MWT). Maximal gait-speed and 6MWT were found to
be predictive factor of executive functions (R2 = 0.558). The training
program lead to significant improvement in physical capacities (PPT,
TUG-T, 6MWT) and cognition performances (episodic memory, speed
of processing) in both frail and non-frail individuals. The relationships
between physical capacities and cognitive performances were not
observed after training intervention, which suggests that the interven-
tion has lead to improvement in cognitive functions in both groups.
Moreover, physical dimension lost its predictive values of cognitive per-
formances. Results of this study suggest that the relationships between
physical capacities and cognition differ among frail and non-frail older
adults. Moreover, both frail and non-frail older adults show positive
changes in physical capacities and cognition after fitness training.

THE IMPACT OF PHYSICAL TRAINING ON PHYSICAL
AND COGNITIVE CAPACITIES IN FRAIL GERIATRIC
PATIENTS
F. Langlois1,2, M. Saint-Martin1, K. Chassé1, P. Campana1, L. Bherer1,2, J.
Institut universitaire de géiatricité de Montréal (IUGM), Montreal,
Quebec, Canada, 2. Université du Quebec à Montreal (UQAM),
Montreal, Quebec, Canada

Background: after discharge from a geriatric day hospital, frail
patients may still be at risk of falling and functional decline. Recent
studies suggest that physical activity programs can enhance physical
and cognitive capacities in older adults and therefore might reduce post-
hospitalization complications. However, whether such a program could
be implemented effectively with frail geriatric patients remains under-
studied. Objectives: this study evaluated the impact of a 12-week (twice
a week) physical training program on physical and cognitive capacities
in frail geriatric patients following discharge from a day hospital. Meth-
ods: thirty-four patients (M = 81.32 years) completed physical tests
before and after the physical training program. Fourteen of those par-
ticipants also completed a Pre/Post cognitive evaluation battery. For
each physical and cognitive measure, effect sizes were computed as fol-
lowed: Cohen’s d = Mpre - Mpost / SDpooled [SDpooled = \sqrt{(SDpre2 +
SDpost2) / 2}]. Results: participants showed significant improvements
in mobility (d = 0.77), balance (d = 0.67), gait speed (d = 0.64), physical
endurance (d = 0.54), and strength (d = 0.47) (p < 0.05). Improvements
were also observed on neuropsychological tests measuring global cog-
nitive functioning (d = 0.38), working and episodic memory (d = 0.31),
speed of processing (d = 0.27), and executive functions (d = 0.23), although
none of them reached statistical significance. Conclusions: this study
suggests that physical training can enhance physical capacities and poten-
tially cognitive functions in recently discharged frail geriatric patients.

COMPARISON OF PHYSICAL AND MENTAL FUNCTION
BETWEEN COMPLETERS AND NON-COMPLETERS OF A
ONE-YEAR EXERCISE STUDY
K. Garver1, M. Gray2, M. Powers1, 1. University of Central Oklahoma,
Edmond, Oklahoma, 2. University of Arkansas, Fayetteville, Arkansas

The purpose of this study was to compare baseline characteristics
of elder adults who completed an exercise program to those who did
not complete the program. Fifty-seven elders (mean age = 80.75 ± 5.04)
were eligible to participate in a 52-week progressive resistance training
research study. During the year, 33 volunteers (58%) left the study for
a variety of reasons including lack of interest, health challenges, and
time conflicts. In order to better understand reasons for the high rate of
attrition, we compared baseline characteristics of completers to non-
completers on measures of body composition, functional fitness, and
quality of life using independent samples t-tests. Significant differences
were observed in performance on the Short Physical Performance Bat-
tery (p = 0.02) and the mental health composite score of the Short Form-
36 (p = 0.03). A trend toward significance was observed in the 8-foot
up-and-go test of the Senior Fitness Test (p = 0.09) and the Activities-
Specific Balance Confidence survey (p = 0.14). On average, the non-
completers had a poorer score indicating lower levels of physical func-
tion and mental health. These results may indicate that non-completers
are at greater risk of developing disability and functional limitations
making them the most susceptible to attrition, but also the most at need
for an exercise intervention. Likewise, these results help us understand
the large rate of attrition in the current study. Future researchers should
plan for attrition and develop strategies to improve retention among
those with lower levels of physical and mental function at baseline.

EFFECT OF SITTING PAUSE TIMES ON POSTURAL
STABILITY AFTER SUPINE TO STANDING TRANSFER IN
DIMLY LIT ENVIRONMENTS
E. Johnson, Loma Linda University, Loma Linda, California

Background and Purpose: Falls in the older adult population are a
common occurrence often taking place in the home. Dimly lit envi-
ronments have been identified as one of many contributing causes. The
purpose of this investigation was to measure the effects of sitting pause
times on postural sway velocity immediately following a supine-to-
standing transfer in a dimly lit room in older and younger adult females.
Methods: Five females ages 65-70 and five females ages 23-30 partici-
pated in the study. On each of 2 consecutive days, study participants
lay on a plinth table with their eyes closed for 45 minutes prior to per-
foming a supine-to-standing transfer in a dimly lit room. Sitting pause
times of 2 seconds and 30 seconds preceded the transfers. Results: Mean
postural sway velocity for both groups combined was significantly less
after a 30 second sitting pause time compared to a 2 second sitting pause
time (p = 0.001). Mean postural sway velocity was also significantly less
after a 30 second sitting pause time compared to a 2 second sitting pause
time for individual groups, younger adults (P = 0.019) and older adults
(P = 0.021). No significant difference in mean postural sway velocity
was observed between the two groups (P > 0.05). Conclusions: Postural
sway velocity was less when study participants performed a sitting pause
of 30 seconds prior to standing in a dimly lit room. These results sug-
gest that longer sitting pause times may afford improved adaptability
to dimly lit environments contributing to improved postural stability.

THE DIAGNOSTIC UTILITY OF SELF-REPORTED AND
PERFORMANCE-BASED OUTCOME MEASURES TO
PREDICT FALLS IN COMMUNITY-DWELLING OLDER
ADULTS
E. Hood1, K.K. Chui2, M. Lusardi2, 1. Warren Hospital Balance Center,
Phillipsburg, New Jersey, 2. Physical Therapy and Human
Movement Science, Sacred Heart University, Fairfield, Connecticut

Introduction: Physical therapists often administer a battery of out-
come measures when treating patients with impaired balance. Unfor-
thunately, the diagnostic utility of these outcome measures to predict falls
has not been adequately studied. This study evaluated the diagnostic
utility of self-reported and performance-based outcome measures to pre-
dict falls. Methods: Thirty-three community dwelling older adults (mean
age 77.82 ± 7.1 years, 73% female) referred to physical therapy (PT)
participated in this longitudinal study. All participants had diagnoses
that impaired their balance (mean duration 9.3 ± 10.0 months) and 58%
A. Dornelas de Andrade, P.M. Marinho, A. Góis, M. Santana, R. Cruz Junio, R. Guerra, L. Fioreto, Universidade Federal de Pernambuco, Recife, Brazil, 2. Universidade Federal do Rio Grande do Norte, Natal, Brazil

Depressive symptoms are frequent in elderly and in chronic obstructive pulmonary disease (COPD) patients. Some studies report decreased performance of 6-minute walk test (6MWT) in the presence of these symptoms, but do not know to what extent the presence of the verbal stimulus would affect the distance (SD) achieved by those carrying elderly depressive symptoms. Aim: To evaluate the performance in 6-minute walk for the presence of the stimulus words between healthy elderly and patients with COPD. Methods: A cross-sectional study with 53 healthy elderly and 40 elderly patients with COPD in both sexes, mean age of 69.68 ± 7.03 years and 70.63 ± 6.98 years respectively. They were evaluated for presence of depressive symptoms (GDS-15) and performance in 6-minute walk test, walked distance (WD) and perceived exertion (Borg Scale). Results: The prevalence of depressive symptoms in patients with COPD was 25% and 5.7% among the healthy elderly group (p = 0.013). COPD patients without depressive symptoms walked a shorter distance when the test was performed without verbal stimulus (373.10±142.67 m vs. 461.92 ± 69.33 m and 292.33±119.88 vs. 355.40 ± 22.988 respectively) and with verbal stimuli (411.78 ± 115.43 m vs. 477.36±85.99 m and 322.04±60.23 s vs. 355.90±25.52 s). There was no difference between them on the Borg scale. No differences were observed in walked distance between groups with depressive symptoms in the presence and absence of verbal stimulus. Conclusion: The use of verbal stimulus during the 6MWT was not enough to improve the performance of walked distance between the groups when they had depressive symptoms.

EFFECTS OF AN AEROBIC EXERCISE PROGRAM ON INTERNAL RIGHT CAROTID RESISTIVE INDEX AND FUNCTIONAL AUTONOMY LEVELS OF ELDERLY WOMEN

A. Dornelas de Andrade, P. Uchoa, Y. Menezes, R. Vale, L. Fioreto, Universidade Federal de Pernambuco, Recife, Brazil, 2. Universidade Estadual do Piauí/UESPI and Faculdade NOVAFAPI, Terezina, Piauí, Brazil, 3. Universidade Castelo Branco (PROCIMIH-UCB/RJ), Rio de Janeiro, Brazil

Objectives: The aim of this study was to analyze the effects of an aerobic exercise program on internal right carotid resistive index (IRCRI) and functional autonomy levels of elderly women. Methods: The sample consisted of 25 elderly sedentary women (60-75 years), divided into two groups: an experimental group (n=14), which submitted to aerobic exercise, and a control group. Assessment of IRCRI was conducted by Doppler ultrasound and functional autonomy using the following tests: 10-m walk (10mW); rising from a sitting position (RSP); rising from a chair and moving about the house (RCMH); rising from a ventral decumbent position (RVDP); and putting on and removing a t-shirt (PRTS). Results: The experimental group had a significant decrease in IRCRI and a significant increase in the 10mW, RSP, and RCMH tests. Discussion: These results suggest that the exercise program was effective in reducing IRCRI and in improving functional autonomy in elderly women.
in 38 older adults (mean age 78.3±4.9 yrs) from the Study of Energy and Aging Pilot. Energy level score from Health ABC, two questions from the CES-D, physical energy subscale score from the Motivation and Energy Inventory and the 13-item Situational Fatigue Scale (SFS) were compared. SFS was associated with 400m walk time (r=0.37, p<0.04), gait speed (r=-0.43, p<0.02), VO2peak (r=-0.50, p<0.01) and daily active energy expenditure measured by SenseWear Pro armband (r=0.34, p<0.05), all adjusted for age and sex. No other fatigue measures were associated with function, fitness or energy expenditure. Although not previously validated for older adult populations, the SFS may be preferred for epidemiologic studies because it measures reported fatigue in relation to performing specific types and duration of activity rather than perceived global fatigue.

RELATIONSHIP BETWEEN FATIGABILITY AND MITOCHONDRIAL FUNCTION IN OLDER ADULTS

Fatigability is assumed to reflect poor health and low energy and mitochondrial function may be in the etiologic pathway. The relationship between fatigability and mitochondrial function was examined in the Study of Energy and Aging Pilot (N=38, mean age 78.3±4.9 yrs). Fatigability was measured as Rating of Perceived Exertion (RPE) at the end of a 5 min treadmill walk at 6.7m/s. Maximum phosphorylation capacity (ATPmax) of the quadriceps and skeletal muscle mitochondria was measured by 31P magnetic resonance spectroscopy, a direct and non-invasive measure of the capacity of muscle to replenish ATP after a 20-30s rapid isometric contraction. Quadriceps ATPmax was 162.61mM ATP/s lower in those with high (RPE ≥10) vs. low (RPE ≤9) fatigability, p=0.03. ATPmax of skeletal muscle mitochondria was 0.08mM ATP/s lower in those with high vs. low fatigability, p=0.09. This suggests that mitochondrial function may be an important contributor to the onset of fatigability in older adults.

SESSION 230 (POSTER)

HEALTH PROMOTION AND SUCCESSFUL AGING

SCREENING IN OLDER ADULTS: WHAT EVIDENCE DO WE REALLY NEED?

Older adults often have multiple chronic conditions and modest additional life expectancy. Evaluating the benefits and harms of screening must include consideration of competing morbidities, increased harms of screening, and patient preferences. Key issues include the lack of evidence for older adults on the harms of screening tests; the over diagnosis of disease; the burden of disease labeling; the effects of inaccurate test results; the harms of disease treatment; and harms related to prioritization of healthcare (for a particular patient life style counseling may be more important than screening). Non-traditional outcomes such as the effects on family caregivers are also relevant. Studies comparing trajectories of quality-adjusted survival with and without screening to assess net benefit are typically lacking. There is little evidence on the preferences of older adults for deciding whether to be screened, the process of being screened, and the health states associated with being or not being screened. To enhance the quality and quantity of evidence, older adults need to be enrolled in screening trials. Measures of functional status and health-related quality of life (HRQOL) need to be included in trials, registries, and cohort studies. This presentation will address these challenges and review potential solutions for systematic reviewers wishing to produce evidence-based guidelines to inform policy and practice.

DEVELOPMENT OF COMPUTER SOFTWARE TO EVALUATE EXERCISE FOR OLDER ADULTS

K. Yamauchi, Y. Lau, T. Ichikawa, S. Oshita, A. Ogita, Institute of Physical Education, Kanto University, Yokohama, Kanagawa, Japan

Introduction: Audio visual system as learning material of exercise for older adults has been developed and part of it has been reported in GSA2010. Further development of the audio visual system based on the effectiveness has been carried out. Some problems that we encountered were demonstrated in a survey that we present here. Purpose: The purpose of this research was to develop computer software and to investigate the effectiveness of computer software as learning material of exercise for older adults. Methods: Computer software as learning material of exercise was developed. There were two screens on computer. One screen showed an instructor and another screen showed a learner. These two screens can be reproduced and compared by learners in order to evaluate their exercise. The software also can be calculates angle of joints of older adults. These learning materials were provided to older adults as examinees who are living in the suburb of K prefecture in Japan for a trial. After these trials, they were asked about their impression by researchers and interviewed regarding these learning materials. Results: Most learners stated that although they felt they could exercise as same as the instructor, they couldn’t do it accurately. They also indicated that it was useful to watch the scene of exercise repeatedly anytime. On the other hand, some learners suggested that it had better to take direct coaching of exercise first, then to utilize indirect coaching by software. In conclusion, the software was efficient for learners to exercise accurately by themselves.

FACTORS AFFECTING DEPRESSION OF COMMUNITY DWELLING OLDER WOMEN IN KOREA

Y. Lim, Department of Nursing, Yonsei University Wonju College of Medicine, Wonju, Kanwon-do, Republic of Korea

The purpose of the study was to examine a staged causal model as a theoretical base to explain the depression of community-dwelling older women in Korea. The model contained three stages including antecedents (Stage 1), perception (Stage 2), and outcome (Stage 3). The antecedents included physical function performance (grip strength, standing balance, and sit and reach flexibility). Stage 2 focused on activity specific balance self-efficacy. In Stage 3, the outcome variable was depression. A total of 163 community dwelling older women over 60 year-old participated. The instruments were the Korean version of CES-D, Korean version of Activity-Specific Balance Confidence Scale (K-ABC), Grip strength test, Sit-and-Reach test, and One-leg balance test. Results show activity balance self-efficacy (β= .437, p=0.00) explained 26.6% of the variance in depression. Grip strength (β=.350, p=0.00), sit-and-reach test (β=.196, p=.00), and one-leg balance test (β=.158, p=.03) explained 27.6% of the variance in activity balance self-efficacy. Results indicated that low muscle strength, reduced body flexibility, and low balance had an indirect influence on depression through lower self-efficacy of activity balance. The findings showed that activity balance self-efficacy mediates the relationship between the physical function performance and depression as a negative outcome.
CONTRIBUTING FACTORS TO VITAMIN D DEFICIENCY AND ITS HEALTH OUTCOMES

M. Pallaki, D.M. Kresevic, J.E. Denton, C.J. Burant, 1, Louis Stokes Cleveland VA Medical Center, Cleveland, Ohio, 2. Case Western Reserve University Frances Payne Bolton School of Nursing, Cleveland, Ohio, 3. Case Western Reserve University School of Medicine, Cleveland, Ohio, 4. University Hospitals Case Medical Center, Cleveland, Ohio

Research continues to indicate that 25-hydroxyvitamin D (25-OHD) deficiency is prevalent among older Americans and is associated with health problems including cancers, fractures, and hypertension. However, there are no current guidelines for routine testing and guidelines for oral supplementation remain controversial. This prospective study gathered data from older community dwelling Veterans and included a survey of health habits, a chart review, and a physical performance measure for frailty (Fried et al.). The sample included 36 men (M=77 years) from the geriatric outpatient clinic. Mean 25-OHD was 29 mg/dl with 57% of the sample below 32 mg/dl (identified as the lower limit of normal based on the Cleveland Veterans Affairs Hospital criteria). Respondents most often noted spending an average of 2 hours per week outdoors in the sunlight. Common food sources included tuna (160 IU/serving) and milk with cereal (40 IU/serving), with an average 25-OHD dietary intake of 60 IU/day. Lower 25-OHD levels were not significantly correlated with elevated HbA1C levels, falls, or the summative frailty scale; however, they did correlate with the single item of activity (r=-0.503, p=0.002) on the Fried scale. In addition, lower 25-OHD levels demonstrated trends with higher Body Mass Index (r=-0.284, p=0.098) and higher Geriatric Depression Scale scores (r=-0.293, p=0.088) but not with the St. Louis University Mental Status Examination. Recommendations for screening and oral supplementation are needed due to low reported sunlight exposure and dietary intake. There is a continued need to investigate health outcomes associated with vitamin D including depression and physical performance.

THE USE OF COMPLEMENTARY THERAPIES TO ENHANCE PATIENT SATISFACTION

D.M. Kresevic, A.M. Bee, J.E. Denton, B. Heath, M. Rashid, N. Seifi, N. Thompson, Louis Stokes Cleveland VA Medical Center, Cleveland, Ohio, 2. University Hospitals Case Medical Center, Cleveland, Ohio, 3. Case Western Reserve University Frances Payne Bolton School of Nursing, Cleveland, Ohio, 4. MetroHealth Medical Center, Cleveland, Ohio

Complementary/alternative medicine (CAM) has been shown to have health benefits including decreased pain, anxiety, and confusion among older patients. Patient and family interest in these therapies continues to grow. However, incorporating CAM programs (e.g. Tai chi, relaxation) into hospital care has been challenging. As part of a comprehensive patient care initiative in the Cleveland VA Geriatric Research, Education, and Clinical Center (GRECC), the C.A.R.E.S. Project developed a “CAM Center of Excellence” which focused on education of staff and family members and the purchasing of CAM resource materials. A total of 346 healthcare professionals attended 20 CAM programs offered over 4 months; 97.9% of individuals who completed an evaluation (n=233) found the programs to be useful in their personal/professional life (e.g. patient care). Overall responses to the programs were very positive and many staff requested further workshops/trainings. Resource acquisition included the initiation of “comfort carts” for inpatient wards. These carts included books/magazines, DVD players, healthy snacks, and guided imagery on stress, pain, and health care for delivery of comfort care to patients and families. Beds were purchased for inpatient wards to encourage extended family visitation. Though implementing these items onto the wards was slow, patient satisfaction scores improved. Inpatient overall quality (% of responses 9 or 10 out of 10) increased between Quarters 1/2 (before the program) and Quarters 3/4 (during the program) to benchmark levels. Education programs through the GRECC are ongoing to improve access to and knowledge of CAM and to track outcomes associated with CAM’s use.

OUTPATIENT ANTICOAGULATION EDUCATION AND OUTCOMES

D.M. Kresevic, C.J. Burant, J.E. Denton, S. Ibrahim, 1. Louis Stokes Cleveland VA Medical Center, Cleveland, Ohio, 2. University Hospitals Case Medical Center, Cleveland, Ohio, 3. Case Western Reserve University Frances Payne Bolton School of Nursing, Cleveland, Ohio, 4. Philadelphia VA Medical Center, Philadelphia, Pennsylvania

Venous thromboembolism (VTE) (pulmonary embolism/deep vein thrombosis) is estimated to be the third most common vascular disorder with one-year survival possibly as low as 63.6%. Age and race have previously been identified as increasing the risk for VTE-associated mortality. The aim of this study was to evaluate outpatient anticoagulation education and outcomes and assess differences based on race, patient education level, or trust in the anticoagulation clinic staff. The study followed 39 Veterans (M=60.95 years; n=35 males; n=30 Caucasian; n=9 AA) from the time of VTE diagnosis to 3 months after anticoagulation treatment initiation. Overall, trust in the anticoagulation clinic staff who provided the education was high (mean 48.9 out of 55) and did not correlate with race, education, or income. Subjects with greater trust in the anticoagulation clinic staff had higher satisfaction with their healthcare decision regarding anticoagulation (r=0.668, p<0.001), found the anticoagulation management to be less complicated (r=-0.397, p=0.012), and had better mental health scores (r=0.368, p=0.021). The mean score on the Oral Anticoagulation Knowledge (OAK) test was 13.54 of 20 (range: 4 to 18). OAK scores were not significantly correlated with race, education, income, social support, mental/physical health, or trust in anticoagulation clinic staff. In regard to outcomes, the average percentage of INR values within therapeutic range (2.0-3.0) was 37.1%. No significant differences were found in INR management based on race (p=0.05). These findings should be validated in a larger study but suggest the need for additional educational strategies to achieve quality anticoagulation outcomes for all patients.

WHAT DO OLDER ADULTS UNDERSTAND AND REMEMBER AFTER READING COLORECTAL CANCER PREVENTION INFORMATION?

C. Liu, S.M. Rawl, Indiana University at Indianapolis, Indianapolis, Indiana

Colorectal cancer is the third leading type of cancer affecting both men and women age 50 years and above. Although the national screening rate has slightly improved after decades of prevention efforts, it still falls below the optimal level. The availability of easy to read cancer prevention information is fundamental to increase awareness and the screening rate. The purpose of the current study was to examine whether or not cancer prevention information written at high text cohesion would be easier for older adults to understand and remember than information written at low text cohesion. Forty-five adults (51 to 84 years old) read the information written at either high text cohesion or low text cohesion. Results show that text cohesion facilitates reading speed but not comprehension nor recall. Both comprehension and recall decline after two weeks. Non-significant findings of text cohesion could be due to the high percentage of participants with adequate health literacy. Additionally, although poor lifestyle (high fat diet, inactivity) is mentioned only as a risk factor in the information given to participants, more than half of the participants recalled lifestyle change along with screening tests as ways to prevent cancer. Conclusion: To help older adults retain knowledge of colorectal cancer prevention, multiple exposures to the information is necessary. Further research on the effect of text cohesion among older adults with limited health literacy is recommended. The results also indicate that participants often have misconceptions about lifestyle change and how it relates to cancer prevention. The infor-
OUTDOOR ENVIRONMENT, MOBILITY DECLINE AND QUALITY OF LIFE AMONG OLDER PEOPLE

M. Rantakokko, S. Swarsson, T. Rantanen, 1. Gerontology Research Centre, Department of Health Sciences, University of Jyväskylä, Jyväskylä, Finland, 2. Department of Health Sciences, Lund university, Lund, Sweden

Objective: The purpose of this study was to examine the effects of perceived barriers in the outdoor environment on outdoor mobility and quality of life in older people. Methods: Baseline data on all participants (n=727) and follow-up data on the control group (n=314) from the Screening and Counseling for Physical Activity and Mobility among Older People randomized controlled trial was used. Participants were 75- to 81-year-old community-dwelling people living in Jyväskylä, Finland, and the total follow-up time was 3.5 years. Data on barriers in the outdoor environment, walking difficulties, fear of moving outdoors, unmet physical activity need and quality of life (QoL) were obtained in face-to-face interviews. Results: Perceived barriers in the outdoor environment predicted development of walking difficulty in the 3.5-year follow-up. Barriers in the outdoor environment also underlay fear of moving outdoors, which predicted development of walking difficulty and unmet physical activity need. Fear of moving outdoors predicted walking difficulties independently of the environmental factors. Unmet physical activity need was more common among ambulatory community-dwelling older people who had mobility problems and reported barriers in the outdoor environment. Barriers in the outdoor environment which encumbered outdoor mobility increased perceptions of fear of moving outdoors and unmet physical activity need and resulted in poor QoL. Conclusions: Barriers in the outdoor environment may hinder older people to maintain outdoor mobility which is a prerequisite for independent living in the community. Ways of overcoming fear of moving outdoors and barriers to physical activity need to be developed and further explored.

ASSOCIATION OF SMOKING AND BLOOD PRESSURE AMONG OLDER CHINESE POPULATION

X. Pan, Miami University, Oxford, Ohio

The objective of the current study is to examine cigarette smoking as a predictor of blood pressure among the Chinese population 45 or older. It is hypothesized that smoking will be associated with increased blood pressure after adjusting for demographic characteristics, social class, BMI, and alcohol intake. Pilot data from the CHARLS 2008 (Chinese Health and Retirement Longitudinal Survey) were used to investigate the difference in blood pressure between smokers and nonsmokers. Participants were 1,945 residents (51.7% men and 48.3% women) of the Zhejiang and Gansu provinces of China. Data includes survey interviews (including smoking status: never, past, or current) and laboratory exams (e.g., BMI, BP measurements). Participants were stratified into 4 age groups (under 55, 55-65, 65-75 and 75+). Multiple regression investigated the prediction of smoking in BP. Results revealed that male smokers 55-65 had higher systolic BP adjusted for age, BMI, social class, and alcohol intake than nonsmoking men. Among women, light smokers (1 to 4 cigarettes/day) tended to have lower BPs than heavier or never smokers, significantly so for diastolic BP. Among men, a significant interaction between BMI and smoking was observed. Women, BP differences between nonsmokers and light smokers were most obvious in those who did not drink alcohol. In summary, the independent chronic effect of smoking on BP among older Chinese population is small, and differences between men and women in this association are likely due to complex interrelations among smoking, alcohol intake, social class and BMI.

THE RELATIONSHIPS BETWEEN RETIREMENT, SOCIAL CAPITAL, AND HEALTH: A POPULATION-BASED LONGITUDINAL COHORT STUDY

J. Wang, L. Chang, 1. Department of Health Care Management, Chang Jung Christian University, Kway Jen, Tainan, Taiwan, 2. National Cheng Kung University, Tainan, Taiwan

Study Objectives: To examine the impact of retirement on self-perceived health and social capital of community-dwelling elderly in Taiwan. Methods: Subjects aged 50 and older participating in 2003 and 2007 waves of the Survey of Health and Living Status of the Elderly in Taiwan were included in analyses. After excluding observations with missing values, nursing home residents, and people without prior employment history, the final sample numbered 3322. Multinomial logistic regression models were used to examine the relationships between retirement and self-perceived health. Logistic regression and multiple regression models were used to examine the relationships between retirement and three measures of social capital — social trust, social support, and social participation. All models were controlled for age, gender, race, marital status, educational level, comorbidities, and health behaviors. Results: 1217 subjects retired between 2003 and 2007. Retirement status is not significantly associated with change in self-perceived health and social trust. However, those who retired had significantly higher levels of social participation and social support. Conclusions: Contrary to the ageist belief of decreasing health with aging, the results suggest that retirement does not predict change in subjective health. The findings do not support the notion of disengagement theory and, instead, suggest that retirement provides more opportunities for building social support and participation. Future studies should examine whether social capital mediates the relationships between retirement and subjective health.

DIFFERENCES IN PHYSICAL ACTIVITY BETWEEN ELDERLY JAPANESE MEN AND WOMEN

T. Sakai, Faculty of Health and Sports Science, Doshisha University, Kyotanabe, Japan

The purpose of this study was to determine the differences in the duration and intensity of physical activity among elderly couples. The participants comprised 20 elderly Japanese couples (husband: 71.1 ± 5.6 yrs, wife: 67.9 ± 4.8 yrs). All the participants were issued with an Active Style HJA-350IT accelerometer for 3 months (Omron Healthcare Co., Ltd., Japan). The participants were instructed to wear the pedometer on their waistline all day, except when bathing, showering, swimming, or sleeping. This instrument was to measure the number of steps and the duration of physical activity of the husbands (609.1 ± 107.6 minutes/day) was significantly shorter than that of their wives (730 ± 97.1 minutes/day). The duration of physical activity of the husbands (609.1 ± 107.6 minutes/day) was significantly shorter than that of their wives (730 ± 110.0 minutes/day, P < 0.05). In addition, the duration of activity > 3 METs among the husbands was significantly shorter than that for their wives (553.1 ± 107.6 minutes/day vs. 671.3 ± 97.1 minutes/day, P < 0.05). However, the durations of activity > 3 METs were very similar between men and women. The most characteristic difference in physical activity in elderly couples is the duration of activities of different intensities. Therefore, I think that it is necessary to measure not only step counts but also the intensity of activity.

THREE DIMENSIONS TO DESCRIBE THE HEALTH OF THE ELDERLY: FUNCTIONING, MORBIDITY AND PERCEIVED HEALTH

This study aimed to describe the relation among functional impairment, number of chronic diseases, and subjective health in the elderly.
population over 60. Data were gathered from the SNAC-K Project, a community-based prospective cohort in Sweden. At baseline the health of 3363 adults, 60 years and older, was examined by physicians, and their functioning assessed by nurses. Functioning concerned the ability to perform activities of the daily living, and all chronic disorders were classified according to ICD10. Perceived health was reported as subjective absolute health, i.e. how the participant rated his/her health, and comparative subjective health, i.e. rate of health with respect to peers. A health score was created using functional impairment and number of chronic diseases, being 0 no functional impairment and no chronic diseases, and 8 high impairment and 3+ chronic disorders. The absolute and relative subjective health changed in opposite directions with age, as subjective absolute health was rated more negatively by the oldest old than by the younger old, but the opposite was true for relative subjective health. For that reason we used relative subjective health when analyzing the relation between perceived health and health score. A strong positive association was found, as subjects who better rated their health with respect to others, had lower health score. The positive association was driven by functional aspects more than morbidity.

COLLAGE CREATION AS A TECHNIQUE OF EXPRESSION FOR AN OLDER PERSON WITH COGNITIVE IMPAIRMENT

J. Kitayama, Sophia University, Tokyo, Japan

Previous Japanese research suggests that creating collages is an effective technique of art therapy for older adults. The purpose of this case study is to interpret the process of successive photo collage creation by a person who has cognitive impairment. A Japanese woman in her mid-80’s, who suffers from Alzheimer’s Disease, attended the collage group at her group home. Due to short term memory loss she did not recall that she participated in the group or remember the work she did afterward, but she enjoyed making collages on each occasion. In nine months, she produced 28 works. She preferred to select religious images such as Buddhism, Shinto, and Christian materials. Also she liked photos of beautiful landscape, great nature or something mysterious which are considered elements of the idea of the numinous. Even though various kinds of pictures were prepared, she tended to choose such motifs in line with her own interest. During the group sessions, she denied believing in any particular religion, and did not mention her thoughts on faith. Analysis of the process reveals that she experienced psychological interactions with spirituality through the collage making. She must need spiritual assistance because of her confrontation with illness or death unconsciously, however, she never verbalized these abstract sentiments in her routine life. The results of this case study demonstrate that even if the person with dementia who has limited capability of memory or speech, can express the depth of his/her internal mind by means of collage creation.

SHORT INTERVENTION TO IMPROVE ACCEPTANCE AND SUBSEQUENT USE OF HEARING HEALTH SERVICES

M.I. Wallhagen1, W. Strawbridge1, 1. Physiological Nursing, University of California, San Francisco, San Francisco, California, 2. Institute for Health and Aging, San Francisco, California

Hearing loss (HL) is common in older adults yet many do not seek treatment or obtain hearing aids (HAs) when screened for HL because they lack knowledge about HL and what to expect from HAs. We designed a short educational intervention for use in primary care settings that addresses HL, perceptions about its consequences, and issues related to HA adaptation. Twenty-seven adults age 60 or older with varied ethnic backgrounds have participated in a pilot test of the intervention. All completed a 21-item questionnaire assessing their understanding of HL and treatment before and after exposure to the education material. The most striking result was change in “Don’t Know” responses from 138 on the pre-test (5.1 per subject) to only 11 on the post-test (0.4 per subject). When asked whether the educational material made it more likely they would seek a hearing evaluation, consider getting HAs, or use assistive devices if they had HL, all but two answered positively. All questions assessing knowledge showed higher scores on the post-test compared with the pre-test. Some changes were dramatic; four items increased by 0.85-1.30 points: #6 (not hearing consonants in words), #13 (other assistive aids besides hearing aids can help), #15 (you hear better when someone shouts) and #20 (you have to relearn words), #13 (other assistive aids besides hearing aids can help), #15 (you hear better when someone shouts) and #20 (you have to relearn words). In spite of the small N, 14 changes were statistically significant. This short intervention could improve acceptance and use of hearing assistive devices for those undergoing screening for HL.

HEARING-AID IMPROVES SPEECH RECOGNITION IN BOTH SILENCE AND PRESENSE OF NOISE IN THE ELDERLY

C.C. Soldera1,2, A.J. Bozé1, M.I. Costa3, 1. Federal University of Health Science of Porto Alegre, Porto Alegre, RS, Brazil, 2. Pontifical Catholic University of Rio Grande do Sul, Porto Alegre, RS, Brazil, 3. Federal University of Santa Maria, Santa Maria, RS, Brazil

The aging process causes a physiologic degeneration of the whole organism, causing physical and psychological changes, including hearing loss, called presbycusis. Presbycusis is characterized by a high-frequency hearing loss and difficulties in speech intelligibility, mainly in noisy environments. The aim of this study was to verify, in elderly subjects, the effectiveness of hearing aids use in the recognition of sentences in silence and in the presence of noise. Methodology Thirteen elderly patients, with ages between 67 and 92 (average of 76 y.o.), with mild to moderately severe hearing loss, who were hearing-aid users for at least three months of hearing aids with the same technology, brand and model. The individuals were submitted to an anamnesis and to the test of the Silent Sentence Recognition Threshold (SSRT) and in the presence of noise (NSRT). The sentences and the noise (fixed in 65 dB) were presented on free-field through the “ascendant-descendant” strategy, using the test material idealized by Costa. Results There was a statistically significant difference (p=0.026) between the SSRT obtained with and without the use of hearing aids, and also in the NSRT (p=0.012). Conclusion In the elderly group evaluated, the use of hearing aids was effective for speech recognition, both in silence and in the presence of noise.

THE MEANING AND IMPACT OF CREATIVE DANCE AND STORY TELLING IN LONG TERM CARE: AN INTERDISCIPLINARY PERSPECTIVE

L. Dutton1, M. Genne1,2, K. Haertl1, C.N. Sullivan1, S. Rydholm1, K. Shafer1, 1. St. Catherine University, Minneapolis, Minnesota, 2. Kairos Dance Theatre, Minneapolis, Minnesota

PURPOSE: The aim of this study was to apply mixed methods to explore the impact of an arts-based program incorporating creative dance, reminiscence and story-making on the quality of life of long-term care residents. Recent research has sparked renewed interest in the importance of the arts for the health and well-being of older adults (Cohen, 2006). This literature suggests that participation in arts-based programs may be associated with positive health outcomes related to quality of life, physical function, cognition and depression (Cohen et al, 2006; Eyigor et al, 2009; Hokkanen et al, 2008). However, there is a dearth of research examining these outcomes as they relate to the impact of creative dance for long-term care residents. DESIGN AND METHODS: A mixed methods design study was conducted by an interdisciplinary team. Professionals from Kairos Dance Theatre designed and implemented a creative dance and story-telling program at five long-term care facilities. Quantitative measures of cognition (MMSE), mood (GDS) and balance (Berg Balance Scale) were collected at the beginning of the program and after each 12 week session by facility staff. These data were analyzed using a retrospective design with paired t-tests and repeated measures ANOVA. The prospective phase of the study

THE Gerontological Society of America
was conducted at the end of the program in two of the five facilities. Semi-structured interviews were administered to 11 volunteers and staff and 3 caregivers. Questions focused on their observations of the dance program’s impact on the participants, volunteers, families and staff.

RESULTS: There was a statistically significant improvement (n = 71, t = -2.1, p = .034) in balance scores from baseline (m = 22.55, SD = 16.36) to 12 weeks (m = 24.15, SD = 17.46). Average MMSE scores significantly declined (n = 116, t = -2.10, p = .031) from baseline (m = 13.39, SD = 8.99) to 12 weeks (m = 13.21, SD = 9.19). On the GDS no significant differences were found after 12 weeks. No significant differences were found on any measure at 24 or 36 weeks. Initial analysis of the qualitative data using framework analysis (Lacey and Luft, 2001) suggests that this program had a positive impact on participants’ mood, cognition, mobility, personal validation and creativity. There was also a positive influence on the atmosphere of the long-term care facilities.

IMPLICATIONS: This mixed method study suggests that creative dance programming can have a positive influence on residents in long-term care facilities. Quantitative results were mixed but largely remained stable over time, while qualitatively positive impacts were reported for participants, caregivers, staff and the facilities.

SESSION 235 (POSTER)

DISEASE MANAGEMENT

ASSOCIATIONS BETWEEN PHYSICAL ACTIVITY, BODY MASS INDEX, AND HEALTH RELATED QUALITY OF LIFE AMONG OLDER BREAST CANCER SURVIVORS

K.L. Phillips1, R. Paxton2, L.A. Jones2, J. Pierce2, 1. Program on Aging & Care, Scott & White Health Care, Temple, Texas, 2. MD Anderson, Houston, Texas, 3. University of California, San Diego, La Jolla, California

Physical activity among breast cancer survivors has been linked to a reduction in treatment-related burden and an improvement in health-related quality of life (HRQOL). However, few studies have reported on the associations between physical activity and HRQOL in older breast cancer survivors. The purpose of this study was to examine the associations between physical activity, body mass index (BMI), and HRQOL in the context of demographic and medical characteristics among an older sample of cancer survivors. This study is based on 715 older (mean age = 64.7; SD=3.4) breast cancer survivors that participated in the Women’s Healthy Eating and Living (WHEL) Study. At baseline, survivors were assessed on height and weight and they completed measures regarding physical activity, HRQOL, demographic and medical characteristics, including total number of chronic conditions and physical function. Crude and adjusted Spearman correlation coefficients were used to examine associations between physical activity, body mass index, and HRQOL. The analyses revealed that total number of chronic conditions adversely influenced HRQOL (p < 0.001). Physical activity was significantly and positively associated with physical function, general health, and energy (p < 0.001). BMI was inversely associated with physical function, role limitations, and energy (p <0.001). These results indicate that medical characteristics play a considerable role in the health and health behaviors of survivors. The data also suggests that participating in physical activity may preserve function and improve mental health outcomes among older survivors.

HEALTH CARE UTILIZATION BY PATIENTS WITH CANCER NEWLY ENROLLED IN LONG TERM CARE

OBJECTIVES: The limited research concerning older adults with cancer enrolled in Long Term Services and Supports (LTSS) primarily targets nursing home patients close to their death. The purpose of this descriptive study was to more fully explicate the older adult cancer population newly enrolled in LTSS and their health care utilization. METHODS: Secondary analysis of baseline data from 470 study patients ages 60 and over enrolled in Health Related Quality of Life: Elders in Long Term Care Study. Patients were newly enrolled in LTSS from assisted living facilities (ALF) (n=156), nursing homes (NH) (n=158), and home and community based sites (HCBS) (n=156). Demographics, cancer status, health care utilization (defined as sum of number of hospitalizations, emergency room visits, short-term rehabilitation stays, nursing home placements, and physician visits during previous three months) were abstracted from medical records. Statistical analysis consisted of descriptive statistics and t-tests. RESULTS: Among patients enrolled in the study, 84 (18%) were diagnosed with cancer. Majority of patients with cancer lived in ALFs (54%) and diagnosed with breast (24%), prostate (19%), or colon (11%) cancers. Four of the patients with breast and prostate cancer received hormone therapy. Patients with cancer had significantly higher health care utilization during previous three months before enrolling in LTSS (p=0.01) than those not diagnosed with cancer. CONCLUSIONS: The results of this study suggest that patients with cancer newly enrolled in LTSS may have differing health care requirements than other LTSS populations.

THE PREVALENCE OF ARTHRITIS AMONG MEN AND WOMEN FARMERS

M. Teaford, S.R. Flinn, The Ohio State University, Columbus, Ohio

Rural America is aging which is putting a strain on the rural health care system since there are fewer healthcare professionals available to care for older adults. For example, the average farmer is 57 years old (Census, 2007). Because of the strenuous activity involved in their occupation, farmers may develop arthritis. This is a disease that can impact functional health and economic livelihoods. Women now are 30% of all farm operators, an increase of almost a third since 2002. In general, women are significantly more likely to report that they have arthritis than men (43% v. 31%) and this increases with age (CDC, 2011). Are farmers more likely to report that they have arthritis and are women who farm more likely to report that they have arthritis than male farmers? A recent study of farmers in Ohio studied 111 women and 198 men (age 50 to 89) who are farming. They were recruited at county fairs and other agricultural events. They were asked if they had been told by a health care professional that they had arthritis: 144 reported they had been told they had arthritis (37.8%). Of the women, 56.4% reported arthritis compared to 41.8% of the men (chi-square= 5.968, p<.01). The results suggest that women are more likely to see a health care professional regarding arthritis. Given the shortage of professionals in rural areas, there is a need for better outreach to farmers regarding arthritis prevention and management in order to better serve men.

ADAPTING THE ASHP FOR USE IN THREE RACE/ETHNICITY GROUPS: DESCRIBING THE PROCESS AND PRODUCTS

Pain disorders are common in later life and a major cause of disability and suffering. Self-management programs have been developed and implemented as a means of helping individuals better manage pain. The Arthritis Self Help Program (ASHP) is an evidence-based program that improves participants’ pain-management abilities, but has limited reach, particularly among older minority communities. Using community based participatory research (CBPR) methods, we adapted the ASHP in an effort to enhance the program’s reach and utility among three groups of older persons: African American, Hispanic and non-Hispanic white adults. Specific steps included: 1) creating a community steering committee (SC); 2) implementing the ASHP among older adults
with pain and using diverse data collection methods to generate recommendations for program change; and 3) employing a shared decision-making approach to determine which recommendations to adopt. The process generated 71 recommendations for program change; 54% were accepted by the SC and grouped into several categories: 1) restructuring class format to maximize learning (e.g., cutting down on individual sharing during class), 2) modifying programmatic elements to accommodate persons with lower literacy levels, and 3) expanding existing or adding new educational components (e.g., expanding section on healthy eating, adding new section on spirituality as a method of dealing with pain). The CBPR model was a practical tool for adapting the ASHP for use by the target populations and produced suggestions for change that may help to extend the program’s reach and effectiveness. Implications of the findings regarding adaptation of evidence-based programs are discussed.

WARFARIN-SPECIFIC MEDICATION CHARTS - DO THEY HAVE A PLACE IN AGED CARE FACILITIES? J. Mullan, M. Jordan, V. Traynor, Graduate School of Medicine, University of Wollongong, Wollongong, New South Wales, Australia

Research Methods An action research study using a qualitative approach was used to evaluate the implementation of a warfarin-specific medication chart in a number of different residential aged care facilities based in Australia. At the conclusion of a 3 month trial with the new chart, semi-structured interviews were conducted with General Practitioners (GPs) and Registered Nurses (RNs) involved in trialing the new chart. Research Results The warfarin specific medication chart was successfully developed by a multidisciplinary team (including doctors, nurses and pharmacists) and trialed in three Australian ACFs managing 23 older residents receiving warfarin therapy. The 10 GPs and 12 RNs interviewed about the new chart at the completion of the 3 month trial, unanimously agreed that the chart should be accepted as usual practice for all ACFs because it was easy to use; time-saving; and improved communication about warfarin doses, administration times and monitoring. Research Conclusions A warfarin specific medication chart can be used effectively to improve current practice with regard to warfarin prescribing, management and administration. Furthermore, these improvements in clinical practice could also potentially reduce the number of warfarin related adverse events in ACFs.

SLEEP: AN OVERLOOKED COMPONENT OF HEALTH AND QUALITY OF LIFE IN OLDER ADULTS J. Hughes, J.L. Martin, Geriatric Research, Education, and Clinical Center; VA Greater Los Angeles Healthcare System, North Hills, California

Sleep complaints are prevalent in older adults (57%) and are associated with a variety of medical and psychiatric comorbidities, poor health behaviors, and increased medication use. Numerous studies show that self-reported indicators of poor sleep (e.g., nightly hours of sleep) are associated with poor health outcomes, low quality of life, and elevated mortality risk. Healthy People 2020 includes sleep as a national health objective; yet, few state-level health surveys measure sleep-related variables. The current analysis explored factors known to be related to poor sleep among older adults (age≥65) respondents to the California Health Interview Survey (CHIS). 22.8% of respondents were 65 or older. Among factors known to be related to sleep apnea, high blood pressure (60.1%), anti-hypertensive use (53.8%), obesity/overweight (53.9%), and heart disease (52.3%) were commonly reported. Among factors known to be related to insomnia, arthritis (50.2%), limited activity/sedentary lifestyle (72.2%), and low health-related quality of life (42.0%) were commonly reported. Only 20.2% had discussed health behaviors with a doctor. These findings suggest a high number of older CHIS respondents report factors known to be associated with poor sleep. While sleep is known to worsen with increasing age and number of chronic conditions, the role of poor sleep in overall health and quality of life remains unclear. To understand this role, sleep itself must be measured. Since there are clear evidence-based treatments for poor sleep, and given that early treatment is known to improve health and quality of life, the addition of sleep-related items to statewide surveys is recommended.

IMPORTANCE OF VISION IN MAINTAINING HEALTHY LIFESTYLE HABITS IN JAPAN A. Hagedorn1, Y. Saito2, J. Davis School of Gerontology, USC, Los Angeles, California, 2. Nihon University, Tokorozawa, Japan

Vision loss is closely associated with difficulty functioning in a community setting, and is associated with the need for long term care services. This study investigates longitudinal changes in vision and disability that occurred over the decade between 1999 and 2009 across 5 waves of data in the Nihon University Japanese Longitudinal Study of Aging (N=4,997, nationally representative of the population 65+) and analyzes how loss of vision at one point over the 10 year study is associated with 2.6 times increased risk of being unable to perform Instrumental Activities of Daily Living, 3.6 times lower likelihood of participating in social activities, and 1.9 times increased mortality risk over the time period, controlling for demographic characteristics and lifestyle behaviors. Vision loss is associated with a high degree of comorbidity, and the impact of vision loss fades considerably in multivariate models which control for chronic diseases and physical activity. The only significant predictors of vision loss are diabetes in a prior wave, untreated cataracts and advanced age. Vision loss is experienced by 25.5% of this sample, with wide variation in the effects of vision loss on later reports of behaviors such as social participation, ability to perform ADLs and IADLs, and the onset of depression. The results suggest that successful adaptation to vision loss can profoundly affect level of disability, risk of falls, and depression in late life.

SEXUAL BEHAVIOR AMONG OLDER PEOPLE ON ART IN LOMÉ, TOGO: A CASE STUDY Y.A. Bessa, A. Moore, Sociology, University of North Texas, Denton, Texas

Recent increases in the availability of antiretroviral therapy (ART) in low-income countries have led to substantial health improvement among people living with HIV/AIDS (PLHA). Studies have shown that PLHA on ART have also gained improved sexual health. However, studies have mostly investigated sexual behavior of younger people, ignoring older people. This study examined the sexual behavior of older Togolese who were on ART. Data were collected on 49 older PLHA via in-depth interviews. More men (73%) reported being sexually active in the past three months of the study relative to women (15%). Several concepts explained sexual behavior among participants. Both men and women reported that because of age and positive serostatus, they could not be promiscuous. However, women were more likely to report that they were sexually inactive to avoid trouble from sexual relationships and have a peace of mind. Findings are explained within the cultural context of the study.

A TWO-YEAR FOLLOW-UP STUDY OF NUTRITION STATUS AMONG VETERANS LIVING IN A LONG-TERM SETTING A. Bostrom1,2, D. Van Soest1, B.K. Kolewaski1, D. Faulder1, D.L. Milke1,2,3, B.K. Kolewaski1,2,3,1. Neurobiology, Care sciences, and Society, Division of Nursing, Karolinska Institutet, Huddinge, Sweden, 2. University of Alberta, Edmonton, Alberta, Canada, 3. CapitalCare Area, Edmonton, Alberta, Canada

In a 2008 study of the nutrition status of elders living in a Veterans’ LTC setting, 58% were identified as ‘at risk for malnutrition’, 31% were malnourished, and 11% were well nourished. In a 2010 follow-up study, following changes in care practices, including more frequent monitoring of intake and weight, nutrition status of the earlier participants was reviewed. The Mini Nutritional Assessment (MNA), well known in

The Gerontological Society of America

BUILDING BRIDGES TO EFFECTIVE CHRONIC KIDNEY DISEASE MANAGEMENT: A MIXED-METHODS NEEDS ASSESSMENT OF PRIMARY CARE PHYSICIANS AND OLDER MINORITY NEPHROLOGY PATIENTS IN EASTERN NORTH CAROLINA

T. Hilliard¹, J.W. Bethel², M. Barchman², 1. University of North Carolina at Chapel Hill, Chapel Hill, North Carolina, 2. East Carolina University, Greenville, North Carolina

Introduction: Aging adults constitute a substantial portion of the Chronic Kidney Disease (CKD) population. This study assesses and identifies CKD management-related needs among primary care physicians (PCPs) and older minority nephrology patients in Eastern North Carolina (ENC). Methods: PCPs practicing in ENC were invited to complete a mailed, semi-structured questionnaire assessing knowledge of CKD management variables and physician-identified needs for improvement. Minority nephrology patients were recruited to participate in a one-time, qualitative interview assessing barriers to care. Results: Thirty-three PCPs responded and twenty-four patients were interviewed (patient mean age=55). The majority of PCP respondents (45.5%) answered exactly three out of five structured test questions correctly. Physician-identified needs included a desire for increased CKD knowledge and the need for affordable medications. Patient-identified barriers included an inability to afford and obtain necessary medications, gaps in Medicaid and Medicare coverage, and inconsistency among primary care providers. Conclusions: Our study highlighted some very important needs among PCPs and minority nephrology patients in ENC. Additional research, to directly assess and address gaps in CKD management most relevant for aging CKD patients, is strongly recommended.

SESSION 240 (POSTER)

HEALTH PROMOTION

OUTREACH TEAM IMPACT: ADDRESSING ISSUES OF OLDER ADULTS IN SENIOR LIVING FACILITIES

K. Segrist, ball state university, Muncie, Indiana

The Community Center for Vital Aging in Muncie, Indiana has been in existence for over 9 years. Within the past 5 years, the Center has reached out to persons living in a variety of housing arrangements in the city. Programming has been provided to a senior exercise group in a federally subsidized housing complex, five skilled nursing care facilities, two low income senior apartment complexes, and an adult day care center. From 2006 through 2010, 297 visits have been made with a total of 3613 persons in attendance. Programming offered included: arts and entertainment (e.g. crafts, Bingo, music presentations, Asian children song presentation, “what if...” sessions); cultural presentations; physical presentations such as Tai-Chi, breathing and hydration, laughing yoga, exercise tactics; and health and education programs on such topics as osteoporosis, preventing stroke, changing and adapting in later life, seasonal depression, brain health, etc. Each semester at least a minimum of 20 programs occurred. A 2009 survey of those who attended the programs indicated the following: 92% learned something from the programs; 91% felt that the programs were well organized; 88% felt comfortable joining in the programs; 82% felt the programs met or exceeded their expectations; 68% indicated that they felt motivated by the programs. Comfort in joining and expectations indicate to be important as a predictive variable determining results of other variables evaluated. As an example of impact on individuals is the case for Jim, a 62 year old with multiple chronic diseases and with over a 10 year experience with prescription medications can be cited. Jim attended programs, learned information that he applied to daily life, saved money on his ability to cut down on medications (under health professional supervision), reported feeling better, and lost 100 lbs.

USING MEDIA STRATEGIES TO PROMOTE HEALTH LITERACY AND COMMUNITY CAPACITY

Media strategies within the health communications arena have built a track record for their use and impact, especially utilizing the Theory of Diffusion of Innovation. Gerontologists can also take advantage of these strategies to promote health literacy and build community capacity, however these concepts and approaches are not commonly and consistently used within the aging workforce. This presentation examines the case studies of two communities that utilized specific media strategies to promote health literacy and build community capacity, devised and executed by social workers specializing in gerontology. Newspaper columns, radio shows, therapeutic workbooks and documentary shows were used and devised using Procheska and Diclemente’s “Stages of Change” theory. The different media strategies targeted specific stages of behavior along the “Stages of Change” continuum. Public policy and program planning efforts often neglect the use of public media as a strategy to promote initiatives, or to garner public support. Findings suggest that these approaches have been helpful in the development of community capacity and improvements in community members’ health literacy.

THE UTILIZATION OF HEALTH CARE SERVICES BY OLDER ADULTS WITH SELF-REPORTED AND ACTUAL MEMORY DECLINE

H. Lee, C. Lee, J. Porter, J. Vaughan, E. Dugan, University of Massachusetts Boston, Boston, Massachusetts

Self-report and objective health statuses are associated and can be a significant predictor of behaviors including health care service utilization. However, self-reported memory decline does not always reflect actual decline accurately. In this study we compared preventive healthcare utilization among those who self-report memory impairment (and may or may not have actual impairment) and those with and without cognitive impairment (those aware of the decline or not). We sought to understand how cognitive function and concern about cognitive function impacts preventive care service utilization. Using data from the 2008 wave of the Health and Retirement Study (HRS), a longitudinal, nationally representative survey of older Americans, a total of 9,702 respondents aged 65 or older (male=4,098, female=5,816) were included in the analysis. Statistical analyses included descriptive statistics, Pearson’s Chi-Square, and one-way ANOVA. Results show that persons with actual cognitive impairment are more likely to use health care services (t=11.26, p<0.00). We found that older women with self-reported memory decline and actual cognitive impairment were less likely to get preventive health services (flu shot, dentist, breast exam) (p=0.00). The percentage of men with cognitive impairment was as expected, but men had a much lower rate of self-report compared to women. Men who do
not report memory decline but actually experience cognitive impairment were much less likely to use health care services (flu shot, cholesterol, dentist, prostate cancer screening) \((p=0.00)\). These findings underscore the need for increased assistance for vulnerable older adults in obtaining routine, but nonetheless important, preventive health care.

SOCIAL INTEGRATION AND SELF-RATED HEALTH AMONG OLDER ADULTS IN URBAN CHINA: DEPRESSIVE SYMPTOMS AS THE MEDIATOR

W. Mao, I. Chi, University of Southern California, Los Angeles, California

The few studies that have investigated the relationship between social integration and health within the Chinese cultural context are very limited, both in terms of explanatory factors considered and sample locations. Utilizing the “social integration and health conceptual framework”, this study aims to examine how social network and community involvement influence self-rated health among older adults in urban China and understand the mediating effect of depressive symptoms. Data used are from the nationally representative study “Sample Survey on Aged Population in Urban and Rural China in 2006”, collected by the China Research Center on Aging. A subsample of adults age 60 and above in urban China \((N=8,018)\) was included in the structural equation modeling using AMOS 18.0 software. Social networks were measured with the 6-item Chinese Version of Lubben Social Network Scale. Depressive symptoms were measured with the 15-item Chinese Version of Geriatric Depression Scale. The model fit was acceptable \((\chi^2 = 3170.75; \text{df} = 57; p = .000; \text{NFI} = .94; \text{CFI} = .94; \text{RMSEA} = .08)\). Gender, years of education, marital status, functional capacities, presence of chronic disease, community involvement, and depressive symptoms were significantly associated with self-rated health. The effects of family network and friend network on self-rated health were mediated by depressive symptoms. Encouraging and maintaining social integration have protective effects on self-rated health among older adults in urban China, however, interventions should also focus on preventing and reducing depressive symptoms besides strengthening and expanding social connections among older adults in order to improve health outcomes.

BODY-MIND-SPirit PRACTICE FOR HEALTHY AGING: EDUCATIONAL PROGRAM DEVELOPMENT AND IMPLEMENTATION

J. Lee\(^{1}\), E. Lee\(^{2}\), H. Yoon\(^{2}\), E. Jang\(^{3}\), Y. Ji Young\(^{2}\), 1. Boston College, Chestnut hill, Massachusetts, 2. University of North Carolina at Charlotte, Charlotte, North Carolina, 3. Hallym University, ChooonChun, Republic of Korea

The changing needs for health promotion of South Korean older adults and their broad definition of healthy aging call for innovative educational programs that can be implemented at senior centers. This community-based, health promotion program for older adults provided a comprehensive review of the effects of body-mind-spirit (BMS) interventions on health behaviors. The 12-week curriculum offered sessions on exercise, nutrition, sexuality, leisure, stress management, cognitive behavioral therapy, forgiveness, and happiness. Evaluation of the BMS program was conducted in terms of goals, processes, and outcomes. In goal-based evaluation, 56 gerontological experts carefully reviewed the adequacy of the program’s objectives and instructional methods to meet the needs of older adults in South Korea. Seventy community-dwelling older adults were recruited at two community welfare centers and assigned to experimental and control groups. A mixed method quasi-experimental research design used pre-and-post-tests groups to examine the outcomes for experimental \((n=32)\) and control groups \((n=38)\). Qualitative feedback from older participants and instructors’ field notes were also used. The multifaceted evaluations using before-and-after measures and comparison groups showed that participation in the BMS program contributed to better outcomes in the physical and spiritual dimensions of health. One of the most successful aspects of the BMS program was the enthusiastic participation of the community-dwelling older adults. Group cohesiveness and strong motivation brought by the older participants enriched the curriculum and active learning processes. Gerontological practitioners should continue developing lifestyle intervention models to help older adults maintain a strong motivation and thirst for active learning.

BE WELL: RESULTS OF A NUTRITION, EXERCISE, AND WEIGHT MANAGEMENT INTERVENTION AMONG FRAIL OLDER ADULTS

A. Coulourides Kogan\(^{1}\), B. Hart\(^{2}\), J. Gonzalez\(^{3}\), S. Enguidanos\(^{1}\), 1. Davis School of Gerontology, University of Southern California, Los Angeles, California, 2. Food and Nutrition Management Services, Inc., North Hollywood, California, 3. Partners in Care Foundation, San Fernando, California

Exercise and physical activity are thoroughly documented to improve psychosocial well-being by reducing depressive symptoms, in addition to the multitude of physical health benefits. As the number of older adults increases world-wide, including the prevalence of chronic diseases and extended life expectancy, it is imperative to develop interventions specifically targeted at this population to combat the effects of and increased risk for frailty, disability, and hospitalizations. The purpose of this study was to test the effectiveness of a multifaceted exercise, health, and nutritional education intervention for community-dwelling older adults with multiple chronic conditions. This study reports finding from Be Well; a fitness and exercise program providing nutritional counseling, low impact exercise, and weight management especially designed for nutritionally high-risk older adults with chronic conditions. A pre/post, quasi-experimental study design as employed with data collection points at baseline and four-month follow-up in the setting of two community-based senior centers in the Los Angeles area. Participants included sixty-two older adult health maintenance organization members, aged 60 years or more, with multiple chronic conditions, one or more emergency department visits or hospital admissions in the previous six months, and screened for high nutritional risk. Significant improvements for hours of weekly exercise, daily distance walked, performance on six different fitness tests, depression scores, nutritional risk scores, and body measurements (including circumference, weight, body fat percentage, and body mass index) were observed. Findings speak to the healthy benefits of exercise and good nutrition as possible alternatives to pharmacological interventions for weight loss and depression.

BE WELL: AN EXERCISE AND NUTRITION INTERVENTION TO IMPROVE THE HEALTH STATUS OF CHRONICALLY ILL OLDER ADULTS

M.E. Canon\(^{1}\), S. Enguidanos\(^{1}\), B. Hart\(^{2}\), N.E. Gibbs\(^{3}\), J. Gonzalez\(^{3}\), 1. USC-Gerontology, Los Angeles, California, 2. Be Well Services, Inglewood, California, 3. Kaiser Permanente Medical Center, Baldwin Park, California, 4. Partners in Care, San Fernando, California

Environmental factors such as diet and exercise have been shown to greatly influence the development and progression of many chronic conditions. Chronically ill older adults have increased risk of hospitalization, disability and death, as well as presenting a distinct challenge for the American Healthcare system. The purpose of this study is to assess whether chronically ill older adults participating in Be Well—a fitness and nutrition intervention that provides low impact exercise classes, nutritional counseling, and weight management—exhibit improved health. Participants included 62 males and females over the age of 60. Eligible participants included individuals with two or more chronic conditions, and who had been admitted into the hos-
Hispanic, and Other Race adults were less likely to use CAM (p<0.05). Nic disparities in provider-administered CAM use: Non-Hispanic Black, analytic sample (N=2,554) included adults age 55 and older who reported physicians. Data for this analysis come from the 2007 National Health this study is to investigate: 1) demographic characteristics of older users education: chiropractic, acupuncture, and massage (CAM). The aim of on provider-administered, licensed, modalities that require accredited attended treatments like supplements and prayer). This study focuses A CREATIVE ARTS PROGRAM: UNDERSTANDING MORALE AND EXPERIENCES OF OLDER ADULTS I.A. Gutheil1, J.C. Heyman1, M. Bial1, M. O’Malley1, 1. Ravazzin Center on Aging, Fordham University, West Harrison, New York, 2. Lifetime Arts, Pelham, New York A one-group pretest posttest design was used to determine if arts and performance programs offered to older adults at public libraries in New York City increased the morale of participants. Each workshop series had from 8 to 10 sessions led by a professional teaching artist provided by Lifetime Arts. The Philadelphia Geriatric Center (PGC) Morale Scale was used in this study. This instrument has been widely used and was one of the measures in Cohen’s (2004) research. Morale is a composite score of 17-items and three factors: attitudes, loneliness dissatisfaction, and agitation. Possible scores range from 0 to 17, with higher scores indicating higher morale. Of the 45 matched cases, participants were predominately female (88.9%) and Caucasian (66.7%), with an average age of 68.6 years (SD=8.1). Over 55% lived alone. At pretest the average morale score was 12.40 (SD=3.80). At posttest the average morale score increased to 13.11 (SD=3.59), indicating a statistically significant improvement in overall morale of program participants. Participant responses to an open-ended question asking what they liked best about the program underscored its value. Examples of responses: “Coming together for the program development, going through the process and finding a new aspect of myself.” and “Replaces any therapy I might feel I need.” This study adds to the empirical literature demonstrating the value for older adults of involvement in creative arts programs.

PROVIDER-ADMINISTERED CAM THERAPY: CHIROPRACTIC, ACUPUNCTURE & MASSAGE USE AMONG OLDER AMERICANS K. Porter, C. Lee, M. Nguyen, E. Dugan, UMass Boston, Quincy, Massachusetts Previous CAM research includes a range of therapies (e.g., self-administered treatments like supplements and prayer). This study focuses on provider-administered, licensed, modalities that require accredited education: chiropractic, acupuncture, and massage (CAM). The aim of this study is to investigate: 1) demographic characteristics of older users and reasons for use 2) financial burden of use, and, 3) role of allopathic physicians. Data for this analysis come from the 2007 National Health Interview Survey (NHI). The NHI is a representative, population-based survey of the civilian, non-institutionalized US population. The analytic sample (N=2,554) included adults age 55 and older who reported ever having used CAM. The mean age of subjects was 66.99 (SD 8.87), 58% were female, 81% were non-Hispanic White, and 56% reported at least some college education. Logistic regression showed racial and ethnic disparities in provider-administered CAM use: Non-Hispanic Black, Hispanic, and Other Race adults were less likely to use CAM (p<0.05). Those most likely to use CAM were: female, college education, White, very good/excellent health.

RACIAL-ETHNIC DIVERSITY, MIND-BODY INTERVENTIONS, AND DEPRESSION AMONG SENIOR CENTER USERS: RESULTS FROM THE NEW YORK CITY HEALTH INDICATORS PROJECT N. Giunta1, C. Morano1, S. Panuska1, N.S. Parikh1, D. Friedman1, M.C. Faha1,2, W. Gallo1,2, 1. Hunter College School of Social Work, City University of New York, New York, New York, 2. City University of New York School of Public Health, New York, New York, 3. City University of New York Graduate Center, New York, New York, 4. Brookdale Center for Healthy Aging & Longevity at Hunter College, New York, New York As the older adult population grows and racial/ethnic diversity increases, there is increasing evidence that older adults are turning to complementary and alternative medicine (CAM) to address physical and mental health issues. However, there are mixed findings regarding racial and ethnic differences in the use of CAM. The Health Indicators Project included a comprehensive survey with a representative sample of senior center participants (N = 1,870) in New York City. Using a stratified random sample of 56 senior centers citywide, in-person interviews were conducted in five languages using standardized individual and neighborhood-level measures. This paper examines the relationship between one type of CAM known as mind-body interventions (MBI) and severity of depressive symptoms among an ethnically and racially diverse sub-sample with depressive symptoms (n=525). Bivariate analyses support evidence of racial/ethnic differences in MBI use (Chi square = 14.09, p < .01) and suggest a significant negative relationship between MBI use and depression severity (F = 6.73, p < .01) as measured by the Patient Health Questionnaire-9 (PHQ-9). These findings depart from the literature in that African American elders in this sample were more likely to have used MBI than other racial/ethnic groups. Multivariate analysis using ordinal regression suggests that when controlling for race/ethnicity, health status, use of MBI, and barriers to medical care, predictors of depression severity include health status, experiencing barriers to medical care, and Hispanic identity. The implications for designing community-based interventions as well as directions for future research will be discussed.

SESSION 245 (POSTER) INTERGENERATIONAL RELATIONS THE EFFECT OF GRANDPARENTING ON THE GRANDPARENT’S PSYCHOLOGICAL WELL-BEING: SOCIAL SUPPORT AS MEDIATORS S. Won, Social Welfare, Daegu Cyber University, Gyeongsan, Republic of Korea As a maternal employment rate has been increasing in Korean society, grandparents often provide child care for their grandchild. Thus, the purpose of this study is to investigate the effect of grandparenting on the grandparent’s psychological well-being, depression. In addition, it is to analyze the mediating effect of relationship with the adult child, relationship with friends, and social gathering in relation to grandparenting and the grandparent’s depression. The researcher conducted a secondary data analysis using the Korean Longitudinal Study of Aging (KLOSA), collected between July and December in 2006. The 555 grandparents were included in the structural equation model for the analysis. The findings indicated that the time grandparents spent to care for their grandchild per day and the total grandparenting period per year were significantly related to the grandparents’ level of depression. Among social support measures, the relationship with the adult child was a significant mediator between grandparenting and the grandparent’s well-being. In addition, grandparent’s age was also associated with the grandparenting and the grandparents’ level of depression. However, grandparent’s health condition was not significant to depression while it had a negative relationship with time of grandparenting per day. This...
study suggested community-based social support programs for grandparent caregivers as their psychological well-being decreases as they spend more time caring for their grandchild. In addition, as family support mediates the relationship between care stress and the psychological well-being of the grandparents, it is necessary to provide programs to enhance family ties for three-generation families.

LEGAL CHALLENGES AND CONCERNS FACING GRANDMOTHER CAREGIVERS
A. Jeanblanc1, C. Musil2, C. Warner2, 1. Jeanblanc & Rosser, LLP, Cleveland, Ohio, 2. Frances Payne Bolton School of Nursing, Case Western Reserve University, Cleveland, Ohio

In the legal world, there is much attention paid to the issue of visitation rights of non-custodial grandparents, but significantly less to the needs of grandparents actively raising their grandchildren. With ever-increasing numbers of children living in skipped-generation households, more public attention to the corresponding legal issues is needed. According to the 2008 American Community Survey, 2.6 million US grandparents (1.6 million grandmothers) are responsible for the day-to-day care of 7 million grandchildren. This paper focuses on the general legal needs and analysis of specific issues faced by Ohio grandparent caregivers and includes analysis of legal issues and needs raised by 486 Ohio grandmothers participating in a longitudinal study of grandmother caregivers. Most of our grandmothers raising grandchildren took the responsibility because one or both parents were unable to do so, most commonly because of substance abuse or mental health issues. Many have faced long legal battles to obtain custody of their grandchildren — still others remain in an informal limbo, reluctant or unable to fight their adult children for custody. These women face a number of challenges raising these children, many of which are complicated by the fact that not all have legal custody of their grandchildren. In our sample, fourteen percent of primary caregiving grandmothers reported that they had unmet legal needs. Without legal custody, grandmothers face an uphill battle on a number of fronts — school enrollment, medical care, public assistance, and even planning their own estate.

THE EFFECTS OF LIVING ARRANGEMENTS ON SELF-RATED HEALTH AND DEPRESSION SYMPTOMS AMONG OLDER KOREAN
B. Kim, J. Liang, The University of Michigan, Ann Arbor, Michigan

Objectives: This study examined (a) the linkages between living arrangements (i.e., living alone, living with spouse only, living near children, and living with children) and changes in health outcomes (i.e., self-rated health and depression symptoms) among older adults in South Korea, and (b) how these linkages differ by marital status and gender.

Methods: Data came from the 2006 and 2008 waves of the Korean Longitudinal Study of Ageing, which involved a national sample of persons 65 years of age and older, who had at least one living adult child (N=3,946). Results: Among the married, those living with their children were less likely to rate their health as poor than those living with spouse only or those living near their children. However, older adults living with their spouses had fewer depressive symptoms than those living with their children and those living near children. Among those not married, living arrangements were not associated with changes in self-rated health and depressive symptoms. In addition, baseline living arrangements were uncorrelated with health outcomes among older women, whereas older men who lived with their children had better self-rated health. Discussion: Traditional Korean culture places a great value on the support from adult children in the same household, which suggests positive health outcomes of coresidence. Nonetheless, our research indicated that the linkages between living arrangements and health outcomes vary by marital status and gender among older Korean.

SINGLE PARENT CAREGIVERS TO OLDER ADULTS: A TRANSLATIONAL RESEARCH STUDY
D.L. Wagner1, 2, G. Hunt1, 1. College of Health and Social Services, New Mexico State University, Las Cruces, New Mexico, 2. National Alliance for Caregiving (NAC), Bethesda, Maryland

Extensive research on family caregiving has demonstrated a range of issues affecting both caregivers and care recipients. However, there has been scant attention paid to the unique circumstances of single parents with family caregiving responsibilities. The percentage of households with children headed by single parents increased from 19.5% in 1980 to 29.5% in 2008 (US Census Bureau, 2011). NAC (2009) estimates that 18% of family caregivers are single parents. Single parent caregivers are likely to have more complicated care situations than other “sandwich generation” caregivers. This poster describes the first national study of single parent caregivers to older adults now underway. The study will estimate the prevalence of this type of family caregiving and examine needs by a telephone survey (n=1000) designed to elicit information about the care dyad, children, strategies used to manage care and needs. With the Office of Women’s Health (DHS), the sponsor of the study, findings will be communicated to federal agencies and policy makers about single parent caregivers and policy and practice models that support this household type. This poster will describe the survey, key domains of inquiry, and sampling strategies for both the survey sample and the prevalence estimates. Existing “best practices” will be presented. The foundation for translational activities is being developed as the survey is reviewed by OMB in order to ensure that the findings will result in increased awareness and improved policies for these families.

EDUCATIONAL PREDICTORS FOR CHILDREN LIVING IN OLDER-ADULT HEADED HOUSEHOLDS IN KENYA
N. Kagotho, J. Tan, School of Social Work, Adelphi University, Garden City, New York

Background: The number of older adults providing care to children and youth is on the raise in sub-Saharan Africa. Approximately 36% of children in Kenya do not live with their parent(s) (Ministry of Gender Children and Social Development, 2008). Research indicates that the individuals providing care to these children are more likely to older and female. Orphans and vulnerable children are also more likely to have higher drop out rates and lower school enrollment rates. Aims: To investigate determinants of positive educational outcomes among children living in households headed by older adults in Kenya. Methods: Data from the Kenya Demographic Health Survey 2003 was analyzed. Households headed by older adults (50 years +) which had school age children were subset. Results: The mean age of the head of household was 58.9 years (range 50-97). Data from 4519 children was analyzed and of these approximately 20% were foster children. The logistic model was significant ($\chi^2 (14) = 292.65, p=0.00)$. Holding all other variables constant children in households headed by adults 65+ were less likely to have positive school outcomes. In addition fostered children, those in the bottom 3 wealth quintiles, and those living in Arid & Semi-Arid areas were also less likely to have positive educational outcomes. Conclusion: The recently introduced means tested Social Protection Program which provides cash transfers to adults 65+ is timely. However these results indicate that in addition to cash, other intervention mechanisms are necessary to support older adults who head households with school age children.

D. Cox1, 2, M.M. Way1, 1. Economics, Babson College, Wellesley, Massachusetts, 2. Boston College, Newton, Massachusetts

What happens to intergenerational transfers with the onset of a recession, when economic shocks hit family members across the generations?
Economists have long recognized transfers might serve to insure against the risk of income shortfalls. Yet there is little evidence about how transfers might vary over the business cycle because few surveys collect the needed information on an ongoing basis. One that has is the Health and Retirement Survey (HRS), which started in 1992 and includes the first year of the Great Recession of 2008, with supplemental data for 2009. Together with the RAND American Life Panel (ALP), which queries respondents about the effects of the recession using monthly panel surveys, we examine familial transfers during the recession from both givers’ and recipients’ perspectives. A priori, it is not clear whether inter-household transfers should increase during a recession—problems of potential recipients become more severe, but resources of potential donors become less plentiful. The question therefore becomes an empirical one. We find that despite diminished wealth, older parents increased their financial help to adult children as the recession deepened and children suffered from job losses and mortgage problems. Parents who gave tended to harbor expectations of having to provide financial help well before the recession began. Financial help appears to have been targeted to those in economic distress, such as the recently unemployed. Taken as a whole, our estimates indicate an important role for familial insurance—private transfers are responsive to income shortfalls and are comparable in the aggregate to Unemployment Insurance. Still, the family safety net provides only partial coverage, because financial distress is correlated among family members.

**CORRELATES OF INTERGENERATIONAL CONFLICT OF OLDER NEPALESE ADULTS WITH THEIR DAUGHTERS-IN-LAW**

R. Gautam, S. Houde, Department of Nursing, University of Massachusetts Lowell, Lowell, Massachusetts

The family social norm in Asian countries is to live with a married son where daughter-in-laws (DIL) are expected to take care of their parents-in-law. This study explores the correlates of intergenerational conflict of older Nepalese adults with their DIL. A cross-sectional quantitative study of 489 older Nepalese adults aged 60 and older, living with their DIL, was conducted with face-to-face interviews using structured instruments. Intergenerational conflict was measured by three items commonly used in the literature: make too many demands, criticize, and argue. The Cronbach’s reliability alpha coefficient was 0.88. The Intraclass Correlations Coefficient was 0.86 during a one week interval (n = 10). The score for the scales ranged from 3 to 12 with higher scores denoting more conflict in the relationships. Bivariate analysis revealed gender, marital status, education, instrumental activities of daily living, instrumental and emotional support received from DIL and education of DIL correlated with intergenerational conflict with DIL. Variables with significant correlations were entered in a regression model. Factors correlated with lower conflict with DIL among older adults of Nepal were older adults being educated (B = -.545; p<.005), instrumental support received (B = -.939; p<.0001), and higher education of DIL (B = -.442; p<.05). Intergenerational relationships in an urban modernizing context is discussed. The study results will contribute to the knowledge of aging in Nepal by exploring family relationships of older adults, which are important considerations when developing policy to meet the needs of both older adults and their family members.

**LIKELIHOOD OF COMMUNITY-DWELLING ELDERLY TO LIVE WITH A CHILD: DOES COGNITIVE IMPAIRMENT MATTER?**

A. Chan1, M. Setia1, R. Malhotra1, D.B. Matchar2, 1. Health Services and Systems Research, Duke-NUS Graduate Medical School, Singapore, Singapore, 2. Duke University Medical Center, Durham, North Carolina

Aim: Assess if the likelihood of non-institutionalized elderly to live with their child is associated with cognitive functioning of the elderly.

**SUPPORT PROVIDED BY ELDERLY CHINESE PARENTS TO THEIR ADULT CHILDREN**

M. Ye, Y. Shen, 1. Department of Sociology, Bowling Green State University, Bowling Green, Ohio, 2. Shanghai Research Center on Aging, Shanghai, Shanghai, China

Many studies have examined the ways in which Chinese adult children support their elderly parents; few studies have focused on how and why these parents support their adult children. This study investigates the manifestations of elderly parents’ support, including financial support as well as caregiving for the house and grandchildren. The dataset is 2005 Shanghai Elder Citizen Longitudinal Tracking Study, a stratified sample of 1630 respondents aged 60 and above. Age, gender, marital status, number of children, self-care status, and self-report health are included as independent variables. The dependent variables are (1) the proportion of parents’ monthly income given to children; and (2) the provision of caregiving. The ordinary least squares (OLS) regression shows that monthly income of elderly parents is positively correlated to the monthly financial support provided to their adult children but negatively correlated to caregiving, which means the richer parents tend to help with money while poorer parents tend to provide caregiving assistance. Moreover, reciprocal monthly money from their adult children positively affects both monetary as well as task-based assistance. The findings of the study provide insight into intergenerational exchange rules that Chinese elderly parents are willing to help their adult children through financial support or task-based assistance and the more financial support they get from their children, the more help they provide back to their children.

**PUBLIC SUPPORT, FAMILY SUPPORT, AND ELDERS’ LIFE SATISFACTION: EVIDENCE FROM A NATURAL EXPERIMENT**

E. Kim, Duke University; Durham, North Carolina

Many governments provide poor elderly people with supplemental income in order to improve elders’ well-being. However, it is still largely unknown how effective such policies are. This concern is particularly keen in countries where families play an important role in taking care of the elderly population since families might undercut the effectiveness by reducing their support in response to the government policies.

**PUBLIC SUPPORT, FAMILY SUPPORT, AND ELDERS’ LIFE SATISFACTION: EVIDENCE FROM A NATURAL EXPERIMENT**

E. Kim, Duke University; Durham, North Carolina

Many governments provide poor elderly people with supplemental income in order to improve elders’ well-being. However, it is still largely unknown how effective such policies are. This concern is particularly keen in countries where families play an important role in taking care of the elderly population since families might undercut the effectiveness by reducing their support in response to the government policies.
This paper addresses these issues by utilizing a unique natural experiment from Korea. The Korean government radically expanded its financial support for elders in 2008 with the introduction of the Basic Old-Age Pension (BOAP), a means-tested income support program for elders. I examine how the program affected adult children’s support (in terms of co-residence and geographic proximity, financial transfers, and contact) and, eventually, elders’ life satisfaction. For empirical analyses, this paper takes a difference-in-difference quasi-experimental approach and uses two recent longitudinal datasets, the Korean Retirement and Income Study and the Korean Longitudinal Study of Ageing. Results suggest that BOAP benefits partially, but not completely, crowed out adult children’s financial transfers, causing a net increase in elders’ income for those with no change in other sources of income. BOAP had little impact on other types of family support, including cohabitation, geographic proximity, and visiting. BOAP did cause elderly recipients’ life satisfaction to increase in the short-term. However, the positive effect disappeared over time, suggesting elders’ adaptation to the increased level of income.

CAMBODIAN GRANDPARENTS’ TRANSCENDENT SACRIFICES
D.C. Lewis, Child and Family Development, University of Georgia, Athens, Georgia

Over 7000 families live and work in a dumpsite in Cambodia’s capital (population of about 2 million). This study focused on ten elder-headed families residing in that dumpsite, nine households included at least one orphaned grandchild and one grandmother who had recently experienced the deaths of all three of her co-resident grandchildren. Ethnographic methods, including in-depth, semi-structured interviews and participant-observation, were used for this study. Analysis was an ongoing, iterative coding process that led to themes of life’s difficulties, and spiritual sacrifice. These themes correspond with the day-to-day existence of these grandparent-headed households, an existence that consisted of too little food, inadequate housing, no clean water, lack of organized sanitation and abject poverty. In this predominantly Buddhist nation, religion and spirituality provide a beacon of hope for coping with one’s present-day existence and improving one’s merit that might allow for a better next life. Family Exchange Theory (a synthetic theoretical perspective recently developed by the author) provides a three-part foundation across instrumental, affective, and symbolic exchanges for analysis of these qualitative data. This study shows that meeting their family exchange responsibilities, including filial responsibility of providing care to their orphaned grandchildren, severely limited the ability of grandparents to fulfill their expected late-life Buddhist practices of offering rice to honor Buddha and ancestors, time in prayerful meditation, and service to the Temple. The consequences of their caregiving had detrimental consequences negatively influencing their present lives and negatively influenced the conditions of their next lives. Implications for these sacrifices will be discussed.

SESSION 250 (POSTER)
MENTAL HEALTH

A RANDOMIZED CONTROLLED TRIAL OF A SPECIFIC NARRATIVE GROUP IN ENHANCING THE PERSONAL WELL-BEING OF STROKE SURVIVORS IN HONG KONG
E. Chow, Applied Social Studies, City University of Hong Kong, Kowloon, Hong Kong

As majority of the psychosocial interventions for the chronically ill clients are cognitive behavioral therapy or psycho-educational in nature, this study is a first attempt to apply narrative therapy in group practice for stroke survivors, with aims to address their psycho-social-spiritual needs, affirm their personal values and strengths, share practical wisdom of life and living, and promote continuity of the post-stroke life with positive attitude. 35 stroke survivors recruited from stroke registries of the Hospital Authority in Hong Kong are randomly assigned using computerized minimization method to either intervention group or treatment-as-usual group. Participants in the intervention group received 8 consecutive weeks of narrative therapy while the treatment-as-usual group received 8 consecutive weeks of psycho-education. Quantitative data are collected at baseline, 4 weeks, and 2 month after the sessions through face-to-face interviews to assess the effectiveness of both groups. Friedman’s ANOVA reveals that narrative therapy has significantly improved stroke survivors’ self-esteem, locus of control, subjective wellbeing, proactive coping, hope, meaning in life, and reduced depression. On the other hand, the psycho-education program is significant on hope. Findings obtained from the study contribute to the knowledge and development of strength-based practice in enhancing quality into the survival years.

CLERGY VIEWS ON HOW PREPARED THEY ARE TO COUNSEL OLDER ADULTS
J. Pickard1, M. Inoue2, 1. University of Missouri-St. Louis, St Louis, Missouri, 2. Boston College-Graduate School of Social Work, Boston, Massachusetts

Background: Clergy provide substantial amounts of counseling services to older adults, and they are an important component of the de facto system of mental health services. The purpose of this study was to examine clergy’s perceptions of how prepared they feel to counsel older people. Methods: This study used Dillman’s tailored design method for a mailed survey. Responding clergy (N=509) completed a two page questionnaire that included information on the amount of counseling they do with older adults, the Attitudes toward Older Adults and Mental Illness (AOAMI) scale, their relationships with mental health professionals, their knowledge of resources for referring people for additional help, and basic demographic data, such as race, age, years in the clergy, and education level. Logistic regression was used to examine clergy’s perceptions of how prepared they feel to counsel older people. Results: Being male, having good relationships with mental health professionals, having more knowledge of outside resources, and having more training were all associated with increased perception of being prepared for their counseling roles concerning older people. Discussion: Public-private partnerships should be formed for providing trainings to help clergy improve relationships with mental health providers and to help them increase their abilities to recognize issues needing referrals.

FACTORS ASSOCIATED AND MENTAL HEALTH OUTCOMES OF USING POTENTIALLY INAPPROPRIATE MEDICATION IN ELDERLY AUSTRALIANS
H. Alfonso1,2, J.J. Pfaff2, C. Beer1, L. Flicker3,4, O. Almeida1,2,5, 1. WA Centre for Health and Ageing, Perth, Western Australia, Australia, 2. School of Psychiatry and Clinical Neurosciences, University of Western Australia, Perth, Western Australia, Australia, 3. School of Medicine and Pharmacology, University of Western Australia, Perth, Western Australia, Australia, 4. Department of Geriatric Medicine, Royal Perth Hospital, Perth, Western Australia, Australia, 5. Department of Psychiatry, Royal Perth Hospital, Perth, Western Australia, Australia

BACKGROUND Despite the agreement that several medicines are inappropriate for use among older people, they are still commonly used. Little is known about risk factors and consequences of using potentially inappropriate medications (PIM) in elderly. AIM To examine the prevalence, associated factors and the mental health outcomes of using of PIM in older Australians METHODS We obtained health information from an Australian-wide sample over a period of 24 months. We identified PIM following the consensus criteria of medications to avoid (independent of diagnosis) in older adults (Arch Inter Med 2003; 162:2716). Logistic regression was applied to examine associations between PIM use and risk factors, and outcomes variables. RESULTS: Of 17,309 par-
Participants over 65 years, 15% were exposed to PIM. Higher prevalence of PIM was associated with older age, having more than 5 diseases or depression (defined as PHQ-9 ≥10). Older adults who were physically active, who had a BMI of 25 or more, or good self-perceived quality of life (SF-12 physical and mental scores ≥50) had a lower odds of using PIM. After two years of follow up, being exposed to PIM at baseline was not statistically associated with depressive symptoms or suicide ideation, once prevalent cases and potential confounders were taken into account. However, those using PIM had lower self-perceived QoL at the end of the study period. CONCLUSION: Work is required to determine the factors leading prescribers to initiate medicines agreed to be inappropriate in this population, and to determine benefits associated with modifying use of inappropriate medicines.

THE STRAINS AND GAINS OF CAREGIVING: AN EXAMINATION OF THE EFFECTS OF PROVIDING PERSONAL CARE ON A RANGE OF PSYCHOLOGICAL OUTCOMES

T. Hansen, Norwegian Social Research (NOVA), Oslo, Norway

As the need for informal care rises it is important to know how such caregiving affects well-being and the factors that moderate these consequences. The literature so far has been limited by their scope of dependent variables and there has been little discrimination between groups of caregivers. This paper explores caregiving effects along a wide range of measures of well-being (life satisfaction, self-esteem, mastery, positive and negative affect, depression, and loneliness). Data is from the Norwegian Life Course, Ageing and Generation (LOGG) study (N=8,104, age 40-85). We find the caregiving has predominantly negative consequences, as it relates to lower life satisfaction and more depressive symptoms and loneliness, particularly among women. However, these consequences only apply to caregiving for a partner or co-residential parent. The more common practice of caregiving for a non-residential parent, has few such costs and also relates to higher mastery. Hence, there are psychological rewards associated with caregiving, a fact that tends to be ignored in theoretical and empirical work on caregiving. Analysis of potential moderators of the association between caregiving and well-being shows that gender, age, education, concomitant work and family responsibilities, and receipt of public care services play little role in these associations. Having access to social support, however, is an important buffer against the adverse consequences of caregiving. We discuss ways in which policies can promote more extensive systems of support to caregivers.

PREDICTORS OF HEALTH UTILITY IN OLDER DEPRESSED AFRICAN AMERICANS: BEAT THE BLUES TRIAL RESULTS

L. Pizzi1, E. Jutkowitz2, L.N. Gittin2, D. Sah3, 1. Thomas Jefferson University, Philadelphia, New Jersey, 2. Johns Hopkins University, Baltimore, Maryland, 3. Rutgers University, Piscataway, New Jersey

OBJECTIVES: Beat the Blues (BTB) is a non-pharmacological intervention designed address depression in older community-dwelling African Americans. BTB was tested in an 8-month randomized two-group experimental design (treatment vs. wait list control). We examined factors associated with health utility at baseline. METHODS: Patients were enrolled from 2009-2010 and eligible if they had depressive symptoms (PHQ-9 score ≥5), ≥55 years, English speaking, and cognitively intact (MMSE >24). Data included demographics, co-morbidities, functionality (ADL, IADL, and mobility), and health utility (EQ-5D and HUI2/3; 0=death and 1=full health). Regression analyses were conducted to assess the relationship between health utility (EQ-5D and HUI2/3) and relevant variables with focus on PHQ-9 score, adjusting for demographics and comorbidities. RESULTS: In the sample (n=86), average age was 68, most patients were female (77%), unmarried (92%), and taking at least one medication for depression, anxiety, sleep, or pain. Mean EQ-5D utility index score was 0.56 (SD 0.2; n=83) compared to mean HUI2 0.52 (SD 0.206) and HUI3 0.36 (SD 0.308; n=64); mean PHQ-9 score was 12.6 (moderate depression; SD 4.9). After adjusting for patients’ age, education, and gender, EQ-5D utility scores significantly decreased as patients had mobility difficulty, high PHQ9 score, or more comorbidities. Regression results were consistent with HUIU 2/3 utility score except for PHQ-9 (not significant). CONCLUSIONS: BTB serves as a unique sample for examination of contributors to health utility in depressed African American elders. Mobility, depression severity (only EQ-5D), and number of comorbidities appear to be significant predictors of health utility.

RELATIONSHIP BETWEEN HOME CARE USE AND ITS DURATION AND PSYCHOLOGICAL DISTRESS AMONG ADULTS AGE 50 AND OVER

S. An, N.G. Choi, School of Social Work, University of Texas at Austin, Austin, Texas

Although many previous studies found high rates of depression in older adult recipients of home care services, little research examined the level of overall psychological distress among home care users. Based on data from the 2009 National Health Interview Survey, the purposes of this study were to examine (1) the relationship between home care use in the preceding 12 months and psychological distress among persons age 50 and over (n=11314); and (2) the relationship between the use and duration of home care and psychological distress among those with functional impairment (n=1042). Psychological distress was measured with the Kessler 6 (K6) scale, a 6-item, 5-point screening tool for nonspecific distress in the last 30 days. The negative binominal regression results show that home care use was associated with significantly higher K6 scores among the general population age 50+, controlling for sociodemographic and health status indicators. However, home care use and duration were not significantly associated with K6 scores among those with impaired activities of daily living (ADL) or instrumental activities of daily living (IADL). For this group, age, race, education, number of chronic medical conditions, degree of functional impairment,
and the history of mental health help seeking were significant predictors of their K6 scores. With respect to functional impairment, those with 1-2 ADL impairments had significantly higher K6 scores than those with only IADL impairment, but those with 3+ ADL impairments did not differ from those with only IADL impairment. Implications of the findings are discussed.

**FAMILY RELATIONS, SOCIAL CONNECTIONS, AND MENTAL DISORDERS AMONG ASIAN AND LATINO OLDER ADULTS: A CROSS-CULTURAL STUDY**

M. Guo, S. Li, F. Sun. 1. USC School of Social Work, Los Angeles, California. 2. New York University School of Medicine, New York. 3. Arizona State University School of Social Work, Phoenix, Arizona

Supportive family and social ties are important sources of strength in late-life mental health. However, little is known about whether these protective factors function in the same way and to the same extent across racial/ethnic groups. Using data from National Latino and Asian American Study, this research compared Latinos and Asian elderly, two fastest-growing minority groups, in terms of their family relations and social connections (i.e., family cohesion, family conflict, support from friends, support from relatives, and neighborhood cohesion), and how these family and social ties are associated with lifetime risks of mental disorders in the two groups. Results showed that Latino and Asian elderly had similar levels of family cohesion, family conflict, and neighborhood cohesion. However, Latino elderly reported more support from friends and relatives, but were twice as likely to have mental disorders as their Asian counterparts. Among the five types of family and social ties examined, only family conflict was associated with a higher risk of lifetime mental disorders among both Latino and Asian elderly. This association was not significant for Latinos when personal resources such as education, income, and physical health were controlled for. The study showed that although in general Latino and Asian older adults shared a high level of family cohesion, the negative influence of family conflict on their mental health was more detrimental than the benefit of family cohesion. Particular attention is needed for Latino older adults, because such an association was moderated by personal resources, which many of Latino elderly lacked.

**THE EFFECTS OF DEBT ON MENTAL HEALTH OUTCOMES AMONG MIDDLE-AGED AND OLDER AMERICANS**

Objectives. This study examines the effects of unsecured debt on two distinct mental health outcomes: depression and psychological well-being. Domain-specific control over finances is used as a mediator to test its indirect effects on mental health outcomes. Methods. Based on cross-sectional data from the Health and Retirement Study (HRS), we studied 5,502 adults aged 51 and greater in 2006. Data from the psychosocial leave-behind questionnaire were merged with the HRS core data and we estimated the effects of the independent variable and mediator using ordinary least squares regression analysis. Results. Thirty-three percent of the respondents have unsecured debt. Unsecured debt had a positive effect on depression and a negative effect on psychological well-being. Domain-specific control over finances influenced the size and magnitude of the linkages between unsecured debt and the mental health outcomes. Domain-specific control over finances boosted explained variance in psychological well-being and depression by 83 and 12 percent, respectively. Discussion. Control over one’s financial circumstances strongly influences the psychological well-being of mid-aged and older Americans and has a moderate influence on their depression levels. Accordingly, interventions that influence peoples’ control over their finances may enhance their psychological well-being significantly. This study provides new evidence regarding the domain-specific measure of control as a factor that mediates the relationship between the debt of adults and their mental health outcomes.

**THE STRESS PROCESS AND QUALITY OF LIFE OF DISABLED ELDERLY IN TAIWAN**

S. Chao, P. Lu. 1. Tzu Chi University, Hualien City, Taiwan. 2. National Chengchi University, Taipei City, Taiwan

Background: Being dependent has been regarded as one of the most stressful life events in later life. The functional disabilities that occur among many older individuals not only diminish their independence but also largely change their existing life styles, social roles and social relationships. However, some people maintain their quality of life, despite disabilities and irreversible functional losses in old age. Methods: The study examined the usefulness of the revised Pearlin et al.’s “Stress Process Model” in understanding the lives of aging persons with disabilities in Taiwan. Data from the Taiwanese 2003 Survey of Health and Living Status of the Elderly (SHLSE) was utilized. Hierarchical regression analysis was applied to capture the interrelations among the six domains proposed to describe the stress process in disability. Findings: 1.1,541 out of 2,751 participants in the 2003 survey had at least one IADL difficulty. 2. Analyses mapped associations among primary stressors (cognitive functioning, IADL difficulty and self-reported health status), secondary stressors (changes in family relationship and social participation), secondary intrapsychic strains (self-esteem and attitude toward old age), moderating factors (social support) and quality of life outcomes. 3. Elderly quality of life was best predicted by the degree of disability, self-reported health status and elder-caregiver relationships. Conclusions and Implications: The findings from the current investigation support redesign of social policy and interventions guided by the identified differential factors associated with the quality of life of this vulnerable population.

**IMPACT EVALUATION OF THE NON-CONTRIBUTORY SOCIAL PENSION PROGRAM 70 Y MÁS ON DEPRESSIVE SYMPTOMS**

M. Tellez-Rojo Solis, A. Salinas, B. Manrique-Espinoza, G. Angeles-Tagliafero, National Institute of Public Health, Cuernavaca, Morelos, Mexico

Objective: To estimate the impact of the Non-contributory Social Pension Program 70 y más on depressive symptoms. Methods: We applied a discontinuity regression design based on the 2 eligibility criteria used by the program (age and population size). The intervention (70-74 yr) and a 1st control group (65-69 yr) were selected from localities with ~2500 inhabitants. The 2nd and 3rd control groups were selected from localities with 2,501-2,700 inhabitants (70-74 and 65-69 yr, respectively); the later will allow us to estimate potential anticipation effects. A baseline survey was conducted in late 2007 interviewed 5465 elderly in 516 localities in seven states of Mexico. The follow-up survey was conducted in late 2008 and interviewed 96% of the individuals from the baseline. Surveys collected data on individual, household and locality characteristics. Depressive symptoms (DS) were measured using Geriatric Depression Scale. A dif-in-dif model was used for the estimation. Results: The program reduces the prevalences of DS and severe DS in the beneficiary group (between 6 or 7 percentage points) and there be a differential impact by sex, larger in women. Conclusion: According to the Madrid International Action Plan on Aging, non-contributory pensions can help to fulfill the commitment of reducing in half the number of poor elderly by 2015, as well as contributing to their empowerment. Our results show that the effect of a non-contributory pension program may go beyond the economic sphere, impacting other health indicators, specifically mental health indicators.
SENSE OF COMMUNITY AND DEPRESSIVE SYMPTOMS AMONG OLDER EARTHQUAKE SURVIVORS IN SICHUAN CHINA
Y. Li, School of Social Work., San Diego, California
Purpose: To evaluate the impact of earthquake on depressive symptoms among older survivors and to examine how sense of community might buffer the impact of earthquake. Method: A mixed method approach was used. At the first stage, a household survey using standardized questionnaires was conducted among 299 older earthquake survivors three months after the 2008 Sichuan earthquake in China. Demographic information, distress associated with the earthquake, social psychological resources and depressive symptoms were assessed. Following the survey, a qualitative study using focus groups was conducted to explore older survivors’ perceptions on the sense of community and identify strategies which helped cultivate their sense of community. Results: Quantitative analyses show that the earthquake associated distress had a direct effect on depression and such effect remained significant controlling for coping, informal support, and sense of community. The effect of earthquake associated distress on depressive symptoms is contingent upon the level of sense community. Qualitative analyses reveal that strong government support, new perspectives on meaning of life, mutual support and volunteering experience during and after the earthquake helped older earthquake survivors develop a sense of community in their neighborhoods. Conclusion: The findings highlighted the role of individuals’ sense of community as a protective factor against depression among older earthquake survivors. Providing a place for older survivors is far from sufficient to meet their psychosocial needs. Attempts to build trust and form a sense of community among elder survivors would help reduce their distress and facilitate a smooth recovery.

THE EFFECTS OF RELIGIOSITY ON THE ONSET AND RECOVERY FROM DEPRESSION IN OLDER ADULTS
C.R. Oala, Gerontology, University of Massachusetts Boston, Boston, Massachusetts
Nearly 20% of older adults suffer from depression in the U.S. Extant studies suggest that religious activity serves as a protective factor against depression in this population. However, most research has analyzed cross-sectional data for samples that are unrepresentative of the elderly population generally. This study examines the relationship between religious activity and both the onset of and recovery from depression with the 2006 and 2008 waves of the Health and Retirement Study (HRS), a nationally representative sample of older adults in the U.S. Onset of depression in 2008 is modeled for respondents (n=5,740) without depression in 2006. Recovery from depression by 2008 is modeled for respondents (n=1,992) with depression in 2006. Depression is measured using the CES-D-8 depression scale. Religiosity is assessed using multiple measures of religious service attendance, prayer, and other activities contained in the general HRS as well as the Leave-Behind Questionnaire. Gender, race, and age differences in the relationship between religiosity and depression onset were explored as well. Multivariate analyses suggest inverse and positive relationships between religious involvement and depression onset and recovery from depression, respectively. Findings highlight the potential role that religious involvement in religious and other activities might play as buffers against depression. They suggest that places of worship could serve as an ideal pathway through which to deliver mental health services, particularly among women, African Americans, and other population subgroups with strong ties to their faith communities.

THE RELATIONSHIP BETWEEN LONELINESS AND THOUGHTS OF DEATH IN THE SECOND HALF OF LIFE
L. Ayalon1, S. Shioviz-Ezra2. 1. Bar Ilan University, Ramat Gan, Israel, 2. Hebrew University, Jerusalem, Israel
OBJECTIVES: To evaluate the relationship between loneliness and thoughts of death in the general population of Europeans over the age of 50. DESIGN: Thoughts of death were evaluated in wave 1 and 2 of the Survey of Health Ageing and Retirement in Europe, using the question, “in the past month, have you felt that you would rather be dead?” Predictors were gathered in wave 1. Analysis was stratified into three age groups (50-65, 66-75, >75). RESULTS: Both thoughts of death (15.6%) and loneliness (M[SE]=1.68[.03]) were the highest in those over the age of 75, relative to the other two age groups (age 50-65: 4.6%, M[SE]=1.43[.01]; age 66-75: 7.3%, M[SE]=1.50[.02], respectively). Loneliness remained a significant risk for thoughts of death, net of the effect of demographic, health, mental health, and various social indicators in those 50 to 65 (OR=1.47, 95%CI: 1.10-1.97) and 65 to 75 (OR=1.74, 95%CI: 1.28-2.38), but not in those over the age of 75 (OR=1.12, 95%CI: 0.84-1.47). None of the objective social indicators were associated with thoughts of death in any of the age groups. CONCLUSIONS: The present study emphasizes the differential role of loneliness across the lifespan. Any intervention to alleviate thoughts of death in the general population will benefit from addressing the subjective sense of loneliness more so than objective indicators of social interaction.

WHEN CHILDREN GO FIRST: HOW MANY OLDER SWEDES LOSE AN ADULT CHILD?
Family networks of older Swedes have become tighter: older people increasingly have partners, siblings, children and other offspring, and even parents. Maybe these findings – although many people presume the opposite tendency – have numbed us for the potential loss of close relatives. We use demographic sources to describe how common it is to lose an adult child and how this has shifted over time. Losing a small child was common until recently, with on average 18 % of mothers in 1935 having lost at least one small child. (Longer marriages and unions with many children had much higher risks.) For Swedish women born in 1940 or later the risk of losing a child 0-4 years old the risk was less than 1 %; for any child under 20 years of age the risk was ca. 1.5 %. Among women born in 1940 3.4 % have so far lost an adult (20+) child. Probing loss of adult children with survey data is problematic. Estimates of this loss for today’s older Swedes vary from 5 % for 50-74 year olds, to 16 % of the 80+. Historical population data since 1749 suggests a decreasing risk of death of adult children, but the risk is still sizeable. Possibly as many as 4 out of 10 of today’s older persons will lose one or more of their adult children before they die themselves.

THE EFFECT OF ASSET OWNERSHIP ON THE WELL-BEING OF OLDER AMERICANS: AN EVALUATION OF THE RELATIONSHIPS BETWEEN FINANCIAL WEALTH AND CES-D SCORES AMONG AMERICANS AGE 65 AND OLDER
L.E. Becaw, Brandeis University, Waltham, Massachusetts
As the American population ages, many senior citizens are seeking environments to “age-in-place,” meaning that they remain in their own homes as they grow older rather than relocating to institutional or facility settings. In addition, aging in place can maintain seniors’ happiness and sense of well-being while preserving the financial wealth and assets that might be spent otherwise on residential facility care. Accordingly, this researcher hypothesized that older Americans who are aging-in-place, as defined by having financial wealth and owning homes, would experience lower levels of depression than those seniors who have not remained in their own homes to age. Using 2008 data from the Health
OVERCOMING BARRIERS TO CARE: SERVING OLDER ADULTS WITH SUBSTANCE USE DISORDERS

C.L. Jensen, The Center for Excellence in Aging and Geriatric Health, Williamsburg, Virginia

Substance abuse by older adults is a complex and often hidden problem in our society. Some of the substance misuse or abuse is better conceptualized as hazardous use that is unintentional and is impacted by other mental health conditions, such as depression or dementia, and the use of numerous prescription medications. Through an evidence-based framework, an extensive literature review and primary data collection, this project identified: 1) the types of substances older adults are abusing; 2) the causes for the abuse; and 3) how the abuse is linked to dementia and other mental health issues. In addition, barriers to screening and treatment were uncovered. Focus groups with inpatient and outpatient treatment teams (n=21), surveys of direct care workers (n=47), and a review of inpatient medical records (n=25) was completed. The Virginia project team worked closely with representatives of the Florida BRITE (Brief Intervention and Treatment of Elders) Project. The information gleaned from these data sources has informed the future direction of work in this area, specifically in training area healthcare providers in Screening, Brief Intervention, and Referral to Treatment (SBIRT). It was determined that screening of substance use and other geriatric syndromes (e.g., depression, dementia) is not widely done. Screening and referral to treatment is an area in which improvements can be made in order to enhance quality of life of older adults with substance use disorders and those most at risk.

AN ANALYSIS OF NEEDS/RESOURCES ASSESSMENT FINDINGS ON MENTAL HEALTH ISSUES AND PROVIDER ACCESS AMONG RURAL OLDER ADULTS

D.C. Wihry, L.W. Kaye, M. Callaway, J. Crittenden, UMaine Center on Aging, Bangor, Maine, 2. Community Care, Bangor, Maine

A qualitative needs and resources assessment combined with secondary data analysis was conducted targeting mental health issues impacting adults age 55 and older in the state of Maine. The study utilized key informant interviews (N=22) with geriatric mental health providers including physicians, social workers, and nurses. Findings underscore that: 1) Rural service providers of mental health services continue to lack the essential expertise required to respond to the special psychological and behavioral health considerations of the older adult population; 2) The lack of available transportation options as well as personal mobility limitations for individuals create significant barriers for older adults with mental health conditions in rural areas from accessings specialized services; 3) There is a pronounced need for more home-based geriatric mental health services; and 4) There are often major differences in the integrity of the continuum of services that are available to geriatric mental health patients in different geographic regions of the state. These findings highlight serious challenges faced by older adults with mental health needs in rural communities and the importance of educating mental health professionals about the needs of this segment of the aging population.

SESSION 255 (POSTER)

OLDER WORKERS & ELDER CARE WORKFORCE

ELDERCARE PREVALENCE AND CORRELATES AMONG MANUFACTURING SECTOR EMPLOYEES

R.H. Fortinsky, A. Kleppinger, Center on Aging, University of Connecticut Health Center, Farmington, Connecticut

Background: Despite increased attention in the business community to challenges of juggling caregiving and work responsibilities, surprisingly little is known about eldercare responsibilities among employees in the manufacturing sector. As part of a larger study (R01OH008929, M. Cherniack, PI), we examined the prevalence of eldercare and compared caregivers to non-caregivers according to sociodemographic and health-related characteristics. Methods: In a self-administered questionnaire, employees from 6 manufacturing companies in Connecticut were asked: “How many adults age 65 and older depend on you in any way to help them due to disability or chronic illness?” We compared those responding “0” (non-caregivers) to those responding 1+ (caregivers) by: company; gender; age group (<35, 35-44, 45-54, 55+); race (Black vs others); ethnicity (Hispanic vs others); educational level (high school or less vs college); self-reported health (current and compared to previous year). Results: Sample members (n=778) were: 70.1% male; mean age=48.6 (sd=11.0; range=22-72); 5.7% Black; 7.3% Hispanic. More than one-fifth (21.9%) reported eldercare responsibilities; prevalence ranged from 11.1%-26.3% across companies (p=0.09). Caregiver prevalence did not vary by gender, race, or ethnicity, and no differences were observed in self-reported health between caregivers and non-caregivers. Group did distinguish caregivers in a linear fashion, ranging from 4.7% of the youngest group to 28.3% of the oldest group (p<0.001). Employees with college education (23.9%) tended to report caregiving more often than employees with less education (18.5%; p=0.09). Conclusions: Manufacturing sector employees with eldercare responsibilities were older and more highly educated than non-caregivers, and caregiving prevalence varied across companies.

THE WORK-ELDERCARE INTERFACE: WORKPLACE FLEXIBILITY AND WELL-BEING AMONG FAMILY CAREGIVERS

M. Brown, 1. Boston College, Chestnut Hill, Massachusetts, 2. Sloan Center on Aging and Work, Brighton, Massachusetts

The ability of society to meet the challenges associated with an aging population—and to do so in a manner that honors and respects older adults—is dependent on ensuring the well-being of caregivers of older adults. Of the estimated 44.5 million people providing unpaid care to an older family member or friend, over 60% are currently working, with the vast majority doing so full-time (National Alliance of Caregiving & AARP, 2009). While caregiving can be a rewarding and positive experience (Fredriksen-Goldsen & Scharlach, 2001), it can also be a demanding one. In fact, the majority of employed caregivers of older adults report inter-role conflict in managing the demands of work and caregiving roles (Families and Work Institute, 2002). As an increasing number of employees become caregivers, the role of workplace resources in supporting caregivers has attracted the attention of researchers, employers, and policymakers. Workplace flexibility is one type of resource that has attracted particular interest, with research exploring whether flexibility (that is, giving employees some control over when and/or where work gets done) is related to important outcomes for both employees and employers. This investigation develops and tests a mediational model explicating the process through which workplace flexibility impacts caregiver well-being. Using a sample of 211 caregivers from the National Study of the Changing Workforce (2008), results show that work-to-family conflict mediates the relationship between perceived
workplace flexibility and caregiver well-being. However, the mediational model is not supported for caregivers in fair/poor health.

RETIREMENT RISK IN MA STATE AGENCIES: IMPLICATIONS FOR STRATEGIC PLANNING
A. Tull, 1. University of Massachusetts Boston, Boston, Massachusetts, 2. Commonwealth Corporation, Boston, Massachusetts

Public sector Health and Human Service (HHS) agencies in Massachusetts are characterized by an older workforce (mean age 48.3), which places these organizations at risk for knowledge loss and skills gaps as older workers transition into retirement. Patterns of delaying retirement that are normative in the private sector are less applicable to Massachusetts state employees, who receive defined benefit pensions and retiree health insurance. This paper, based on dissertation work, analyzes the retirement risk within HHS agencies using a Cox regression model to predict retirement, based on the demographic, agency, employment and pension characteristics of 9,157 retirement-eligible employees over a 5.5 year study period. This analysis is supplemented by interviews with agency leaders regarding their perceptions of retirement risk and the actions taken to plan for the retirement transitions of older workers. The results suggest that workers in licensed positions (HR 1.03, p=.000) and protective service positions (HR 1.38, p=.000) were at greater risk for retirement than similar administrative, non-licensed employees. The results also suggest that pension benefit accrual is a significant determinant of retirement behavior, with hazard ratios increasing rapidly once employees reach the 60% benefit accrual level. Interview results provided evidence of the need for workforce planning processes within state agencies, and also described the barriers to planning, which are not well accounted for in theories of organizational response to risk.

WHO ENJOYS GOING TO WORK IN OLD AGE? INDIVIDUAL AND JOB-RELATED CONDITIONS AFFECTING OLDER WORKERS’ POSITIVE ATTITUDES TOWARD WORK
E. Choi, I. Nam, School of Social Work, University of Pittsburgh, Pittsburgh, Pennsylvania

Purpose: Although working in old age is commonly thought of as a means of filling the lack of retirement income, many older workers, in fact, find prolonged working lives enjoyable. However, there is a lack of knowledge of what contributes to older workers’ positive attitudes toward work. Thus, this study aims to examine individual and job-related conditions that influence older workers’ positive attitudes toward work. Methods: Using the 2008 Health and Retirement Study (HRS) dataset, this research selected older workers aged 65+ (N=1,117). In addition to demographic variables, this study included two levels of variables: individual (education, financial status, and health) and job levels (working hours, salary, job stress, a level of physical effort to perform the job, and occupation type). Given the dichotomous nature of the dependent variable (whether older workers enjoy going to work or not), the model was analyzed by Probit and PRE (predicted probabilities) analysis. Results: At the p .1 level, the older workers that enjoy going to work in old age are those who are older (β=.076, p=.077), have good health (β=.514, p=.004), work longer hours (β=.024, p=.066), have higher salaries (β=.000, p=.046), and receive less job stress (β=.972, p=.000). More interestingly, it is not significant whether older workers are wealthy or not, whether the job requires physical effort or not, and whether the job is blue- or white-collar. Discussion: Regardless of financial status and job types, older workers appear to be happy with working longer in old age as long as they are healthy enough to work, and the job is not stressful. Also, those who are relatively older and receive higher salaries seem to appreciate more working in old age.

FACTORS PROMOTING WORKFORCE DIVERSITY IN NURSING-CARE AND MEDICAL FACILITIES IN JAPAN
I. Kitamura1, K. Ishii2, 1 Nihon Fukushi University, Chita, Aichi, Japan, 2 Osaka City University, Osaka, Japan

The Japanese government accepted 208 Indonesian certified care-worker/nurse candidates under the Japan-Indonesia EPA program as a measure towards alleviating the labor shortage in nursing-care/medical facilities in 2008. Non-nationals generally cannot work as care-workers/nurses in Japan, but as an exception, Indonesian candidates can work in Japan for 4 years. They need to get a care-worker/nurse certification from the Japanese government within 4 years to continue working in Japan. They are assigned to nursing-care/medical facilities, and the staff of those facilities support them in preparing for the certification exams. It is expected that very few candidates will pass because of their language competencies. The government may change the rules to allow the candidates continue working in Japan without certification. A survey was conducted to identify factors that promote diversification of the workforce, with 460 staff members working in 20 facilities out of 100 cooperating. The results indicate that candidates are diverse, and factors such as language ability, professional knowledge and skills, reliability, sincerity, and desire to get a certification are important. Language ability and professional knowledge and skills are more important in the medical facilities than in nursing facilities. Characteristics of the candidates, such as reliability and sincerity, are the key when Japanese staff support them and accept workforce diversity. In the nursing facilities, workforce diversity tends to be accepted if the candidates have good natures and strong desire to stay and work in Japan. In the medical facilities, language ability and professional knowledge and skills are crucial.

THE FUNCTIONING OF GERIATRIC SOCIAL WORKERS IN CHINA: A PILOT STUDY
Y. Sui,1 L. Gao2, W. Guo3, Y. Zhang4, 1 Renmin University of China, Beijing, China, 2 Jinan University, Jinan, China, 3 China University of Political Science and Law, Beijing, China, 4 Yunan Newspapers, Kunming, China

This study explored the content of the newly emerging geriatric social workers’ job, and their perceptions of their work. Subjects were from 8 elderly welfare institutions and 8 urban communities in 9 cities which were selected to implement a national pilot project for developing professional social work forces. Both qualitative and quantitative methods were employed. Totally 16 in-depth interviews were conducted, and 63 standardized questionnaires were administered. It was found that over half of the subjects received no formal social work training. The in-depth interviews showed that most of the subjects had a narrow definition of their work focusing on remedial work, e.g. solving financial difficulties, dealing with family and other interpersonal relationship issues, and helping the elders cope with emotional stress. Results of the quantitative study verified this finding. Only few subjects emphasized on preventive and developmental work in their daily routines, e.g. empowering the elders, advocating for social policy that responds to the elders’ needs, and creating a social environment respecting and caring elders. Social functioning was paid less attention compared to physical and psychological functioning when conducted need assessment of the elders. Subjects who got formal professional training showed more comprehensive understanding of their work, and commitment to a broad definition of their work. This study suggested that professional training was essential for new geriatric social workers to be fully functioning.

HOME CARE AIDES: DIFFERENCES BETWEEN AGENCY AND CONSUMER-DIRECTED EMPLOYEES
C.M. Kelly, P.M. Quinn, J. Deichert, University of Nebraska, Omaha, Nebraska

Home care is the fastest-growing occupation in the direct care workforce and is largely comprised of two types of workers: 1) aides who

64th Annual Scientific Meeting 89

Downloaded from https://academic.oup.com/gerontologist/article-abstract/51/suppl_2/1/646194 by guest on 30 April 2018
work for home care agencies and 2) consumer-directed aides who work for private households. In 2009, there were 172 thousand consumer-directed aides, an increase of more than 50 percent since 2000. However, there is little known about these aides. While home care agencies are increasingly regulated, with many states strengthening training requirements for new employees, consumer-directed aides are largely unregulated and therefore do not appear in government databases (for example, the U.S. Bureau of Labor Statistics). In this study, we compare the characteristics of consumer-directed aides with those who work for home care agencies, using data from the 2009 American Community Survey from the U.S. Census Bureau. Based on our results, we find that aides working for private households receive higher earnings, are less likely to receive food stamps or be in poverty, are less likely to have someone under 18 in their household but are more likely to have someone 65 or older, are more likely to have health insurance, own their home, and receive some type of retirement income. Consumer-directed aides are also more likely to be 55 or older, White, non-Hispanic, and college graduates. This study enhances what is known about a largely hidden workforce. Not only are consumer-directed aides more likely to be related to clients (as has been noted previously), these aides may also have greater capacity to assume increased care responsibilities.

SESSION 260 (POSTER)

PERCEPTIONS OF AGING

DECISION-MAKERS’ PERCEPTION AND KNOWLEDGE ABOUT LONG-TERM CARE IN NEPAL: AN EXPLORATORY STUDY

K. Basnyat, R. Applebaum, J. Brown, S. Kunkel, J. Subedi, Sociology & Gerontology, Miami University, Oxford, Ohio

Understanding issues related to long-term care (LTC) is more prominent in western countries than in developing countries. Many developing countries including Nepal are passing through a process of modernization which is replacing traditional social structures and value systems. For example in Nepal, even though long-term care is sometimes provided by a very limited number of government funded old age homes and non-profit organizations, the family remains the sole care-taker for most elderly. Research has demonstrated that the modern ideology of individualism along with the growing number of nuclear families is placing vulnerable populations such as the elderly in a difficult predicament. It is thus safe to argue that if decision-makers of Nepal lack basic knowledge of needs related to aging, disability, and LTC, this will impact all policies concerning these issues. This paper, therefore, explores the perception and knowledge pertaining to aging, disability and LTC among key decision-makers (bureaucrats and politicians) of Nepal. This exploratory study was conducted in Kathmandu and involved face-to-face in-depth interviews with 18 decision makers. The findings reveal that decision-makers have limited knowledge about aging, disability in aging and LTC needs. This paper maintains that the formulation and implementation of any new policies regarding aging and LTC needs could be problematic due to the unstable Nepali political climate.

WHAT ARE THEY THINKING: SURVEY OF BABY BOOMERS OF MINNESOTA

L.A. Knatterud, MN Dept of Human Services, St. Paul, Minnesota

The state of Minnesota has worked for 15 years to prepare for 2011 when the first boomers begin to turn 65 and the age wave begins. As a way to mark the beginning of this age wave, a survey of Minnesota’s boomers was completed in July 2010. The survey content was developed through research and discussions with boomers, our own staff and collaboration with our internal survey research coordinator on the survey design and methodology. The focus of the survey questions was the key transitions that boomers are experiencing: work vs. retirement and civic engagement, decisions on moving or staying in current homes and communities, perceptions of their financial situations now and in the future, staying healthy vs dealing with chronic illness, caregiving and social relationships. Surveys were mailed to a random sampling of residential addresses in July 2010, a total of 10,000+ households in all parts of the state. The sample included individuals born between 1946 and 1964, with a heavier weighting on the leading edge boomer group born 1946 - 1951. Surveys were completed and returned by 3,800 boomers, a very high response rate for a mailed survey. The poster session will provide results of this survey and implications for actions that the state, cities, providers and employers may want to take based on boomer attitudes and perceptions. For example, 51 percent of those who responded have lived in the same community for 20 years and expect to stay there for another 20 or more years. Only 5 percent said they would consider moving to senior only housing. A total of 60 percent of those responding said they provided financial help to family members in the past year. These are just a sampling of the results.

MASCULINE GENDER SCRIPTS AND AGING STEREOTYPES: A FOCUS GROUP STUDY

T.L. Peak, J. Gast, Social Work Program, Utah State University, Logan, Utah

It is accepted wisdom that men prefer to avoid health care settings and will participate in health prevention activities only if these activities are somehow disguised. Masculine gender scripts may promote this gendered response to health issues. Burns and Mahalik (2007) define masculine gender scripts as ways of acting, feeling, and thinking based on socially prescribed norms of masculinity. Thompson (2008) refers to this notion as masculinity performance and suggests that men may adopt unhealthy behaviors like smoking because that demonstrates masculinity. This is relevant to health education and health prevention because, unlike advertisers who do utilize male stereotypes when marketing for men, few health education and health promotion programs incorporate masculine gender scripts into program needs assessments or planning. This study examines focus group results from the perspective of masculine gender scripts and aging male stereotypes (Levy, 2003). Of particular interest is how masculine gender scripts impact men’s views on aging. Four focus groups were held with a volunteer sample of men for a total of 32 men, all Caucasian, whose ages ranged from 21-68 (Mean = 42.65). Results indicated that 1) men recognize that their bodies change as they age, 2) masculine gender scripts have an impact on their views on aging, 3) men need to and will rethink what masculinity means when faced with the challenges of aging, and 4) men think of aging in terms of capacity for physical activity. Implications for health education and men’s health research will be discussed.

INFLUENCE OF EXPECTATIONS REGARDING AGING AND EMOTION ON THE PRIORITIZATION OF PATIENT NEEDS

A. Conlon, The University of Texas at Austin, League City, Texas

Previous research has identified the existence of age-based differences in the provision of psychological and emotional care to people diagnosed with cancer. PURPOSE: The purpose of this study was to examine this phenomenon and to test the relationships between practitioners’ expectations regarding aging, their emotions towards the patient’s situation and the prioritization of patient needs. SUBJECTS: Participants included 322 social work practitioners who were members of the Association of Oncology Social Work. METHODS: The study utilized a 2x2 vignette design; four identical vignettes were created describing a patient diagnosed with lung cancer differing only by the age (78/38) and gender (Female/Male) of the patient. It was embedded in an on-line survey that included a random assignment of one of the four vignettes followed by questions concerning the situation described in the vignette and the Mental Health and Physical Health subscales of the Expectations Regarding Aging (ERA-12) scale. RESULTS: Analysis of Variance and Univariate measures found significant differences
in the prioritization of psychological/emotional needs (i.e., depression, anxiety and adjustment) and functional needs (i.e., transportation, financial assistance and home care) based on patient age. Path analysis using a structural equation model confirmed the relationships among practitioner’s expectations regarding aging, emotions, and the prioritization of patient needs for older patients (CMIN=9.417; p=0.926; CMIN/df=5.44; RMSEA=.000; PClose=.989). CONCLUSION: This research highlights age-based differences in the prioritization of patient’s psychological/emotional and functional needs and how these differences are influenced by practitioners’ expectations regarding aging and emotions towards.

SESSION 265 (POSTER)

TRANSPORTATION

EXAMINING AGING PROCESSES THROUGH THE STRESS-COPING FRAMEWORK: APPLICATION TO DRIVING CESSION IN LATER LIFE

M. Choi1, K.B. Adams2, B. Mezuk, 1. Department of Epidemiology and Community Health, Virginia Commonwealth University, Richmond, Virginia. 2. Case Western Reserve University, Cleveland, Ohio

The aging process is marked by a series of transitions that influence multiple domains of well-being. One important transition for older adults is the process of driving cessation. Numerous studies have examined the predictors and consequences of driving cessation; however these reports have been largely empirical and do not draw from a defined conceptual framework. Establishing a theoretical model of how driving cessation interacts with other processes and domains of aging will promote synthesis of seemingly disparate findings and link the empirical research on cessation to the broader field of gerontology. This presentation provides a conceptual model for articulating and examining the components of the driving cessation process based on the stress-coping paradigm. This model situates driving cessation within the context of primary and secondary stressors, individual vulnerabilities and coping strategies, and environmental hazards and buffers over the lifespan. This model can facilitate interdisciplinary research on aging processes such as driving cessation.

REGIONAL AND ORGANIZATIONAL CHARACTERISTICS OF ALTERNATIVE SENIOR TRANSPORTATION PROVIDERS

M. Nguyen, K. Barton, C. Lee, E. Dugan, University of Massachusetts, Boston, Boston, Massachusetts

When a senior person experiences driving cessation, he or she continues to have transportation needs. Alternative transportation is vital in securing their mobility and independence in old age. Understanding characteristics of alternative senior transportation providers is needed to identify best practices, gaps in current services, and future needs. The objective of this study is to examine organizational and regional characteristics of alternative senior transportation. A total of 655 supplemental transportation programs (STPs) completed the Beverly Foundation’s 2008, 2009, or 2010 STAR survey (n=481 nonprofit, n=132 government, and n=21 profit). The purpose of the STAR survey is to demonstrate that STPs for seniors add value to their lives in their communities. Data were collected about senior transportation services, organizational factors, and promising practices. Descriptive statistics were conducted. Nonprofit transportation providers were most frequently reported in every region (17% West, 24% Midwest, 18% South, 14% Northeast) and setting (21% Urban, 17% Suburban, 36% Rural). Approximately 45% of organizations provide medical service transportation with 32% for shopping and 18% for nutrition services. Organizations in the West offered more transportation to a wider variety of destinations, especially those related to nutrition. Using bivariate analysis, results indicate significant associations between destinations an organization provides rides to and the types of assistance/service provided to passengers (p < 0.05). Door-to-door service was the most common type of assistance. There is an urgent need for more alternative transportation services especially those that offer more assistance for impaired passengers and rides to non-medical services.

SUPPLEMENTAL TRANSPORTATION PROGRAMS FOR SENIORS: SAFE AND HELPFUL OPTIONS

M. Nguyen, E. Bernardi, C. Duryee, G. MacKinnon, W.P. Perry, L. Weaver, J. Williams-Mitchell, N.M. Silverstein, Gerontologist Institute, University of Massachusetts Boston, Boston, Massachusetts

Supplemental transportation programs (STPs) are an important source of senior transportation options for those that have given up driving or have limited mobility. STPs supplement existing transportation services such as public transit and paratransit as well as taxi and livery services. STPs enable older adults to stay connected to their communities and maintain active and enriching lives. Data were analyzed from the Beverly Foundation 2011 nationwide, electronic survey of community-based transportation programs (n=281). Results indicate that 78% of the organizations surveyed were nonprofit with almost half (46%) serving between 100 to 500 passengers with 27% operating with budgets less than $50,000. Three-quarters of these programs had been in operation longer than 10 years. Most (96%), including programs with both paid and/or volunteer drivers, reported having no crashes in 2010. Eighty-seven percent reported that they had background checks performed on their drivers, with 40% on all drivers, both paid and volunteer; 17% just for paid drivers; and 29% just for volunteer drivers. A high level of assistance provided was noted with 85% providing door-to-door service; 90% providing door through door service; and 63% reporting stay at the destination service. Areas of difficulty noted in the ability to assist passengers were in transporting passengers with wheelchairs, obesity, or cognitive impairments.

IS IT SAFE FOR AGING DRIVERS TO USE THEIR LEFT LEG INSTEAD OF THEIR RIGHT WHILE DRIVING?

R.R. Goodenough1, J.O. Brooks1, M. Crisler1, K.J. Jeray2, S.L. Tanner1, J. Mckee1, 1. Clemson Univ. Clemson, South Carolina. 2. Greenville Hospital University Medical Center; Greenville, South Carolina

Physicians are commonly asked if patients with a right leg injury can drive using their left leg. This is an important question for the aging population due to joint replacements and lack of transportation alternatives. Older (M=66 years) and younger licensed drivers (M=22 years) drove a driving simulator with a 360° field of view. Three driving scenarios were developed. In the “braking” scenario, participants drove on a straight 2-lane roadway with the cruise control set to 55 MPH following a white SUV; participants tapped on their brake to respond when the SUV’s brake lights illuminated. While there were no differences between the age groups, the mean response time when using the left leg (1.08 seconds) and the right leg (0.97 second) was significantly different. The “target detection” scenario also required the participant to follow the white SUV; however, drivers controlled the speed, and identified and responded to targets in the driving environment. While no “leg” differences were revealed, the younger participants tended to correctly respond to more targets than the older participants. In the “brake control” scenario, drivers followed a white SUV and when the SUV decelerated from 55 MPH to a target speed of either 45 or 35 MPH the participant was required to brake in order to avoid collisions. Drivers using their left leg tended to brake harder (82.5% brake pedal depression) compared to using their right leg (73.9% depression), suggesting a more controlled braking maneuver was used when the right leg was controlling the brake.
DOOR-THROUGH-DOOR MEDICAL ESCORT SERVICE: PARTICIPANT SATISFACTION AND VOLUNTEER OPINION OF EFFECTIVENESS
L.A. Martin, A. Butt, W. Sit, A. Athey, I. Gerontology, Univ. of Massachusetts Boston, Boston, Massachusetts, 2. FriendshipWorks, Inc., Boston, Massachusetts

Environmental barriers encompassing transportation difficulties, hazardous office or hospital access, building navigation and issues with street and sidewalk safety have been recognized by the American health care system as impeding patients’ access to care. This is particularly true for older and disabled adults. This case study evaluates a volunteer-driven door-through-door program whose goal is to remove the environmental barriers keeping older and disabled adults from getting to medical appointments. Research findings consist of 32 volunteer and 78 client surveys (response rates of 74.4% and 66.7% respectively). Presented are results on the role volunteer assistance plays in helping individuals get to and from medical appointments. Overwhelmingly, volunteers report door-through-door assistance is improving the quality of care for elderly and disabled adults. The volunteers report they are providing continued assistance above and beyond their volunteer responsibilities, such as accompaniment into the exam room (66%), facilitating doctor/patient communication (59%), advocating on patient’s behalf (53%), picking up medicines (38%) and scheduling follow-up appointments (34%). Findings also suggest door-through-door assistance improves access to care among program participants. Eight-four percent of volunteers and 59 percent of clients stated it was unlikely that clients could attend their appointments without door-through-door assistance. Recipients of this service were mostly low-income (74%), living alone (88%), disabled (43%) and isolated (45% have no friend/family living nearby, 18% have one person). The results indicate that this door-through-door program reaches a particularly disadvantaged population and reduces barriers that would otherwise impact access to medical care.

AGING IN PLACE FOR VULNERABLE OLDER ADULTS: THE IMPORTANCE OF ACCESS TO TRANSPORTATION
L.M. Richardson, J. Vaughan, H. Lee, M. Nguyen, K. Barton, C. Lee, M. Nguyen, E. Dugan, Gerontology, University of Massachusetts Boston, Boston, Massachusetts

Most adults hope to age in place. Yet few have considered the home modifications or possible services needed to achieve this. Driving cessation is a transition that may impact the feasibility and safety of aging in place. Barriers to transportation put older adults at a greater risk for nursing home placement and dependency. The objective of this study was to explore preferences and expectations related to aging in place and to understand the role that transportation plays. The sample for this study includes N=414 vulnerable older adults age 75 and over (Ages 75-84 n=331, Ages 85 and older n=83). The sample includes 286 women and 128 men. The data are from the Community Partnerships for Older Adults (CPFOA) Program Survey of Older Adults (2008), an initiative of the Robert Wood Johnson Foundation aimed at promoting improvements in the organization and delivery of long-term care and supportive services for older adults. The study surveyed adults regarding supportive and long-term care services for older adults. Desires to age in place, expectation to age in place, demographic variables (e.g., age, gender, family proximity), health variables, and service variables were all explored. Nearly all (96%) participants expected to stay in their communities and 84% said it was important to remain in their home. Most frequently, transportation was reported as a change needed to make the community more senior friendly. A significant relationship (p<0.05) was found between expectation to live in their communities in the next five years and availability of transportation.

INVESTIGATING GENDER DIFFERENCES IN THE ASSOCIATION BETWEEN HEARING IMPAIRMENT AND DRIVING BEHAVIOR AMONG OLDER ADULTS
K. Barton, C. Lee, M. Nguyen, E. Dugan, University of Massachusetts Boston, Boston, Massachusetts

Senior transportation research has demonstrated that visual, cognitive, and ambulation deficits may lead to driving limitation or cessation in older adults. However, results about other medical conditions are less clear. Hearing impairment affects a significant proportion of this growing population and has the potential to impinge on critical driving skills needed for safe navigation. Additionally, continued (safe) driving can help retain one’s independence, autonomy, and quality of life. We examine whether a common age-related sensory impairment (hearing) might impact driving behavior in a large, nationally representative sample of older adults. The data source utilized in this study is the 2006 wave of the Health and Retirement Study (HRS)—a longitudinal, nationally representative survey conducted biannually. The analytic sample included N=8219 adults age 65 or older (3859 men and 4360 women). Logistic regression analyses revealed that—controlling for selected demographic, health, and social variables—females with excellent hearing were less likely to limit their driving to nearby destinations than those females with very good hearing (OR=0.80, p<0.05). However, males reporting good, fair, or poor hearing were significantly more likely to report having driven in the past month than males who reported very good hearing (OR=1.80, p<0.05; OR=2.80, p<0.001; and OR=2.25, p<0.05, respectively). Thus, males who reported the highest levels of hearing impairment in this sample were more likely to be driving than males who reported less impairment. Further research on male gender roles, driving behavior, and risk of driving with hearing impairment is needed to clarify the implications of these findings.

GOING VIRAL IN ACADEMIC MEDICINE: USING A COMPUTERIZED EDUCATIONAL PROGRAM TO ENSURE ALL PHYSICIANS PROVIDERS CAN ASSESS, COUNSEL AND TREAT OLDER DRIVERS

Medically impaired older drivers have elevated crash histories when compared to age matched controls. Physicians and other health professionals are often faced with questions about chronic and/or acute conditions and fitness to drive, yet may lack the knowledge and/or confidence to respond. A web-based educational course, Medical Fitness to Drive: Is your patient at risk?, was pilot tested (residents, physicians and other health care providers) to assess and benchmark change in knowledge through didactic and case studies. This project sought to understand how knowledge gained scores compare across, practice type and level of experience. Participants (N=225) completed pre/post survey questionnaires which assessed their level of knowledge, knowledge gained, and practice improvement implications. Each of the six sites reported in qualitative and quantitative methods how they 1) engaged participants to complete this training; 2) encouraged participants to use the Learning Portfolio and/or Performance Improvement CME; and 3) completed self evaluations of the program after the participants completed the training. Mixed method evaluations of data collected over 7 months (August, 2010 through February, 2011) will be presented. Preliminary descriptive statistical data highlight that the participants increased their knowledge and level of confidence about the content after the educational session. Moreover, the participants agreed to strongly agreed (90%) that the course (1 hour) and it’s educational resources were beneficial for practice. When comparing groups (physician/resident/other healthcare) the majority of participants (70%) recognized that the educational session will improve their practice. Lessons learned regarding methods used to engage and complete the
program will be presented in addition to the inferential comparative analyses.

SESSION 270 (SYMPOSIUM)

THE HEALTHY GUT AND AGING
Chair: R. Martin, Pennington Biomedical Research Center, Baton Rouge, Louisiana
Co-Chair: M. Marco, University of California-Davis, Davis, California

In the past, the gastrointestinal system has been relatively understudied for its contribution to overall health. However, we are now starting to realize how integral this system is in terms of age-related disease and well-being throughout life. This session will have talks focused on the role of the gastrointestinal system in aging. Specifically, speakers will address the issues of cellular biology of the aging gut, weight control in aging and the health benefits of pre- and probiotics. Overall, this topic will address the contribution of this physiological system to overall health during aging.

INTRINSIC AGING OF GUT EPITHELIUM
T. Kirkwood, Newcastle University, Newcastle upon Tyne, United Kingdom

The epithelial lining of the mammalian intestine is an excellent model for investigating how intrinsic aging affects the long-term functional homeostasis of a tissue maintained by ongoing division of stem cells. Any age-related deterioration of these cells can have important consequences for gut function in old age. Important alterations were detected in key functional properties of the stem cells within the crypts of the murine small intestine, including the apoptotic response to low dose radiation, regeneration of radiation-damaged crypts, and mechanisms for detecting and responding to DNA damage. In human colon, aging was shown to be associated with accumulation of mitochondrial dysfunction and mtDNA mutations, which were associated with changes in cell proliferative properties and apoptosis. Understanding how damage accumulates in such a highly proliferative tissue requires detailed attention to kinetics and selection at the cellular level.

PREBIOTICS: A REVIEW OF POTENTIAL MECHANISMS FOR IMPROVED HEALTH SPAN
R. Martin1, J. Zhou2, D. Ingram1, M. Keenan1, 1. Louisiana State University, Baton Rouge, Louisiana, 2. Veterans Affairs Medical Center, Washington, District of Columbia

It is well known that diet restriction attenuates the aging process and increases lifespan. Our lab found dietary prebiotics, in many aspects, mimic many of the short term effects of diet restriction and, therefore, may also increase healthspan. Although the mechanisms remain uncertain, prebiotics have been shown to decrease plasma cholesterol and triglycerides, increase insulin sensitivity, decrease fat storage, and produce anticancer effects in humans. Early results show that the manipulation of gut microbes with prebiotics leads to a cascade of events involving increased fermentation products, butyrate and propionate, improved gut health and gut peptide release and enhanced feeding behavior. As a HDAC inhibitor, butyric acid activates PPARα and PGC-1α in liver tissue to stimulate mitochondrial biogenesis and energy expenditure. Increased production of propionic acid by the microbiota might be considered beneficial. Propionate lowers fatty acid content in liver and plasma, to exert immunosuppressive actions, and to improve tissue insulin sensitivity. Both propionate and butyrate stimulate the expression of gut hormones like Glucagon-like Peptide-1 (GLP-1). It is may be important that prebiotics elevate blood levels of GLP-1 in aging for several reasons. First, GLP-1 can reverse the age-related decline in glucose tolerance by reversing some of the known defects that arise in the beta cell of the pancreas. Second, GLP-1 receptor stimulation has been shown to reduce amyloid-β peptide accumulation in animal models of Alzheimer’s disease. And third, GLP-1 preserves primary cortical and dopaminergic neurons in cellular and rodent models of stroke and Parkinsonism. From these observations it is clear that novel dietary approaches are essential to enhance beneficial bacteria and the cascade of positive events associated with healthy aging.

DIETARY MODIFICATION OF THE INTESTINAL MICROBIOTA TO IMPROVE HEALTH
M. Marco, University of California, Davis, Davis, California

The human gastrointestinal tract is colonized by large amounts of bacterial cells with established roles in food digestion, immune function, and the prevention or development of various disease states. Prebiotics and probiotics offer the opportunity for diet-directed improvements to health by stimulating the growth of beneficial bacteria in the gut, particularly among elderly populations which experience declines in appetite and energy intake. We found that the digestive tracts of aged (2 year-old) mice fed prebiotic type 2 resistant starch, a high amylase corn starch, were enriched with members of the Verrucomicrobia, Actinobacteria, and Bacteriodetes bacterial phyla compared with control mice on an energy balanced diet. The amounts of prebiotic-responsive bacterial genera correlated with physiological parameters including increased food intake, intestinal weight, and gut secreted hormone production. These organisms might serve as targets for dietary intervention studies aimed at improving intestinal homeostasis and longevity of the elderly.

SMALL MOLECULES AND NATURAL PRODUCTS THAT SUPPRESS PROTEIN AGGREGATION AND SLOW AGING
S. Alavez1, P. Rodriguez1, M. Vantipalli1, D. Zucker1, M. Klang1, G.J. Lithgow1, 1. Buck Institute for Research on Aging, Novato, California, 2. Dominican University of California, San Rafael, California, 3. Karolinska Institute, Huddinge, Sweden

We have undertaken screen of synthetic and natural compounds to find agents for aging interventions. Since aging can be considered a causal factor in a number of age-related diseases. We hope such screen could yield useful therapeutics. We focused our search on compounds that maintain protein homeostasis. Collapse of protein homeostasis results in protein misfolding cascades and the accumulation of insoluble protein fibrils and aggregates, such as amyloids. A group of small molecules, traditionally used in histopathology to stain amyloid in tissues, bind protein fibrils and slow aggregation in vitro and in cell culture. We proposed that treating animals with such compounds would promote protein homeostasis in vivo and increase longevity. Here we show that exposure of adult Caenorhabditis elegans to the amyloid-binding dye Thioflavin T (ThT) resulted in a profoundly extended lifespan and slowed ageing. ThT also suppressed pathological features of mutant metastable proteins and human β-amyloid-associated toxicity. These beneficial effects of ThT depend on the protein homeostasis network. Other agents that extend lifespan also suppress protein homeostasis such as Lithium. We are testing for common mechanisms of action. Our results to date demonstrate that pharmacological maintenance of the protein homeostatic network has a profound impact on ageing rates, prompting the development of novel therapeutic interventions against ageing and age-related diseases.
SESSION 275 (PAPER)

HEALTH AND CHRONIC DISEASE TRENDS IN LATE LIFE

SOCIOECONOMIC POSITION ACROSS THREE LIFE STAGES AND INCIDENCE OF DEPRESSIVE SYMPTOMS LATER IN LIFE: RESULTS FROM THE SACRAMENTO AREA LATINO STUDY ON AGING

K. Smith1, 2, T. Ostbye2, J. Tschanz3, S. Gale2, K. Yaffe2, A. Aiello2, 1. Department of Epidemiology and Biostatistics, School of Medicine, University of California San Francisco, San Francisco, California. 2. Department of Psychiatry, Veterans Affairs, University of California San Francisco, San Francisco, California. 3. Center for Social Epidemiology and Population Health, Department of Epidemiology, School of Public Health, University of Michigan, Ann Arbor, Michigan. 4. Mailman School of Public Health, Columbia University, New York, New York

The socioeconomic gradient with regard to depressive symptoms remains relatively unexplored among older Mexican Americans; majority of the work is cross-sectional and does not address the multiple dimensions of socioeconomic conditions. The purpose of the present analysis was to examine the associations between socioeconomic conditions across three life stages and risk of depressive symptoms among a cohort (N=1,789) of older Mexican Americans followed for up to a decade in the Sacramento Area Latino Study on Aging. Depressive symptoms were assessed at baseline and each of six follow-up visits by the 20-item Center for Epidemiologic Studies Depression Scale. Indicators of socioeconomic position (SEP) from three life stages were used to derive a six-level categorical measure of trajectories of SEP mobility. In fully-adjusted Generalized Estimating Equations models, the baseline risk of depressive symptoms was 50% lower among participants who maintained high SEP across the life course (RR=0.50; 95% CI=0.34, 0.74; p-value=0.0005) compared to those who maintained low SEP across the life course. Participants with an upward or downward SEP trajectory but who achieved high early adulthood SEP (educational attainment) showed lower risk of depressive symptoms compared to those with low SEP across the life course (RR=0.53; 95% CI=0.28, 1.00; p-value=0.05 and RR=0.63; 95% CI=0.46, 0.86; p-value=0.004, respectively). Educational attainment seems to play a decisive role in one’s lifelong socioeconomic trajectory. Education may buffer childhood disadvantages and may shape later midlife stages such as aspects of labor force participation which may in turn influence psychological well-being later in life, depressive symptoms in particular.

DEMENTIA AND THE RISK ASSOCIATED WITH MEDICAL CO-MORBIDITIES: RESULTS FROM THE CACHE COUNTY STUDY LINKED TO MEDICARE CLAIMS

K. Smith1, G. Hanson1, T. Ostbye2, J. Tschanz2, S. Schwartz2, C. Corcoran3, M.C. Norton1, 1. Huntsman Cancer Institute, University of Utah, Salt Lake City, Utah. 2. Duke University, Durham, North Carolina. 3. Utah State University, Logan, Utah

Stressful life experiences can have detrimental neuro-physiological effects that may elevate the risk of dementia in late-life. Physical and psychological disorders are likely strong stressors. We examined the role of late-life co-morbid conditions on the incidence of dementia among elderly participants of the Cache County (Utah) Study (CCS). CCS participants were assessed in four triennial waves, with incident dementia identified through in-depth cognitive assessment, ending in expert consensus diagnosis. CCS dementia outcomes were linked to the Utah Population Database (UPDB), a unique, large and extensive population-based data resource, and through the UPDB, to Medicare claims spanning 1992-2002. Cox proportional hazards regression are estimated to study association between medical morbidity and the onset of dementia—either all-cause, Alzheimer’s disease (AD), or vascular dementia (VAD) based on 2,047 linked subjects. Medical conditions derived from the Medicare files included diseases from the Charlson Comorbidity Index (CCI), number of inpatient days, number of Medicare claims, and whether there were claims associated with psychological disorders. Covariates were: age, gender, APOE genotype, education, self-rated health, and parental lifespan. An adjustment was made to correct for competing risks of mortality. An increase of one point in CCI (range 0-6) is associated with a 13% higher hazard rate ratio (HRR) of all-cause dementia (HRR=1.13, p<.05), a result non-significant for AD but larger for VAD (HRR=1.71, p<.01). Subjects whose claims were related to psychological events (mood and anxiety disorders and depression) had an HRR=3.7 (p<.01) for AD. This evidence suggests that comorbid conditions may accelerate the onset of dementia.

GENDER SPECIFIC TEMPORAL RELATIONSHIP BETWEEN OBESITY CLASS AND DEPRESSION IN THE ELDERLY

B. Wild1, W. Herzog1, H. Brenner2, E. Raum2, 1. Department of General Internal Medicine and Psychosomatics, University Hospital Heidelberg, Heidelberg, Germany. 2. German Cancer Research Center, Heidelberg, Germany

Objective: The aim of the study was the gender specific analysis of the temporal relationship between obesity class and depression in a large representative sample of elderly German people. Methods: At baseline (2000-2002), 9,953 participants of the ESTHER study completed a comprehensive questionnaire including items regarding weight, height, and depression history. A total of 7,850 participants of the second follow-up five years later (= 94.9 % of the responders) again completed the items on height and weight, and more than 12 items of the geriatric depression scale (GDS-15). The analysis of the association between obesity class at baseline and depression at follow-up was stratified by gender. Results: Logistic regression analysis - adjusted on age, education, marital status, smoking, multimorbidity, physical activity, self-perceived cognitive impairment, and antidepressive medication - showed that for women with obesity class II (BMI ≥ 30) and III (BMI ≥ 40) at baseline, the odds for being depressive five years later were significantly elevated (class II: 1.67; 95% CI=1.06; 2.64); class III: OR=2.93; 95% CI=1.37; 6.26) compared to women with normal weight. In men, odds ratios for obesity classes II and III were not significantly increased; however, overweight men (25≤BMI<30) had lower chances for being depressive than normal weight men (OR=0.69; 95%CI=[0.51;0.92]). Conclusion: The longitudinal relationship between obesity class and depression in older people appears to be heterogeneous across different BMI classes. Women are more affected by obesity class II and III then men; moreover, in elderly men, overweight appears to be a protective factor for depression.

C. Lennartsson1, I. Kåreholt1, M.G. Parker1, M. Thorslund2, 1. Karolinska Institutet/Stockholm University, Stockholm, Sweden. 2. Department of Social Work, Stockholm University, Stockholm, Sweden

Sweden has one of the world’s highest proportions of people aged over 80 and the life expectancy at higher ages continues to increase. At the beginning of the 21st century a Swedish study of the oldest old showed increasing health problems between 1992 and 2002. This study looks at data gathered in 2010/2011 to see if health in this very old population has continued to deteriorate. SWEOLD—a nationally representative Swedish interview survey of people aged 77+ including institutionalized and proxy interviewed individuals—used several health indicators, including objective tests of physical and lung function, and showed a significant worsening of health between 1992 and 2002. Both women and men showed worsening health. A new wave of SWEOLD has been conducted during 2010/11. Cross-sectional analysis of the first
75% of the interviews conducted, showed neither an improvement nor a deterioration of self reported health problems. Reports of e.g. pain in shoulders, back pain, problems climbing the stairs, anxiety and nervousness, have not changed significantly since 2002. Also the proportion reporting poor self-rated health has been stable at a level of 12% over the years 2002, 2004 and 2010. The preliminary conclusion is that the deterioration of health seen between 1992 and 2002 has not continued. Nor are there any signs of improvement. Results will be discussed with a special emphasis on gender differences and methodological issues.

DIABETES IN AN AGING SOCIETY: IS IT UNDERREPORTED BY SENIORS?
M.G. Ory, S. Ahn, M.L. Smith, J.B. Dickerson, K. Kim, Texas A&M University System Health Science Center School of Rural Public Health, College Station, Texas

Background: Diabetes is a recognized public health problem with many negative health and health care cost consequences for older adults. Yet, diabetes is often undetected and untreated. The purposes of this study are to assess whether older adults’ reports of being told they are diabetic match their actual glucose values and identify factors associated with underreported diabetes. Methods: Data from the 2007-2008 National Health and Nutrition Examination Survey (NHANES) were analyzed for those over the age of 65, who had fasting glucose levels equal to or greater than 126mg/dl (n=962). Logistic regression was used to identify factors associated with diabetes underreporting. Results: Approximately 70% of study participants with glucose values indicating the presence of diabetes did not report being told by their health care providers that they had diabetes. Underreporting of diabetes was more common among those over age 75 (OR=1.73, p = 0.008), whereas it was less common among those who were Hispanic (OR=0.43, p = 0.005) or African American (OR=0.47, p = 0.004), had more than two chronic conditions (OR=0.04, p < 0.001), or were severely obese (OR=0.29, p = 0.002). Conclusions: It is critically important that older adults with diabetes be aware of their status so they can receive appropriate diabetes management counseling. Knowing the characteristics of seniors who underreport their disease can help tailor recruitment efforts for screening and treatment programs.

SESSION 280 (PAPER)
INTERGENERATIONAL SUPPORT

INTERGENERATIONAL SUPPORT AND THE RECESSION: SHIFTING FAMILY INTERDEPENDENCE ACROSS GENERATIONS
I.A. Connidis, Sociology, University of Western Ontario, London, Ontario, Canada

This paper assesses the recession’s impact on intergenerational relations in families in the United States and Canada. The recession’s impact on employment, savings, and pensions affects intergenerational relations as older parents witness the delayed entry of adult children into the labor market and the threat to their parents’ financial security of eroding or cancelled pensions. Using available information on education, family transitions such as marriage, employment, retirement, and pensions across generations, I assess the unique impact of the recession on each generation and consequences for intergenerational family relationships. Government statistics and media and think-tank reports are used for a critical analysis of intergenerational responses within families to the challenges created by the recession. A model of intergenerational relations incorporates support to and from each generation (adult children and their older parents and grandparents), including financial transfers, living arrangements, and decisions to delay or speed up education, job searches, marriage, childbirth, labor force participation, and retirement. In dealing with a current reality that continues to unfold, I will incorporate additional information as it becomes available between now and November. A life course perspective (especially the concepts of linked lives and life stage), a critical perspective that highlights structured social relations (gender, class, age, race), and the concept of ambivalence inform this analysis of links between social change and family life and between social and personal responsibility in public policy.

GEOGRAPHIC PROXIMITY AND FAMILY CONTEXT: EXPLORING MONETARY AND TIME-BASED TRANSFERS BETWEEN OLDER ADULTS AND THEIR CHILDREN
C.A. Mair1, Y. Chen2, J. University of Maryland, Baltimore County, Baltimore, Maryland, 2. University of Maryland, College Park, College Park, Maryland

Geographic proximity constitutes an opportunity structure that can either facilitate or restrain monetary and time-based transfers between older adults and their children. Family context, such as the parent or child’s financial or practical needs, may intensify the likelihood of transfers. In this study, we utilize newly available public data from the Health and Retirement Study (2004, 2006, 2008) on geographic distances between older adults and their children to explore if and to what extent proximity and family context are associated with monetary transfers from older parents to children, monetary transfers from children to older parents, and older adults’ time-based transfers to children in the form of grandparent caregiving. In addition, we examine if and to what extent family context moderates the relationship between proximity and intergenerational transfers. Finally, we utilize fixed effects models to explore if change in proximity and change in family context predict the likelihood of transfers over time. We find that geographic proximity and family context are significant predictors of both monetary and time-based transfers between older adults and their children. In addition, the presence of greater family need (family context) and increases in family need over time moderate the relationship between proximity and likelihood of transfers. Our findings underscore the importance of examining geographic proximity and family context jointly when studying intergenerational transfers.

LONGITUDINAL ANALYSIS OF OLDER ADULT’S PSYCHOLOGICAL WELL-BEING IN JAPAN: HOW INTERGENERATIONAL FAMILY SUPPORT INFLUENCES OLDER ADULTS’ MORALE
E. Takagi1, Y. Saito2, 1. Health Science, Towson University, Towson, Maryland, 2. Nihon University, Tokyo, Japan

This study investigated; 1) characteristics of Japanese older adults who are involved in different patterns of support exchange with their children; and 2) potential longitudinal impacts of support exchange on older parent’s psychological well-being. We analyzed four waves of data in the Nihon University Longitudinal Study of Aging (NUJLSOA) between 1999 and 2006 (n=6201). By pooling the transitional data between each wave, we constructed longitudinal dataset that contained 4441 cases of transition that captured a longitudinal trend of psychological well-being measured by the Philadelphia Geriatric Center (PGC) Morale Scale. We categorized support exchange patterns as: only receiving support from adult children, only providing support to adult children, and both receiving and providing support. Different types of assistance were also considered by creating three categories of support: instrumental support, financial support, and emotional support. We observed an increasing incidence of transitions to the status where parents receive support from adult children as they age. Support exchanges were most commonly observed with older mothers and those living with children. Receipt of support from children was also associated with parent’s declining physical health. The ordered logistic regression in this study revealed a significant negative association between exchange of
support with children and older parents’ psychological well-being, which implies that receiving or providing help with children may contribute to older adult’s declining morale. We discuss the implications of our results in relation to older adults’ individual life transitions and family contexts.

THE INTERGENERATIONAL SOCIAL CONTRACT REVISITED: CROSS-NATIONAL PERSPECTIVES

C.S. Marcum, J. Treas, UCI, Irvine, California

The intergenerational social contract is an implied agreement between society’s providers and dependents. Using data from the International Social Survey Programme’s 2001 Social Network II module, we evaluate individual attitudes towards state spending on children and older adults from thirty largely industrialized and Western countries. A majority of people support the idea that it is the government’s responsibility to provide childcare for everyone who wants it and to provide a decent standard of living for the aged. On average, the largest share of people in each country is supportive of spending on young and old alike. This is a nearly universal orientation among a few populations such as Russians (96%), Spaniards (96%) and Israeli Arabs (97%), but the intergenerational orientation is not embraced by majorities in the liberal welfare regimes of the U.S., Australia, and New Zealand, as well as Switzerland. As multinomial logistic regressions show, respondent’s age increases the odds of having an “older adult only” orientation compared to attitudes favorable to government’s support of both age groups; furthermore, older respondents are more disposed to family or market (rather than government) solutions to the support young or old. Respondents having children younger than 18 are less likely to advocate an “older adult only” or “family-market” approach to social welfare. Despite evidence that self-interest motivates some beliefs, our findings point to a social context that is amiable towards the intergenerational social contract—although results indicate a greater potential for generational conflict in liberal welfare regimes such as the United States.

SESSION 285 (SYMPOSIUM)

BROADENING DEMENTIA ASSESSMENT: NON-COGNITIVE TARGETS

Chair: B.T. Mast, Psychological & Brain Sciences, University of Louisville, Louisville, Kentucky

Discussant: R.G. Logsdon, University of Washington, Seattle, Washington

The assessment of Alzheimer’s disease and other dementias focuses primarily on early detection, cognitive decline, and functional implications. Traditionally there has been less attention given to the personal, social and psychological aspects of developing and living with a dementia syndrome. Because these assessment foci have been underdeveloped in the clinical and research literatures it has not been clear (1) what other targets should be assessed, (2) what tools are available, and (3) how they can be used to provide more individualized intervention and care for people experiencing the earlier stages of dementia. This symposium includes four presentations and seeks to broaden the range of targets in dementia assessment by describing new tools and methods that can be used to better understand the person being assessed. The first presentation (Mast) will provide an overview for the symposium and will outline principles and methods for broadening dementia assessment to integrate non-cognitive targets. The second presentation (Carpenter) will describe the Alzheimer’s Disease Knowledge Scale and how it can be used to assess knowledge and understanding of dementia. The third presentation (Burgener) will describe the evaluation of stigma associated with Alzheimer’s disease and how it impacts the diagnosed person and their family. The final presentation (Whitlatch) will describe methods for assessing the personal preferences of individuals with dementia regarding their care and preferred ways of living with dementia. Each presentation will describe specific tools or methods and the ways they can be integrated into clinical assessment.

EMPHASIZING THE WHOLE PERSON IN DEMENTIA ASSESSMENT

B.T. Mast, Psychological & Brain Sciences, University of Louisville, Louisville, Kentucky

Broadening dementia assessment includes requires a dual focus on the dementia syndrome and on the person experiencing dementia. Although methods to evaluate the various dementia syndromes are well developed, methods to assess the person and her experience have lagged considerably behind. This presentation will describe a whole person approach to dementia assessment that includes a renewed emphasis on the person while maintaining a strong focus on systematic evaluation of dementia and related changes. This framework reconsiders specific aspects of the assessment process including the goals and focus of assessment, the way clinicians approach the interview, and the selection of tests and measures to be incorporated. Specific ways in which standard dementia assessment approaches can be modified to provide a greater focus on the whole person will be described along with the scientific and clinical basis for these changes.

ASSESSING KNOWLEDGE ABOUT ALZHEIMER’S DISEASE: PERSONAL AND PUBLIC IMPLICATIONS

B. Carpenter, Washington University in St. Louis, St. Louis, Missouri

People learn about Alzheimer’s Disease (AD) from a variety of sources, and what they learn can range in its accuracy and usefulness. What people know about AD can, in turn, influence their attitudes and behaviors, such as whether they seek evaluation for cognitive changes and how they plan for future care needs. Therefore, assessing what people know about AD can be helpful at many levels, from the personal to the public. The Alzheimer’s Disease Knowledge Scale (ADKS) is a brief, current, and validated assessment tool to evaluate what people know about AD. This presentation reviews how the ADKS was constructed, pragmatics and psychometrics of the instrument, and how it can be used to assess knowledge and understanding of AD in a variety of contexts.

CONSIDERATIONS IN MEASURING PERCEIVED STIGMA IN PERSONS WITH EARLY-STAGE DEMENTIA

S.C. Burgener1, K.C. Buckwalter2, M. Liu3, R. Riley4, C.J. Einhorn1, S. Fitzsimmons1, I. Biobehavioral Health, University of Illinois College of Nursing, Urbana, Illinois, 2, The University of Iowa College of Nursing, Iowa City, Iowa, 3, University of North Carolina, Greensboro, North Carolina

Recent studies describe the negative effects of stigma on persons with dementia (PwD) including negative self-attributes and accounts of experienced stigma. A longitudinal study is examining the ‘natural history’ of perceived stigma in early dementia stages using the 24-item Stigma Impact Scale (SIS) adapted for PwD. From a sample of 50 PwD (mean MMSE = 21.6), 7 items have item-to-total scale score correlations of > .60, supporting the relevance of experienced loneliness, feeling set apart from others, self-blame, and embarrassment to perceived stigma. Total SIS scores (mean = 40.8) for PwD exceed those for other debilitating illnesses. Qualitative interviews reveal that PwD often underestimate SIS ratings, as responses include stigmatizing experiences not reflected in quantitative ratings. Relationships among SIS scores and quality of life (QoL) outcomes underscore the relevance of perceived stigma. These outcomes point towards the need to measure perceived stigma when assessing QoL in PwD, including multiple data sources.
ASSESSING THE PERSONAL CARE VALUES AND PREFERENCES OF INDIVIDUALS WITH DEMENTIA

C.J. Whitlatch, Benjamin Rose Institute on Aging, Cleveland, Ohio

Individuals with dementia and their family caregivers face a variety of challenges and stressors as they manage and adapt to changes in the individual’s memory, personality, and functioning. These challenges and stressors can be exacerbated if care partners (i.e., individuals with dementia and their family caregivers) do not understand each other’s views about care values and preferences for care tasks. This presentation describes methods for assessing the personal care values and preferences of individuals with dementia and their caregiver’s perception of these preferences. Assessing the perceptions of both care partners provides important information for developing a care plan that respects each person’s perspectives and preferences. Discussion points will include evidence that: 1) individuals with dementia are able to answer assessment questions with a high degree of reliability and accuracy, and 2) family caregivers often underestimate the importance of the care values and preferences of their relatives with dementia.

SESSION 290 (SYMPOSIUM)

CAREGIVING AND SOCIAL SUPPORT IN LESBIAN, GAY, BISEXUAL AND TRANSGENDER POPULATIONS: FINDINGS FROM NATIONAL AND INTERNATIONAL SURVEYS

Chair: B. de Vries, San Francisco State University, San Francisco, California, The Fenway Institute, Boston, Massachusetts

Discussant: J. Bradford, The Fenway Institute, Boston, Massachusetts

Lesbian, Gay, Bisexual and Transgender (LGBT) older adults have been largely invisible in gerontological research; most of the few available studies have been modest and local in scope. The four studies represented here usher in a new wave of research focusing on LGBT caregiving and social support, using large, national and international samples. Fredriksen-Goldsen and colleagues present on their national health study of 2,560 LGBT adults ages 60 and older and the protective nature of social support as it relates to physical and mental health outcomes. de Vries and colleagues present on the MetLife national study of 1,201 LGBT persons, ages 45 and 64, and a comparably aged sample of 1,206 from the general population; analyses reveal higher levels of caregiving involvement among LGBT boomers highlighting the role of friends and “chosen families.” Witten reports on a sample of 1,056 transgender-identified persons from 18 countries finding that older transgender persons have greater needs, fewer resources and seek support within their communities to a higher degree. The extent to which traditional aging agencies are ready to serve and cognizant of the needs of LGBT persons is the focus of the presentation by Moore and colleagues; they find readiness to serve paired with lack of knowledge of LGBT populations. Together, as Bradford notes, these studies highlight the social spheres, needs and resources of LGBT older adults; they illuminate the study of disenfranchised populations offering new ways to conceptualize, understand, and study caregiving and social support.

CAREGIVING AND SOCIAL SUPPORT AMONG LGBT BOOMERS: A FOCUS ON FRIENDSHIP

B. de Vries1, K. Acquaviva2, J.K. Quam1, L. Cook-Daniels2, 1. San Francisco State University, San Francisco, California, 2. FORGE, Milwaukee, Wisconsin. 3. University of Minnesota, Minneapolis, Minnesota, 4. The George Washington University, Washington, District of Columbia

Poised between prominent social and demographic waves, the LGBT baby boomer population has recently captured scientific and popular attention, focusing on their preparation for later life, including plans for and experiences with caregiving. Using the MetLife nationally representative samples of 1,201 LGBT persons ages 45 to 64 and a comparably aged sample of 1,206 from the general population, this study found that LGBT persons were more likely to have provided care in the previous six months than were those from the general population (21 vs. 17%). Friends were more likely to be the recipients of care from LGBT persons; similarly, LGBT persons were more likely to turn to their friends for support than were respondents from the general population. Concomitantly, almost two-thirds of LGBT boomers reported a “family of choice.” These data highlight the understudied but valuable role of friends in the lives of LGBT persons—and perhaps more generally.

READEINESS OF THE AGING NETWORK TO SERVE LESBIAN, GAY, BISEXUAL AND TRANSGENDER COMMUNITIES

R. Moos, K. Knochel, C. Croghan, J.K. Quam, School of Social Work, University of Minnesota, Apple Valley, Minnesota

Since the inception of the National Family Caregiver Support Program in 2000 over 1.5 million contacts are made with caregivers annually through the national Aging Network. These providers support a crucial system linking caregivers to information, counseling, training, and respite care. Research shows that lesbian, gay, bisexual and transgender (LGBT) older adults have significantly different family and caregiving systems than their heterosexual and cisgender peers. This study provides the first snapshot of the Aging Network’s experience with and readiness to serve LGBT older adults; 50% (n=320) of eligible agencies completed the study. More than one-third had offered or funded some type of LGB and T aging training to staff; four out of five were willing to offer training. Agencies that had funded or offered training were also two to three times more likely to have received requests to assist LGBT older adults. Implications for caregiver service development are included.

CAREGIVING AND END OF LIFE RESULTS FROM THE INTERNATIONAL TRANS-METLIFE SURVEY ON END OF LIFE PREPARATION

T.M. Witten, Center for the Study of Biological Complexity, Virginia Commonwealth University, Richmond, Virginia

The MetLife GLBT Survey attempted to understand later life preparations of the GLBT community. However the Phase 1 response to the MetLife instrument had negligible trans-identified responses. The Phase 2 transgender-identified response was significantly larger but still remained small. In addition, the questionnaire itself was designed to capture an overall GLBT picture and therefore lacked the needed focus to address many of the unique population challenges of the transgender population. The Trans-MetLife Survey is a trans-focused version of the Phase 2 MetLife Survey instrument. As of this abstract submission n = 1,068 respondents, from 18 countries and across the ages of 18 to over 80, have responded to the online mixed methods survey. In this presentation we will give a brief demographic overview of the survey and then focus on the respondents challenges around healthcare and end of life issues. Quantitative results will be illustrated along with some of the qualitative responses.

WHY OLDER LESBIANS LIVING ALONE OFTEN FAR BETTER THAN OTHER OLDER WOMEN LIVING ALONE?

E. Portacolone, UCSF, Berkeley, California

Remaining at home later in life is often lauded as a sign of freedom and independence, and therefore an important achievement. However, this study is driven by the concern that living alone in societies that reward independent behaviors may create significant strains in women missing informal and often intangible assistance from cohabitants. It is critical to study sexual minorities living alone in older age considering several factors that distinguish them from the heterosexual counterpart. Sexual minorities are more likely to be disconnected from their family of origin, to be poor, to access less legal benefits, to avoid health care providers, and to lack the support of adult children. They are also more likely to be in worst health and to have suffered stigma and abuse.
because of their sexual orientation. More than one year of ethnographic fieldwork among 21 San Franciscans over 75 living alone led to the contention that lesbian informants tend to report less concerns than other women. Some older lesbians created mechanisms of support that effectively allows them to navigate the system and lead a fulfilling life. Their example can be source of inspiration for best practices in long-term care of older adults living alone.

LIVING ARRANGEMENT AND RELATIONSHIP STATUS AS PREDICTORS OF HEALTH AMONG OLDER LGBT ADULTS: THE IMPACT OF SOCIAL SUPPORT
K.I. Fredriksen-Goldsen, H. Kim, C. Hoy-Ellis, University of Washington, Seattle, Washington

The health and well-being of lesbian, gay, bisexual and transgender (LGBT) older adults have not been adequately addressed in aging research. This presentation highlights findings from the first national research project addressing the health of LGBT older adults. Based on a survey of 2,560 respondents, we investigate the influence of living arrangement and relationship status on quality of life and depression, and impact of social support on these relationships. The results indicate that social support fully mediates the relationship between living arrangement and quality of life and moderates the relationship between living arrangement and depression. For LGBT older adults with higher social support, living arrangement does not influence depression. While both relationship status and social support independently predict quality of life, social support fully mediates the association of relationship status with depression. Future intervention efforts need to address the important impact of social support on health among LGBT older adults.

SESSION 295 (SYMPOSIUM)

FEAR OF FALLING IN DIFFERENT POPULATIONS: IDENTIFICATION, DETERMINANTS, AND CONSEQUENCES
Chair: G. Zijlstra, Maastricht University, CAPHRI School for Public Health and Primary Care, Maastricht, Netherlands
Co-Chair: G.J. Kempen, Maastricht University, CAPHRI School for Public Health and Primary Care, Maastricht, Netherlands
Discussant: E.W. Peterson, University of Illinois, Department of Occupational Therapy, Chicago, Illinois

Prevalence rates for fear of falling among community-dwelling older people range from 20 to over 60% and increase with age, frailty, and number of falls. In view of the increase in life expectancy and the commonness of (co)morbidity in older people, it is highly likely that fear of falling will be even more prevalent in the near future. This merits the development and implementation of (cost) effective programs to manage fear of falling. These programs obviously need to correspond to people’s physical and cognitive abilities and thus different programs may be needed for different populations, e.g. in community or geriatric rehabilitation settings. During this symposium five researchers from the US, Germany and Switzerland present new data on the identification of fear of falling, and the determinants and consequences of fear of falling in different populations. The presentations will focus on: 1) identifying and addressing fear of falling in hip fracture patients of a geriatric rehabilitation setting, 2) the influence of cognitive status or frailty on reporting fear of falling in patients with dementia, 3) determinants of balance confidence among older priests, 4) the relationship between fall concerns and gait performance in well-functioning older persons, and 5) the associations between falls efficacy and rehabilitation outcomes in older patients. Our presenters from the US will reflect on the presentations and will facilitate a discussion on-site.

IDENTIFYING AND ADDRESSING FOF IN GERIATRIC REHABILITATION – RESULTS OF A PILOT STUDY WITH HIP FRACTURE PATIENTS
K. Pfeiffer1, C. Becker1, K. Stranzinger1, K. Stoever1, M. Kuepper1, D. Klein2, M. Jamour2, M. Hautzinger2, R. Robert-Bosch-Krankenhaus, Stuttgart, Germany, 2. University of Tuebingen, Tuebingen, Germany, 3. Geriatric Rehabilitation Clinic, Echingen, Germany

Hip fractures are one of the most serious consequences of a fall and a high risk for becoming community immobile and functionally dependent. There is some evidence that FOF, self-efficacy and perceived control are important psychological variables in the recovery from hip fracture. In contrast to interventions for community-residing older people there is little knowledge about sensitive screenings and cognitive behavioural interventions targeting such psychological variables during inpatient rehabilitation. The following three screening approaches to identify patients with FOF are discussed in terms of feasibility and validity: (a) Short FES-I (Kempen et al. 2007), (b) extended Short FES-I including less demanding activities (e.g. transfer situations) presented with icon cards, (c) 3-item screener with questions referring to the injurious fall, current concerns about falls, and worries regarding future falls. The iterative development of the tools and data collection was done within a pilot study of a multifactorial intervention including CBT components.

EFFECT OF COGNITIVE, PSYCHOLOGICAL, AND MOTOR STATUS ON REPORTS ON CONCERNS ABOUT FALLING IN PATIENTS WITH DEMENTIA
K. Hauer, M. Schwenk, T. Zieschang, P. Oster, Bethanien Hospital/ Geriatric Centre at the University of Heidelberg, Heidelberg, Germany

Objective: to determine whether motor, psychological, somatic, and cognitive status predict fall-related self-efficacy in patients with dementia. Methods: Data collected by valid, established measures in diagnostically confirmed mild to moderate stage dementia (n=130) were used as independent variables in linear regression analysis to predict fall related self efficacy (Falls Efficacy Scale International: FESI). Results: In a step-wise, backward regression model: age (standardised coefficient beta (β)=-0.165; p=0.025), ADL (Barthel) (β=-0.176; p=0.024); QUOL (SF-12) (β=-0.175; p=0.024), motor function (Timed-up-and-go) (β=-0.289; p=0.021); (stair climbing) (β=-0.348; p=0.006); vertigo (β=0.259; p=0.001) and depression (GDS) (β=-0.400; p=0.0001) were identified as significant predictors for fall-related self efficacy. (Corrected R2 for the total model: 0.467). Those specific cognitive tests, which were significant predictors within parameters of cognitive status alone (verbal fluency, word recognition, trail making test) were no longer predictive in the comprehensive model including high impact parameters of motor, somatic and psychological status.

FEAR OF FALLING AMONG OLDER MEN: THE PRIEST STUDY
D. Klima1, R. Newton2, A. Davey2, E. Keshner2, J. University of Maryland Eastern Shore, Baltimore, Maryland, 2. Temple, University, Pennsylvania

OBJECTIVES: To compare balance confidence in two age cohorts of older adult clergy and identify correlates and predictive determinants of balance confidence in a liturgical research initiative. PARTICIPANTS: 131 community-dwelling Roman Catholic priests aged 60-97 years. METHODS: Subjects completed a demographic profile, the Physical Activity Scale for the Elderly (PASE), the Berg Balance Scale (BBS), and Timed Up and Go (TUG) Test. Psychosocial assessments included the Activities-specific Balance Confidence Scale (ABC) and 15-item Geriatric Depression Scale (GDS). RESULTS: Fear of falling (FOF) was present in thirty-nine (30%) individuals and 46 (35%) had fallen in the prior year. Subjects demonstrated a mean test value of 83.0±14.4 pts. on the ABC tool. Younger priests (60—74 years) demonstrated a significantly higher ABC score than the older cohort (75 and above
SESSION 300 (SYMPOSIUM)

LIFE COURSE DETERMINANTS OF PHYSICAL, COGNITIVE, AND EMOTIONAL FUNCTIONING: THE HALCYON AND IALSA COLLABORATION

Chair: S.M. Hofer, Psychology, University of Victoria, Victoria, British Columbia, Canada
Co-Chair: D. Kuh, MRC Centre for Lifelong Health and Aging, London, United Kingdom
Discussant: L. Ferrucci, National Institute on Aging, Baltimore, Maryland

Birth cohort and longitudinal aging studies provide an important basis for understanding lifelong determinants, processes, and consequences of aging. Many of these studies are working together through the Healthy Aging across the Life Course (HALCyon; NDA) and the Integrative Analysis of Longitudinal Studies of Aging (IALSA; AG026453) research networks on inter-cohort and transnational comparative projects to build up robust evidence from multiple sources. The HALCyon network is comprised of nine UK cohort studies and the international IALSA network is comprised of over 30 longitudinal studies of aging for the coordinated analysis and synthesis of longitudinal research. In this symposium, we highlight several sets of the latest findings on life course influences and consequences of physical, cognitive and emotional functioning, their interdependency and change with age, involving European and North American contributors and multiple longitudinal studies. Hardy highlights the value of both inter-cohort comparison and in depth analysis of cohort studies for understanding early life determinants of physical capability (the capacity to undertake the physical tasks of daily living). Cooper examines the impact of physical capability on well-being across five UK cohorts. Clouston examines the causal role of education, in the context of childhood cognition and SES, on cognitive functioning. Sparks examines the impact of morbidity and comorbidity on changes in cognitive functioning. Ben-Shlomo discusses findings on life course exposure and associations between stress, the HPA axis, and aging-related traits.

LIFE COURSE DETERMINANTS OF PHYSICAL CAPABILITY

R. Hardy1, R. Cooper1, A. Aihie Sayer2, D. Kuh1, 1. MRC Unit for Lifelong Health and Ageing, London, United Kingdom, 2. MRC Lifecourse Epidemiology Unit, Southampton, United Kingdom

Systematic reviews and meta-analyses from the HALCyon study team have shown that simple objective measures of physical capability (grip strength, walking speed, balance and chair rising performance) are related to subsequent health and mortality. It is therefore of clinical relevance to understand the lifetime determinants of these measures. We present findings from systematic reviews of the literature, cross-cohort analysis in the HALCyon collaboration and in depth work in the MRC National Survey of Health and Development (NSHD) to illustrate how lifetime socioeconomic position (SEP), body size and cognitive function are related to physical capability in later life. For example, we found by carrying out a systematic review that there was a small effect of childhood SEP on physical capability after adjustment for adult SEP. We build on this work using new data from NSHD and eight other HALCyon cohorts to further investigate the pathways across life which influence physical capability.

PHYSICAL CAPABILITY AND SUBSEQUENT WELL-BEING: FINDINGS FROM FIVE BRITISH COHORTS

R. Cooper1, C.R. Gale2, R. Hardy1, D. Kuh1, 1. MRC Unit for Lifelong Health and Ageing, London, United Kingdom, 2. MRC Lifecourse Epidemiology Unit, Southampton, United Kingdom

Low or declining physical capability, as indicated by objective measures of physical performance and self-reported functional limitations may influence wellbeing among older populations. Using data from five
British cohorts born between 1920 and 1946, we are investigating links between physical capability and measures of wellbeing. In cross-sectional analyses we found consistent evidence that people with lower levels of physical capability had higher levels of anxiety and depression. We are now exploring associations between physical capability and subsequent levels of positive wellbeing, measured using the Warwick-Edinburgh Mental Wellbeing Scale, and examining the modifying role of age, gender, social support and neuroticism. The associations between physical capability and wellbeing could operate in a number of ways across life. Within five British cohorts, there is evidence that one way in which this association operates in later life is through an influence of low physical capability on subsequent wellbeing.

THE HYPOthalamic-Pituitary-adrenal (HPA) Axis and Aging: An Epidemiological Life Course Perspective

Y. Ben-Shlomo, M. Gardner, S. Lightman, University of Bristol, Bristol, United Kingdom

Aging is clearly a progressive multisystem process that occurs at many levels from the cellular to whole body systems. This process will vary between individuals and populations. Neuroendocrine systems are in a key position to modulate aging mechanisms. The hypothalamic-pituitary-adrenal (HPA) axis in particular, has effects on metabolic, inflammatory and immune function. The interaction of the HPA axis and aging is likely to be a two way process with HPA activity affecting the aging process and vice versa. We describe evidence from the HAL-Cyon collaboration as well as other studies on the associations between the HPA axis and aging traits and how life course exposures may influence HPA function.

The Impact of Health on Change in Cognitive Functioning: A Cross-Study Comparison

C. Sparks1, A.M. Piccinin1, M. Richards2, B. Johansson1, S.M. Hofer2. 1. University of Victoria, Victoria, British Columbia, Canada, 2. MRC Unit for Lifelong Health and Aging, London, United Kingdom, 3. University of Gothenburg, Gothenburg, Sweden

Chronic and acute health conditions have been found to account for individual differences in cognitive impairment and declines that have been generally associated with normative aging. In order to understand the impact of aging, it is important to identify the extent to which declines in cognitive capabilities with age result from disease processes, considering both independent and interactive effects of particular health conditions (i.e., dementia, diabetes, hypertension and other cardiovascular disease, and cerebrovascular events). Relatively few studies have considered how changes in health are associated with changes in cognition. We report findings from multiple studies affiliated with the IALS network that differ in country, cohort, design, and measurement, providing an opportunity for comparison and synthesis of longitudinal results. In general, health conditions were found to impact cognitive functioning in later life, with particular health conditions affecting some aspects of cognition more than others.

Selection and Causation: The Educational Benefit to Cognition in Later Life

S. Clouston1,2, M. Richards3, D. Kuhl3, S.M. Hofer1. 1. University of Victoria, Victoria, British Columbia, Canada, 2. MRC Unit for Lifelong Health and Aging, London, United Kingdom

Substantial argument remains regarding the importance of education to adult cognition. Many argue that childhood cognition is better at determining adult cognition than education. We use three birth cohorts in the U.S. and U.K. to relate selective and causal processes of cognition and education. Cognition predicts educational attainment; social class predicts cognitive development and educational attainment. We propose a counterfactual comparison using cognition and education as interactive processes: the impact of cognitive outcomes on respondents from a range of cognitive backgrounds. Findings show that selection determines some of the relationship between education in early life and cognition in later life. However, the gain to education is significant: for a person within the selected range, the gain to education (EI) was significant between [0.28; adult; 0.41; child]. Barring educational attainment, respondents would need to have substantially higher childhood cognitions to expect similar adult cognition as those with better educational attainment (ΔC=[0.78; adult; 1.56; child]).

Session 305 (Symposium)

Narrating Old Age: The Complex Act of Telling and Listening

Chair: K. de Medeiros, Miami University, Oxford, Ohio
Discussant: E.T. Bohlmeijer, University of Twente, Twente, Netherlands

Florida Scott Maxwell wrote, “You need only claim the events of your life to make yourself yours. When you truly possess all you have been and done, which may take some time, you are fierce with reality.” Narratives on the experience of aging offer just that – an opportunity to claim the past through story and, in many cases, to reclaim or reaffirm an identity that might otherwise be marginalized or forgotten. These narratives offer invaluable insight not only to their tellers, but to students, friends, family, scholars and practitioners who “take up” another’s story. The purpose of this symposium is therefore to explore the potential and complexities of narratives of aging from various perspectives. Papers will address the larger issue of irony and resilience in narratives as means of narrative foreclosure or a type of “arrested” state that occurs when stories of the past are simply recycled without being reexamined, rewritten, and re-imagined.; language, trauma and immigration as themes in narratives of African-American and Caribbean seniors; the tragicomedy of narratives of dementia, as experienced by a mother and son, and practical strategies for using narratives to introduce aging studies into classes in other disciplines. Overall, the symposium will introduce both the richness and complexity of telling and listening to narratives of aging.

Writing the Tragicomedy of Dementia: Challenges and Opportunities

M. Freeman, Psychology, College of the Holy Cross, Worcester, Massachusetts

As a long-time student of memory and identity as well as the son of an 88-year old woman with dementia, I have had an extraordinary opportunity to try to understand and narrate the trajectory of her experience. The process has been difficult. The fact that she is my mother is one reason. So too is the fact that much of her experience remains obscure, such that I can only surmise, sketchily, the realities of her inner world. In addition, there is the challenge of writing, that is, of finding a way to tell her story – which is of course not hers alone – that truly does justice to her life. That much of the story of dementia is tragic is clear enough. But it is not only that. By writing the “tragicomedy” of dementia, perhaps a fuller phenomenological portrait can emerge.

The Value of Narrative as Seen by African American and Caribbean Seniors

I.K. Nwankwo, Vanderbilt University, Nashville, Tennessee

This presentation shares qualitative data gathered by the Voices from Our America research project in Panama and the U.S. South. Through analyses of life history interviews with African American and Caribbean seniors it provides insight into the value these elders attribute to narrative—into the specific reasons they want to tell their stories, the impact they wish to have on the particular audiences they envision, and the new directions for research and care-giving their rationales suggest. These seniors perspectives on narrative are significant because as members of historically marginalized populations their and their commu-
nity’s access to the word, to the right to speak and write publicly about themselves has been not only tenuous, but often also prohibited by law, restricted, proscribed, and over-determined (Andrews 1988, Baker 1983, Blassingame 1977). Experiences of racial discrimination, histories of trauma, and legacies of immigration figure prominently alongside hopes for the future.

LEARNING ADVANTAGE: NARRATIVE AGING STUDIES IN GENERAL EDUCATION COURSES AS WORKFORCE PREPARATION
L. Marshall, Department of English and Philosophy, University of Wisconsin - Stout, Menomonie, Wisconsin

Narratives are told by people who are always already aging; thus, “narratives of aging” comes loaded with invisible redundancy. To fully appreciate a narrative, readers and listeners should be as aware of age as they are of gender, race, and other identity categories. Symposium attendees will be able to explain how narratives can serve as vehicles to introduce critical gerontology / aging studies concepts into general education classes such as first-year composition and literature courses, even when instructors are unfamiliar with those concepts. Lesson plans and materials were developed for a one-day class; pre- and post-tests measure pedagogical efficacy. The results show that students gain knowledge via this narrative intervention; a follow-up study will assess long-term impact. Symposium attendees will also understand how these activities can have a positive impact on classroom pedagogy, students’ encounters with age diversity in the workplace, and students’ considerations of their own aging processes.

THE IMPORTANCE OF BEING IRONIC: NARRATIVE REFLECTION, RE-GENRE-ATION, AND PERSONAL RESILIENCE IN LATER LIFE
W. Randall, St. Thomas University, Fredericton, New Brunswick, Canada

Viewing lives as stories, narrative gerontology contributes uniquely to our understanding of many important themes, among them stress and depression. Building on insights into the “poetics” of biographical aging (Randall & McKim, 2008), this paper focuses on the theme of resilience (see Ong, Bergeman, Bisconti, & Wallace, 2006), arguing that a key element in coping with the challenges of later life is the genre by which we story them. Specifically, it proposes that aging itself, on several levels, pushes us past a view of aging as unmitigated tragedy toward an ironic stance - i.e., an openness to complexity, ambiguity, and multiplicity of meaning - and with it, an attitude of humor and wonder. Moreover, various forms of “narrative reflection” (Freeman 2010) and “narrative care” (Bohlmeijer, Kenyon, & Randall, 2011) - life review, life-writing, guided autobiography - can foster such a stance by thickening the stories through which we experience our lives.

SESSION 310 (SYMPOSIUM)

OLDER ADULTS LIVING WITH HIV/AIDS: STRATEGIES FOR REDUCING THE BARRIERS TO SERVICE USE
Chair: N. Orel, Gerontology, Bowling Green State University, Bowling Green, Ohio
Discussant: C.A. Emlet, University of Washington, Tacoma, Washington

In 2005, the U.S. Senate, Special Committee on Aging convened a hearing and subsequent report entitled HIV OverFifty: Exploring the New Threat. The hearing documented that HIV/AIDS in adults age 50 and over has been largely overlooked by researchers, practitioners and policy makers and provided recommendations for increasing research on the impact of HIV disease on older persons. In October of 2010, the White House, through the Office of National AIDS Policy, convened the first White House meeting on aging and HIV/AIDS. In both the Senate hearing and the White House meeting, the social impact of HIV disease received primary focus (The White House, Office of National AIDS Policy, 2010). The increasing rate of HIV infection among older adults, coupled with the dramatic increase in longevity of people living with HIV disease, should make aging and HIV a topic of importance to gerontologists, health care providers, and society at large. The increasing number of older adults living with HIV/AIDS will place greater demands on community-based service providers and medical providers, who often need technical assistance to meet the complex needs of older adults living with HIV/AIDS as well as strategies to reduce the barriers to service use. This symposium will highlight relevant issues and current research on a) barriers to medical/service use among older adults with HIV, b) strategies to improve physician-patient relationships in order to reduce poor HIV+ older adults’ health outcomes, and c) the importance of social support for service use among HIV+ older adults.

EXPLORING THE EFFECTS OF PSYCHOSOCIAL STRESS FACTORS ON UNMET HEALTH NEEDS FOR A SAMPLE OF MIDLIFE AND OLDER GAY MEN BASED ON HIV STATUS
S.D. King’, N. Orel’, S. Brodkey, Bowling Green, Ohio

A cross-sectional sample of 294 participants age 45 – 85 from fifteen states revealed differences in health influencing factors based on HIV status. The HIV group was significantly more likely to report being aware of unmet physical/mental health needs for which services have not been sought. Using a regression model for unmet health needs, resiliency and internalized homophobia was found to be inversely related to unmet health needs. Discrimination based on sexual orientation and mental health distress was also found to be positively associated with unmet health needs. The effects of discrimination based on sexual orientation and internalized homophobia for midlife and older gay men will be discussed and the implications on physical health and social service utilization will be explored. The outcomes of this study provide a starting point in understanding the factors that affect service use for midlife and older gay men, particularly those living with HIV/AIDS.

THE PHYSICIAN-PATIENT RELATIONSHIP: ADHERENCE TO MEDICATION AND BEHAVIORAL RECOMMENDATIONS
T. Davis, A. Thornton, F. Zanjani, Gerontology, University of KY, Lexington, Kentucky

One way to improve medication/behavioral adherence among older adults with HIV is to improve the physician-patient relationship. Physician-patient relationships are extremely important in managing health conditions and can lead to increased longevity. The purpose of this research was to examine the level of satisfaction and comfort HIV+ patients have with their physicians, as well as adherence to HIV medication and behavioral recommendations (e.g., practicing safe sex). This presentation will discuss the group differences in health outcomes between HIV+ individuals who reported greater comfort as compared to those who reported less comfort with their physician interactions. The results of this study will assist in understanding the level of communication and relationships between the HIV+ patients and physicians from the patient’s perspective. This research can serve as an initial step towards improving physician-patient relationships to reduce poor patient health outcomes among older adults living with HIV.
MULTIMORBIDITIES AND ADL DIFFICULTY PREDICT USE OF COMMUNITY-BASED SERVICES AMONG OLDER ADULTS WITH HIV

Multimorbidity is becoming the norm among older adults living with HIV, which has implications for community-based service planning and provision. Using structural equation modeling, we examined the interrelationships of age, physical and mental health problems, ADL difficulty, and barriers to service use on the use of government programs, HIV-specific services, health care, and other older adult services among 180 older adult clients at GMHC. The model fit the data well (RMSEA = .065). Health status, ADL difficulty, and more barriers to services were related to greater use of services, while age was negatively related to the number of services accessed. The increasingly complex needs of the growing older adult population with HIV will place demands on community-based service providers, who may need technical assistance to help them meet the needs of these older adults. Reducing barriers to service use for this growing population is an important policy and program goal.

GROWING OLDER WITH THE EPIDEMIC: HIV AND AGING POLICY RECOMMENDATIONS
N. Schaefer, Gay Men’s Health Crisis, New York, New York

As we enter the fourth decade of the HIV epidemic in the U.S., it has become abundantly clear that we must prepare the HIV and aging infrastructures to care for older adults living with and at risk for HIV. In this presentation, the work of GMHC, ACRIA and SAGE will be discussed, including efforts to make federal policies, such as the Older Americans Act, best serve HIV-positive and at risk older adults. Presenters will also discuss the priorities from a 2010 report, “Growing Older with the Epidemic: HIV and Aging”, which offers policy recommendations for improving the care and treatment of HIV in aging populations, especially in the context of federally-funded senior services, with particular discussion on discrimination and stigma therein. Finally, presenters will discuss recommendations for improving surveillance systems and prevention programs funded by the Centers for Disease Control and Prevention, and research at the National Institutes of Health.

ELEVATED IL-6 LEVELS AND FUNCTIONAL DECLINE IN HIV INFECTED AND IV DRUG USERS: PRELIMINARY RESULTS FROM THE ALIVE STUDY
S. Leng1, M. Salter2, B.R. Manwani1, H. Li1, G. Kirk1, 1. Johns Hopkins University School of Medicine, Baltimore, Maryland, 2. Johns Hopkins University School of Public Health, Baltimore, Maryland

Chronic inflammation marked by elevated IL-6 has been suggested as an important biological mechanism that contributes to disability in older adults. To gain insight into relationships of IL-6 levels with HIV infection and functional decline in IV drug users, we evaluated baseline serum IL-6 in 1442 participants of the AIDS Linked to the IntraVenous Experience (ALIVE) study. The results showed that HIV(+) subjects over 50 (n=137) had higher IL-6 than HIV(-) counterparts (400) (median 2.003pg/ml versus 1.742pg/ml, respectively, p=.03, Wilcoxon rank-sum test). Similarly, HIV(+) individuals under 50 (n=275) had higher IL-6 levels than HIV(-) (n=630) (1.867 versus 1.436pg/ml, respectively, p=.001). Moreover, subjects in highest IL-6 quartile had slower walking speed (mean±SD: 0.949±0.263 meter/sec versus 0.991±0.273 m/s, p=.01) and weaker grip strength (36.96±10.21kg versus 39.13±10.69kg, p<.001) than those in lower three IL-6 quartiles. These findings indicate that elevated IL-6 is associated with HIV infection and functional declines in IV drug users.

SESSION 315 (SYMPOSIUM)

RUSH ENHANCED DISCHARGE PLANNING PROGRAM: A SOCIAL WORK MODEL OF TRANSITIONAL CARE
Chair: G. Shier, Older Adult Programs, Rush University Medical Center, Chicago, Illinois
Discussant: P.J. Volland, Social Work Leadership Institute at New York Academy of Medicine, New York, New York

Researchers estimate that one-fifth of all Medicare beneficiaries are rehospitalized within 30 days of discharge, and that 75% of readmissions are potentially preventable. Poor transition outcomes for older adults yield dangerous results including caregiver burden, medication errors, and mortality. Rush University Medical Center’s Enhanced Discharge Planning Program (EDPP) is a social work based transitions of care model that provides phone follow-up and short term care coordination for at risk seniors as they transition from hospital to home. This model places equal importance on psychosocial factors impacting health outcomes, in particular for seniors who are more vulnerable to adverse events post-discharge. EDPP social workers utilize a biospsychosocial framework for assessing post-discharge adherence to the treatment plan including medication compliance, physician visits, strategies for coping with care demands, and other issues that impact health and quality of life. EDPP interventions focus on forming collaborative relationships with existing health care and community based providers. The goals of EDPP are to promote patient safety and satisfaction; to improve the quality of life for older adults and caregivers; and to reduce unnecessary health care costs, particularly those related to preventable rehospitalizations and emergency room visits.

EDPP: A SOCIAL WORK MODEL FOR TRANSITIONAL CARE
M. Rooney1, D. Markowitz1, M. Packard1, W. Rosenberg1, S. Altfield2, R. Golden1, G. Shier1, 1. Older Adult Programs, Rush University Medical Center, Chicago, Illinois, 2. University of Illinois at Chicago School of Public Health, Chicago, Illinois

The Enhanced Discharge Planning Program model provides transitional care to older adults identified as at risk for adverse events after an inpatient hospitalization. Eligible patients are identified daily through a risk stratification tool drawing upon clinical documentation in the hospital’s electronic medical record. Master’s prepared social workers with experience in health care and aging communicate telephonically with identified older adults and caregivers post-discharge and intervene around a wide array of issues including available social support, transportation, financial resources, health literacy, and mental health. EDPP’s social workers utilize their training in care coordination, extensive knowledge of community resources, and understanding of strategies for navigating complex systems to create a bridge between the hospital and the community, ensuring the direction provided by the medical team is not lost. This presentation will describe this innovative model, focusing on program’s unique use of social workers as transitional care managers.

PUTTING IT ALL TOGETHER: MODEL REFINEMENT AND REPLICATION
G. Shier1, S. Altfield2, V. Fabbre1, M. Rooney1, R. Golden1, W. Rosenberg1, 1. Older Adult Programs, Rush University Medical Center, Chicago, Illinois, 2. University of Illinois at Chicago School of Public Health, Chicago, Illinois, 3. University of Chicago School of Social Service Administration, Chicago, Illinois

After data collection was complete, quantitative and qualitative findings were analyzed as quality improvement mechanisms for the EDPP model. Lessons learned during the randomized controlled trial and clinician interviews revealed many areas for success and development in the model, particularly pertaining to potentially unexplored community...
partnerships, unasked assessment questions, and unidentified risk factors present before discharge. For example, during clinician interviews, “surprises” played a large role in clinician understanding of factors contributing to problematic transitions. Quantitative data analysis showed how those “surprises” may be defined in relation to caregiver and patient level limitations and systems issues. The powerful combination of mixed methods used while studying EDPP reveals opportunities for model refinement. This presentation will explain the process for integrating qualitative and quantitative findings into model delivery and creating a replication process for implementation at other hospitals. Replication process and protocols will be discussed.

EDPP MODEL INTEGRATION INTO PRACTICE AND NATIONAL REPLICATION
R. Golden1, M. Rooney1, W. Rosenberg1, S. Altfeld2, G. Shier1, 1. Older Adult Programs, Rush University Medical Center, Chicago, Illinois, 2. University of Illinois at Chicago, Chicago, Illinois
EDPP is a model for care coordination across settings and providers. The program is built upon a foundation of social work education and theory, making it widely generalizable to multiple hospital and community-based settings where social workers practice. EDPP analysis contributes to an evidence base for care coordination, strengthening the case for its integration into medical care and outlining a process by which it can be provided. Findings from model analysis have potential to inform implementation of health care reform provisions internally, locally, and nationally. This presentation will outline the successes and challenges of integrating EDPP into standard practice and efforts informed by EDPP findings, including hospital care model improvements and discharge standards of care for home health agencies. Details on EDPP’s involvement in the Illinois Transitional Care Consortium, and AoA funded transitional care project, will also be shared.

EDPP: RANDOMIZED CONTROLLED TRIAL RESEARCH DESIGN AND OUTCOMES
This presentation will share outcomes from a randomized controlled trial of the EDPP intervention with 744 participants (360 intervention; 384 usual care). Intervention group participants received a biopsychosocial assessment within 72 hours of discharge and services until problems were resolved. Control group participants received usual care after discharge. EDPP social workers identified issues in 83% of intervention group participants. For 74% of the 83% with issues, the problems did not emerge until after hospital discharge. Intervention group patients reported significant (p<.05) improvement from initial intervention call to 30 days post-discharge, including improved comprehension of medication plan, decreased patient stress, and decreased caregiver stress. Intervention group participants also showed significant (p<.05) differences compared to the control group when surveyed at 30 days, including greater understanding of their responsibilities for managing their health, more communication with physicians, more scheduled follow up appointments, and higher rate of attendance at follow-up medical appointments.

SOCIAL WORK AND TRANSITIONS OF CARE: OBSERVATIONS FROM AN INTERVENTION FOR OLDER ADULTS
V. Fabber1, A. Buffington1, S. Altfeld2, G. Shier1, R. Golden1, 1. Older Adult Programs, Rush University Medical Center, Chicago, Illinois, 2. University of Chicago School of Social Service Administration, Chicago, Illinois, 3. University of Illinois at Chicago School of Public Health, Chicago, Illinois
Interviews with the clinicians who managed 360 intervention group participants in the EDPP randomized controlled trial and a review of clinical notes were analyzed in order to identify salient themes relevant to care transitions. This presentation will detail three salient themes that intertwine the nature of patients’ transitions and the role that social workers played in this intervention. First, while some problems and challenges after a discharge seem to have been avoidable, clinicians encountered many that came about largely as a result of ‘surprises’ and therefore could not be anticipated. Second, the overarching framework through which clinicians approached their cases was in the context of an unusually broad and interconnected conceptualization of the client system in a health care setting. And third, this broad conceptualization of the client system was infused with heightened attention to relationship building between providers, patients and caregivers.

SESSION 320 (SYMPOSIUM)

STRESS, HEALTH, AND WELL-BEING: INDIVIDUAL AND RELATIONAL PERSPECTIVES ON RISK AND RESILIENCE
Chair: K.E. Cichy, Human Development and Family Studies, Kent State University, Kent, Ohio
Co-Chair: R.S. Stawski, University of Michigan, Ann Arbor, Michigan
Discussant: K.S. Rook, University of California Irvine, Irvine, California
The current symposium features research examining risk and resilience from individual and relational perspectives. Everyday life is comprised of positive and negative experiences that interact to shape health and well-being. Positive experiences are seen as protective, whereas adverse experiences threaten psychological well-being and physical health. Further, previous research emphasizes risk and resilience. Certain characteristics may increase risk and exacerbate the negative effect of life’s challenges on health and well-being. In contrast, psychological resources shape individuals’ social experiences and appear to neutralize the consequences of negative experiences. Together, the following presentations explore individual and relational perspectives on risk and resilience by considering how resources and vulnerabilities interact to contribute to health and emotional well-being. Wethington and Exner will examine four theoretical models of how stressors accumulate and impact mental and physical health across the adult life course. Stawski, Ryan, and Smith will examine how older adult husband’s and wife’s personality and life events influence their own, as well as their spouse’s well-being. Cichy, Stawski, and Almeida will examine the effects of family support on daily well-being and the extent to which family support buffers/exacerbates reactivity to daily stressors. Finally, Ong and Bergeman will examine the coordinated response to everyday positive events of those high in personality resilience that comprises a “resilience cascade”. Karen Rook will reconcile the presentations and offer insights into how these studies furthering our understanding of individual and relational perspectives on health and well-being.

A DOUBLE-EDGED SWORD: RACE, DAILY SOCIAL SUPPORT EXCHANGES, AND DAILY WELL-BEING
K.E. Cichy1, R.S. Stawski2, D. Almeida3, 1. Human Development and Family Studies, Kent State University, Kent, Ohio, 2. University of Michigan, Ann Arbor, Michigan, 3. The Pennsylvania State University, University Park, Pennsylvania
Social support is a mixed blessing, where receiving support is accompanied by the burden of providing support. This study explored the effects of family support on daily well-being and the extent to which family support buffers/exacerbates reactivity to daily family stressors. African Americans and European Americans aged 34 to 84 (N = 1, 931) from the National Study of Daily Experiences (NSDE) reported on their daily family support provision/receipt, stressors, and affect during 8 days of telephone interviews. Only European Americans reported compromised well-being on days they received more family support (p < .001). African Americans reported greater increases in negative affect than European Americans on days they provided more family support.
PERSONALITY, POSITIVE EMOTIONS, AND THE RESILIENCE CASCADE

A.D. Ong, Cornell University, Ithaca, New York

To suggest that personality can shape our responses to daily experience is to claim that individual dispositions such as neuroticism can set off a complex suite of coordinated responses, propelling a person to act in characteristic ways. There is diverse and abundant evidence that this is so. Here the authors report on the results of a research program that considers the processes that contribute to the frequent experience of positive emotions reported by individuals high in personality resilience. Five distinct, but interrelated, aspects of the emotional experience of resilient individuals are described. The authors propose that these five processes—differential engagement, differential responsivity, differential control, positive mood savoring, and capitalization—represent integral components of a coordinated response to everyday positive events that together comprise “a resilience cascade.”

FOUR APPROACHES TO MEASURING STRESS ACCUMULATION OVER THE LIFE COURSE IN A NATIONAL SAMPLE

E. Wethington, D. Exner, Human Development, Cornell University, Ithaca, New York

The aim of this paper is to develop and test empirically four theoretical models of how stressors accumulate across the adult life course and have an impact on mental and physical health. Models of stress accumulation are under-developed in the literature. Analyzing the longitudinal Midlife in the United States data, including its two daily diary samples (National Survey of Daily Experience), we show that the predictive power of a simple additive model of stressor accumulation – counting the simple number of severe or chronic stressors over a 10 year period – can be improved by: (1) accounting for the “match” or consistency of stressor exposure in life domains across time; (2) giving greater relative weight to accumulation of stress in relationship domains; and (3) accounting for positive events and resources that may reverse or neutralize the accumulation of stress. Health outcomes are examined at retrospective interview and experience sampling levels.

STRESSFUL EXPERIENCES, HEALTH, AND WELL-BEING AMONG OLDER COUPLES: THE HEALTH AND RETIREMENT STUDY

R.S. Stawski1, L.H. Ryan1, K.E. Cichy2, J. Smith1, 1. University of Michigan, Ann Arbor, Michigan, 2. Kent State University, Kent, Ohio

Stressful experiences are antecedents of poorer physical health and well-being across the lifespan. However, in the context of couples, less is known about the extent to which the stressful experiences of one partner can crossover to impact the health and well-being of the other. The current study will examine stressful experiences, including lifetime trauma, chronic stressors, and recent life events, of older adult couples in relation to their own and their partner’s health and well-being. Data for the current study come from 1,978 couples who completed the psychological, social, and demographic assessment during the 2008 wave of the Health and Retirement Study. Preliminary results indicate that each partner’s stressful experiences were negatively associated with their own self-rated health and well-being. Moreover, each partner’s stressful experiences were negatively associated with their partner’s well-being. Discussion will focus on the role stressful experiences play in understanding health and well-being in the context of older couples.

SESSION 325 (SYMPOSIUM)

USING ASSISTIVE TECHNOLOGY TO SUPPORT AND IMPROVE CAREGIVING ACTIVITIES FOR OLDER ADULTS WITH DEMENTIA

Chair: C. Riley-Doucet, Nursing, Oakland University, Rochester, Michigan
Discussant: C.A. Campbell, Saint Joseph Mercy Oakland Hospital, Pontiac, Michigan

The purpose of this symposium is to present empirically-based research that focus on using Assistive Technology (AT) to identify and/or manage adverse outcomes for at risk older adults. AT describes a range of devices or systems that are used for improving safety, reducing risk and giving confidence and reassurance to people with dementia (PWD) and their caregivers. Riley-Doucet presents a study that examines the effectiveness of using multi-sensory technology to create a therapeutic environment within an adult day care program. Dunn presents a study that focuses on refining the use of auditory technology as a therapeutic modality by comparing two types of music genres to determine if there are any differences in the behavioral responses of PWD. Harrison and Ferrari present two separate studies that investigate AT used in fall prevention with hospitalized older adults. The first of these studies explores the decision making themes nurse aides use to determine immediate risk for falls, when monitoring patients through real-time video-monitoring cameras. The next study describes a new monitoring system and examines the accuracy and acceptance of a wireless, five sensors, motion detection system (SS-MDS). Nowak, Whall, and Yeragani present a study that describes the role of actigraphy in determining biomarkers for aggression in dementia. These studies identify the usefulness of AT to improve the lifestyles of PWD and their caregivers by reducing risk factors and adverse health outcomes common in PWD.

A PILOT STUDY INVESTIGATING THE EFFECTIVENESS OF USING MULTI-SENSORY TECHNOLOGY TO CREATE A THERAPEUTIC ENVIRONMENT IN AN ADULT DAY PROGRAM

C. Riley-Doucet, Nursing, Oakland University, Rochester, Michigan

Over half of care recipients in adult day service centers operating in the US have some form of dementia. Therefore, the development of non-pharmacological interventions designed to prevent or decrease agitation exhibited by persons with dementia (PWD) is essential. This quantitative study examined the effectiveness and feasibility of using multi-sensory technology to create a therapeutic environment within an adult day care program. Results indicated that the majority of participants enjoyed the multi-sensory environment (MSE) and exhibited a significant decrease in the number of negative behavioral symptoms associated with agitation after using the MSE. Reports from formal caregivers indicated that they believed that the MSE was useful and an effective intervention for calming day care participants who exhibited agitated behaviors. Caregivers also suggested that this technology should be incorporated into the design of the building and that a dedicated staff be assigned to facilitate this therapeutic intervention for patients each day.

THE ROLE OF ACTIGRAPHY IN DEVELOPING COMPLEXITY BIOMARKERS FOR DEMENTIA WITH AGGRESSIVE BEHAVIORS

L. Nowak1, A.L. Whall2, V. Yeragani1, 1. Wayne State University, Detroit, Michigan, 2. Oakland University, Rochester, Michigan

Aggressive behaviors (AB) are one of the most disconcerting and difficult to manage challenges in dementia care. The objective of this secondary analysis of data from R01 AR/NIA 04568-0A was to identify potential complexity biomarkers for AB through examining activity patterns utilizing nonlinear indices of approximate entropy (ApEn) and fractal dimension (FD). Motor activity data were collected via actigraphs attached to the wrists of people with dementia (PWD), while caregivers were interviewed using the Activity Patterns Assessment (APA) and the ADL Function Scale (ADL-F) daily. Analysis of PWD’s motor activity and caregiver reports were used to identify potential complexity biomarkers for AB. Multivariate analysis of motor activity data was used to test for the predictive value of these complexity biomarkers.
COMPARATIVE ANALYSIS OF TWO MUSICAL GENRES WITHIN A MULTISENSORY ENVIRONMENTAL INTERVENTION (MSE)

K.S. Dunn, School of Nursing, Oakland University, Rochester, Michigan

Among persons with dementia (PWD), music therapy has been found to decrease agitation, improve cooperation during bathing, increase interactions with family caregivers, and improve appetites during mealtime. The importance of using “individualized music” that has been integrated and preferred by individuals has been emphasized. Hymns of faith learned in childhood have been found to remain relatively intact in PWD. The purpose of this study was to compare non-religious and religious music to determine if there were any differences in the behavioral responses of PWD while listening to these two types of musical genres within MSE. There were no differences found between the use of non-religious, religious music, and observable behaviors (singing, humming, hand tapping) while listening. There were no differences in the number of behaviors associated with agitation before and after listening. Some participants appeared more calm and peaceful listening to religious music and were able to recognize the difference.

A PILOT STUDY TESTING A MOTION DETECTION FALL PREVENTION INTERVENTION IN OLDER ADULTS

M.A. Ferrari1, B.E. Harrison1, O. Rawashdeh2, G. Qu1, R. Hammond2, M.E. Maddens2, 1. School of Nursing, Oakland University, Rochester, Michigan, 2. William Beaumont Hospital, Royal Oak, Michigan

Background: Interventions to prevent hospital based falls in older adults are critically important to reduce morbidity, mortality, and healthcare costs. Biomedical technology, such as wearable motion sensors, which measure and integrate movement in space, may identify human movement patterns that immediately precede falls, thus allowing early prevention. Methods: The purpose of this pilot study was to test the acceptance and accuracy of a wireless, five sensor, motion detection system (5S-MDS) where sensors were attached to ankles, wrists, and chest. This descriptive feasibility study recruited five healthy older adults who wore the 5S-MDS while performing movement scenarios. Results: Participants were 3 males/2 females (mean age 68.1 years). The system was determined to be accurate when compared to video recording. Results on acceptance and skin integrity indicated the sensors were acceptable. Conclusion: The 5S-MDS was accurate acceptable to healthy older adults. The 5S-MDS has potential as an early warning system for falls.

HOSPITAL NURSE AIDES DECISION MAKING ON IMMEDIATE RISK OF FALLS IN VIDEO-MONITORED OLDER ADULTS

B.E. Harrison1,2, M.A. Ferrari1, 1. Oakland University, Rochester, Michigan, 2. University of Delaware, Newark, Delaware

Background: Hospital based falls among older adults are critical events. In one magnet hospital, nurse aides (NA) monitor live video activity of older adults at high risk of falls to detect immediate risk and alert staff. However, nursing does not know what themes contribute to NA decisions about immediate risk of falls. Methods: This qualitative study used grounded theory to explore the decision making themes used by NA to determine the immediate risk for falls in video-monitored, hospitalized older adults. Participants had to be regularly assigned to video monitoring on the unit. The convenience sample (N = 8) was asked five open-ended questions, responses were audio recorded, and themes were verified by an independent researcher. Results: Decision making themes on impaired cognition, impulsivity, speed of mobility, unmet needs, and room conditions were described. Conclusion: Decision making themes of NA can aid in designing systems technology that will replace video monitoring.

SESSION 330 (SYMPOSIUM)

VULNERABLE OLDER WOMEN

Chair: R.N. Rooks, Health and Behavioral Sciences, University of Colorado Denver, Denver, Colorado
Co-Chair: S. Arber, Health and Behavioral Sciences, University of Colorado Denver, Denver, Colorado

This symposium is a joint session between the Task Force on Minority Issues in Gerontology and the Task Force on Women’s Issues. The topic of vulnerability includes intersecting issues of gender with financial status, race and ethnicity, caregiving, chronic conditions, and disability. Our speakers will discuss connections between older women’s socio-economic status (SES), race and ethnicity, and health outcomes to provide a broader understanding of the range of factors contributing to women’s vulnerability. Dr. Karen Holden will examine differences in women’s and men’s contributions to retirement savings accounts based on survey data, contributing to women’s inadequate retirement income and greater vulnerability in later life. Dr. Tracie Harrison will discuss how long-term employment conditions and associated benefits contribute to the disablement process and health disparities among Mexican American vs. Non-Hispanic White women using content analyses and descriptive statistics. Dr. Karen Roberto will focus on racial (White and African American) and SES variation in caregiving experiences of family members with mild cognitive impairment using Pearlin’s stress and coping framework and interview data. Dr. Barbara Cochran will discuss a synthesis of findings on ill health and chronic conditions by race and ethnicity from the longitudinal Women’s Health Initiative study based on clinical center data across the United States. After attending this symposium participants will be able to identify and explain the pathways connecting women’s SES and related resources to their health outcomes, with attention to racial and ethnic variations, contributing to the greater vulnerability of women over the life course.

EMPLOYMENTS CONTRIBUTION TO HEALTH DISPARITIES IN MEXICAN AMERICAN WOMEN AGING WITH DISABILITIES

T. Harrison, S. Hendrickson, T. Scott Ricks, University of Texas at Austin, Austin, Texas

Work environment and associated benefits may contribute to health disparities in older women. The investigators explored how work experiences contributed to health disparities over the life course among Mexican American (MA) and Non-Hispanic White (NHW) women. The sample consisted of 56 MA and 54 NHW age 55 to 75 with mobility impairment who completed questionnaires and were interviewed multiple times (n=363) regarding disablement. Content analysis of interviews and descriptive statistics were performed. The MA women began work at an earlier age and were more likely to report work injury than the NHW women. NHW women were more likely to remain employed after disability onset. Once injured, both groups described similar problems. Types of employment and benefit trajectories varied based upon ethnicity. The study highlights the cumulative effect of work related injuries with differential benefits as experienced over the life course.
WHAT HAVE WE LEARNED FROM THE WOMEN'S HEALTH INITIATIVE ABOUT RACIAL/ETHNIC MINORITY WOMEN'S HEALTH?
B.B. Cochrane1,2, V.G. Benavente1, L.H. Coker1, 1. School of Nursing, University of Washington, Seattle, Washington, 2. Fred Hutchinson Cancer Research Center, Seattle, Washington, 3. Wake Forest University School of Medicine, Winston-Salem, North Carolina

The Women’s Health Initiative (WHI) is one of the largest longitudinal studies to date of postmenopausal women’s health. Over 160,000 women, ages 50 to 79 years at baseline, were enrolled at 40 clinical centers across the United States. Representative numbers of racial/ethnic minority women were included, in part by designating 10 WHI minority centers with goals of enrolling 60% of their participants from diverse racial/ethnic minority groups. A total of 28,267 WHI participants (17.5%) identified their race/ethnicity within one or more minority groups. As the study continues in long-term follow-up, many of these WHI participants have been contributing data about their health for over 15 years, and over 500 papers have been published from these data. This presentation will synthesize study findings related to the health of older racial/ethnic minority women, focusing specifically on cancer, cardiovascular disease, fracture and osteoporosis, and psychosocial health. Implications for future research will be identified.

OLDER WOMEN CARE PARTNERS: RACE AND SOCIOECONOMIC INFLUENCES ON CARING FOR A RELATIVE WITH MCI
K.A. Roberto, R. Blieszner, N. Brossoie, J. Savla, Ctr for Gerontology, Virginia Tech, Blacksburg, Virginia

Researchers have paid insufficient attention to the influence of race and socioeconomic status on family caregiving, yet the effects of inadequate resources are known to be detrimental to health and well being. Guided by Pearlman’s stress and coping framework, we examined challenges and outcomes among 106 women (M age = 66.7; 81W; 25AA) caring for a family member with mild cognitive impairment. Lower income was associated with more negative views of formal service use and less planning for the future. Neither income nor race was associated with the women’s reports of burden or stress. However, open-ended interviews revealed differences, including by race, in how low and high income women approached assisting their memory-impaired relative and managed unwelcomed changes in their lives. Identifying how older women with varying resources respond to caregiving responsibilities underscores the importance of tailoring education and interventions for sub-groups of women providing family care.

SESSION 335 (PAPER)

BRAIN PHYSIOLOGY

THE EMERGING ROLE OF ADIPOKINES IN COGNITIVE DECLINE AND DEMENTIA
D.J. Llewellyn1, D. Melzer1, I. Lang1, K.M. Langa2,3, K. Kos1, 1. Peninsula College of Medicine and Dentistry, University of Exeter, Exeter, Devon, United Kingdom, 2. Department of Internal Medicine and Institute of Social Research, University of Michigan, Ann Arbor, Michigan, 3. Department of Veterans Affairs, VA Center for Practice Management and Outcomes Research, Ann Arbor, Michigan

Obesity increases the relative risk of incident dementia over 10 years or more by around 75%, but the mechanisms involved are unclear. It is commonly overlooked that the effects of excess adipose tissue on the brain may be mediated by recently discovered adipokines that cross the blood brain barrier and whose functions in the brain have yet to be fully established. White adipose tissue is the largest endocrine organ in the body, and adipokines establish cross-talk between adipose tissue and the brain to communicate energy status. Adipokines may influence the risk of conditions related to dementia such as atherosclerosis and stroke through inflammatory mechanisms. However, recent large population-based studies suggest that the proinflammatory adipokine leptin may paradoxically be neuroprotective. Here we review recent adipokine research, with particular attention to the roles of leptin, adiponectin, TNFα, IL-6, and ZAG. Adipokines may provide early markers for those at higher risk and new insights into the complex pathogenesis of cognitive decline and dementia. Increased understanding of these mediators may also make it possible to prevent cases of dementia resulting from obesity by pharmacological manipulation of selected adipokines.

TESAMORELIN, A HUMAN GROWTH HORMONE RELEASING HORMONE ANALOGUE, IMPROVES COGNITIVE FUNCTION IN MCI AND HEALTHY AGING: RESULTS OF A RANDOMIZED PLACEBO-CONTROLLED TRIAL

Age and pathology related changes in the somatotrophic axis (growth hormone releasing hormone (GHRH), also known as Growth Hormone Releasing Factor (GRF), growth hormone/insulin-like growth factor-I (IGF-I)) have potent effects on brain function, setting the stage for targeted interventions to improve cognition. Previously we reported preliminary evidence that six weeks of GHRH treatment improved cognitive function in healthy older adults. Here we report a replication and expansion of that preliminary study. One hundred twenty-four older adult men and women (55-87 yrs), half of whom were cognitively normal and half of whom were diagnosed with amnestic mild cognitive impairment (MCI), received either tesamorelin, a stabilized analogue of human growth hormone releasing hormone (1 mg/d, provided by Theratechnologies Inc.), or placebo subcutaneously 30 minutes before their normal bedtime for 20 weeks in a double-blinded, randomized, placebo-controlled design. Tesamorelin increased IGF-I (p<0.0001) although IGF-I values remained within the normal physiological range. Tesamorelin improved executive function (response inhibition, p=0.009, set-shifting, p=0.01 and working memory p=0.07) in both cognitively normal older adults and in adults with MCI. Tesamorelin improved delayed verbal recall (p=0.05) only in adults with MCI. Tesamorelin had no effect on general cognitive status, visual memory, word fluency, or processing speed. This study is the first to demonstrate that short-term administration of a human GHRH analogue improves executive function for both cognitively normal and memory-impaired older adults, and has an additional favorable effect on verbal memory for MCI adults, who are at high risk for progression to Alzheimer’s dementia. Supported by PHS R01-AG025515 (MVV) and Theratechnologies Inc.
Using cerebral oximetry, we previously showed that \( p = 0.05 \). In all groups, rcSO\(_2\) increased during sleep. These trends in rcSO\(_2\) were undetectable in proinflammatory cytokines postulated to function as peripheral “drivers” of neuroinflammation and delirium. However, evidence of increased CSF levels of a chemokine (IL-8) and a TH-2 class cytokine (IL-10) lends support to the theory of brain microglial activation in delirium, as these markers are secreted by or act on microglial cells. Given IL-10’s anti-inflammatory role, this may also reflect the brain’s response to injuries in the context of delirium. It remains to be seen whether such CSF measurements are predictive of delirium diagnosis or clinical outcome.

**QUANTITATIVE PHENOTYPES OF COGNITIVE AGING BASED ON ESTIMATED TRAJECTORIES OF LATENT CLASSES**

L. Han, T.M. Gill, H. Allore, *Internal Medicine, Yale University, New Haven, Connecticut*

To characterize longitudinal patterns of cognitive aging, we followed 754 community-living persons aged 70 years or older from the Precipitating Events Project with the Mini-Mental State Examination (MMSE) every 18 months for nine years. Latent growth curve (LGC) and latent growth mixture (LGM) models were used to examine the trajectories of MMSE scores and to evaluate effects of demographic and time-varying covariates on the trajectories, including age, sex, education, cumulative number of months with disability, number of comorbidities, and severity of depressive symptoms. The crude population path of the MMSE performance can be characterized by a latent intercept (27.4, \( p < 0.001 \)) and a latent slope (0.3, \( p < 0.001 \)). Age was associated with both the intercept (0.11, \( p < 0.001 \)) and slope (0.04, \( p < 0.001 \)); lower education was associated with only the intercept (-2.2, \( p < 0.001 \)). However, about 67% and 92% of the variances of the two latent parameters remained unexplained. LGM revealed at least four distinct trajectories: (1 and 2) 45% and 34% of participants had intercepts of 29.1 and 27.0, respectively, and showed no or minimal decline associated with both the intercept (-0.11, \( p < 0.001 \)) and slope (-0.04, \( p < 0.001 \)); lower education was associated with only the intercept (-2.2, \( p < 0.001 \)). However, about 67% and 92% of the variances of the two latent parameters remained unexplained. LGM revealed at least four distinct trajectories: (1 and 2) 45% and 34% of participants had intercepts of 29.1 and 27.0, respectively, and showed no or minimal decline associated with both the intercept (-0.11, \( p < 0.001 \)) and slope (-0.04, \( p < 0.001 \)); lower education was associated with only the intercept (-2.2, \( p < 0.001 \)). However, about 67% and 92% of the variances of the two latent parameters remained unexplained. LGM revealed at least four distinct trajectories: (1 and 2) 45% and 34% of participants had intercepts of 29.1 and 27.0, respectively, and showed no or minimal decline associated with both the intercept (-0.11, \( p < 0.001 \)) and slope (-0.04, \( p < 0.001 \)); lower education was associated with only the intercept (-2.2, \( p < 0.001 \)). However, about 67% and 92% of the variances of the two latent parameters remained unexplained.

**TRENDS IN CEREBRAL OXYGEN DURING SLEEP IN COMMUNITY DWELLING OLDER ADULTS, AGE 70 YEARS & OLDER**

B. Carlson, V.J. Neelon, J. Carlson, M. Hartman, D. Bliwise, J. Biobehavioral Laboratory, School of Nursing, The University of North Carolina at Chapel Hill, Chapel Hill, North Carolina. 2. Office of Research Support and Consultation, School of Nursing, The University of North Carolina at Chapel Hill, Chapel Hill, North Carolina. 3. Department of Psychology, The University of North Carolina at Chapel Hill, Chapel Hill, North Carolina. 4. Department of Neurology, School of Medicine, Emory University, Atlanta, Georgia

**Background.** Using cerebral oximetry, we previously showed that low pre-sleep cerebral oxygen reserve \( rcSO_2 \) is associated with lower cognitive function. Here, we examine trends in \( rcSO_2 \) in 112 older adults with normal (>60%, \( n = 64 \)), marginal (50%-59.9%, \( n = 41 \)), and low (<50%, \( n = 7 \)) pre-sleep \( rcSO_2 \). **Methods.** Subjects (72 women, 40 men, ≥ 70 years) underwent two nights of standard polysomnography; we report data from night 2. Group differences in hourly mean \( rcSO_2 \) trends during sleep were examined using linear mixed models. **Results.** Overall, the change in \( rcSO_2 \) was significantly greater in the groups with below normal \( rcSO_2 \) (\( ArcSO_2(normal-marginal-low) = 1.6\% ± 3.6\% ; 2.9\% ± 3.9\% ; 4.9 ± 5.4\% ; F(2,101) = 3.1, p = 0.05 \)). In all groups, \( rcSO_2 \) declined during the first hour of sleep but exceeded presleep levels by morning. Half the marginal group (\( n = 21 \)), but none of the low group, reached normal levels by morning. Compared to those with normal pre-sleep \( rcSO_2 \), the rise in \( rcSO_2 \) occurred sooner in those with marginal \( rcSO_2 \) and later in those with low \( rcSO_2 \) (Group x Time interaction: \( F(2,151) = 9.19, p < 0.001 \)). **Conclusions.** These trends in \( rcSO_2 \) (an initial drop during the first cycle of sleep with recovery to presleep levels by morning) support the hypothesis that sleep restoration of neural function depends on adequate cerebral oxygen reserve. Furthermore, low pre-sleep \( rcSO_2 \) is associated with impaired cognitive function, and may identify individuals at risk for cognitive decline. Increased oxygen extraction and inadequate cerebral oxygen reserve suggest a cerebral microvascular pathologic mechanism and give direction for early intervention.

**SESSION 340 (PAPER)**

**EPIDEMIOLOGY AND CARDIOVASCULAR HEALTH**

**STATISTICAL AND MATHEMATICAL APPROACHES TO UNDERSTANDING LONGITUDINAL CHANGES IN SUITES OF BIOMARKERS**

There is increasing recognition that studies of aging involving biomarkers need to consider not just their static levels but also their dynamic properties and their interactions with each other. This is methodologically challenging, given the large number of potential biomarkers and our still-imperfect knowledge of which ones are most important. Because correlations among biomarkers are often in opposite directions at different timescales (such as minutes and years), biochemical relationships are not sufficient to predict relationships important at longer timescales. Here we present a method we have developed for understanding the roles of biomarkers as they interact with each other during aging by combining two complementary statistical tools. First, principal components analysis (PCA) and/or factor analysis (FA) is applied to suites of markers to identify primary axes of variation. A variation on this conduct PCA/FA on the differences in markers between time points of longitudinal data sets. This method allows us to assess the dimensionality of aging in the biomarkers measured, as well as to understand the biological relevance of each axis as a function of biomarker loadings on each axis. Second, structural equations models or D-separation are used to test hypotheses about causal pathways among biomarkers operating at timescales of years. We present validation data using the Women’s Health and Aging Study II data set from Baltimore, and discuss various complicating factors, limitations, and extensions. We conclude that
both methods have great potential to help understand the aging process, but must be implemented with care.

CHANGING PREDICTION OF MORTALITY BY SYSTOLIC BLOOD PRESSURE WITH INCREASING AGE: THE ROTTERDAM STUDY
J. Blom1, W. de Ruijter1, J. Witteman2, W. Assendelft1, M. Breteler2, A. Hofman2, J. Gussekloo1, 1. Leiden University Medical Center, Leiden, Netherlands, 2. Erasmus University Medical Center, Rotterdam, Netherlands

Background There are indications that in people of old age high systolic blood pressure (SBP) is not associated with mortality anymore. This finding brings up the question how the predictive value of SBP changes from younger to older age groups. Design, setting and participants An analysis in the Rotterdam Study, a population-based prospective cohort study, among 4612 participants aged ≥55 years, without previous cardiovascular disease. Median follow-up 14.9 (IQR 11.1-15.8) years. Measurements Within four age groups (55-64, 65-74, 75-84 and ≥85 years) the predictive value of baseline SBP for mortality was studied. Results From age 55-64 to age ≥85 risk for all-cause mortality associated with SBP≥160 mmHg decreased from HR≥160 1.7, 95%CI 1.2,2.2 to HR≥160 0.7, 95%CI 0.4,1.1, p for trend <0.001. For SBP 140-159 mmHg the risk decreased from HR≥140 1.2, 95%CI 0.9,1.5 to HR≥140 0.7, 95%CI 0.5,1.1, p for trend <0.001. Analysis in 5-year age groups showed higher risk with higher SBPs up to age 75 years. Conclusion Up to 75 years of age high SBP predicts higher mortality. After 75 years, SBP is no longer associated with an increased mortality risk. From 85 years, high SBP predicts lower mortality risk. The discrepancy of these findings with recently shown beneficial effects of antihypertensive treatment, also in high age groups, fuels the discussion about possible clinical consequences.

The Gerontological Society of America

ARTERIAL STIFFNESS, PHYSICAL FUNCTION AND FUNCTIONAL LIMITATION: THE WHITEHALL II STUDY
E.J. Brunner1, M. Shipley1, D.R. Witte2, A. Singh-Manoux1, A.R. Britton1, A. Tabak1, C.M. McEnery1, I.B. Wilkinson1, 1. Department of Epidemiology and Public Health, University College London, London, United Kingdom, 2. Steno Diabetes Center A/S, Gentofte, Denmark, 3. Semmelweis University Faculty of Medicine, Budapest, Hungary, 4. University of Cambridge, Cambridge, United Kingdom

Arterial stiffness has been proposed as an indicator of vascular aging. We aimed to examine this concept by analyzing associations of arterial stiffness with age, subjective and objective measures of physical functioning, and self-reported functional limitation. We measured aortic pulse wave velocity by applanation tonometry among 5392 men and women aged 55-78 years. Arterial stiffness was strongly associated with age (mean difference (SE) per decade: men 1.37 (0.06) m/s, women 1.39 (0.10)). This association was robust to individual and combined adjustment for pulse pressure, mean arterial pressure, anti-hypertensive treatment and chronic disease. Participants took an 8 ft (2.44 m) walking speed test, a spirometry lung function test, and completed health functioning and (instrumental) activities of daily living questionnaires. Associations of stiffness and blood pressure with physical function scores scaled to SD=10 were compared. One SD higher stiffness was associated with lower walking speed (coefficient (95% CI)-0.96 [-1.29 to -0.64] m/s) and worse physical component summary score (-0.91 [-1.21, -0.60]), and poorer lung function (-1.23 [-1.53, -0.92]) adjusted for age, sex and ethnic group. Pulse pressure and mean arterial pressure were linked inversely only with lung function. Associations of stiffness with functional limitation were robust to multiple adjustment including pulse pressure and chronic disease. In conclusion, the concept of vascular aging is reinforced by the observation that arterial stiffness is a robust correlate of physical functioning and functional limitation in early old age. The nature of the link between arterial stiffness and quality of life in older people merits attention.

BLOOD PRESSURE, APOE GENOTYPE, AND WHITE MATTER HEALTH
B.K. Lee1, D.D. Jagatia1, B.S. Schwartz2, 1. Epidemiology and Biostatistics, Drexel University School of Public Health, Philadelphia, Pennsylvania, 2. Johns Hopkins University Bloomberg School of Public Health, Baltimore, Maryland

Prior studies suggest that increased blood pressure in midlife is associated with white matter (WM) deterioration and subsequent cognitive decline. The apolipoprotein E (APOE) ε4 allele is a well-known genetic predictor of late-onset Alzheimer’s disease and may modify effects of vascular risk factors. We examined the association of blood pressure, APOE genotype, and indices of WM health in a male cohort of 342 former occupationally-exposed lead workers and controls ages 40-78 at first blood pressure measurement. We rated WM lesion grade using the 10-point Cardiovascular Health Study scale and with diffusion tensor imaging (DTI) completed 9.4 years on average after first blood pressure measurement. DTI assessed fractional anisotropy (FA), the extent to which the diffusion of water is oriented in a single direction and which reflects the amount of myelin and axonal loss. Blood pressure was parameterized as the continuous means of systolic and diastolic measurements collected over an average of five study visits on or prior to CHS and FA assessment. After multiple linear regression adjustment for age, education, tibia lead, control status, and use of anti-hypertensive medications, the adverse associations of both mean systolic (p = 0.04) and diastolic blood pressures (p = 0.01) with WM lesion grade and FA were worse in subjects with the APOE-ε4 allele. The results of this study suggest that the association of blood pressure with white matter health is modified by APOE genotype, a biologically plausible observation.

THE ASSOCIATION OF BLOOD PRESSURE AND MORTALITY DIFFERS BY FUNCTIONAL STATUS IN OLDER LATINOS

The relationship between blood pressure and mortality changes with age. We hypothesize that the association of blood pressure and mortality is modified by functional status in older adults. Study participants were 1,497/1,789 adults aged 60-101, from the Sacramento Area Latino Study on Aging. Functional status was measured by self-reported walking speed, and blood pressure was measured by automatic sphygmomanometer. There were 547 deaths from 1998 - 2009, and 46% were cardiovascular: Mean blood pressure levels varied across fast, medium, and slow-walkers: 136, 139, and, 140 mmHg (systolic), p<0.02, and 75, 76, and 77 mmHg (diastolic), p<0.08, respectively. After adjustment for potential confounders, higher systolic blood pressure was associated with increased mortality in fast walkers: hazard ratio (HR): 1.29 per 10 mmHg higher blood pressure (95% confidence interval: 1.07, 1.55), but not in medium: 1.00 (0.93, 1.08), or slow walkers: 0.94 (0.87, 1.01). We found a similar trend for diastolic blood pressure; the adjusted HR per 10 mmHg higher blood pressure was 1.20 (0.82, 1.76), 1.00 (0.88, 1.15), and 0.90 (0.78, 1.04) in fast, medium, and slow walkers, respectively. The associations were similar when we excluded deaths in the first year of follow-up, and when we included anti-hypertensive medication use in the models. In high functioning older adults, elevated systolic blood pressure is a risk factor for all-cause mortality. In low-functioning adults, higher diastolic blood appears to be associated with lower mortality and may be a marker for physiologic vigor.
SESSION 345 (PAPER)

OSTEOPOROSIS AND OSTEOARTHRITIS

HAND GRIP STRENGTH AND ITS INFLUENCE ON BONE MINERAL DENSITY AND BONE BIOCHEMICAL MARKERS: ARE GRIP MEASUREMENTS ABLE TO PREDICT A RISK FOR OSTEOPOROSIS?

V. Acker, D. Spira, N. Bacholz, M. Henig, N. El-Zidy-Ibrahim, M. Ibrahim, E. Steinhausen-Thiessen, R. Eckardt, Prof. Steinhausen, Forschungsgruppe Geriatric (geriatric research group), Charité Universitätsmedizin Berlin, Berlin, Germany

Objectives: In women aged 50 years and older hand grip strength has been reported to be associated with bone mineral density. Deoxypyridinoline and osteocalcin are useful bone biochemical markers for the management of osteoporosis. The aim of our study was to examine the association between hand grip strength and bone mineral density in women and men aged 60 years and older as well as to examine the relation between grip strength, deoxypyridinoline and osteocalcin.

Methods: 318 women and 185 men aged 60 years and older were recruited for participation in the Berlin Aging Study 2. Subjects had bone mineral density measurements performed at the spine and hip using dual-energy x-ray absorptiometry. Subjects were assessed for grip strength measurements using a hand dynamometer. Blood and urine samples of the participants were taken to measure deoxypyridinoline and osteocalcin. Our participants had to answer an interviewer-administered questionnaire about their physical activities and underwent height and weight measurements. Drug use, smoking habits, alcohol intake and previous diseases were also recorded. First preliminary results show a correlation between grip strength and BMD at the total hip ($r=0.44$, $p<0.01$), at the femoral neck ($r=0.36$, $p<0.01$) and at the spine ($r=0.31$, $p<0.01$).

We will show the full results with multivariate analysis and implications for clinical practice.

CYSTATIN C AND HIGH LOWER EXTREMITY PERFORMANCE IN OLDER WOMEN: STUDY OF OSTEOARTROPIC FRACTURES (SOF)

Serum cystatin C is a biomarker of renal function; lower levels indicate better function. Lower cystatin C is associated with a lower risk of self-reported physical disability in older adults, but the longitudinal association between cystatin C and objectively measured physical performance is uncertain. To determine whether lower cystatin C in older women is associated with a high level of lower extremity performance 10 years later, we measured cystatin C using frozen serum specimens from the SOF Year 10 exam in 1384 surviving women (mean age 87.5 years) who completed the Short Physical Performance Battery (SPPB) at the SOF Year 20 Exam (average 9.8 years between exams). Cystatin C was expressed in quartiles (cutpoints 0.82, 0.91 and 1.03 mg/L). The SPPB summary score (range 0-12) was created for each participant based on gait speed, five chair-stands test, and balance test; high performance was defined by a summary score of 10-12 (26% of cohort). After adjustment for age, race, education, health status, diabetes, prevalent cardiovascular disease, and body mass index, lower cystatin C at Year 10 was associated in a graded manner with increasing likelihood of high performance at Year 20. Compared with quartile 4 (worst renal function), the odds ratio (95% CI) was 1.58 (1.07-2.34) for quartile 3, 1.78 (1.19-2.66) for quartile 2, and 1.80 (1.21-2.68) for quartile 1, p-trend = 0.006. Among older women, lower cystatin C may be a biomarker for successful aging as manifested by a high level of lower extremity performance measured 10 years later.

EFFECT OF OSTEROPTIC FRACTURES ON FUNCTION, QUALITY OF LIFE AND HOSPITALIZATION. THE AGES-REYKJAVIK STUDY

Background: Understanding the determinants of health burden after fracture in aging populations is important. We investigated the effect of vertebral fractures (Vfr) and other osteoporotic fractures (oOSfr) on function, activity of daily living (ADL), quality of life (QoL) and hospitalization. Methods: 5764 free living individuals born, 1907-1935, from the population based cohort study Age, Gene/Environment Susceptibility (AGES)-Reykjavik Study were examined between 2002 and 2006 and followed-up for an average of 5.3 years. The impact of sustained fracture on future hospitalization was prospectively assessed using Cox proportional hazards model in 3 subgroups with history of Vfr, oOSfr, and no fracture at entry into the study. The main outcomes were associations of fracture status with concurrent measures of mobility, strength, ADL and QoL; and risk ratios (RR) for hospital admission and length of hospitalization during followup. Results and conclusion: History of Vfr conferred an increased risk of hospitalization compared with controls, RR = 1.4, (95% CI 1.3-1.7), (P<0.0001), while for history of oOSfr the RR was 1.2, (95% CI 1.1-1.3), (P=0.0001). Vfr individuals had on average 50% (95%CI 27%-77%) longer hospital stay than those not fractured (P<0.0001) and 33% (95%CI 11%-60%) higher than the oOSfr group. History of osteoporotic fractures was reflected in a consistently worse performance assessed by functional tests and ADL in both sexes and QoL for women only. This was especially pronounced for those with Vfr, who carried more of a health burden than those with oOSfr. It is thus important to pay greater attention to the care of those with regard to complication and consequent diseases.

WEEKS OF COMBINED EXERCISE TRAINING ELICITS FAVORABLE CHANGES IN BONE MINERAL DENSITY AND C-REACTIVE PROTEIN IN OLDER MEN AND WOMEN

Physical inactivity is a well recognized risk factor for osteoporosis and in recent years, inflammation has also been implicated. High-sensitivity (hs) C-reactive protein (CRP) is a circulating marker of systemic inflammation, and high CRP has been associated with lower BMD, higher levels of bone turnover markers, and even, greater risk of fracture. However, there are no reports documenting the effect of exercise interventions on both bone mineral density (BMD) and hs-CRP in older adults, which is the purpose of the present study. Forty-eight older adults (68.9 ± 5.3 years, 24 females, 23 males) performed supervised combined training of resistance training 2 d/wk, for 60 min, and weight-bearing and balance training 1 d/wk for 60 min. Primary outcomes included lumbar spine (LS) and proximal femur BMD (by dual X-ray absorptiometry) and hs-CRP (Cholestech LDX® Analyzer). Secondary outcomes included dietary intake, accelerometer-based physical activity (PA) and body composition. After 32 weeks, no significant changes were observed in body composition, PA and dietary intake. There were significant interactions between sex and time on BMD and CRP. A significant main effect of time (p<0.05) on CRP and trochanter, intertrochanter, total hip, and LS BMD was observed. Moreover there
was a significant main effect on sex (p=0.05) for all BMD sites. Together, these data confirm that a training program combining resistance exercise and moderate-impact weight-bearing training is safe and effective for increasing BMD and decrease hs-CRP in older adults, which suggest that the association between exercise and reduced osteoporosis risk, may be, at least in part, mediated by anti-inflammatory effects of regular exercise training. THE MEDIATING EFFECT OF LEPTIN ON THE RELATIONSHIP BETWEEN INCREASING BODY MASS INDEX AND KNEE OSTEARTHITIS

A. Fowler-Brown, D. Kim, L. Shi, E. Marcantonio, C. Wee, R.H. Shmerling, L. Lipsitz, S.G. Leveille, J. Medicne, Beth Israel Deaconess Medical Center, Boston, Massachusetts, 2. Hebrew SeniorLife, Boston, Massachusetts, 3. University of Massachusetts, Boston, Massachusetts

Obesity is associated with increased risk of osteoarthritis (OA) of the knee. While it is generally assumed that mechanical factors underlie this relationship, emerging evidence suggests that adipokines, substances produced by adipose tissue, may also play a role in the development of knee OA associated with obesity. Our aim was to determine whether the inflammatory adipokine, leptin, mediates the relationship between body mass index (BMI) and symptomatic knee OA. We used baseline data from 659 participants aged ≥70 years in the population-based MOBILIZE Boston study. Height and weight were measured and participants were assessed for knee OA using standard clinical criteria. Serum leptin was measured using a microsphere-based assay. Average BMI and serum leptin was 27.5 kg/m² and 589 pmol/L, respectively; the prevalence of knee OA was 24.7%. Using Sobel-Goodman mediation analysis, we found that BMI was positively associated with both prevalence of knee OA (Odds ratio [OR] = 1.06, p<0.004), and with serum leptin (regression coefficient = 65.2, p<0.001). Increasing serum leptin was associated with a higher prevalence of knee OA (OR=1.0004, p=0.012). Models controlled for age, sex, race, smoking, alcohol use and medical conditions. The ratio of indirect total effect was 0.49, suggesting that approximately half of the total effect of BMI on knee OA could be mediated by serum leptin. Based on the bootstrap results, the indirect effect and total effect are both significant (confidence interval does not contain zero), whereas the direct effect is not statistically significant. Further research is warranted on the possible role of leptin in OA pathology.

SESSION 350 (SYMPOSIUM)

AN INTERNATIONAL PERSPECTIVE OF HEALTH CARE NEEDS, INFORMAL CAREGIVING AND HEALTH OUTCOMES IN OLDER CARE-DEPENDENT ADULTS

Chair: K. Wolf-Ostermann, Alice Salomon University, Berlin, Germany
Co-Chair: E. Tanner, Johns Hopkins Schools of Nursing and Medicine, Division of Geriatric Medicine and Gerontology, Baltimore, Maryland
Discussant: E. Capezuti, Hartford Institute for Geriatric Nursing New York University College of Nursing, New York, New York

In most parts of the world the number of older care-dependent adults is increasing rapidly. The concomitant expectation for a rise in cost of care, as well, will place greater demand for new solutions, including an increase in sufficient caregiving. Yet, caregiving must not only be understood in terms of professional care provided, but also in terms of informal caregiving – including family caregivers as well as volunteers – since the role and importance of informal caregiving is needed to meet the rising care dependency demands. Bringing together academic researchers from multiple disciplines in the US, Germany and the Netherlands, this symposium will examine health care needs, caregiver characteristics and burden, models of attracting caregivers and health outcomes in older adults. The first presentation will focus on the health and function of community-living older adults who are managing co-morbidities, furthermore, care dependency characteristics will be discussed which elucidate the need for informal caregiving in the US. The second presentation will compare the influence of caregiver’s health status between African American and white caregivers of dementia patients on health outcomes of care recipients. The third presentation will describe health outcomes of older, care-dependent people with dementia living in shared housing arrangements in Germany and relate these to the type and amount of informal caregiving provided. In the fourth presentation, we will discuss models of attracting informal caregivers in long term dementia care and the opportunities for informal caregiving to improve the quality of care in the Netherlands.

OLDER ADULTS WITH DEMENTIA LIVING IN SHARED HOUSING ARRANGEMENTS (SHA): HEALTH OUTCOMES AND EFFECTS OF INFORMAL CAREGIVING

K. Wolf-Ostermann, J. Gräske, Alice Salomon University, Berlin, Germany

Objectives: Informal caregivers (ICG) without family relationship to residents often assist professional caregivers in SHA in Germany. It is unclear if this leads to better health outcomes and quality of life (QoL) of residents. Methods: Using a cross-sectional design, all 400 SHA in Berlin/Germany were asked to participate in the survey in spring 2011. Using the MDS we examined the type and amount of informal caregiving provided and health outcomes of residents including cognitive and ADL functioning, challenging behavior and QoL. Results: In nearly half of all surveyed SHA ICG are present, typically visiting weekly. Most frequent assisting tasks are going for a walk, helping with administrative aspects, shopping or meaningful activities in general. Further results on residents’ health outcomes will be presented. Conclusion: Involvement of ICG is not as present as postulated. The study will add some clarification whether or not claims of QoL-improvement in SHA are viable.

INFLUENCE OF CAREGIVER’S HEALTH STATUS ON HEALTH OUTCOMES OF CARE RECIPIENTS WITH DEMENTIA

N.A. Hodgson, L.N. Gitlin, Johns Hopkins University, Baltimore, Maryland

The stress and burden of caring for a relative with dementia can result in biopsychosocial consequences for both caregivers (CGs) and care recipients (CR). We examined whether CG characteristics including health status and demographic factors are associated with CR outcomes including the presence of undiagnosed but treatable illness. The sample included 117 CGs of community residing CR assigned to experimental arm in a randomized controlled trial (Project COPE). Stepwise standardized logistic regression was conducted with variables selected from the stress process model. The dependent variable, undiagnosed illness, determined through brief nursing assessment and lab evaluations, was present in 35% of sample. Different patterns that emerged between CG and CR health outcomes will be explored in the session. The stress and burden associated with the CG role may be associated with undiagnosed but treatable illness. Future interventions that address modifiable factors contributing to undiagnosed illness may reduce burden in dementia CGs.
The growing number of older adults places a large burden on the sustainability of long term care in terms of financial and human resources. Also in living arrangements for people with dementia labor shortages and costs will increase. Hereby individual residents’ needs for wellbeing and activities will be difficult to fulfill, as it already is to some extent. The involvement of voluntary workers offers the opportunity to fulfill personal needs of residents with dementia, thereby increasing their wellbeing. There is much variation in the amount of voluntary workers that living arrangements for people with dementia involve into care. In this presentation, results from the Living Arrangements for people with Dementia study are presented that provide an overview of the involvement of volunteers in long term dementia care in the Netherlands. Furthermore, conditions for a successful involvement of voluntary workers and examples of good practices of involving voluntary workers are presented.

HEALTH CARE NEEDS, RISKS FOR CARE DEPENDENCY AND NEED FOR INFORMAL CAREGIVING AMONG OLDER ADULTS
E. Tanner, M. Hayat, Johns Hopkins University School of Nursing, Baltimore, Maryland

Independent living is challenging for older adults with co-morbidities, particularly with functional decline when informal care giving is lacking. Health care needs, risks for care dependency, and informal caregiver resources will be discussed. The sample (n=1348) is 76% female, 70% white, with a mean age of 78.5. Sixty-nine % reported poor/fair health status; 73% reported functional dependence; 63% reported ≥ 3 chronic illnesses; 57% reported ≥3 medications, yet 60% lived alone. 33% received home healthcare and only 46% had someone to call for help. Caregiving provided and caregiver perceptions of ADL/IADL abilities, particularly with functional decline when informal care giving is lacking. The growing number of older adults places a large burden on the sustainability of long term care in terms of financial and human resources. Also in living arrangements for people with dementia labor shortages and costs will increase. Hereby individual residents’ needs for wellbeing and activities will be difficult to fulfill, as it already is to some extent. The involvement of voluntary workers offers the opportunity to fulfill personal needs of residents with dementia, thereby increasing their wellbeing. There is much variation in the amount of voluntary workers that living arrangements for people with dementia involve into care. In this presentation, results from the Living Arrangements for people with Dementia study are presented that provide an overview of the involvement of volunteers in long term dementia care in the Netherlands. Furthermore, conditions for a successful involvement of voluntary workers and examples of good practices of involving voluntary workers are presented.
nerve function (Lee, Ward) and relationship of unique components of MP (velocity, force) vs. strength with mobility will be presented from epidemiologic studies (Osteoporotic Fractures in Men Study, InCHIANTI Study). Finally, a strength and power training intervention associated with improvements in lean recovery will be described (Dr. Marsh). The discussion led by Dr. Fielding will critically review current research, focusing on important issues for future research to defining the role of MP in muscle function and disability among older adults.

**LONGITUDINAL CHANGES IN MUSCLE POWER OUTPUT AMONG HEALTHY OLDER AND MOBILITY-LIMITED OLDER ADULTS: PHYSIOLOGICAL DETERMINANTS**

K. Reid1, D.J. Clark1,2, G. Doros1, E. Pasha1, C. Patten1,4, E. Phillips1,3, R. Fielding1, 1. Nutrition, Exercise Physiology and Sarcopenia Laboratory, Jean Mayer USDA Human Nutrition Research Center on Aging at Tufts University, Boston, Massachusetts, 2. Brain Rehabilitation Research Center, Malcom Randall VA Medical Center, Gainesville, Florida, 3. Department of Biostatistics, Boston University School of Public Health, Boston, Massachusetts, 4. Department of Physical Therapy, University of Florida, Gainesville, Florida, 3. Department of Physical Medicine and Rehabilitation, Harvard Medical School and Spaulding Rehabilitation Hospital, Boston, Massachusetts

This longitudinal study examined the major physiological determinants of leg extensor muscle power output among two distinct groups: healthy older adults (70-85yrs, n=21) and mobility-limited older adults (70-85yrs, n=14). After 2.8 years of follow-up, significant deficits in peak muscle power were evident in healthy older (-26.2%,p<0.001) and mobility-limited elders (-18.9%,p<0.001). While the overall magnitude of muscle power loss was similar between groups (p>0.8), mobility-limited elders had greater reductions in muscle mass (-6.4%,p<0.01) and muscle strength (-12.3%,p<0.02) compared to healthy older participants (-1.4%,p=0.8 and -3.0%,p=0.07, respectively). Both groups exhibited significant declines in specific peak muscle power (p<0.006), however, rate of vastus lateralis neuromuscular activation was significantly impaired within healthy older participants (-27.8%,p<0.05) but not in mobility-limited participants (-5.5%,p=0.3). These data suggest that divergent physiological mechanisms contribute to lower extremity muscle power decrements with advancing age among healthy older adults and elders with overt mobility limitations.

**COMBINED CHANGES IN MUSCLE AND FAT ASSOCIATED WITH LOSS IN POWER**

Older adults with sarcopenic obesity have greater disability. We examined age-related, combined changes in lean (LM) and fat mass (FM) (by quintiles) over 4.6±0.4 years in 4364 men (ages 65-93) from the Osteoporotic Fractures in Men Study. With increasing age, the most common change in body composition shifted from the greatest combined increase in LM and FM (ages 65-69) to the greatest combined decrease in LM and FM (ages ≥75). In 2782 men, the average change in leg power (LP) was computed for quintile combinations of LM and FM change. Compared to men with median combined changes, men with the most LM loss had greater LP loss that worsened with concurrent decreases in FM (p-value for trend<0.05); whereas men with the greatest concurrent gain in LM and FM had attenuated LP loss (p<0.05). Aging men experience concurrent LM and FM loss – a combination associated with the greatest decline in LP.

**PERIPHERAL NERVE FUNCTION AND LOWER EXTREMITY MUSCLE POWER IN OLDER MEN**

R.E. Ward1, P. Caserotti2, K. Faulkner1, R. Boudreau4, P.M. Cawthon4, A.B. Newman1, J.A. Cauley1, E.S. Strotmeyer1, 1. Epidemiology, University of Pittsburgh, Pittsburgh, Pennsylvania, 2. Laboratory of Epidemiology, Biometry, and Demography, National Institute on Aging, National Institutes of Health, Bethesda, Maryland, 3. NIOSH/NIH/Penn State Health Milton S. Hershey Medical Center, Hershey, Pennsylvania, 4. California Pacific Medical Center, San Francisco, California

Decline in muscle power with age may be partly due to lower peripheral nerve (PN) function, particularly number and firing rate of motor units. We assessed cross-sectional relationships between maximal power/kg body weight (Nottingham power rig) and sensorimotor nerve function (peroneal/sural nerve conduction, monofilament testing, symptoms) in 568 men (mean age=77.2±5.1, BMI=28.2±4.0, power=1.87±0.6 watts/kg) from the Osteoporotic Fractures in Men (MrOS) Study in Pittsburgh, PA. Covariates included age, body composition, comorbidities (e.g. diabetes, ankle arm index), lifestyle factors (e.g. physical activity), and grip strength. Higher compound muscle action potential (CMAP) and detection of 1.4g monofilament were associated with greater power/kg (both p<0.05). Having >2 PN symptoms (numbness/tingling, stubbing/burning/pain, open/persistent sores/gangrene) was associated with lower power/kg (p<0.01). Sural nerve conduction and motor latency were not associated with power/kg after adjustment. In these older men, CMAP, monofilament detection and PN symptoms were related to power/kg and may identify muscle function problems.

**THE RELEVANCE OF LEG SPEED, LEG STRENGTH AND OTHER PHYSICAL ATTRIBUTES TO SUCCESSFUL WALKING SKILLS**

Many physical attributes including leg speed and leg strength, the components of leg muscle power, are considered important within the rehabilitative care of older adults with mobility problems. We aimed to identify which attributes are most important for optimal mobility. We conducted an analysis of baseline data from the InCHIANTI study among (n=723) participants that completed a battery of 10 physiologic tests that could be easily administered in rehabilitative care settings. Among multivariable logistic regression models predicting self-reported ability to walk 400 meters, kyphosis, leg speed, leg strength and unipedal balance were significant predictors (p<.001, c = .86). In another model substituting, leg power for leg speed and strength the findings were not substantially different (p<.001, c = .83). Kyphosis, balance, and both components of leg power (leg strength, leg speed) are important attributes relevant to walking ability.

**POWER AND STRENGTH TRAINING TO IMPROVE THE ABILITY TO RECOVER IN A FORWARD AND LATERAL LEANING TASK IN OLDER ADULTS**

A. Marsh1, D. Pamukoff2, E.C. Haakonsen1, J.A. Zaccaria1, M. Madigan2, 1. Health and Exercise Science, Wake Forest University, Winston Salem, North Carolina, 2. Virginia Tech, Blacksburg, Virginia

Improving muscle strength and power may mitigate the effects of sarcopenia and improve one’s ability to recover from postural perturbations. We used a forward leaning task and a lateral leaning task and quantified maximum recoverable lean angle (Forward Leanmax, Lateral Leanmax) in 20 older adults (age: 70.8±4.4 yrs, BMI: 30.4±4.4...
Klotho is a recently discovered hormone that extends lifespan in mice and has important implications for health and longevity in humans. The anti-aging klotho gene encodes a single-pass transmembrane protein that exists as a circulating hormone and as a membrane-bound co-receptor. The gene was named after one of the three Fates in Greek mythology, the goddess Klotho who spins the thread of life. Circulating klotho plays a central role in protecting against atherosclerosis, maintaining calcium homeostasis, and inhibiting insulin-like growth factor-1 signaling. Klotho-deficient mice develop multiple disorders resembling human aging, such as atherosclerosis, decreased bone density, sarcopenia, and impaired cognition, and have a shortened lifespan. In contrast, mice that overexpress klotho hormone have reduced aging phenotypes and live 20% longer than wild-type mice. The damage caused by klotho deficiency is reversible or preventable with in vivo gene delivery of klotho. These findings have generated intense interest in klotho as a potential therapeutic pathway for intervention in human disease. In order to gain insight into the role of klotho in human aging, we examined the relationship between circulating klotho, chronic diseases, and longevity in the InCHIANTI Study in Tuscany, Italy. Adults with lower circulating klotho levels were at significantly higher risk of death. Low plasma klotho concentrations were independently associated with cardiovascular disease and with low skeletal muscle strength. These findings support the idea that the anti-aging hormone klotho plays a role in aging phenotypes and longevity in humans. Further insight is needed into the relationship of klotho with mineral metabolism.

KLOTHO AND SKELETAL MUSCLE STRENGTH

C. Crasto1, A. Cappola1, K. Sun1, S. Bandinelli1, L. Ferrucci1, R. Semba1, 1. Johns Hopkins, Baltimore, Maryland

Objective: Sarcopenia is a feature of klotho-deficient mice, but whether circulating klotho is related to muscle strength in humans is not known. Our objective was to examine the relationship of circulating klotho with muscle strength. Methods: We measured circulating klotho in 804 adults, ≥65 years, in the InCHIANTI study. Grip strength was measured in the same subjects using dynamometry. Results: Grip strength was positively correlated with plasma klotho at threshold <681 pg/mL. After adjusting for age, sex, education, smoking, physical activity, cognition, and chronic diseases, plasma klotho (per 1 standard deviation increase) was associated with grip strength (beta = 1.20, standard error = 0.35, P > 0.0009) in adults with plasma klotho <681 pg/mL. Conclusion: These results suggest that older adults with lower circulating klotho have poor skeletal muscle strength.
AGING IN TURKEY: CHALLENGES IN LIFESTYLE AND LIFESPAN
Chair: I. Tufan, Gerontology, Akdeniz University, Antalya, Turkey
Discussant: G. Naegle, Technical University of Dortmund, Dortmund, Germany

According to 2002 data from the Turkish Statistical Institute, Turkey is aging very quickly. While in 1960, Turkey’s population of older adults was approaching 1 million, today the number of seniors aged 60+ has increased 6 fold. Within the past 42 years (1960-2002) the overall number of older adults has increased 628%. During this same period, Turkey’s population has increased by 24.8%. Accordingly, the population of older adults has increased 25 times faster than the overall general population. (TUIK 2002; Calculations: Tufan & Arun, 2006). It is thought that many serious social challenges will be created in the future as a result of demographic aging. This symposia will address aging in Turkey and related challenges, namely: intergenerational relations, aging migrants, effects of demographic aging and a gerontological agenda, and rural and urban care for dependent older adults in Turkey. An effort to address these challenges include the inception of a program in 2006 by the Prime Ministry Social Services and Child Protection Agency (SHÇEK) to provide institutional support for in-home care. While the number of individuals receiving support is minimal, SHÇEK reports that numbers are quickly rising. As part of it’s 2011-2013 care strategy and plan of action, attention has been given the necessity of care insurance provision under the social security system.

OLDER GERMAN MIGRANTS IN ANTALYA
I. Tufan, Gerontology, Akdeniz University, Antalya, Turkey

Over a relatively long period now, foreigners have been buying homes and settling in Antalya and it’s vicinity. Germans aged 50+ make up a considerable proportion of such migrants. While in German society the term “foreigner” has significant political weight, in Turkey it evokes the image of a “tourist”. However, foreigners who have settled in the region are no longer tourists; conversely, they should be accepted as compatriots. We’ve collected empirical data from our German compatriots regarding their lives in Turkish society. From 105 ad hoc samplings, we collected information on topics including: general situation, expectations, social relationships, interest in the Turkish language and activities planned for the future. This sampling is not representative of the German population. However, this project done in 2009 on older German adults (50+) represents the first such study to obtain findings independent of the term “tourist”.

AGING IN TURKEY: FINDINGS OF THE FIRST TURKISH GERONTOLOGY ATLAS PROJECT
S. Yazici, Gerontology, Akdeniz University, Antalya, Turkey

Statistics clearly show that population aging is a reality in Turkey. However, there is a widely accepted belief in society that social and intergenerational relations of Turkish families are strong and that older adults will be well cared for by families. Yet findings of the First Gerontology Atlas have found the opposite to be true. The First Gerontology Atlas is a longitudinal study, where face-to-face interviews were conducted annually with 3500 older adults age 60+ from the 7 regions of Turkey between 2005 and 2009. The change in objective life conditions over time and subjective values has been researched. Results show that 38% of respondents were despairing about their future, and 45% reported being progressively more unhappy. Some 87% of respondents believed they are no longer respected by their families. A fund was established in 2007 by the Turkish federal government to financially support dependant peoples of all ages.

AGING IN TURKEY: PROFILES OF THE NEXT GENERATION OF OLDER ADULTS
O. Arun, Gerontology, Akdeniz University, Antalya, Turkey

Between 1960-2002, Turkey’s cumulative population has increased by 25%, while its elderly (65+) population has increased 628%. Given these figures, the urgency for a policy response naturally follows. Thus, the focus of this paper is on trying to identify the particular areas of policymaking requiring the most attention to meet the challenge of an aging Turkish population by first providing an analysis of the social, economic and health profile of today’s 50-64 age group, the 65+ population of tomorrow. Several data sources, including the European Quality of Life Survey 2007 were analysed. In Turkey, 33.3% of older adults (50-64) and 51.2% of older women (50-64) are illiterate. Employment status differs according to gender. Between 2000-2025, adults (40-65) will comprise the biggest population group in Turkey’s history. Turkey should appraise this demographic gift and identify its own gerontological agenda so as to pave the way for social justice and social citizenship.

AGING IN TURKEY’S RURAL AND URBAN CONTEXTS: ANTALYA SAMPLE
J.K. Holdsworth1, M. Reichert2, I. Gerontology, Akdeniz University, Antalya, Turkey, 2. Technical University of Dortmund, Dortmund, Germany

This presentation addresses quality of care and potential for care of dependent older adults (60+) in Turkey. The study examined how in-home care for older adults is carried out in the province of Antalya, Turkey. Findings are based on empirical data collected between April 2009 and March 2010 in 735 face-to-face interviews with dependent older adults (60+) and their primary caregivers in rural and urban settings. Of the dependent older adults interviewed, 60% were men and 36% women. While 94.0% of caregivers were family members, 5.4% were hired, and 0.6% neighbors (volunteer). Some 50.6% of informal caregivers reported having one or more chronic illnesses and 17.3% reported being psychologically/spiritually unwell. While this sampling is not representative of the larger Antalya or Turkey population, the findings bring into question the extent to which in-home care providers may be overtaxed and requiring outside assistance in caregiving.

SESSION 375 (SYMPOSIUM)
ENVIRONMENT AND AGING: THE CHALLENGE AHEAD
Chair: H. Moody, Academic Affairs, AARP, Washington, District of Columbia

The interaction of aging and the environment creates a pressing need for new research and appropriate developments in practice and policy. Although population aging has enormous implications for the environ-
ment, the gerontological community has produced little research to inform the debate about how the older population is affected by critical environmental issues. For example, frail elders, like the very young, are especially susceptible to environmental hazards, such as heat waves and weather disasters which may become more frequent with climate change. In addition, a growing body of research points to environmental toxins, such as pesticides, where lifespan exposure can trigger neurological diseases of later life, such as Parkinson’s. The thrust of this symposium is that issues of environment and aging need to be approached in terms broader than age alone: that is, in a life-course framework encompassing multiple generations. Initially, we provide an overview of current research and public policy implications, as seen by the Environmental Protection Administration in its Aging Initiative. In a second presentation, we consider how it is possible to broaden environmental awareness among children through intergenerational education. Finally, we consider the challenge of global warming as an issue of justice between generations, examining arguments about intergenerational obligations pointing to a distinctive role of today’s elders who will leave a legacy for the future. In conclusion, our discussion provides a perspective on how issues of environment and aging appear in historical perspective.

THE INTERGENERATIONAL SCHOOL: SUSTAINABLE EXCELLENCE FOR THE AGES
P. Whitehouse, Case, Shaker Heights, Ohio

For ten years The Intergenerational School (TIS), an award-winning public charter school in Cleveland Ohio, has been providing high-quality urban education for children aged 5-14 based on a developmentally appropriate curriculum embedded in a service-oriented, experiential learning multi-age community that includes adults and elders. Based on standardized educational performance measures the school is ranked the best charter in the state. Clinical trial and ethnographic data demonstrate the value of volunteering for elders with dementia. New programs are focusing on sustainability and health and wellness. An Edible Forest Garden will serve as the focal point for learning about systems thinking around growing local healthy food and water sheds. Virtual reality and other IT approaches will enhance the curriculum. Partnerships with the Cleveland Botanical Garden and our local Nature Center at Shaker Lakes will be central to our integrated approach.

LEAVING A LEGACY: OBLIGATIONS TO FUTURE GENERATIONS
H. Moody, Academic Affairs, AARP, Washington, District of Columbia

Why should we sacrifice for future generations? This question arises in the ethics of distributive justice and global warming. Present cohorts have enjoyed a consumer society based on abundant fossil fuels, but climate change threatens the planetary environment for our descendants. A purely rational appeal on behalf of future generations may prove unpersuasive. A different strategy would build on intergenerational ties displayed in legacy behavior: what Kotre, building on Erikson’s idea of generativity, called “outliving the self.” Here it is argued that, by strengthening dialogue among living (proximate) generations, it may be possible to enhance legacy motivation among today’s elders on behalf of remote generations. Case studies of environmental activism by older people suggest a new area for new research at a time when population aging and climate change are expected to accelerate.

THE ENVIRONMENT: WE ARE ALL IN THIS TOGETHER

The intersection of aging and the environment is both global and personal. As threats to our planet increase—such as climate change, oil claiming the gulf—so does the responsibility of one generation to another. It’s about daily life and the difference one person can make. The degree to which one generation cares for another is demonstrated by the degree of investment in protecting the environment. Elders strive to pass on a commitment to the environment. Elders are the natural constituency for genealogy and oral history and they could become “memory keepers” for the community and the human species. Research suggests that engagement in environmental organizations and activities may provide additional benefits beyond those found in other types of volunteering. Successful pilots discussed include 1) Building Healthy Communities for Healthy Aging (a pilot and award program); 2) Safe disposal of medications; and 3) Elders as environmental leaders benefit all ages.

SESSION 380 (SYMPHOSIUM)

EXPANDING CAPACITY THROUGH COLLABORATION AMONG THE HARTFORD GERIATRIC SOCIAL WORK INITIATIVE PROGRAMS
Chair: N. Hooyman, School of Social Work, University of Washington, Seattle, Washington, CSWE Gero-Ed Center, Alexandria, Virginia

For over ten years the Geriatric Social Work Initiative (GSWI), supported by the John A. Hartford Foundation, has increased the competence of social workers to improve the care and well-being of older adults and their families. GSWI was by design a coordinated effort envisioned to accomplish a major paradigm shift in the social work education. GSWI has accomplished this through innovative initiatives such as training academic leaders to teach, mentor, and conduct cutting-edge research; recruiting, sustaining, and preparing a cadre of talented doctoral students; developing aging-rich field education models; and promoting the infusion of gerontology into curriculum and the organizational structure of social work programs. The importance of collaborative efforts across these projects cannot be overstated during times of competitive funding and increasing needs of older adults and their caregivers. The proposed symposium will consist of leaders from the GSWI that represent programming efforts directed at faculty, doctoral students, BSW and MSW classroom curriculum, and field education. The authors of this symposium are visionary leaders of geriatric social work education. They will discuss the paradigm shifts that have been achieved through collaborative efforts over the past decade, and point to areas that must be addressed in the future to ensure geriatric social work practice and research capacity within a rapidly changing health and long-term care context.

TODAY’S DOCTORAL STUDENTS ARE POTENTIALLY TOMORROW’S FACULTY LEADERS

The Hartford Doctoral Fellows (HDF) Program has been successful at cultivating the next generation of academic leadership in geriatric social work. Almost 100 students representing 35 universities have received the fellowship. However, its success would not have been possible had it not been a component of the GSWI, which brings value-added to each of the programs. The HDF clearly articulates with the mission of the HFS; graduates of the HDF and HFS programs have become the primary sponsors of applicants to the HDF program. Moreover, the HPPAE and Gero-Rich/Gero-Ed programs have contributed to identifying and recruiting doctoral students into gerontology and geriatrics as well as planted the seeds for academic careers for the graduates of the HDF. This network of past GSWI participants provides important social capital upon which to build future activities devoted to 64th Annual Scientific Meeting
HARTFORD GERIATRIC SOCIAL WORK FACULTY SCHOLARS PROGRAM: PROGRESS AND FUTURE DIRECTIONS
B. Berkman, School of Social Work, Columbia University, New York, New York

The Hartford Faculty Scholars program addresses the shortage of social work faculty and mentors with geriatric expertise. Many Faculty Scholars have demonstrated significant outcomes for their own careers and their institutions. Moreover, many of the institutional outcomes have involved Faculty Scholars seeking grants from other GSWI programs, such as mentoring doctoral students to apply for the Doctoral Fellows program. The Faculty Scholars are making great efforts to identify future leadership in the field of geriatric social work, in much the same way that they were identified as future leaders. However, much work remains to be done if we are to ensure Faculty Scholars step into leadership positions within their schools and the profession in order to impact education and practice in both geriatric social work and the profession.

PREPARING STUDENTS WITH GERONTOLOGICAL COMPETENCIES: CURRENT PRACTICES AND NEW MODELS

The National Center for Gerontological Social Work Education (Gero-Ed Center) promotes gerontological competencies in social work programs to prepare students to enhance the health and well-being of older adults and their families. The Center’s focus is on ensuring that all students are gerontologically-competent, through infusing aging into required curriculum and programmatic structures, and creating experiential learning activities with elders. In partnership with the other GSWI programs, progress has been in expanding the teaching of gerontological competencies, encouraging students and faculty to apply for other GSWI programs, and recruiting and retaining students committed to working with older adults. With the rapidly changing context for social work practice created by the Patient Protection and Affordable Care Act, however, new models of accountable and integrated care with social work at the center are essential. The implications of these changes for the preparation of social work scholars and practitioners will also be discussed.

THE HPPAE MODEL: STRENGTHENING FIELD EDUCATION IN AGING
P.J. Volland, Social Work Leadership Institute, New York Academy of Medicine, New York, New York

The Hartford Partnership Program for Aging Education (HPPAE) has worked to develop high-quality models of, and disseminate new knowledge about, aging-rich field education at social work programs and community agencies across the country. HPPAE strengthens field education and deliberately links with classroom curriculum to strengthen the overall educational experience. HPPAE model is proving successful at recruiting and training students to the field of aging. Faculty Scholars and Gero-Ed participants work with field education staff in their home institutions to develop their HPPAE program through implementation and sustainability. Infusion of aging content in course curriculum builds knowledge and strengthens practice skills for HPPAE students. Future directions for this program include a more deliberate effort to ‘require’ faculty and field staff to focus on workforce development in the educational mission and to use experience to address current educational needs of the

SESSION 385 (SYMPOSIUM)

HEALTHY AGING POLICY PROMOTION AND IMPLEMENTATION: TOOLS FOR EFFECTIVE ADVOCACY
Chair: K.T. Unroe, Duke, Durham, North Carolina
Discussant: W.F. Benson, Andersen Benson Consulting Services, Silver Spring, Maryland

Effective advocacy for policies that promote healthy aging requires persistence, skill, and a number of other tools, especially in an environment of political turmoil. The 2009-2010 Health & Aging Policy Fellows are a multi-disciplinary group of professionals in aging at various career stages who participate in the program to gain an understanding of and experience in policy processes. The Patient Protection and Affordable Care Act, signed into law in March 2010, exemplifies the broad implications health policy has for older Americans. Fellows will discuss their involvement in aging related provisions of this legislation resulting from their placements with Executive Agencies, Congressional offices and committees, or through policy related projects. Additionally, experiences in advocacy on issues relating to aging policy, such as transportation, care coordination, hearing health, chronic conditions, and patient safety, will be discussed. Fellows will provide recommendations for ways in which professionals in aging, researchers and practitioners, can become involved in the policy process through formal and informal mechanisms. Barriers to moving a policy agenda forward, and translating research into policy, will be explored, as well as strategies to overcome these challenges. The Health & Aging Policy Fellowship program, funded by The Atlantic Philanthropies, is a 9-12 month opportunity for professionals in health and aging to participate directly in the policy arena. Through residential and non-residential tracks, Fellows work on policy related projects and may obtain placements in the legislative or executive branches of government or “think tank” organizations.

TRANSPORTATION AND HEALTH POLICY: INTERSECTIONS, DETOURS, AND CONNECTING ROUTES
R.A. Marottoli, 1. Yale University School of Medicine, New Haven, Connecticut, 2. VA Connecticut Healthcare Center, West Haven, Connecticut

Health and transportation policy and practice intersect at many levels. How do older persons get to medical appointments, as well as to social and productive out-of-home activities that allow them to stay engaged in their communities? How do transportation systems accommodate people of different functional abilities, in different geographic locations, and plan for future changes in both? This discussion will focus on policies and programs that address these issues, as well as examples of how the application of research findings and health practitioner involvement at the local, state, and national level can benefit both sides of the equation.

LISTENING TO AND EMPOWERING STAKEHOLDERS TO MOVE POLICY FORWARD: A FOCUS ON HEARING HEALTH ADVOCACY
M.I. Wallhagen, Physiological Nursing, University of California, San Francisco, San Francisco, California

Hearing loss is one of the most common chronic problems experienced by older adults and has significant negative health effects, including depression, isolation, and altered relationships. Yet only approximately 20% of persons who could benefit from amplification use hearing aids. Cost is one significant barrier. Medicare, the major source of health care coverage for older adults, statutorily prohibits coverage of hearing health care services. This discussion focuses on a project designed to gain an understanding of the ways in which Medicare makes coverage determinations and to develop a strategy to influence policy to expand opportunities for Medicare beneficiaries to obtain services that promote hearing health. It became clear that an understanding of the perspec-
tive of multiple stakeholders was critical to the development of any effective strategy; the views of some stakeholders were not what were anticipated. Listening to and accounting for these various perspectives is essential in evolving effective policy.

THE AFFORDABLE CARE ACT AS A LEVER FOR SUPPORTING EVIDENCE-BASED CHRONIC DISEASE SELF MANAGEMENT

K.D. Horton, National Council on Aging, Washington, District of Columbia

Chronic conditions are a growing public health problem contributing to 75% of U.S. health care costs. Nationally, over 80% of older Americans have at least one chronic condition and 50% have at least two. In 2011, 25% of seniors with 4 or more chronic conditions will spend 80% of nation’s $2.8 trillion healthcare dollars. With millions of older adults struggling with health challenges such as chronic disease, falls, and mental health issues, concepts such as prevention, self-management, and patient activation have become critically important. As new mandates of the Affordable Care Act (ACA) are implemented, there are opportunities for a variety of providers in many settings to play a vital role in linking people with chronic conditions to self-management services and programs that can help individuals achieve better health. Participants will learn about successful strategies for utilizing the ACA to promote referral to and funding of evidence-based healthy aging programs.

DOING NO HARM: PROMOTING SAFETY ACROSS THE CONTINUUM OF CARE

H.L. Wald, Division of Health Care Policy and Research, University of Colorado, Aurora, Colorado

Older adults are at high risk of suffering adverse effects of medical care due to both their inability to tolerate perturbations in homeostasis and their frequent contacts with the health care system. The Affordable Care Act solidifies the commitment of CMS to measuring and rewarding safe and high quality care. While many of these initiatives have initially focused on the hospital setting, they are increasingly being applied to other settings of care including long-term care and home health care. There are many challenges associated with developing meaningful measures across settings of care and to reforming payment models to incentivize safety and quality. Using health-care associated infections and hospital-acquired conditions as a paradigm, this discussion will highlight initiatives aimed at measurement, reduction and reimbursement of adverse events of medical care; review the federal and non-federal stakeholders; and discuss the implications of these activities on the provider community as practitioners and advocates.

SESSION 390 (SYMPOSIUM)

MAKING THE CASE AND TAKING ON THE CHALLENGES OF INTERDISCIPLINARY TEAMWORK EDUCATION IN GERIATRICS

Chair: P. Clark, Gerontology, University of Rhode Island, Kingston, Rhode Island

Discussant: J. Damron-Rodriguez, UCLA, Los Angeles, California

Interdisciplinary teamwork (IDT) is increasingly essential in providing quality care to older adults with complex and chronic health care needs. IDT education is critical for all health care professionals if they are to master the core knowledge and skills necessary for teamwork. The Partnership for Health in Aging (PHA), a coalition of over 30 health professional associations and organizations, has recently released an IDT position statement and resource directory calling for the development and expansion of IDT education. This symposium reviews the major findings and recommendations of this position paper, and explores their implications for developing, implementing, and sustaining IDT in educational and clinical settings. The first paper presents the position statement’s major conclusions and recommendations, including the process of their development. The second paper describes current and future initiatives within the Veterans Administration (VA) health care system in support of IDT utilization and training, including how the lessons of the past can be used to inform the present and shape the future of IDTs generally. The third paper explores how professional associations, accreditation organizations, licensing agencies, and payers can work together to promote sustainable IDT education and practice through creating expectations and incentives for their development. The final paper develops a typology of challenges to designing effective IDT training programs in higher educational settings and integrates them into a conceptual framework based on professional, collaborative, and contextual factors. Recommendations for developing, implementing, and sustaining interdisciplinary geriatric teamwork education and practice to meet future health care needs will be developed.

ADDRESSING THE NEED FOR INTERDISCIPLINARY TEAM TRAINING

The Partnership for Health in Aging established a work group to address the need for enhanced education in interdisciplinary teamwork (IDT) in geriatrics. The work group conducted a comprehensive literature search on existing resources for IDT training, and developed a position statement and an annotated bibliography. After reviewing the evidence, the work group agreed on the following positions: (1) IDT training programs enhance the clinical skills and effectiveness of health-care professionals caring for older adults; (2) the core curriculum components of a geriatric IDT training program should include the following domains: team development, role definition, communication strategies, consultation, conflict resolution, collaborative decision-making, and leadership; and (3) institutional and financial support is vital for the development, professional training, and ongoing maintenance of IDTs. The position statement and the annotated bibliography should be used as an advocacy tool and resource for professionals interested in developing and expanding IDT training programs.

TEAMS IN VA GERIATRICS: PAST, PRESENT, AND FUTURE

R. Tsukuda1, K. Shay2, 1. VISN 20 MIRECC, Portland, Oregon, 2. VA Central Office, Washington, District of Columbia

For over three decades, the Department of Veterans Affairs (VA) has supported clinical and educational initiatives in geriatrics based on interdisciplinary practice. The VA's Interdisciplinary Team Training in Geriatrics (ITTG) programs served as loci for interdisciplinary training of health professionals and trainees with the goals of developing discipline-specific clinical knowledge and skills, enhancing geriatric practice, and learning skills necessary for effective teamwork. Presently the VA has the opportunity for leveraging the lessons learned from ITTGs in its adoption of the medical home model. We polled VA geriatric and primary care programs in order to gain insight into the real life problems facing emerging teams and how the lessons of the geriatric team care model are being applied and adapted—or not. Our findings will be of use in refining the VA's efforts to apply established geriatrics expertise to the new look of VA primary care.

HOW HEALTH-RELATED ORGANIZATIONS CAN SUPPORT IDT IN GERIATRICS

D. Reuben, UCLA, Los Angeles, California

Health-related organizations fulfill a variety of roles in health care delivery, and each can have unique leverage in promoting or impeding the adoption of interdisciplinary team (IDT) training in geriatrics. Professional societies are typically membership organizations and often
create educational products for practicing clinicians. They also frequently engage in lobbying or advocacy activities to secure reimbursement for services. Licensing and certifying bodies set standards and serve the public through regulating or credentialing clinicians. Frequently, these organizations also influence professional schools and post-graduate programs by establishing requirements that must be met prior to being eligible for licensure or certification. Accrediting organizations are typically aimed at institutions where professionals are taught or where health care is provided. Finally, payers can incentivize or de-incentivize innovations by reimbursing or denying coverage. When aligned, these complementary roles of organizations can greatly facilitate the diffusion of new approaches to health care delivery.

TAKING ON THE CHALLENGES OF DEVELOPING AND SUSTAINING IDT TRAINING IN HIGHER EDUCATION
P. Clark, Gerontology, University of Rhode Island, Kingston, Rhode Island

Higher education institutions present unique challenges for the development, implementation, and continuation of interdisciplinary geriatrics team training programs. In spite of recent calls for the expansion of such programs, significant barriers remain to their long-term success. This paper develops a typology of such factors and integrates them into a conceptual framework suggesting some potential solutions. The following are included in this framework: (1) factors related to each profession, such as its unique cultural and historical background, power base, and willingness to embrace change, (2) factors related to interrelationships among the professions, including their status, ability and willingness to collaborate to achieve improved health care quality and outcomes, and (3) factors related to the context for IDT education, including acute, long term, and community care settings. Geriatrics offers unique opportunities to develop successful strategies to overcome these traditional barriers, and this presentation summarizes recommendations for implementing them in higher education settings.

SESSION 395 (SYMPOSIUM)

OLLIE RANDALL AWARD SYMPOSIUM:
UNDERSTANDING ADOPTION OF CULTURE CHANGE PRACTICES IN U.S. NURSING HOMES: A MIXED-METHODS APPROACH
Chair: S.C. Miller, Brown University, Providence, Rhode Island
Discussant: C.E. Bishop, Brandeis University, Waltham, Massachusetts

For nearly two decades a movement to transform the “culture” of U.S. nursing homes (NHs) has been underway. The “NH culture change” movement aims to transform NH physical environments to be more homelike and advocates for reduced hierarchy by encouraging resident-centered/directed care practices and staff empowerment. This movement occurs in a rapidly changing NH environment that includes increasingly diverse NH populations. In this symposium we present findings to further our understanding of how and to what extent U.S. NHs have transformed. Our mixed-methods approach: 1) estimates adoption of culture change practices, 2) examines factors and care processes associated with more versus less adoption, and 3) identifies processes and strategies NHs use to implement culture change practices. In 2009/10 we surveyed directors of nursing (DoNs) and Administrators at 3,697 NHs (i.e., a stratified, proportionate random sample of U.S. NHs). Response rates were 57.6% (DoNs), 59.4% (administrators), and 44.5% (both). Survey questions focused on the culture change constructs of quality changes and their related motivations, strategies, facilitators, barriers and impacts. Survey findings show while full culture change transformation is uncommon the vast majority of U.S. NHs has adopted some culture change practices. Interviews illustrate variation in motivators and strategies, but consistency in reports of positive impacts.

CULTURE CHANGE PREVALENCE AND CORRELATES IN NURSING HOMES

In 2007, 43% of U.S. nursing homes (NHs) had little or no commitment to or adoption of culture change. In 2009/10, 86% of NH directors of nursing (DoNs) reported involvement in culture change at least partially changed resident care; 13% reported it completely changed care throughout the NH. Scores derived from questions on resident and staff practices and on physical environments had acceptable Chronbach’s alphas and congergent and construct validity. Higher scores on the culture change constructs were significantly associated with lower administrator and DoN turnover, and with longer aide tenure, as reported by administrators. Also, in facilities with higher resident-centered/directed care scores there was lower use of physical restraints and long-stay residents had lower increases in depression/anxiety (per NH Compare indicator). Adoption of culture change practices has increased substantially in U.S. NHs. Future research is needed to disentangle the cause/effect relationships between adoption and staff turnover/tenuer and resident outcomes.

THE SKILLED CARE NURSING HOME MARKET AND CULTURE CHANGE APPROACHES
M. Lepore1,2, R.R. Shield3, J. Looze2, D. Tyler2, S.C. Miller1, I. Planetree, Atlanta, Georgia, 2. Brown University, Providence, Rhode Island

Nursing homes (NHs) are increasingly serving short-stay residents with sub-acute care/rehab needs. Concomitantly, a “culture change” movement is afoot to transform NHs from medical-model settings to providers of person-centered care offering “home” environments. This study examines NH approaches to culture change in the context of the transition to short-term services. Data derive from in-depth interviews conducted with 64 NH administrators. Findings indicate NHs are responding to culture change in the growing skilled care market in a variety of ways. Approaches to NH culture change identified in the context of serving sub-acute care/rehab residents vary by whether culture change practices are implemented differently or with different emphases for short- and long-stay residents; whether provision of “hospitality-like” amenities substitute for fundamental culture change practices; and whether reforms are considered inappropriate for sub-acute care/rehab residents. Future research is needed to further understand these trends and identify how best to care for short-stay residents.

THE IMPORTANCE OF COMMUNICATION AND EDUCATION TO SUCCESSFUL CULTURE CHANGE INITIATIVES

Culture change (CC) is becoming increasingly prevalent in US nursing homes (NHs), yet little is known about how facilities go about implementing. Among the 64 NH administrators (NHAs) we interviewed, those who reported incorporating CC practices noted varying strategies employed and approaches taken. Most stressed the importance of communication with and education of all stakeholders, including NH staff at all levels, NH residents, and residents’ family members. As one administrator said, “We’ve had a series of meetings...educated our staff on the new culture change initiatives; why it’s important. We do a resident satisfaction survey...and so we use feedback from residents as
a way to say this is where we need to go.” Themes emerging around the concepts of communication and education indicate that these efforts should be ongoing, communication should be reciprocal, and all stakeholders should be active participants in the CC process.

QUALITATIVE EXPLORATION OF MOTIVATIONS, SUCCESSES AND BARRIERS IN CULTURE CHANGE IMPLEMENTATION

R. Shield1, J. Looze1, M. Lepore2, D. Tyler1, S.C. Miller1, 1. Brown University, Providence, Rhode Island, 2. Planetree, Inc., Derby, Connecticut

Following a national survey of nursing home administrators (NHAs) and Directors of Nursing, semi-structured qualitative telephone interviews lasting 20-30 minutes each were conducted with a subset of NHAs (N=64) to explore their views and experiences of adopting “culture change” practices in their facilities. Each interview transcript was individually coded by research team members. Codes were reconciled in analysis team meetings, scored by the team according to how extensive the facility’s culture change practices appeared and triangulated with quantitative survey responses. Transcript analysis reveals prominent themes, including NHAs’ motivations for implementation, their strategies and approaches, factors that impeded and facilitated the changes, and lessons learned. Important tenets include the need for sustained leadership; continual communication among staff, residents and families about culture change; and tackling small steps first when incorporating new practices. As one NHA advised, “Start out with simple things [to] … succeed...[and] have the right players sit around the table.”

SESSION 400 (SYMPOSIUM)

QAPI COMES TO THE NURSING HOME: OPPORTUNITIES, CHALLENGES, TOOLS, AND BEST PRACTICES

Chair: R.A. Kane, Health Policy and Management, University of Minnesota School of Public Health, Minneapolis, Minnesota
Discussant: A. Bonner, Division of Nursing Homes, Survey & Certification Group, Centers for Medicare & Medicaid Services, Baltimore, Maryland

The Affordable Care Act mandates a Quality Assessment and Performance Improvement (QAPI) requirement for nursing facilities (NFs). QAPI ushers in a focus on data-driven proactive performance improvement for all aspects of NF care and services, including quality of life and effective transitions in and out of NFs. This Symposium describes a model for QAPI developed by the Centers for Medicare and Medicaid Services (CMS), discusses tools and resources to enhance QAPI implementation (as well as gaps in such tools), describes the structure of a QAPI demonstration in 20 nursing homes in four states beginning in July 2011, and technical assistance that is being tested through a learning collaborative model and other multifaceted approaches. Rosalie Kane summarizes the initiative, including the 5 major elements of QAPI, and the challenges in developing prototypes given the heterogeneity in NH resources, organizational structure, and care programs. Pamela Lee presents a review of tools to implement QAPI processes and topical tools to monitor specific areas. Jennifer Lundblad presents the learning collaborative and technical assistance approach, built on insights from the experience of the QIOs; this approach multiplies lessons learned from the demonstration. Robert Kane discusses the evaluation of the demonstration and its relationship to the national QAPI roll-out. Alice Bonner kicks off the audience discussion with comments on the CMS vision for QAPI in the context of overall CMS initiatives.

QAPI FOR NURSING FACILITIES: A POSITIVE APPROACH TO QUALITY

R.A. Kane1, R. Kane1, P.J. Lee2, K. Clayton2, 1. Health Policy and Management, University of Minnesota School of Public Health, Minneapolis, Minnesota, 2. Nursing Home Division, Survey & Certification Group, Centers for Medicare & Medicaid Services, Baltimore, Maryland

Current nursing facility (NF) regulations are designed to assure compliance with a minimum set of expectations for quality in multiple areas. QAPI offers a complementary approach geared to continuous improvement. Each NF will be expected to develop a QAPI program that includes tracking and investigating Adverse Events, monitoring Performance Indicators that can be examined against thresholds and/or targets, conducting Performance Improvement Projects, applying a Systemic Approach to identify and correct root-causes of problems, and developing a sustainable Governance Structure for QAPI. The challenges of implementing a reproducible QAPI program are magnified because of variability in NH resources, organizational structure, and care programs. A demonstration project in 20 varied NFs (some chain-owned and some free-standing) in 4 states will be mounted to demonstrate QAPI in action and to help inform the national QAPI rollout. Assumptions and preliminary findings leading to the demonstration are discussed in this presentation.

EVALUATION OF THE QAPI DEMONSTRATION

R. Kane, R.A. Kane, School of Public Health, University of Minnesota, Minneapolis, Minnesota

The QAPI demonstration is designed to test a model of technical assistance that can be used in a national roll out of QAPI. The evaluation is based on a combination of goal attainment (was each operational component of the five elements successfully completed in each site?), qualitative analysis (what problems were encountered in implementing the system and how were they overcome), and quantitative analysis (were targeted areas of quality reflected in improvements in corresponding quality measures; was there evidence of spill-over into other quality measures; were they offsetting decrements in some quality measures; were there reductions in hospital admissions and ER visits for ambulatory sensitive conditions). The data come from site visits, analysis of MDS data that provides 24 case-mix adjusted quality measures and MedPAR data.

TOOLS, RESOURCES, BEST PRACTICES AND BROAD OUTREACH VIA A WEB-BASED RESOURCE CENTER

P.J. Lee1, J. Pederson2, K. O’Neill1, R.A. Kane1, R. Kane1, J.P. Lundblad2, M. Reierison1, 1. University of Minnesota, Minneapolis, Minnesota, 2. Stratis Health, Inc., Bloomington, Minnesota

The QAPI contractor team at University of Minnesota and Stratis Health reviewed available tools to mount a QAPI process in nursing homes, identifying gaps and adapting or developing tools as needed. The team also reviewed a wide range of assessment tools available to improve care and services across the broad spectrum of areas involved in NF care. The presentation describes the process and results of this comprehensive analysis of tools and the effort to identify evidence-based QAPI practices. It also illustrates the Web-based Resource Library in its beta-testing phase; this library is designed as a transparent user-friendly mechanism for providers, consumers, and regulators to become engaged in the challenges of improving nursing homes through QAPI.

TECHNICAL ASSISTANCE FOR QAPI: THE ROLE OF THE LEARNING COLLABORATIVE

J.P. Lundblad1, M. Reierison1, K. O’Neill1, J. Pederson1, R.A. Kane2, P.J. Lee2, 1. Stratis Health, Bloomington, Minnesota, 2. Division of Health Policy & Management, School of Public Health, University of Minnesota, Minneapolis, Minnesota

The 20-NF demonstration project includes multiple inter-related types of technical assistance (TA): individualized TA to each NF, interactive on-line curriculum, newsletters; TA hotlines; and tailored...
resources and forums for “communities of practice”—i.e. all persons with the same role in participating NFs (e.g. medical directors, DONs). A Learning Collaborative comprised of representatives from each NF will be developed for participating NFs; it entails phone and in-person meetings and ample opportunities to network, and share successes and cautionary tales. As participating NFs work on achieving their QAPI milestones and applying common approaches to identify individual NF needs and plans, the learning collaborative provides a rich vein of experience and generates useful case studies for the QAPI national roll-out. TA approaches are informed by the experiences of Quality Improvement Organizations in working with NFs (synthesized by Stratis Health) and by the authors’ research into current QAPI practices in independent and chain-affiliated NFs.

SESSON 405 (SYMPOSIUM)

THE FUTURE OF RETIREMENT SECURITY: TRENDS AND POLICY OPTIONS

Chair: L. Polivka, Claude Pepper Center, Florida State University, Tallahassee, Florida
Discussant: E. Kingson, Syracuse University, Syracuse, New York

The future of retirement security in the U.S. and other countries is fundamentally dependent on sustained and sustainable economic growth. This presentation will argue that historically slow growth over the last 30 years, the continuing effects of the Great Recession and the renewed dominance of conservative (neoliberal) economic policy at the national and state government levels have greatly increased the risk that increasing numbers of future retirees will not have what are generally considered sufficient resources for an adequate standard living in retirement. This perspective on the political economy of retirement security will be based on an analysis of fundamental changes in corporate goals and strategies and public policies from the early 1970’s to the current emergence of austerity measures and the impact of these changes on the retirement prospects of the next generation of retirees. The presentation will conclude with an assessment of alternative options for restoring economic security in retirement.

RETIREMENT SECURITY LESSONS FOR THE U.S. FROM ABROAD

J.B. Williamson, Sociology, Boston College, Chestnut Hill, Massachusetts

There are important lessons from abroad for the debate over Social Security reform in the United States. The thirty or so countries with partially privatized pension schemes, make it clear that such schemes can be made to work reasonably well, particularly for affluent workers. But there is also evidence of serious problems associated with many of these schemes including high administrative costs, poor returns, and poor coverage for low-wage workers. There is also evidence from other countries abroad suggesting that the introduction of notional defined contribution (NDC) individual accounts may offer a way to increase Social Security revenues in the U.S. without the market and investment risks associated with the diversion of Social Security contributions into funded individual accounts.

WORK LONGER. SURE. BUT WHO CAN DO THAT?

D. Ekerdt, Univ of Kansas, Lawrence, Kansas

A trend toward extended work lives is already underway, with increased employment among older people and more working retirees on the rise. Policy figures promote delayed withdrawals as a way to increase retirement income both for the household and to relieve pressure on pension systems. As an example, lowering the “retirement wage” for Social Security would raise the incentive to work longer. Worthy as this advice may be, how feasible is greater employment among retirement-age workers? There is scant evidence that the labor market has become more welcoming to older workers, or that population health and fitness has improved. Those who do stay tend to have labor market advantages, better health, higher wages, and more control over working conditions. The work-longer policy imposes a regime of retirement delay on those with fewer work options and characteristically shorter lives. The work-longer prescription is a solution with inequality baked in.

SESSION 410 (SYMPOSIUM)

NIA SYMPOSIUM: LIFESTYLE Ç LIFESPAN Ç ADVANCES & OPPORTUNITIES IN AGING RESEARCH

Chair: R. Hodes, National Institute on Aging, Bethesda, Maryland
Co-Chair: J. Harden, National Institute on Aging, Bethesda, Maryland
Discussant: MA Bernard, National Institute on Aging, Bethesda, Maryland

Roundtable Discussion Participants: R Barr, Division of Extramural Activities MA Bernard, Deputy Director F Sierra, Division of Aging Biology E Hadley, Division of Geriatrics and Clinical Gerontology R Suzman, Division of Behavioral and Social Sciences S Snyder, Division of Neuroscience JT Harden, Office of Special Populations C Hunter, Division of Extramural Activities/Training Officer NIA-supported research is helping to identify lifestyle factors and health behaviors that directly influence physical, cognitive, and emotional fitness and risk of disease. As we identify more precisely these health behaviors and lifestyles factors that influence health and quality of life, we will be able to reinforce prevention efforts, enhance symptom management, conserve function, and improve caregiving. This interactive symposium will provide an overview of recent research advances highlighting lifestyle and lifespan. The National Institute on Aging conducts and supports biomedical and behavioral research with a focus on understanding basic processes of aging, improving prevention and treatment of diseases and conditions common in later years, and improving the health of older persons. The symposium includes two podium presentations and roundtable discussions. An overview of NIA appropriations and recent advances in aging research related to lifestyle and lifespan will be highlighted in the first podium presentation. The NIA also supports training and career development of scientists focusing on aging research and the development of research resources. This topic will be the focus of the second podium presentation, followed by interactive roundtable discussions.

A RUN THROUGH THE NIA MECHANISM MAZE

R.A. Barr, Division of Extramural Activities, National Institute on Aging, Bethesda, Maryland

I will describe recent changes in NIH and NIA policies concerning grant opportunities, comment on the budget climate for grant awards and describe particular kinds of training and grant awards suitable for students and researchers at different stages of their training or research careers. I will finish with an overview of any open NIA initiatives and introduce other NIA staff who will be present to speak on a one-one basis with participants. After my talk participants should know more about opportunities to seek support for their research or training from NIA and should know the individual division of NIA appropriate for their scientific background.

NIA SYMPOSIUM: INTERACTIVE ROUNDTABLE DISCUSSIONS ON LIFESTYLE, LIFESPAN, AND ADVANCES AND OPPORTUNITIES IN AGING RESEARCH

J. Harden, National Institute on Aging, Bethesda, Maryland
Participants: RJ Hodes and MA Bernard, Office of the Director/Deputy Director; R Barr and C Hunter, Division of Extramural Activities, F Sierra, Aging Biology; E Hadley, Geriatrics and Clinical Gerontology; R Suzman, Behavioral and Social Sciences; S Snyder, Neuroscience. This interactive symposium brings together participants and the leadership and staff of NIA offices and extramural research divisions. The roundtable discussions vary and may focus on...
advances in research at the NIA, career development plans, questions about review, and pre/post award management. Participants may prepare a one-page abstract to discuss and leave with staff for follow-up or use the time for mini-mentoring sessions. The NIA conducts and supports biomedical and behavioral research with a focus on understanding basic processes of aging, improving prevention and treatment of diseases and conditions common in later years, and improving the health of older persons. Join the fun and style of NIA!

SESSION 415 (POSTER)

BIOLOGICAL MECHANISMS OF AGING I

HOW GENES CONTRIBUTE TO AGING RELATED CHANGES AND AFFECT LIFE SPAN IN HUMANS

The genetic studies of human life span produced controversial results. The effects of a number of genes on longevity are confirmed in some studies and are not manifested in others. None of the connections resulting from the genome wide association studies (GWAS) of longevity achieved genome-wide significance level. New approaches are needed to evaluate the roles of genetic factors in longevity from available data.

In this paper we investigate joint influence on life span of a set of genetic variants individually selected in GWAS of life span using Framingham Heart Study data. We use bio-demographic models to investigate possible mechanisms, which are likely to be involved in regulating differences in survival patterns in groups of individuals with different genetic background and at different time points. We show that difference in genetic background among groups of individuals from the same cohort generates differences in aging related changes in physiological indices, as well as differences survival/mortality curves resembling those observed during survival/mortality improvement in developed countries in the last century. 

Observed similarity in patterns of survival changes in response to radically different factors indicates the presence of important systemic biological mechanisms involved in life span regulation. Although these mechanisms could be different for different stimuli their functional roles could be similar. We also show how average age patterns of physiological indices differ for groups of individuals with different genetic background.

INDIVIDUAL ESTIMATION OF AGING BIOMARKERS IN HEALTHY CHINESE POPULATION

X. Bai, Gerontology and Geriatrics, The First Affiliated Hospital of China Medical University, Shenyang, China

[Background] Biological age has been proposed to serve as an essential indicator for individual estimation of aging. [Objective] The purposes of this study were to estimate the levels of biological aging in healthy Chinese population and to observe the differences of biomarkers among the aging levels in the same chronological age (CA) groups. [Method] 852 healthy adults aged 30-98 years were enrolled and divided into four CA groups, and the individual biological age was estimated. Based on the confidence interval with ± 1 standard deviation of the regression line, each CA group was divided into 3 aging levels (Delayed, normal and early aging level). We observed the differences of 7 biomarkers (PP, IMT, EDV, MVEL, E/A, FIB, Cystatin C) among 3 aging levels in each CA group. [Results] In each CA group there were significant differences of biological age score among 3 aging levels (P < 0.001). There were also significant differences of 7 biomarkers among 3 aging levels (P < 0.001) and 4 CA groups (P < 0.05). PP and EDV were significant difference among 3 aging levels in 4 CA groups (P < 0.001), and other biomarkers except FIB were significant differences among 3 aging levels in CA groups except 30-44 yr group. FIB was significant difference among 3 aging levels only in 45-59 yr and 60-74 yr CA group. [Conclusion] Biological age score play an essential role in the evaluation of aging. 7 biomarkers were competent for the evaluation of aging.

RELATION BETWEEN OXIDATIVE STRESS RESISTANCE AND KIDNEY DISEASES IN SPONTANEOUS DWARF RATS

T. Shinaka, Tokyo Metropolitan Institute of Gerontology, Tokyo, Japan

Spontaneous Dwarf rat (SDR), a dwarf rat strain derived from Sprague–Dawley (SD) rats, has a longer lifespan than that of SD. This report describes that, although chronic nephropathies and renal cell tumors frequently develop in SDR rats, the diseases were extremely rare in SDRs. The results indicate that SDRs can resist these diseases, and suggest that resistance to oxidative stress causes the abatement of the disorders. To investigate the augmentation of tolerance for oxidative stress in SDRs, we administered N-ethyl-N-hydroxyethylhydrosamine and potassium bromate, which are carcinogens that produce active oxygen. Administration of the drugs induced weight loss because of the loss of appetite in both SDRs and SD rats. The kidney weight increased after drug administration to SDR rats, but no change was found in SDRs. Administration of the drugs led to tissue aberration in all SD rat kidneys, but no marked aberration occurred in SDRs. Moreover, the drugs showed carcinogenicity in half of the SD rats, but none in any SDR. These results indicate that the carcinogens cause neoplasia, hyperplasia, and hypertrophy in SD rat kidneys, and that SDRs have resistance to renal oncogenesis and brightism caused by them. Reportedly, oxidative stress can be involved in the canceration mechanism of the drugs used in these experiments. Our findings suggest that SDRs have oxidative stress-controlling mechanisms, and that the suppression of kidney deficiencies might support the longevity of SDRs.

VASCULAR OXIDATIVE STRESS IN AGING:

HOMEOSTATIC FAILURE VIA DYSREGULATION OF NRF2-MEDIATED ANTIOXIDANT RESPONSE

Z. Ungvari1, L. Bailey-Downs2, D. Dosnoswka3, T. Gautam1, P. Ballabh2, R. De Cabo1, W. Sonntag1, A. Ciszor1, J. Reynolds, Oklahoma Center on Aging, Department of Geriatric Medicine, University of Oklahoma Health Sciences Center, Oklahoma City, Oklahoma, 2. Departments of Pediatrics, Anatomy & Cell Biology, New York Medical College-Westchester Medical Center, Valhalla, New York, 3. Laboratory of Experimental Gerontology, National Institute on Aging, Baltimore, Maryland

Aging is associated with vascular oxidative stress, which promotes the development of cardiovascular diseases. NF-E2–Related Factor-2 (Nrf2) is a transcription factor, which is activated by reactive oxygen species in the vasculature of young animals leading to the up-regulation of various antioxidant genes. The present study was designed to elucidate age-related changes in the homeostatic role of Nrf2-driven free radical detoxification mechanisms in the vasculature. We found that in the aorta of F34xBN rats aging results in a progressive increase in O2·- production, and down-regulates protein and mRNA expression of Nrf2, which is associated with a decreased nuclear Nrf2 activity and a decrease in the Nrf2 target genes NQO1, GCLC and heme oxygenase-1. In cultured aorta segments of young (3 month old) rats treatment with H2O2 and high glucose significantly increases nuclear translocation of Nrf2 and up-regulates the expression of Nrf2 target genes. In contrast, in cultured aorta segments of aged (24 month old) rats, the induction of Nrf2 dependent responses by H2O2- and high glucose are blunted. High glucose-induced vascular oxidative stress was more severe in aortas of aged rats, as shown by the significantly increased H2O2 production in these vessels, as compared to responses obtained in aortas from young rats. Moreover, we found that aging progressively increases vascular sensitivity to the pro-apoptotic effects of H2O2 and high glucose treatments. Taken together, aging is associated with Nrf2 dysfunction in the vasculature, which likely exacerbates age-related cellular oxidative stress and increases sensitivity of aged vessels to oxidative stress-induced cellular damage.
AGING-ASSOCIATED ALTERATIONS OF FUNCTION OF MESENTERIC LYMPHATIC VESSELS
A.A. Gashev, G.L. Cote, H. Bohlen, T. Nagai, T.J. Akk, 1, Dept. of Systems Biology and Translational Medicine, Texas A&M HSC College of Medicine, Temple, Texas, 2, Dept. of Biomedical Engineering, Texas A&M University, College Station, Texas, 3, Dept. of Cellular and Integrative Physiology, Indiana University Medical School, Indianapolis, Indiana

An effective mesenteric lymph flow is crucial for fluid and macro-molecule homeostasis, fat absorption, and immunity. Aging alters all of these functions; however, status of contractility and flow in aged mesenteric lymphatic vessels (MLV) is not well characterized. In this study, two age groups of Fischer-344 rats were used: 9-mo and 24-mo old. We investigated the aging-related changes of contractility and flow in MLV in vivo as well as in isolated vessel experiments in reference to their nitric oxide (NO)-dependent modulation. Diameters/pump indices of isolated/pressurized segments of rat MLV were determined. High-speed cell video monitoring was performed using an intravaltral microscope equipped with a digital 500 fps video camera. Lymphatic diameters, contraction frequency, flow velocity, and wall shear stress were calculated. Application of the non-selective nitric oxide synthase inhibitor - L-NAMe was implemented. Additionally, we performed direct measurements of NO concentration near aged lymphatic wall. We found severe weakening of the lymphatic pump in aged MLV including diminished tone, contraction amplitude, frequency with corresponding decrease in their minute productivity. The imposed flow gradient-generated shear-dependent relaxation does not exist in aged MLV, while at the same time, application of L-NAMe is able to enhance contractility of aged MLV. Moreover, we found significantly elevated concentration of NO by walls of the aged MLV. We conclude that functional disturbances in aged MLV lead to their diminished ability to adapt effectively to volumetric challenges in elderly, therefore limiting the adaptive reserves in functioning of the mesenteric lymphatic network. NIH RO1 AG-030578 and HL-094269.

CENTRAL AND PERIPHERAL MUSCLE FATIGUE IN HOSPITALIZED GERIATRIC PATIENTS VERSUS ELDERLY CONTROLS
I. Bautmans, S. Vantieghem, D. Duchateau, T. Mets, I. Fralij in Ageing research department (FRIA), Vrije Universiteit Brussel (VUB), Brussels, Belgium, 2. Universitat Ziekenhuis Brussel (UZBrussels), Brussels, Belgium, 3. Université Libre de Bruxelles, Brussels, Belgium

Background: Previously, we have demonstrated the negative impact of acute inflammation on muscle fatigue resistance in geriatric patients. The involvement of central and peripheral muscle activation deficits in inflammation-induced muscle fatigue remains unclear. Methods: Hospitalized geriatric patients (assessed within the first 3 days of admission, N=10) and elderly community-dwelling controls (N=18) performed a sustained maximal isometric contraction of the M. Adductor Pollicis until the strength dropped to 50% of its maximal value. The voluntary activation of the M. Adductor Pollicis was studied before and at the end of the fatigue test using the twitch interpolation method (by simulation of the Ulnar Nerve). During the fatigue test, muscle activity was continuously monitored using surface EMG. In all participants, serum cytokines/chemokines as explanatory outcomes. Results: Our preliminary analyses indicate that muscle fatigue in geriatric hospitalized patients is attributable to a loss of muscle contractibility due to local inhibitory processes rather than a reduced central nervous drive. In fact, we found no significant difference in central muscular activation between both groups. In addition, geriatric patients showed a significant (p<0.05) decrease in normalized surface EMG activity during the fatigue test, whereas it increased in the elderly controls. In this contribution, full data analysis of differences in central and peripheral muscle activation deficits following a sustained fatigue test between geriatric hospitalized patients and community dwelling elderly controls will be presented, as well as the relationships with circulating markers of inflammation.

DO EARLY-LIFE AGING-RELATED PHENOTYPES IN ADULTS PREDICT HEALTH TRAITS AT LATE AGES IN FAMILIES? INSIGHTS FROM THE LONG-LIFE FAMILY STUDY

Aging is associated with systemic remodeling of organism’s functioning which increases chances of virtually all geriatric traits. It is believed that various geriatric traits and longevity are heritable. Because the senescent (i.e., post-reproductive) phenotypes can be caused by the reproductive-age-related risk factors, their heritability can be driven by evolution. Studies of heritability are important because their results can be used for evaluating chances of developing health problems in offspring knowing health information of their parents and for identification of genetic variants contributing to healthy life. We focus on 4954 participants of the Long Life Family Study (LLFS) from two generations to elucidate whether: (i) risk factors (e.g., body mass index, blood glucose, and blood pressure) and diseases (e.g., hypertension and diabetes) measured in long-living parents are associated with the same traits in other members of their families, (ii) risk factors are associated with diseases in different members of the LLFS families, and (iii) risk factors measured in long-living parents are associated with diseases in other members of their families. We show that: (i) heritability of each trait is sensitive to the age of parents, (ii) risk factors might not be associated with diseases in the longest-living population, and (iii) certain risk factors in parents can predict diseases in their children and vice versa, but this effect is sensitive to the parents’ age. The results suggest that mechanisms of heritability of individual traits and associations among diseases and risk factors in long-living populations might be different than in the normal populations.

ALTERED EXPRESSION OF MICRORNA IN THE AGING HEART

Objective: MicroRNAs are short, endogenous, single-stranded RNA molecules that regulate gene expression, and are important regulators of cardiac structure and function. However, the expression of microRNAs and their role in the aging heart have not been well established. In the present study, we examined microRNA expression pattern and the role of transcriptional regulation in the altered expression of microRNA in the heart. Methods: We analyzed the microRNA expression in young adult (YA, 4 mo) vs old (O, 24-mo) C57BL6 mouse hearts. Results: We observed that 66 microRNAs were differentially expressed with at least 1.5-fold change in the O versus YA mouse heart; 35 microRNAs were up-regulated, while 31 microRNAs were down-regulated. Over half of the 66 microRNAs belong to 8 microRNA clusters. We also examined the transcription of microRNA primary transcript (pri-miRNA), which is the first step in the microRNA biogenesis. The pri-miR-21 level changed during maturation and aging at various ages, which correlated with the expression of miR-21 mature
microRNA. Furthermore, we examined the miR-21 passenger strand, as well as Ago1 and Ago2 proteins. Our data indicate that transcriptional regulation and the Agonate proteins contributed to the age-related change in the expression of both microRNA guide strand and passenger strand. Bioinformatics analysis revealed that miR-25, miR-199a and miR-455 could inhibit the sirtuin family proteins. Conclusion: The cardiac expression of microRNA changes during adult aging. Transcriptional regulation and Agonate proteins may contribute to the age-related differences of both microRNA guide strand and passenger strand in senescence.

AGING-RELATED PHENOTYPES AND INTER-CHROMOSOMAL LINKAGE DISEQUILIBRIUM IN THE HUMAN GENOME

A. Kulinski, Center for Population Health and Aging, Duke University, Durham, North Carolina

Studies of plants and animals show that loci on non-homologous chromosomes can be in linkage disequilibrium (LD). Such LD is often observed in populations with qualitatively different phenotypic structure, particularly, in admixture of different inbred strains. This paper explores whether the phenomenon of inter-chromosomal LD can be associated with complex, aging-related phenotypes and be caused by intrinsic bio-genetic mechanisms in human genome. The analysis is based on an original two stage approach, which employs phenotype-based pre-selection of SNPs for the analyses of LD, and focuses on 9,274 genotyped participants of the Framingham Heart Study. The results document remarkably strong and extensive LD among SNPs at loci on multiple non-homologous chromosomes. The analyses provided compelling evidences that the inter-chromosomal LD was unlikely generated by stochasticity, population or family structure, or mis-genotyping. The analyses reveal highly significant clustering of risk alleles of SNPs showing inter-chromosomal LD in parental and offspring generations of the FHS participants who are characterized by heritable phenotypes of poor health. These findings suggest that the observed inter-chromosomal LD can be caused by intrinsic bio-genetic mechanisms which can be associated with favorable or unfavorable epistatic evolution. This phenomenon might be of fundamental importance challenging currently prevailing view on the role of genes in regulating complex, aging-related phenotypes.

REduced IGF-I SERUM LEVELS IN FORMERLY OBESE WOMEN SUBJECTED TO LONG-TERM CALORIC RESTRICTION

W. Zwierschke, M.C. Mitterberger, M. Mattesich, E. Klaver, H. Piza-Kater, 1. Cell Metabolism and Differentiation Research, Institute for Biomedical Aging Research of the Austrian Academy of Sciences, Innsbruck, Austria, 2. Department of Plastic and Reconstructive Surgery, Innsbruck Medical University, Innsbruck, Austria

Life span extension in laboratory rodents induced by long-term caloric restriction (CR) correlates with decreased serum insulin-like growth factor-I (IGF-I) levels. Reduced activity of the growth hormone (GH)/IGF-I signaling system slows aging and increases longevity in mutant mouse models. In the present study we show that long-term CR achieved by different interventions for 4 years, either laparoscopic-adjustable gastric banding, or reducing diet, leads to reduced IGF-I serum levels in formerly obese women relative to normal-weight women eating ad libitum. Moreover, we present evidence that the CR interventions reduce fasting GH serum levels. The present study suggests that the activity of the GH/IGF-I axis is reduced in long-term calorically restricted humans. Moreover, our findings indicate that the duration and severity of the CR intervention is important for the outcome on the GH/IGF-I axis in humans, as shown before in animal models.

YEAST MOTHER CELL-SPECIFIC AGING: ASYMMETRIC DISTRIBUTION OF DAMAGE AND THE ROLE OF A NOVEL NADPH OXIDASE

M. Breitenbach, H. Klinger, Y.T. Lam, M. Rinnerthaler, A. Klocker, J. Hasek, P. Laun, 1. Department of Cell Biology, Div. of Genetics, University of Salzburg, Salzburg, Austria, 2. School of Biotechnology and Biomolecular Sciences University of New South Wales, Sydney, New South Wales, Australia, 3. Institute of Microbiology, Czech Academy of Sciences, Praha, Czech Republic

Yeast mother cell-specific aging is viewed as a model for the aging process of a stem cell population. Aging mother cells create oxidative stress inactivating, among other proteins, aconitase, which is highly sensitive to ROS. In this talk we are presenting evidence that in cell divisions of old yeast mother cells aconitase activity is very preferentially distributed into the bud. In addition to the regulated degradation of damaged material through autophagy and the proteasome, asymmetric segregation is a mechanism which is necessary for rejuvenation of cells and therefore survival of the species. The genome of S. cerevisiae contains nine ORFs showing considerable sequence similarity to the catalytic subunits of mammalian NOX enzymes, only some of which have been functionally assigned as ferric reductases involved in iron uptake. We are showing here that only one of the nine ORFs (YGL160W) codes for a genuine NADPH oxidase, which is located in the ER, produces superoxide in a NADPH-dependent way, and displays no ferric reductase activity. We renamed this ORF YNO1 (Yeast NADPH oxidase 1).

One of the functions of YNO1 seems to be creating a signal for F-actin polymerization.

DEVELOPMENT OF AGE ASSOCIATED DISORDERS AND ENERGY METABOLISM DYSREGULATION. A NONLINEAR DYNAMIC MODEL

A.B. Mitinitski, K. Rockwood, Department of Medicine, Dalhousie University, Halifax, Nova Scotia, Canada

Background: The ability of the organism to maintain proper functioning in response to external stresses is essential. The imbalance between catabolic and anabolic pathways occurs with age but their interaction is complicated as multiple pathways are involved. We suggest a simple nonlinear model of energy metabolism and investigate how changes in energy expenditures might affect homeostatic imbalance. Methods: A system of two nonlinear differential equations with positive and negative feedback mechanisms of control is suggested to model the macrokinetics of key factors: (e.g. catabolic/anabolic hormones at the organism level, ATP/ADP at the cell level, etc.). The system of equations is investigated analytically and numerically. Results & Discussion: In a simplest case, the model allows two stationary solutions, reflecting two stationary levels of a putative key metabolite, corresponding to ‘high’ and ‘low’ energy metabolism states. When the system (which is initially in the high energy state) is perturbed by the external load, the high energy state can be still maintained within a certain range of loads. When the external perturbation reaches a threshold, the system quickly switches to the low energy level. The system also demonstrates hysteresis: restoration of the previous high energy state is possible, but only when the load level is much lower than the one caused the switch to the low energy state. Conclusion: A simple, tractable model highlights the essential feature of the changes in metabolism during aging. The model can explain the basic mechanisms of compensation and how with time, there are increasing limitations in maintaining health status.

MTOR REGULATION OF COGNITIVE AGING AND AGE-DEPENDENT NEURODEGENERATION

V. Galvan, J.H. Halloran, N. Podlatskaya, A. Pierce, Physiology and The Barshop Institute, University of Texas Health Science Center at San Antonio, San Antonio, Texas

The target of rapamycin (TOR) is a major signaling hub that regulates cell metabolism. Reduced activity of TOR extends invertebrate
and mammalian lifespan, possibly by retarding aging. Consistent with this idea, we showed that long-term treatment with rapamycin prevents Alzheimer’s (AD)-like deficits in a mouse model. Moreover, long-term inhibition of mTOR improved cognitive function and reduced anxiety as well as depressive-like behavior in wild-type mice. Proteomic and gene expression studies revealed that the chaperone/heat shock response family is overrepresented among the proteins upregulated in brains of rapamycin-treated transgenic (3x) mice. In agreement with this observation, the activity of heat-shock factor I was increased. The small chaperone alpha-B crystallin (3x), which is already upregulated in brains of untreated AD mice, showed the greatest increase as a result of rapamycin treatment, suggesting that long-term inhibition of mTOR enables alpha-B crystallin to further accumulate and possibly contribute to the amelioration of AD-like deficits in mice. Our results suggest that maintenance of proteostasis may have a key role in sustaining cognitive function and preventing age-related dysfunction during aging and in AD-like neurodegeneration. Low-level, long-term inhibition of mTOR pathway may thus act by boosting the activation of the chaperone network as a response to the accumulation of aggregated or damaged proteins during aging, and in AD. Our data support the hypothesis that inhibition of mTOR delays aging, and suggest that rapamycin, already used in clinical settings, may be a potentially effective therapeutic agent for the treatment of a continuum of age-associated cognitive dysfunctions, depressive disorders, and AD.

MYELOPEROXIDASE TO SELENIUM RATIO AND MORTALITY RISK AMONG OLDER PEOPLE: RESULTS FROM ILSIRENTE STUDY

F. Landi, E. Giovannini, E. Mocchegiani, F. Lattanzio, G. Onder, R. Bernabei, 1. Geriatric (CEMI), Catholic University of Rome, Rome, Italy, Italy, 2. INRCA, Ancona, Italy

Objective. Elevated systemic levels of myeloperoxidase (MPO) have been associated with unfavourable clinical outcomes. In the present study, we evaluate the impact of MPO, a pro-oxidant enzyme that catalyzes the initiation of lipid peroxidation and impacts nitric oxide levels, and selenium, a molecule that activates glutathione peroxidase thus preventing oxidative damage, on the risk of all-cause mortality in a large population of frail octogenarians and nonagenarians living in community. Study Design and Setting. We analyzed data from the Aging and Longevity Study in the Sirente Geographic Area (iSIRENTE Study), a prospective cohort study that collected data on all individuals aged 80 year and older living in a mountain community (n=363). The main outcome was the relative hazard ratio of death after four years of follow-up. Participants were classified according to the median value of MPO and selenium and divided into four groups by contrasting MPO and selenium levels: high MPO and low selenium, high MPO and high selenium, low MPO and low selenium, low MPO and high selenium. Results. A total of 150 deaths occurred during 4-years follow-up. The mean MPO level was 170.8 ± 177.5 ng/L among those who died, compared with 135.4 ± 142.4 ng/L among survivors (p=0.03). The mean selenium level was 101.5 ± 177.5 ng/L among those who died, compared with 135.4 ± 177.5 ng/L among survivors (p=0.001). Individuals in the group of low MPO and high selenium had the lower risk of mortality (24%), compared with the other three groups (49%, high MPO/low selenium; 45%, high MPO/high selenium; 54%, low MPO/low selenium) (p for trend = 0.01). After adjusting for potential confounders, compared with participants in the other three groups, those in the low MPO and high selenium group had a hazard ratio for mortality of 0.38 (CI:0.20-0.72). Conclusion. Our results obtained from a representative sample of very old and frail elderly individuals expand the knowledge that low levels of MPO when associated to high levels of selenium are associated with better survival.

METABOLIC PROFILING OF FRAIL, PRE-FRAIL, AND NON-FRAIL OLDER ADULTS

H. Lum, S.E. Espinoza. 1. Medicine, Division of Geriatrics, University of Texas Health Science Center at San Antonio, San Antonio, Texas, 2. Barshop Institute for Longevity and Aging Studies, San Antonio, Texas

INTRODUCTION: Frailty is a geriatric syndrome associated with disability and death whose underlying mechanisms are poorly understood. The purpose of this study was to use metabolomics as a tool for clinical phenotyping. We reason that metabolomics, by providing a ‘snapshot’ of metabolites in a discrete sample at a specific time, can afford the assessment of multiple simultaneous physiological processes, such as frailty and related comorbidities. METHODS: Subjects were 10 frail, 10 pre-frail, and 10 non-frail community-dwelling older adults (mean age 77 ± 7.6 years). Frailty was assessed using validated criteria (weight loss, exhaustion, low physical activity, weakness, slow gait). Frail was defined as 3+, pre-frail as 1-2, and non-frail as 0 of these. Mass spectrometry was used to isolate and identify metabolites from plasma, and Welch’s t-tests were used to test for differences between groups. RESULTS: 303 biochemicals were identified. Consistent with our predictions, several key metabolites of fatty acid and glucose oxidation surfaced in our analysis. Levels of medium chain fatty acids tended to be higher in frail versus non-frail subjects (8 of 9 species), adhering to a narrow physiological range. In addition, alpha-hydroxybutyrate, a putative biomarker for insulin resistance, was 1.5 times greater in participants with diabetes, a predisposing condition for frailty. CONCLUSION: These findings show a capacity to isolate small molecule metabolites in older adults and suggest that this new biotechnology may be useful in assessing age-associated metabolic function. Future studies will evaluate other metabolites with larger samples, in order to elucidate pathways underlying frailty.

ALTERED AUTOPHAGY IN THE SKELETAL MUSCLE OF THE FRAIL MOUSE

F.C. Ko1, C. Cooke2, Y. Yang3, J.D. Walston2, 1. Brookdale Department of Geriatrics and Palliative Medicine, Mount Sinai School of Medicine, New York, New York, 2. Johns Hopkins University School of Medicine, Baltimore, Maryland

Background. The homozygous interleukin 10 knockout mouse (IL-10tm/tm) has been proposed as a model for human frailty because it develops age-related increases in serum IL-6 and muscle weakness compared to B6 control. Gene expression differences in skeletal muscle between these mice suggest possible alterations in autophagy-mediated mitochondrial turnover. Therefore, we sought to characterize differences in autophagosome (AP) accumulation in skeletal muscles of IL-10tm/tm frail mice and matched B6 controls. Methods. Transmission electron microscopy (TEM) was performed on the hind-limb skeletal muscles of female 12-week-old IL-10tm/tm (n=4) and B6 (n=4) and 90-week-old IL-10tm/tm (n=6) and B6 (n=6). AP were identified and quantified for each mouse by averaging the number of AP detected at 10,000x magnification per 32,000 μm2 of muscle tissue from multiple sections. Age and genotype group differences in AP/32,000 μm2 were tested by repeated measurement ANOVA. Results. In 90-week-old mice, more intracellular, double-membrane vacuolated structures consistent with AP were identified in IL-10tm/tm compared to B6 (12.7 ± 4.8 AP/32,000 μm2 vs. 8.3 ± 3.2 AP/32,000 μm2, p < .003). AP frequently localized to clusters of mitochondria (89.5% in IL-10tm/tm, 88.1% in B6). IL-10tm/tm had more AP with electron-dense granular inclusions similar to those in lipofuscin compared to B6 (35.6% vs. 23.2%, p < .015 by chi-square). AP were not identified in any 12-week-old mice. Conclusion. These results suggest that the IL-10tm/tm mouse has an age-associated increase in accumulation of AP and that altered autophagy-mediated mitochondrial turnover may contribute to its accelerated skeletal muscle decline. Further mechanistic studies to investigate the interac-

IMPAIRED NUCLEAR TRANSLLOCATION OF STRESS-ACTIVATED SIGNALING CONTRIBUTES TO AGEING-ASSOCIATED APOPTOSIS RESISTANCE

S. Kim, H. Kang, S. Park, *Biochemistry, Seoul national university College of medicine, Seoul, Seoul, Republic of Korea*

In order to study the nature of aging-dependent apoptosis resistance, we compared the activation pattern of mitogen-activated protein kinases (MAPK) in response to three different stress modalities: hydrogen peroxide (H2O2), staurosporine, and thapsigargin. We observed the agonist-specific activation pattern of MAP kinases in human diploid fibroblasts (HDFs). When young HDFs were treated with PD98059, a specific inhibitor of extracellular signal-regulated kinase (ERK), H2O2-induced apoptosis was blocked, whereas staurosporine-induced apoptosis was inhibited by treatment with SB203580, a specific inhibitor of p38. In addition, the levels of anti-apoptotic protein Bcl-2 (B-cell lymphoma protein-2) were restored by PD98059 or SB239063 in cells treated with H2O2 or staurosporine, respectively. We also found that inhibition of the nuclear import of p-Erk and p-p38 using wheat germ agglutinin induced apoptosis resistance in young HDF cells in response to H2O2 or staurosporine. These data indicate a potential role of the nuclear translocation of apoptotic signals in the induction of apoptosis. Moreover, the nuclear translocation of activated ERK1/2 and p38 in response to H2O2 or staurosporine was significantly compromised in senescent HDFs, compared with young cells. Taken together, we propose that the apoptosis resistance of senescent HDFs might be related to the defective nuclear translocation of stress-activated signals in an agonist-specific manner, which would imply the operation of an aging-dependent functional nucleo-cyttoplasmic trafficking barrier.

RESTORATION OF SENESCENT HUMAN DIPLOID FIBROBLASTS BY MODULATION OF THE EXTRACELLULAR MATRIX

H. Choi, K. Cho, S. Park, *1. Seoul National University College of Medicine, Seoul, Republic of Korea, 2. Chonnam National University Medical School, Gwangju, Republic of Korea, 3. Seoul National University College of Medicine, Seoul, Republic of Korea*

Human diploid fibroblasts have the capacity to complete a finite number of cell divisions before entering a state of replicative senescence characterized by growth arrest, changes in morphology and altered gene expression. Here, we report that interaction with extracellular matrix from young cells is sufficient to restore aged, senescent cells to an apparently youthful state. The identity of the restored cells as having been derived from senescent cells has been confirmed by a variety of methods, including time lapse live cell imaging and DNA fingerprint analysis. In addition to cell morphology, phenotypic restoration was assessed by resumption of proliferative potential, growth factor responsiveness, reduction of intracellular ROS levels, recovery of mitochondrial membrane potential, and increased telomere length. Mechanistically, we find that both Ku and SIRT1 are induced during restoration and are required for senescent cells to return to a youthful phenotype. These observations demonstrate that human cellular senescence is profoundly influenced by cues from the extracellular matrix, and that senescent cell plasticity is much greater than was previously believed to be the case.

DDS, 4,4'-DIAMINODIPHENYLSULFONE, EXTENDS ORGANISMIC LIFESPAN

S. Park, S. Cho, *Department of Biochemistry and Molecular Biology, Seoul National University College of Medicine, Seoul, Republic of Korea*

DDS, 4,4'-diaminodiphenylsulfone, is the most common drug prescribed to treat Hansen disease patients. In addition to its antibacterial activity, DDS has been reported to be involved in other cellular processes that occur in eukaryotic cells. Because DDS treatment significantly enhances the antioxidant activity in humans, we examined its effect on lifespan extension. Here we show that DDS extends organismic lifespan using Caenorhabditis elegans as a model system. DDS treatment caused a delay in aging and decreased the levels of a mitochondrial complex. The oxygen consumption rate was also significantly lowered. Consistent with these data, paraquat treatment evoked less reactive oxygen species in DDS-treated worms, and these worms were less sensitive to paraquat. Interestingly enough, all of the molecular events caused by DDS treatment were consistently reproduced in mice treated with DDS for 3 mo and in the C2C12 muscle cell line. Structural prediction identified pyruvate kinase (PK) as a protein target of DDS. Indeed, DDS bound and inhibited PK in vitro and inhibited it in vivo, and a PK mutation conferred extended lifespan of C. elegans. Supplement of pyruvate to the media protected C2C12 cells from apoptosis caused by paraquat. Our findings establish the significance of DDS in lowering reactive oxygen species generation and extending the lifespan, which renders the rationale to examine the possible effect of DDS on human lifespan extension.

SESSION 420 (POSTER)

AGEISM

AGE RELATED ATTRIBUTIONS BIASES TO SUCCESS AND FAILURE AT A TECHNOLOGY TASK

E.E. Entin, C. Dean, C. Knott, *Aptima, Inc, Woburn, Massachusetts*

Research literature indicates that younger adults hold negative attitudes towards the competencies of older adults. This age bias influences how younger adults attribute success and failure for older adults. Younger adults’ successes are attributed to internal factors (ability & effort) and failure is attributed to lack of effort. Older adults’ successes are attributed to external factors (luck & ease of task). Such an attributional pattern by young adults is self-serving in that it protects their egos and maintains control of the task environment, as well as denying older adults an internal rationale for success. To assess age-related attributional biases for outcomes of younger and older adults at technology tasks, 43 people read eight vignettes describing a male or female, younger or older females. The world is becoming more technology oriented and the attributions to ability and effort were the same for younger and older males. Older males’ successes were attributed to ease of task or luck. These attributional results for technology-oriented tasks support the existence of a self-serving bias favoring younger adults to the detriment of elders and extend knowledge by showing the bias is more severe for older females. The world is becoming more technology oriented and these results heighten concern that age-related biases may inappropriately inform technology providers, who are inclined to view older adults as less able to handle advanced technology.

SOCIAL CONTACT WITH THE ELDERLY AND DEGREE OF COLLECTIVISM AS CORRELATES OF AGEISM IN CAUCASIAN AND ASIAN-AMERICAN POPULATIONS

A.G. Beatty, *Midwestern University, Elmhurst, Illinois*

Ageism is a multidimensional form of discrimination involving social, economic, and cultural components. This cross-sectional study correlated level of contact with the elderly and social values and degrees of individualism and collectivism with attitudes toward ageing and the elderly in European-American and Asian-American college students. Participants in this study were undergraduate students (N =114) enrolled in Midwestern community colleges. Ageism was measured by the Ageing Semantic Differential. Individualism and collectivism were measured by the Individualism-Collectivism (INDCOL) scale. Level of contact with the elderly was measured by the Hale social contact scale.
Results of this study using Pearson’s r correlations indicated that ageism was negatively correlated with collectivism and negatively correlated with contact with the elderly. However, results obtained using multiple regression analysis found that when the variable contact with the elderly was controlled, the contribution of collectivism to ageism was non-significant. The results suggest that ageism is both a socially and culturally related phenomena. Future research should investigate the social and cultural correlates of ageism, with specific emphasis on the origins and developmental influences these correlates have on the onset and maintenance of ageist beliefs.

AGE DIFFERENCES IN THE UNDERLYING MECHANISMS OF STEREOTYPE THREAT EFFECTS

L.E. Popham, T.M. Hess, Psychology, North Carolina State University, Raleigh, North Carolina

This study examined potential age differences in mechanisms underlying stereotype threat effects on cognitive performance. In younger adults, there is evidence that threat reduces working memory efficiency due to monitoring and worrying about one’s performance, which consumes cognitive resources and leads to poor performance. Other research with younger adults suggests that threat motivates prevention-focused strategies, which are maladaptive for most cognitive tasks. Although threat effects have been demonstrated in old age, the mechanism accounting for the effects is unclear. To assess possible mechanisms, younger and older adults were read information to activate either negative or positive stereotypes. For younger adults, the positive stereotype highlighted their ability to think quickly, whereas the negative stereotype suggested that they are inexperienced. For older adults, the positive stereotype emphasized their knowledge and experience, whereas the negative stereotype suggested that older adults’ thinking is slow and inflexible. Following the positive or negative stereotype, participants completed a word selection task to measure speed and accuracy. Then, the degree to which participants were engaging in global or local processing was assessed using their response times to global and local stimuli. Next, participants completed the operation span, a working memory measure. The results suggest that negative stereotypes motivate older adults to be cautious and vigilant in their performance, whereas positive stereotypes lead to eagerness and more error-prone performance in older adults. Negative and positive stereotypes did not have the same effect on younger adults’ performance.

STUDENT REACTIONS TO INTERNET AGEISM: AN EXPERIMENT ON THE EFFECT OF THREE ALLY INSTRUCTIONS ON AGEIST ATTITUDES AND STEREOTYPING

J.M. Calton, A.M. Stripling, M.L. Heesacker, University of Florida, Gainesville, Florida

The purpose of the current study was to examine the effect of three ally instructions on ageist attitudes and stereotypes. Students attending a large, comprehensive southeastern university (n=132) read a series of actual, ageist, internet blogs. They were directed to respond to them according to one of four randomly-assigned instructions: (1) empathize with what you imagine to be a typical older adult reading these posts, (2) check the facts and correct any errors, (3) advocate for older adults and respond in a way to reduce future offensive blogs, or (4) respond with a comment (control). Qualitative data revealed that 58% of responses contained age stereotypes and that 8% more suggested awareness of age stereotypes, without direct endorsement. Eight percent of stereotypes were positive, 41% were negative, and 21% were both positive and negative. More importantly, this study compared participants’ baseline scores on Fraboni’s Scale of Ageism (FSA) with their post-response scores. FSA scores of participants assigned to advocate for older adults improved the most, though differences fell just shy of conventional significance F(1,84)=3.67, p=.059. An effect-size calculation suggested that 170 additional participants would produce a significant effect. Use of stereotypes differed significantly by condition χ²(3)=10.22, p<.05: participants in empathy and fact-checking conditions used stereotypes less than participants in the advocacy condition, who used them less than control participants. Implications include the potential importance of simple instructions in reducing collegians’ use of age stereotypes, as well as a more complete understanding of the impact of engaging in advocacy on age stereotypes.

AGE STEREOTYPES AMONG EMPLOYEES IN ACADEMIA, GOVERNMENT, AND PRIVATE BUSINESS

M.M. Patterson1, T.J. Calo2, W.H. Decker2, 1. Salisbury University Department of Psychology, Salisbury, Maryland, 2. Salisbury University Department of Managing and Marketing, Salisbury, Maryland

Questionnaires were completed by 716 employees (aged 21 to 91 years) of four organizations: a mid-Atlantic city government and county government, a mid-sized, mid-Atlantic university located in the city, and a privately-held business headquartered in the county. Participants rated the degree to which they agreed or disagreed with 26 statements regarding older workers on a Likert scale (strongly agree to strongly disagree). The questionnaire included items that concerned perceptions of older workers’ adaptability, effectiveness, generativity, and work motivation. Overall, older respondents rated older workers more favorably than did younger respondents on all scales, despite the fact that there is very little evidence that work performance declines with age. The same pattern was detected in the manager group as well, with younger managers perceiving older workers less favorably than older managers. Workers in the private business displayed the least age stereotyping overall, whereas those in local government displayed the strongest age stereotypes. Respondents with higher formal education rated older workers lower than did the less educated on all scales except adaptability. The implications for stereotype threat and the “graying of the workforce” are discussed.

THE RELATIONSHIP BETWEEN THE CO-OCCURRENCE OF AGE DISCRIMINATION AND ANOTHER DISCRIMINATION AND DEPRESSIVE SYMPTOMS AMONG OLDER PEOPLE

J. Han, J. Kim, College of Social Work, The Ohio State University, Columbus, Ohio

Little research has not only tested potential associations between perceived age discrimination and depression among older people, but the relationship of depressive symptoms with the co-occurrence between perceived age discrimination and discrimination due to different reasons (i.e., race, gender, disability, etc.) has not been explored. Similar to discussion of ‘double standard of aging’, perceiving the co-occurrence of discrimination due to age and other reasons can be more detrimental to depressive symptoms among older people than perceiving only age discrimination. The current study explores how the co-occurrence of discrimination is related to depressive symptoms among older people by using a sample of older persons over 65 years old from the Health and Retirement Study. The results from multinomial logistic regression (Pseudo R²=.102) indicated that older persons were more likely to perceive only age discrimination rather than the co-occurrence of age discrimination and discrimination due to other reasons. Persons who are African American and report worse physical health were more likely to perceive the co-occurrence of discrimination. Although the effect of the co-occurrence of age discrimination and discrimination due to other reasons on depressive symptoms was not significantly greater than those of only age discrimination controlling for demographics and self-rated health, older persons who perceived age discrimination were more likely to experience depressive symptoms than older persons with no discrimination. These findings indicate that older persons
who perceive only age discrimination might be vulnerable to depressive symptoms as well as older persons who perceive discrimination due to different reasons.

EXPERIENTIAL LEARNING AND COMPETENCE WITH AGING: A RURAL BEL PROGRAM'S OUTCOMES AND LESSONS

As the number of aging Americans grows we face an expanding need to provide a range of geriatric health care services, including gerontological social work services, to an increasingly large portion of the population. We need to prepare our social work practitioners to meet the accompanying service demands not only in geriatric specialty settings, but across a wide range of general care settings (Institute of Medicine, 2008). In an effort to begin addressing this impending need, our rural BSW program implemented an experiential learning project targeting myths and negative attitudes held by our students that are (a) factors which may impede effective practice with elders, and (b) are consistent with related competencies for gerontological social work education established by the Council on Social Work Education Gero-Ed Center. Research has found that direct experience with elders can have a positive effect on college students, reducing their negative attitudes toward the elderly (e.g., Dorfman et al., 2002; Murphy-Russell et al., 1986). Therefore, it was expected that students would change negative attitudes regarding elders and aging, and would take steps to dispel myths about aging. Also, a corresponding increase in students’ perceptions of their basic competence for engaging and working with elders was expected. Various instruments and open-ended questions were used in pre- and post-test surveys to determine the extent to which these activities impact the students’ attitudes and self-perceived competences. Both the expected attitude changes were observed between pre- and post-test, as were the expected changes in self-perceived basic competences.

COLLEGE STUDENTS’ PERCEPTIONS AND RESPONSES TO INTERNET AGEISM
A. Stripling, J.M. Calton, M.I. Heesacker, University of Florida, Gainesville, Florida

The goal of the current investigation was to understand better how collegians perceive and react to ageism, which is ubiquitous online. As part of a larger study, participants (n=31) were requested to provide responses to ageist blog statements collected from the Internet. (e.g., “God forbid these miserable old once-were-people not survive as long as possible to burden the rest of us.”). Of those sampled, 83.9% disagreed with these statements (e.g., “Saying all these terrible things about people just because they are older is wrong…Would you want someone saying these things about you just because you’ve aged? I didn’t think so…try looking at them as the individuals that they are.”). Exploration of participants’ rebuttals revealed three major counter-arguing strategies (1) combating specific ageist assumptions (57% of participants), (2) describing older adults as a sources of knowledge (46.2%), and (3) drawing attention to the blogger’s own aging and that of their older relatives (69.2%). The remaining 16.1% of the sample provided assenting responses (e.g., “The problem with the elderly is that their are very hypocritical…[and]…they revere to the competence level of a child.”) The entire sample that provided assenting responses also included negative ageist stereotypes vs. only 26.9% of the sample that produced dissenting responses. Implications of the current study include increased understanding of college students’ reactions of ageism by peers on online forums. Specifically, it appears that for the most part collegians do not approve of the ubiquitous online ageist and can probably be counted on to counter-argue virulently ageist rhetoric if motivated.

SESSION 425 (POSTER)

COGNITIVE PROCESSES

AGE DIFFERENCES IN PROCESSING STRATEGIES OF EMOTIONALLY DIFFICULT TRADE-OFF DECISIONS
X. Ma1, Y. Chen2, 1. University of Houston Clear Lake, Houston, Texas, 2. Bowling Green State University, Bowling Green, Ohio

The present study examined age differences in processing strategies of emotionally difficult trade-off decisions. In addition, the relevant contributions of the cognitive and emotional mechanisms to age differences in processing strategies were directly tested by a mediation hypothesis. Forty younger adults and 40 older adults completed a decision making task (i.e., purchasing a car). They were randomly assigned to either the high or low emotional trade-off difficulty condition. Mouse-labWEB software was used to trace participants’ processing strategies. Older adults were more likely to use attribute-based processing strategies, whereas younger adults were more likely to use alternative-based processing strategies in the high emotional trade-off difficulty condition. In addition, the negative emotions elicited, instead of processing speed, mediated the age effects on processing strategies.

THE IMPACT OF PROCESSING SPEED TRAINING ON WORKING MEMORY IN OLD ADULTS
H. Peng1, J. Wei2, D. Wang2, 1. Institution of Developmental Psychology, Beijing Normal University, Beijing, China, 2. Institution of Developmental Psychology, Beijing Normal University, Beijing, China

Many cross-sectional data showed that processing speed was more fundamental than working memory to explain the aging of complex cognitive abilities. However there were still some longitudinal data showed contrary results about the relationship between processing speed and other cognitive abilities. Experimental analyses were needed to develop further evidences. Therefore, this study, to explore the relation between speed and working memory in cognitive aging, investigated the effects of processing speed training on speed task performance improvement and transfer in working memory. Adults aged 58-79 years from Beijing participated in speed intervention study. 27 participants practiced a paper-pencil figure matching task and 25 participants had a figure comparison practice on computer across 5 weeks for about 45min-1hr per week respectively. 23 elders participated as age-matched, education-matched, and no-contact control group. A battery of cognitive test was administrated at pre-and postest. These tests included two speed measures (Digit Comparison and Pattern Comparison) and two working memory measures (Operation Span and Spatial Span). The results showed that (1) there were substantial training gains on two speed tests in two training groups. Paper-pencil group (DC, Δ=462ms, ES=0.28; PC, Δ=267ms, ES=0.18) and computer group (DC, Δ=975ms, ES=0.71; PC, Δ=942ms, ES=0.69) had more improvement than control group (DC, Δ=426 ms, ES=0.20; PC, Δ=204ms, ES=0.08). (2) no transfer effect was found in two training groups. Processing speed training could improve elders’ performances on speed test. The evidence for speed training transfer to working memory was weak.

DOES COGNITIVE RESERVE SHAPE COGNITIVE DECLINE?
A. Singh-Manoux, 1. INSERM, Paris, France, 2. University College London, London, United Kingdom

Objectives: Cognitive reserve is associated with a lower risk of dementia but the extent to which it shapes cognitive aging trajectories remains unclear. Our objective is to examine the impact of three markers of reserve from different points in the life course on cognitive function and decline in late adulthood. Methods: Data are from 5234 men and 2220 women, mean age 56 years (standard deviation=6) at baseline, from the Whitehall II cohort study. Memory, reasoning, vocabulary, phonemic and semantic fluency were assessed three times over 10

64th Annual Scientific Meeting 127

Downloaded from https://academic.oup.com/gerontologist/article-abstract/51/suppl_2/1/646194 by guest on 30 April 2018
The primary purpose of the present study was to examine age differences in choice deferral when older and younger adults make high vs. low conflict decisions in 3 different domains. Sixty young and 60 older adults were presented with 6 different decision scenarios, in which they could choose among four health plans, physicians, cars, apartments, DVD players, and cameras or use choice deferral (i.e., not buy any of the options for the time being). The high conflict decisions had negative interattribute correlations, while the low conflict decisions had positive interattribute correlations. Both young and older adults were more likely to choose the deferral option when they made high conflict decisions. Older adults were more likely than young adults to choose the deferral option across domains. For older adults, post-decision affect was more positive for those who deferred choice than for those who did not defer. Results suggest the importance of conducting future research on identifying the mechanisms underlying age differences in the preference for choice deferral.

**NON-COGNITIVE PREDICTORS OF COGNITIVE IMPAIRMENT: A TWO-PART MODEL**

R. Rupprecht, D. Zimprich, F.R. Lang, University of Erlangen-Nuremberg, Erlangen, Germany

Using a two-part model, the present research addresses the question whether non-cognitive variables can account for cognitive impairment in a memory clinic outpatient cohort. The non-cognitive predictor variables examined were age, gender, education, depressive mood, subjective cognitive complaints, and reason for admission. In our two-part model, the dichotomous part specifies the probability of a MMSE-score above or below the critical threshold of 24 points. The second, continuous part of the model specifies the distribution of the MMSE-score falling between 24 and 0 points. N=441 (59.4% female; age; M=72.9; SD=9.09) outpatients of the Erlangen memory clinic were included and diagnosed according to ICD-10 criteria to the following groups: subjective memory complainers (N=85; 19.3%); mild cognitive impairment (N=90; 20.4%) and people with dementia, mostly SDAT (N=216; 49.0%). N=126 (28.6%) contacted the memory clinic by their own decision, N=215 (48.9%) were sent by their relatives, and N=100 (22.7%) were referred by health care professionals. For part one of the model (R-square = .414) we did find that higher age, reason for admission (sent to memory clinic by relatives or health care professionals, a lower education level and a lower level of depressive symptoms were significant predictors for a pathological MMSE-score. In the second part of the model (R-square = .05) the reason for admission (sent to memory clinic by relatives) and high levels of subjective memory complaints emerged as predictors for lower levels of the MMSE-Score. The findings underline the impact of non-cognitive variables and decisional aspects (reason for admission) on measures of cognitive impairment.

**STRATEGIC ENCODING AND RETRIEVAL PROCESSES IN VERBAL RECALL AMONG OLDEST-OLD ADULTS**

K.E. Cherry1, E. Golob2, E.M. Elliot1, J. Silva Brown1, Q. Yu1, J. Volaufova3, S. Jazwinski1, 1. Psychology, Louisiana State Univ, Baton Rouge, Louisiana, 2. Tulane University, New Orleans, Louisiana, 3. Drury University, Springfield, Missouri, 4. Louisiana State University Health Science Center, New Orleans, Louisiana, 5. Tulane University School of Medicine, New Orleans, Louisiana

There is a small but growing literature on the cognitive capabilities of healthy oldest-old adults who show no signs of dementia or other neurologic impairment. In this study, we examined strategic encoding and retrieval processes in verbal recall of a lifespan sample of 237 adults who ranged in age from 44 to 97 years. This research is part of the Louisiana Healthy Aging Study, a multidisciplinary study of healthy aging in nonagenarians. We examined associations among three cognitive variables assumed to vary in executive function involvement from the most (short-term retention and working memory) to the least (vocabulary and general cognitive status) and verbal recall. We tested the hypothesis that short-term retention measures with presumed executive function involvement would be more strongly associated with strategic encoding than strategic retrieval. In contrast, vocabulary and general cognitive status would show associations of similar magnitude among indices of strategic encoding and retrieval. Results confirmed the expected pattern of outcomes. Correlations were larger in size among digit span measures and strategic encoding (r’s = 0.37 and 0.30) compared to these same measures and strategic retrieval (r’s = 0.24 and 0.21). Vocabulary and general cognitive status were associated with strategic encoding and strategic retrieval as expected with correlations of a similar magnitude. Implications of these data for mechanisms of preserved episodic memory in late life are considered. This research was supported by the Louisiana Board of Regents through the Millen-
EVALUATION OF VERBAL FLUENCY TRAINING TO IMPROVE EXECUTIVE FUNCTIONS IN OLD AGE
C. Sutter, J. Zöllig, M. Martin, Department of Psychology, University of Zurich, Zurich, Switzerland

Verbal fluency tasks are frequently used to study executive functions in old age. In this study, we investigated the effects of verbal fluency training on cognitive performance measures, especially executive functions, in old age. A total of 105 participants were randomly assigned to one of three verbal fluency training groups, an active control group, or a no-contact control group. Training was provided on 15 sessions with a duration of six minutes each over a period of three weeks and was administered over the phone. The three training groups worked on different verbal fluency tasks, each task involving a specific dimension of executive functions (i.e., shifting or inhibition) or a basic cognitive process (i.e., processing speed). We used an extensive neuropsychological test battery before and after training in order to measure transfer effects. Transfer tests were chosen according to the same processes targeted in training. Training gains and near transfer effects were found in two groups, that is in the speed and the shifting group. Furthermore, for the shifting group evidence for far transfer to a digit span task was found. In addition, the active control group significantly improved performance on a semantic verbal fluency task. Overall, our results demonstrate that a short-term verbal fluency intervention significantly improves cognitive performance in healthy older adults. Furthermore, this study adds to the discussion of including different control groups to evaluate cognitive training programs.

WHY DO OLDER PEOPLE AND CHILDREN MORE OFTEN FAIL TO EXECUTE THEIR INTENTIONS?
F. Mattli, J. Zoellig, R. West, M. Martin, 1. University of Zurich, Zurich, Switzerland, 2. Iowa State University, Ames, Iowa

The capacity to form an intention such as “At home, I will take medicine XY” and later execute it correctly that is, take the correct medicine at home, is called prospective memory. It is an important function for attaining and maintaining an autonomous life. The process of prospective memory comprises executive functions as well as retrospective memory elements. It is so far unclear which of these processes underlie the crucial changes in prospective memory performance across the lifespan resembling an inverted U-shaped function. Electrophysiological analyses identified specific modulations that are related to differential processes within the retrieval phase of prospective memory (i.e., N300, frontal positivity, prospective positivity). Hence, to gain more knowledge about the developmental trajectory and its underlying processes within the retrieval phase across the lifespan, we examined 101 participants (7.5-89 years of age) divided into six age groups with respect to prospective memory performance and electrophysiology. Our behavioral results indicate that when controlling for retrospective elements within our prospective memory task, prospective memory performance still follows an inverted U-shaped function across the lifespan. Moreover, electrophysiological data suggest that for successful retrieval of prospective intentions young and old adults apparently apply the same processes, although with higher effort for old adults. Children seem to apply similar processes as young adults to detect a prospective memory cue (although with higher effort), however, to initiate the intention and/or retrieve the intention from memory, they apply different processes than both young and old adults.

ABSOLUTE AND RELATIVE JUDGMENTS IMPACT SELF-REFERENCING BENEFITS WITH AGE
N.M. Rosa, L. Grewal, A.H. Gutchess, Psychology, Brandeis University, Waltham, Massachusetts

Self-referencing benefits memory for information related to the self for both older and younger adults. However, the pattern of benefit may differ depending on whether information is considered in relation to others. Previous studies have shown that the neural activation patterns during the encoding of self-referenced information differ dramatically between young and old when tasks include both self- and other-relevant judgments (Gutchess, Kensinger, & Schacter, 2010). When participants make judgments only about the self, however, the age groups tend to converge, with discrete differences in the recruitment of neural regions. This pattern may indicate age differences in the qualitative ways in which one reflects on the self, relative to thinking about others. In the present study, we examined how alternating between making judgments about the self and others impacted memory for self-related information. We predicted that older adults would experience more interference from making judgments about others due to changes in social interactions and in social comparison with age (Heckhausen & Krueger, 1993). Findings indicate that older adults’ memory of adjectives of different levels of self-descriptiveness was impacted by whether they made general or relative judgments at encoding. This was especially true for participants who were asked to make judgments about another person as well as judgments about the self. It appears as though the benefit from self-reference is diminished when older adult participants make judgments involving social comparison and alternate between self and other judgments.

THE EFFECTS OF RACE, AGE AND EDUCATION ON THE ASSESSMENT OF EVERYDAY PROBLEM SOLVING IN OLDER ADULTS
E. Wayde, S.R. Black, Psychology, The University of Alabama, Tuscaloosa, Alabama

As individuals age, cognitive functioning is decreased. This decline in older adult’s cognitive resources has been shown to have an effect on older adult cognitive processes in tasks that involve every day problem solving. Examples of problem solving domains older adults are likely to encounter in their daily lives include medication use, telephone use and financial management. Questions pertaining to these domains are included in the Observed Task of Daily Living (OTDL) questionnaire. The Everyday Problems Test (EPT) is used to examine and assess other areas of older adult’s ability to process information and respond to questions that are common to older adult’s daily living. The abilities assessed in The EPT include reading, writing skills and the ability to follow instructions. Previous research performed with pilot data from the Advanced Cognitive Training for independent and Vital Elderly (ACTIVE) database showed that performance on every day problem solving was correlated with age and education. A secondary data analysis of the ACTIVE data set shows that age, education and race/ethnicity explain a significant amount of variance in each of the two problem solving tasks. The variables account for 20.4% of the variance in the OTDL questionnaire, F (3, 2793) = 238.81, p < .001. The variables accounts for 29.2% of the variance in the EPT, F (3, 2786) = 382.52, p < .001. The results of this analysis indicate that for this data, age, education and race/ethnicity are good predictors of everyday problem solving abilities of older adults.

OLDER ADULTS AND VIDEO GAMES: THE RELATIONSHIP BETWEEN PREVIOUS GAMING EXPERIENCE AND COGNITIVE PERFORMANCE
T.R. Patterson1, A. Trujillo1, L.A. Whitlock1, J.C. Allaire1, A. McLaughlin1, M. Gandy1, 1. North Carolina State Univ., Raleigh, North Carolina, 2. Georgia Institute of Technology, Atlanta, Georgia

There is a growing body of literature that suggests that video game playing is associated with better cognitive performance in both younger and older adults (Basak, Boot, Voss, & Kramer, 2008; Green & Bavelier, 2003; 2006). Furthermore, previous experience with video games has been shown to benefit future performance on games (Gagnon, 1985), as well as motivation in game-based occupational training (Orvis, Horn, & Belanich, 2006). The goal of the current paper is to examine the extent
to which prior experience with video games is associated with cognitive functioning in older adults. Present analyses utilize data from a video game intervention consisting of 56 community dwelling older adults (mean age = 80.93, SD = 6.66, range = 66-93). At pretest, participants completed a battery of cognitive tests assessing memory, speed, spatial attention, and everyday cognition. Results indicated that 27% of the sample was currently playing video games, while another 17% had played in the past 5 years. Regression analysis revealed that prior experience was significantly related to performance on tasks of processing speed, choice reaction time, spatial attention, working memory, and everyday reasoning, where more experience was related to better cognitive performance. Most of these relationships remained significant after controlling for age, education, and gender. Discussion will focus on video games as potential cognitive interventions, as well as the impact video game playing may have on younger cohorts as they age.

DECISION MAKING AND AGING: THE ROLE OF MOTIVATION AND RELEVANCE IN INFORMATION SEARCH

The goal of this study was to examine the effects of motivation and decision relevance on young (ages = 21 – 40, N = 59) and older (ages = 63 – 90, N = 68) adults’ decision making. Of primary interest was how these factors differentially affected how individuals in these two age groups searched through information presented in the form of 8 x 6 (Products X Attributes) matrices. Previous research has suggested that older adults seek less information and rely on less exhaustive search strategies when making complex decisions. In the current study, participants were presented with two complex decision tasks, one of which was designed to be more relevant to younger adults (cellular phone plans) and the other more relevant to older adults (prescription drug plans). Motivation was manipulated in the form of accountability by asking half of the participants to defend their decisions. Consistent with the selective engagement hypothesis, we posited that older adults would be more motivated to engage in a more complex information search when the relevance of the decision context and accountability are increased. Preliminary analyses suggest that older adults are more thorough in their information search under high accountability conditions (p < 0.01), and may also be motivated by task context. Young adults were less affected by the accountability manipulation. Information regarding specific search strategies and physiological arousal will also be examined.

ADULT AGE DIFFERENCES IN THE TIME COURSE OF REFLEXIVE ORIENTING TO GAZE CUES

N. Gayzur, L. Langley, S.V. Wyman, A. Saville, C. Friesen, Department of Psychology-Center for Visual and Cognitive Neuroscience, North Dakota State University, Fargo, North Dakota

The purpose of these studies was to examine age patterns of reflexive orienting in response to gaze cues. Gaze cues have been shown to direct a person’s attention toward the gazed-at location, even when the cue is not informative of the upcoming target location. Participants have shown faster responses to targets that have been gazed at compared to those that have not been gazed at (facilitation effects). In two experiments, young adults (18 – 31 years), young-old adults (60 – 74 years), and old-old adults (75 – 92 years) localized targets that were preceded 100, 300, 600, or 1,000 ms earlier by a gaze cue. In Experiment 1, the cue remained present upon target onset. Age differences were found at the shortest cue-target interval (100 ms). Young adults and young-old adults showed facilitation effects, whereas old-old adults did not. By later cue-target intervals, the three age groups showed significant facilitation effects. We interpreted the pattern to indicate old-old adults had difficulties disengaging attention from the gaze cues in order to make an orienting response. In Experiment 2, the cue was presented briefly and was removed prior to target onset. All three age groups showed a similar magnitude in the facilitation effects, even at the 100 ms time interval. We concluded that when the cue is removed, old-old adults could disengage attention from the cue to make an orienting response. These studies showed that older adults could orient with gaze cues, but with increased age, older adults had difficulties disengaging from gaze cues.

THE INFLUENCE OF WIDOWHOOD AND COMPLEXITY ON THE DECISION MAKING PROCESS

C.L. Ortiz, J.M. Jacobs-Lawson, Gerontology, University of KY, Lexington, Kentucky

Life transitions, such as widowhood, are stressful events that influence higher order cognitive functioning. The purpose of this study was to examine how widowhood and decision complexity influence older women’s decision making processes. Married (N=146; M age =73.50, SD=8.52) and widowed women (N=146; M age =73.50, SD=8.52) were randomly assigned to make a simple or complex treatment recommendation on behalf of a hypothetical individual. In the complex condition, six potential treatments were presented and in the simple condition, only three of the six options were presented. Each treatment was described based on six dimensions (e.g.; side effects, survival rates). Decisions were made using a Tablet PC to aid in recording information processing. A series of 2 (widow status: widowed, married) x 2 (complexity: simple, complex) ANOVA revealed several main effects and an interaction. A main effect of widow status showed that widowed women examined a smaller proportion of information. Widow status also influenced the types of information considered. A main effect of complexity revealed that compared to women in complex task group, those in the simple group considered a greater proportion of information. Significant interaction revealed that in the complex decision condition, married women viewed more information within each treatment than widowed women. In the simple condition, the two groups of women did not differ. Analyses also showed that complexity and marital status influence the treatment selected. Results are discussed in terms of how a life event such as widowhood and decision complexity can impact the decision making process.

INTRUSIVE THINKING MODERATES THE AGE-COGNITION RELATIONSHIP: TYPE OF INTRUSIVE THINKING MATTERS

Prior research suggests that individuals reporting more intrusive thinking (IT) demonstrate poorer performance on cognitive tasks compared to individuals reporting less IT. However, previous research has not examined whether this relationship is consistent across different types of self-reported IT. A total of 98 participants were used for the current analyses (data collection to be completed by the end of June). The current sample consisted of 62 individuals between 18 and 26 years of age and 36 individuals over the age of 60. We utilized the Thought Occurrence Questionnaire (trait IT), the Cognitive Interference Questionnaire (state IT), the Impact of Events Scale (event-based IT), and the White Bear Suppression Inventory (trait thought suppression) to assess IT. The participants completed several cognitive tasks that assessed processing speed, episodic memory, and executive functioning. Hierarchical multiple regressions were performed to examine the association between age, IT, and cognitive performance. The results revealed that there was a significant age*state IT interaction for working memory performance where the older adults performed worse on the task as state IT increased. In contrast, there was no relationship in the young adult group. Further, there was a significant age*trait and event-based IT interaction for episodic memory errors where older adults who reported more IT reported more intrusions and, again, there was no...
relationship in the young adult group. The current findings suggest the state IT is negatively related to performance in older adults and trait/event-based IT is related to the number of errors older adults commit.

NORMATIVE DATA FOR THE COGNITIVELY INTACT OLDEST-OLD: DATA FROM THE FRAMINGHAM STUDY

I.N. Miller, J.J. Himali, A. Beiser, J.M. Murabito, S. Seshadri, R.A. Wolf, R. Au, Boston University, Boston, Massachusetts

The oldest-old are now the world’s fastest growing population. Normative cognitive data for this group are limited, and use of normative data from younger-old samples (e.g., 75+) can result in misclassification of cognitive status. Participants for this study numbered 315 (35% men), ages 80+ from the Original FHS cohort who were administered the Wechsler Memory Scale Logical Memory subtest (LM) as part of a larger clinical evaluation from 1999-2005. Participants were stratified into three age groups (80-84, 85-89, 90+); average performance for each group was compared for the whole sample, a dementia-free subset, and a dementia- and stroke-free subset, after adjusting for sex and premorbid cognitive ability using WRAT III Reading scores. Mean (standard deviation) performance on LM delay was as follows: 80-84: 8.43 (3.95), 85-89: 7.13 (4.45), 90+: 5.76 (4.46). Significant differences were found across age levels (LM: p=0.003). Pair-wise comparisons found significant differences between 80-84 and 90+ (p=0.006). Gender specific analyses showed that the age effects were driven by men (overall p<0.001); pair-wise comparison between 80-84 & 90+ (p=0.001). For the dementia-free subset, the overall effect of age was no longer significant (p=0.056), though among men the effect remained (p=0.002); pair-wise comparisons were significant between 80-84 & 85-90 (p=0.023), and 80-84 & 90+ (p=0.009). For the dementia- and stroke-free subset, the overall effect of age was significant (p=0.044), driven by men (p=0.001); pair-wise comparisons were significant between 80-84 & 85-90 (p=0.026), and 80-84 & 90+ (p=0.007). These results provide evidence for the use of age appropriate normative data for oldest-old individuals.

GROUP DIFFERENCES IN FACTOR LEVEL TRANSFER EFFECTS IN THE IMPACT TRAINING PROGRAM

S. Hindin, E. Zelinski, USC, Los Angeles, CA, California

The IMPACT extended practice cognitive training program was designed to test improvement on untrained outcomes. 487 adults over age 65 in three different communities participated in this randomized clinical study, 242 individuals participated in the experimental training regimen. Published results showed experimental group improvement on memory and attention compared to the active control group. Few training studies evaluate beyond mean differences at the group level by examining age differences in everyday problem-solving effectiveness; older adults’ strategies are more effective than those of younger adults when hypothetical problems involve an interpersonal context (Blanchard-Fields, Mienaltowski, & Seay, 2007; Cornelius & Caspi, 1987; Thornton & Dumke, 2007). However, research has not systematically examined the dimensions that make some strategies effective and others ineffective for various problems. Although social-emotional selectivity has been hypothesized to explain older adults’ effectiveness for interpersonal problem solving, it is not clear why age differences in effectiveness may vary across specific problem domains (friend, family, home, consumer, information, work). The present study adapted Cornelius and Caspi’s (1987) Everyday Problem Solving Inventory, but added health care and technology problem domains. Participants: 69 younger and 61 older adults who provided level of endorsement for 4 strategy types (avoidance-denial, passive-dependence, cognitive analysis, problem-focused action) for solving problems within each domain. Participants and expert raters assessed strategy effectiveness on three dimensions: (1) solving the immediate problem, (2) preventing/minimizing future problem occurrences, (3) managing emotional reactions. Overall, older adults rated avoidance-denial higher in the dimensions of effectiveness than did younger adults for most domains (not health care; significant group effects ranged from F(2,115)=6.67–25.32, p<.001). Other strategies were rated similarly regardless of age/expertise. Specific results for each strategy and each domain are presented and discussed.

SESSION 430 (POSTER)

AGE DIFFERENCES IN EVERYDAY PROBLEM-SOLVING STRATEGY EFFECTIVENESS: ARE OLDER ADULTS’ STRATEGIES MORE LIKELY TO SOLVE PROBLEMS, PREVENT FUTURE PROBLEMS, OR MANAGE EMOTIONS?

J. McFall, J. Strough, I. Psychology, Syracuse University, Syracuse, New York. 2. West Virginia University, Morgantown, West Virginia

Everyday problems are dilemmas, obstacles, or challenges encountered in daily life (Berg & Klaczynski, 1996; Meacham & Emont, 1989). Everyday problems are ill-defined—have multiple potential solutions (Wagner, 1986). An effective strategy for everyday problem solving is one that solves the problem, maximizes beneficial consequences of responding, and minimizes negative outcomes (D’Zurilla, Nezu, & Maydeu-Olivares, 2004). Some studies have examined age differences in everyday problem-solving effectiveness; older adults’ strategies are more effective than those of younger adults when hypothetical problems involve an interpersonal context (Blanchard-Fields, Mienaltowski, & Seay, 2007; Cornelius & Caspi, 1987; Thornton & Dumke, 2007). However, research has not systematically examined the dimensions that make some strategies effective and others ineffective for various problems.

SESSION 430 (POSTER)

WHAT ABOUT THE 90+?

W. He, M. Muenchrath, U.S. Census Bureau, Washington, District of Columbia

The population aged 90 and over (90+) has been growing more rapidly in both size and proportion of the older population (65+) than any other age group. Little is known about the 90+ population. This study examines their characteristics – age, sex, race, Hispanic origin, and socio-economic and health status. Results from the 2006-2008 and 2008 American Community Survey show that most 90+ are high school graduates, and 20 percent of the 90+ men have a Bachelor’s degree or higher. Social security represents almost half of their total personal income, and they are universally covered by health insurance because of Medicare and Medicaid. Over 80 percent of the 90+ women are widowed while more than 40 percent of the 90+ men are married. Compared with ages 65-89 or 85-89, the 90+ have higher poverty rates, and are more likely to have disabilities. About 20 percent of 90-94 and 32 percent of 95+ are institutionalized, compared with 11 percent for 85-89 and 3 percent for 65-84. Race and Hispanic origin differ. For example, 40 percent of White 90+ live alone, compared with 20 percent for Asians. Interestingly, some of the smallest states in terms of the 90+ population size have the highest percent 90+ of 65+, while some top older states (e.g.,...
Florida) are not among the top ranking oldest states when their share 90+ of 65+ is compared.

INTERNATIONAL RETIREMENT COMMUNITIES IN MEXICO: SUSTAINABILITY ISSUES
I. Amin1, S. Ingman1, 1. University of North Texas at Dallas, Dallas, Texas, 2. University of North Texas, Denton, Texas

By 2050, one out of five of the global population will be 60 years or older. With the aging of the population there has been an interest in understanding the patterns of retirement migration. While in the past migration usually involved return migration to one’s place of origin, recent literature suggests an opposite trend. In the last decade, international retirement migration (IRM) has increased dramatically as a result of an increase in travel and improved communication worldwide that enable retirees to choose destination beyond state boundary. In Europe international migration is reported to be a popular trend, and in the U.S. retirees are increasingly heading to Latin American countries. In most of the host countries the expatriates live in retirement communities. This current paper focuses on the retirement communities in Mexico, and examines how sustainable are these retirement communities in the long-run? Findings indicate that the affluent seniors boost the local economy of the receiving country, while do the same to the sending country by leaving it, which is facing sharp increase of dependency ratio and shortage of care providers for its senior citizens. Two very obvious economic activities related to retirement communities are housing and health care. Although these housing activities on some occasion have created segregated communities with a tremendous environmental toll on the host society, it has been observed that an influx of population from different cultural background could lead to a cultural shift in the host country. Policy implications have been discussed.

THE RISE AND FALL OF WOMEN’S ADVANTAGE: A COMPARISON OF NATIONAL TRENDS IN LIFE EXPECTANCY AT AGE 65 YEARS
M. Thorslund1,2, J.W. Wastesson1, N. Agahi1, M. Lagergren2, M.G. Parker1, 1. Aging Research Center - Karolinska Institutet / Stockholm University, Stockholm, Sweden, 2. Stockholm Gerontology Research Center, Stockholm, Sweden

Why has the size of the gender gap in life expectancy changed over time? And why do so many countries show a similar pattern of increase and decrease? Most industrialized countries have had remarkably similar developments in regards to gender differences in life expectancy. After a long phase with a female advantage in life expectancy of less than one year, the gender gap rose during the twentieth century. This was followed by an abrupt fall in female advantage towards the end of the century. However, the timing of the shifts differs. Some European countries (e.g. England and France) had a significant rise in female advantage as early as 1890-1900, followed by countries such as U.S and Australia, while it occurred 50 years later in the Scandinavian countries. This country variation regarding the rising gender differences suggests explanations that are complex and country specific. The more recent fall in female advantage occurred over a much shorter time in all countries, suggesting common causality. No single hypothesis has emerged that adequately explains these shifts in gender differences in life expectancy, and yet they are key to understanding the interacting effects of biological and social factors determining longevity.

THE IMPACT OF FAST MIGRATION ON THE MENTAL AND PHYSICAL HEALTH OF OLDER ADULTS
A. Barrett, I. Mosca, TILDA, Trinity College Dublin, Dublin, Ireland

Having to leave one’s home to go and live in another country can be an extremely stressful event. As a result, it seems likely that migration could lead to long-term negative mental health outcomes. Similarly, migration can impact on physical health if migrants work in specific occupations or adopt a different lifestyle in the host country. In spite of this, there has been relatively little research conducted on the link between migration and subsequent health outcomes in older adults.

In this paper, we use a new and rich dataset from Ireland with information on a nationally representative sample of people aged 50 and over - Wave 1 of The Irish Longitudinal Study on Ageing (TILDA). Ireland provides a unique setting in which to study migration and health because about a quarter of its older adults lived outside of Ireland for a period of time and subsequently returned. Using multivariate regression, we find that male migrants are 30% more likely to have been diagnosed with mental health problems, including alcoholism, compared to those who never left. We find no evidence of physical impacts of migration. For women, the reverse holds. No evidence of mental health impacts is found but migrants are 17% more likely to suffer from arthritis compared to those who never left. Participants attending this session will be made aware of: i) the link between migration and health (and the differences by gender); ii) TILDA, this important new addition to the international set of longitudinal studies on ageing.

NEIGHBORHOODS CHARACTERISTICS AND HEALTH STATUS AMONG UNDERSERVED OLDER ADULTS
R. Suzuki1, A.B. Mathis2, D. Kruger2, 1. Public Health & Health Sciences, University of Michigan-Flint, Flint, Michigan, 2. University of Michigan, Ann Arbor, Michigan

Increased understanding about the etiology of having poor health status in older people has led to the recognition that social factors play a major role in health status. Few studies, however, have investigated the degree to which social capital constructs relate to health status among underserved older adults. The purpose of this study was to examine the relative contribution of social capital factors to health outcomes in Flint, MI. Older adults were assessed by the Speaking to Your Health Community Survey 2009 and the American Community Survey 2010. The two-level analysis on M-plus was utilized to examine the relationship of neighborhoods characteristics to self-rated health (SRH), body mass index (BMI), and chronic conditions. Of the 217 participants, a large percentage were Caucasian or African American (48%) women (73%) with low education levels (52 % ≤ high school or GED), married or committed relationship (39%) and retired (78%). Their mean age was 74.14 (SD=7.02). In the International Classification of Functioning, Disability and Health, perceived fear of crime (β=-.24) and chronic conditions (β=-.44) predicted SRH. Social participation (β = -.18) and chronic conditions (β=.18) predicted BMI. BMI (β=.27) and SRH (β = -.84) predicted chronic conditions. Additionally, the census tracts poverty level predicted SRH (β=.99) and chronic conditions (β=1.00). No interaction effects of race/ethnicity on health status existed. The importance of the intervention programs targeting safety and social support in a community will be discussed.

POPULATION MORTALITY RATES AND EXCESS DEATHS AMONG DIABETICS IN THE US
S.L. McFall1, D.W. Smith2, B.S. Bradshaw2, 1. Inst. for Social and Economic Research, University of Essex, Colchester, United Kingdom, 2. University of Texas Health Science Center, San Antonio, Texas, 3. Private Consultant, Colchester, United Kingdom

We estimate mortality rates and excess deaths among diabetics using surveys that can be generalized to the US population. We pooled the National Health Interview Survey for 1997-2001 with followup for deaths through 2006. All deaths within five years of interview were used to estimate death rates by age and sex separately for respondents known to have diabetes and for all other respondents. Estimates that account for complex survey design were computed using Stata. In 1997-2001, 17% of diabetics were under age 45, 43% were 45-64, and 40% were over age 65. We report estimates for age 45 and over by 10 year intervals to 84 and for age 85 plus. The death rates (per thousand) of diabetics were: females, 35.7 (se: 0.75), males, 37.5 (se: 1.11), and combined, 34.1 (se: 1.01). Death rates increased by age. Odds ratios of
KOREAN BABY BOOMERS PANEL STUDY SERIES 1: KOREAN BABY BOOMERS’ MARITAL RELATIONSHIPS

G. Han1, J. Lee2, J. Kim1, 1. Seoul National University, Seoul, Republic of Korea, 2. Family Environment & welfare, Chonnam National University, Gwangju, Republic of Korea

Background: Rapid social changes in Korea have resulted in changes in various aspects in family life, such as an increased age of marriage, lowered fertility rates, and the rise of dual earner families. Baby Boomers have been characterized as the forerunners of those changes. The purpose of this study was to examine various aspects of marital relationship such as communication skill, marital conflict and marital satisfaction of Baby Boomers and to explore the determinants of marital relationships. Method: Data used in this study are from the first wave of Korean Baby Boomers Panel Study. A total of 4,668 respondents born between 1955 and 1963 were surveyed in face-to-face interviews using structured questionnaires. The surveys were conducted from May 2010 till August 2010. Result: About forty-five percent of Baby Boomers are satisfied with their marriage while 7.9% are not satisfied with their marital relationships. In general, Boomers seems to have positive relationships with their spouse. Thirty-six percent report that they have open, positive communication with their spouse almost every day. Better communication skill means better marital satisfaction. However, not surprisingly Boomers’ marital relationships also reflect certain levels of conflict and discord. The main areas of marital conflict among Baby Boomers are financial issues and issues related to child rearing. About 40% of Baby Boomers have seriously considered getting a divorce during the past five years. Female Boomers are more likely to have given a serious thought about divorce than male Boomers. The implications in order to enhance the stability of Korean Baby Boomers’ marital life is discussed.

RECENT EVIDENCE OF EDUCATIONAL DIFFERENCES IN HEALTHY LIFE EXPECTANCY BETWEEN BLACKS AND WHITES IN THE U.S. ARE WE CLOSING THE GAP?

A. Solé-Auró1,2, H. Beltrán-Sánchez2, 1. RFA-IREA, University of Barcelona, Barcelona, Spain, 2. University of Southern California, Los Angeles, California

The study of race/ethnic differences in mortality has a long history in the United States. Comparisons of Black-White (B-W) death rates have consistently shown higher mortality for blacks than for whites, except among the oldest old where differences can be affected by data quality (Manton et al. 1987, Preston et al. 1996; Elo&Drevenstedt 2004, Harper et al. 2007). In addition to race, mortality differentials extend to other socioeconomic factors such as education and income. In this paper we are interested in studying whether educational differences in healthy life expectancy (HLE) between B-W in the U.S. have declined in the last decade. Evidence, from the 1970s through the 1990s, shows that educational differences in HLE increased during that period due to widening of the mortality and morbidity rates between B-W (Crimmins and Saito 2001). Recent evidence, however, shows that the racial gap in mortality has declined since 1980 (Macinko and Elo 2009, Harper et al. 2007). Little is known on whether the recent narrowing of the mortality gap has been accompanied by a reduction in the educational gap in HLE between B-W. We use the National Health Interview Survey (NHIS) to estimate the prevalence of functional limitation by age, race, sex, and level of education in the non-institutionalized U.S. population in 1996, and use the mortality follow-up in 2006 to estimate mortality rates. We employ a Poisson log-linear model to estimate mortality rates by age, race, sex, education and functional limitation, and then construct a life table using standard life table techniques (Preston et al. 2001). We apply Sullivan method to estimate HLE over the period of study and compare racial differences in HLE by level of education (Jagger 1997).

LONGEVITY OF OFFSPRING OF CENTENARIANS: EVIDENCE FROM THE UTAH POPULATION DATABASE

K. Smith, H. Hanson, G.P. Mineau, A. Fraser, D. Lane Reed, Huntsman Cancer Institute, University of Utah, Salt Lake City, Utah

Centenarians comprise an important group of individuals on which to assess the familiality of longevity. Several studies have examined measures of health status of the offspring of centenarians, including cardiovascular, cancer and diabetes risk factors, but rarely age at death for extinct cohorts. In this study we estimate the mean ages at death and recurrence risks among the offspring of centenarians in relation to controls. We use data from the Utah Population Database (UPDB) because the UPDB holds complete birth and death dates of individuals linked into multi-generational families spanning 200 years. For this analysis, we identify all centenarians (CT) born prior to 1900 as well as all offspring (OS) of these CTs who were also born before 1900. These restrictions allow us to observe death ages for both CTs and OS (N=351 male and N=306 female OS of CT). Controls comprise a set of OS where both parents were born prior to 1900 and where both died between ages 65 and 85 (N=33,705 males and N=31,113 females). All OS studied were those who lived to age 40. Gender-specific linear regressions were estimated to estimate differences in age-at-death between the two groups, controlling effects of birth year and religion (Active Mormon or not). We find that the offspring of centenarians live 4.5 years longer than controls conditional on survival to 40. This difference applies to both male and female offspring. These results suggest strong familiality in life span suggestive of both shared beneficial environments and shared genetic resilience.

SESSION 435 (POSTER)

DEVELOPMENT, GROWTH AND ADAPTATION

PERSPECTIVE TAKING IN OLDER AGE: A MOTIVATIONAL PERSPECTIVE

X. Zhang1, H. Fung2, J.T. Stanley3, D. Isaacowitz4, X. Song5, 1. Department of Psychology, CUHK, Hong Kong, Hong Kong, China, 2. Brandeis University, Boston, Massachusetts, 3. Peking University, Beijing, China

There was a folk notion of increased perspective taking abilities with age such that older adults should be better at understanding others’ behavior, intention and showing great empathy to others. However, empirical studies on older adults showed the reversed pattern. In a series of experiments, we would like to investigate the phenomenon from a motivational perspective. In experiment 1, we manipulated perceived closeness between participants and the experimenter in a faux pas recognition task, and in experiment 2, we manipulated perceived closeness between participants and the target in an emotion recognition task, to examine whether the experimental manipulations could influence participants’ performance in the two perspective taking tasks. The results revealed that in the control condition without any closeness manipulation, the well-documented negative age effect in both faux pas recognition and emotion recognition was replicated. However, in the closeness manipulation condition, older adults significantly enhanced their performance in...
DOES COPING MEDIATE BETWEEN STRESS SEVERITY AND STRESS-RELATED GROWTH?

X. Bi,1,2, C.M. Aldwin,2, 1. Center for Health Care Evaluation, Menlo Park, California, 2. Oregon State University, Corvallis, California

Stress can have not only adverse effects but also positive effects on health, called stress-related growth (SRG; Park, 2009). However, contrasting models suggest that stress and SRG increase subsequent SRG (Antonovsky, 1987) or decrease it (Hobfoll, 1988). Others have argued that the effects are contingent upon coping strategies (Aldwin et al., 1996). We contrasted these three models using two waves of data collected in 1996 (T1) and 2001 (T2) from the Davis Longitudinal Study (Aldwin et al., 1996). Of the 509 young and middle-aged alumni (Mage = 44.24, SD = 7.38), 44.01% were male, 93.47% were European Americans, and 52.45% had advanced degrees. Structural equation modeling showed that the effects of stress severity on SRG within each wave (βs = .100 & .084, ps < .05), but there were no significant cross-lagged effects between them over time. However, examining the mediating effect of both positive and negative coping strategies showed that there were significant cross-lagged effects between SRG and positive (but not negative) coping strategies. Specifically, stress severity was associated with greater positive coping at T1 (β = .189, p < .001), which in turn was related to more SRG at T2 (β = .095, p < .01), suggesting indirect effects of stress severity on SRG via positive coping. These results indicated that SRG at T1 did increase subsequent positive coping, and if people used more positive coping, they were more likely to report higher levels of SRG at T2. Therefore, the results supported the contingent model.

FLIGHT, EXPULSION, AND DISPLACEMENT OF ETHNIC GERMANS AT THE END OF WORLD WAR II

P. Sauer, Miami University, Oxford, Ohio

The topic of flight, displacement, and expulsion of ethnic Germans is highly complex as it encompasses a tinderbox of sensitive European history, politics, painful emotions, and personal tragedies. The Germans were responsible for both World Wars. In addition to the horrific extermination of 6 million Jews in the Holocaust, the killing of millions of soldiers and civilians, Nazi Germany also brought devastation to its own people, especially the ethnic German people of Silesia, Prussia, Sudentland, and former Yugoslavia. WWII, the most devastating conflict the world has ever seen (60 - 79 million casualties), destroyed and disrupted the life courses of millions. Children, teenagers, young adults, adults, and old people all were affected by it. All these different cohorts had their very own experiences of WWII and its impact on their further life trajectories. For the first part of my thesis, I conducted biographical interviews with two ethnic Germans (Anna, 71 and Paul, 91). I used an adaptation of Wengraf’s (2004) biographic-narrative interpretative method to capture the participants’ experiences, and their retrospective of these from the vantage point of old age. The second part of my thesis included a secondary thematic data analysis of ethnic German expulsion narratives. Emerging themes from this research included marginalization, education, human kindness, violence, contingency, survival. The goal is to give a voice to the victims, to produce a work based on historical facts, and to investigate how two ethnic Germans review(ed) their war time experiences in old age and throughout their life courses.

AGE, COHORT, AND GENDER DIFFERENCES IN SOCIAL NETWORKS AMONG JAPANESE OLDER ADULTS: FINDINGS FROM JAPANESE LONGITUDINAL STUDY BETWEEN 1987-2006

E. Kobayashi1, T. Fukaya1, S. Shinkai1, H. Akiyama2, J. Liang3. 1. Tokyo Metropolitan Institute of Gerontology, Tokyo, Japan, 2. The University of Tokyo, Tokyo, Japan, 3. University of Michigan, Ann Arbor, Michigan

Japanese lifestyles changed greatly during rapid economic growth in 1960’s. It is hypothesized that those who experienced these changes in their youth would have different social relations in old age from former cohorts. This study examined cohort differences in quantity of social networks and their growth trajectories among Japanese older adults. Social networks were measured by number of (a) close friends, (b) close neighbors, and (c) community groups they belonged to, and frequency of (d) face-to-face contact with friends, neighbors, and relatives, and (e) attendance in group meetings. Data came from 7 waves of a national survey of Japanese adults aged 60 and over conducted between 1987 and 2006, which gave us 16,955 observations for 4,999 persons. Within the framework of a hierarchical linear model, we found each network decreasing with age in a quadratic curve. Birth cohort showed different effects for males and females. For men, two recent cohorts (C2: born in 1916-25, C3:1926-36) were more likely to have smaller and less frequent networks except for close friends compared to a cohort born before 1916 (C1). In C1, men belonged to more groups and had more frequent participation than women but women in C3 participated in groups more frequently than men in the same cohort. After controlling for health, family, and socio-economic status, effect of aging became smaller but the gender difference (Female> Male) in C3 became even larger. Unmeasured psychological factors such as attitudes toward women’s social participation might explain the results.

PREDICTORS OF LOVE ACTIONS FOR MATURE ADULTS (40+) DURING A DIVORCE. DOES AGE MATTER?

J.G. D’Ambrosio, A.C. Faul, University of Louisville, Louisville, Kentucky

Love is an anomaly for people experiencing divorce. A study of divorcing individuals found that reduction of anger is the main predictor of love actions for those experiencing divorce. This paper explores if maturation helps marital relationships end with understanding, generosity, humility and altruistic love. Research has been undertaken to test predictors of love feelings and actions towards a former spouse by a divorcing individual. The study started with the development of the Intrinsic Love Inventory (ILI) based on a theory of love focusing on measuring love feelings and actions high in intensity, extensity, duration, purity and adequacy. A sample of 191 divorcing individuals was recruited and asked to complete a survey where data on basic demographics and the ILI were gathered together with the Davis’s Empathy Scale, the Love Attitude Scale measuring altruistic love, the Altruistic Values scale, an Altruistic Behavior Battery, and Feelings of Anger Towards Former Spouse. A multiple regression analysis indicated that the model explained 62% of the variance in love feelings and actions towards former spouses (F(11,110)=16.46, p=0.001). The significant predictors in the model was in order of strength, a reduction of angry feelings towards former spouse (β=-0.710, p=0.001), showing altruistic behaviors (β=0.228, p=0.001), embracing altruistic values (β=0.165, p=0.034) as well as having less children (β=-0.139, p=0.025). The study illustrates that divorcing individuals, regardless of age, have a tendency...
towards understanding, generosity, humility and altruistic love, even in the midst of divorce. Maturation did not play a significant factor in increasing love actions.

TESTING A TWO-FACTOR MODEL OF THE IMPACT OF OPTIMISM ON FUTURE AGING-RELATED WORRY AMONG YOUNG AND MIDDLE AGE ADULTS
S.J. Kohn, M.M. Wood, M.M. Willis, S.E. Spivey, Psychology, Valdosta State University, Valdosta, Georgia

Thinking about one’s own aging-related future can be both an exciting and anxious enterprise. The uncertainty about a person’s developmental future can raise thoughts about many unknown factors, which can heighten worrisome feelings. Research suggests that worry tends to be higher for young and middle-age adults compared to older people. Yet, research on the buffering effect of optimism on worry, although recognized as an important coping variable, has been scarce. In this study we tested a theoretical structural equation model in which aging related worry (as a function of negative social impact variables e.g., ageist media stereotypes) was hypothesized to be mediated by both trait-related (dispositional) and state-related (domain specific) optimism. Trait optimism was hypothesized to directly reduce worry. State optimism was hypothesized to work indirectly in concert with positive social impact variables (e.g., family and education) to reduce worry. Data were gathered from a sample of young (n=180 M-age=21.56) and middle-age adults (n=150 M-age=48.47). The model was tested with EQS-6.1. Goodness of fit indices for the model were found to meet or exceed acceptable benchmark criteria (Chi-square=27.11; df=19; p>.05; CFI= .97; GFI=.95; RMSEA=.56; RMS-Residual=.20). We then tested for differences between young and middle-age participants. Although both trait and state optimism had a significant worry-reducing effect for both age groups, the relative effect of trait related worry was greater for the young adults. This finding is noteworthy because it suggests that young adults might rely on external optimistic cues; while middle-age adults may rely more on internal (dispositional) aspects of optimism.

AN ASSESSMENT OF THE HANDS OF TIME: WHAT PREDICTS FUTURE TIME PERSPECTIVE?
M.B. Beidleman, P.P. Haley, G. Harris, R.S. Allen, University of Alabama, Tuscaloosa, Alabama

Socioemotional selectivity theory (Carstensen & Lang, 1996) posits that, due to limited future time perspective, older adults shift from information-focused to emotion-focused goals. The Strength and Vulnerability Integration (SAVI) model (Charles, 2010) recognizes both the strengths associated with aging and the vulnerabilities caused by reduced reserve capacity to cope with physical decline. In the SAVI model, the timing of the emotion regulation process influences the emotional sequence of events such that years of experience and a motivational shift toward emotion-focused goals may be offset by reduced ability to manage high levels of physiological arousal due to declining physiological flexibility. Future time perspective, largely subjective, is the critical construct underlying shift in motivational goals; thus, factors including religious and spiritual attitudes, functional status impairments, and subjective health status may help to explain an individual’s future time perspective. The current study included 31 participants from the Legacy Intervention Family Enactments (LIFE) project, all of whom were diagnosed with an advanced chronic illness and living in the community. Multiple regression analyses were used to assess the effect of religious and spiritual attitudes, functional status impairments, and subjective health status on future time perspective. Results indicate that religious and spiritual attitudes are related to future time perspective while also supporting the notion that lower subjective health predicts limited future time perspective. Notably, objective health was not related to future time perspective in this sample of individuals with advanced chronic illness, supporting the importance of self-perceptions of vulnerability.

A WEEK IN THE LIVES OF OLDEST-OLD AUSTRALIANS: INITIAL FINDINGS FROM ADULTS MEASUREMENT BURST STUDY

To understand pathways to ageing well, it is essential to explain variation in ageing outcomes at the extremes of late life (85+). An innovative adjunct to the Australian Longitudinal Study of Ageing (ALSA) was launched: the ALSA Daily Life Time-Sampling Study (ADu LTS), to identify mechanisms involved in differential ageing. ADu LTS marks the first attempt to track daily fluctuations in the oldest-old, in the context of ongoing routines and 18-years of pre-existing data. We describe the study protocol and illustrative results from indices of engagement, cognition, and emotion. An entry session provided training and measured health, goals, and personality. Daily protocols began with saliva samples (for cortisol) concurrent with self-report on the previous night’s sleep. A tailored schedule for 5 time-samples, in response to a prompt, was arranged at approximately 3-hour intervals. We recruited participants in 2010 after Wave 11 of ALSA. Because of the demanding protocol, prior to recruitment W1 data on cognition, vision and hearing were examined to screen participants. From a pool of 94 candidates 50 participated: 63% women, average age 89. This paper focuses on selectivity analyses using data from ALSA W1 (1992) and W11 (2010), and trajectories over this period. Initial results show that those who did or did not participate showed no significant differences a range of W1 or W11 measures. Further results will quantify whether the yearly rate of decline was shallower among 18-year, relative to 2-year, survivors in ALSA. Neither proximal nor distal functioning affects participation in this measurement burst design, and it remains a viable way to examine everyday fluctuations even in very old age.

ROLE TRANSITIONS ACROSS THE LIFE COURSE: WIDOWS’ EXPERIENCES ON FAMILY FARMS
J.J. Benson, M. Coleman, Human Development and Family Studies, University of Missouri, Columbia, Missouri

Examining farm families and subsequent changes in women’s roles on the farm from a life course perspective has been neglected in scholarly work. The prevailing assumption has been that after the husband’s death, the farm is either sold or widows relinquish their involvement in the operation of the farm to the younger generation in the family. Data reveal however that the number of women who own farms is increasing, with as much as 60% of farmland in some states owned by widows. Therefore, farms are becoming increasingly female and increasingly gray. This study is designed to address this gap in the literature by exploring women’s role transitions on family farms across the life course. Twenty-three widowed women, ages 57-89, who owned farms in Illinois or Georgia were interviewed in-person about early years on the farm, their family, and how they constructed their new identities as farm widows after the death of their husbands. Preliminary analysis suggests a U-shaped theory of involvement on the farm i.e., these women were highly and directly involved in farm production in their early years of marriage, decreased direct involvement in their middle years (and for some shortly after widowhood), but after the death of their husband they took on new and additional roles as bookkeepers, farm managers, farm laborers, and business women. Further analysis will explore the process by which these new roles evolved as the women transitioned into widowhood status.
AGE DIFFERENCES IN THE FACTOR STRUCTURE OF SELF-TRANSCENDENT WISDOM

M. Levenson1, S. Lee2, S. Choun1, C. Jones3, P. Wink3, C.M. Aldwin1, J. Human Dev. & Fam. Sci., Oregon State University, Corvallis, Oregon, 2. California State University Fresno, Fresno, California, 3. Wellesley College, Wellesley, Massachusetts

Although it is commonly assumed that wisdom increases with age, there are contradictory results in the literature, with studies showing linear, negative, or non-linear, or no effect of age (Staudinger & Bluck, 2011). These discrepancies may be due to differences in the factor structure of wisdom with age. Curnow (1999) identified four aspects of wisdom: self-knowledge, integration, non-attachment, and self-transcendence. We modified the Adult Self-Transcendence Inventory (Levenson et al., 2005) to reflect these four hypothesized factors. Using men (n = 181) and women (n = 186) from the Intergenerational Study who completed a mail survey, we created three age groups: young (23-50; n = 97), middle aged (51-67; n = 114), and old (70+; n = 161). Exploratory factor analysis revealed that a four factor solution was the best fit in all three groups (RMSEA ranged from .052 to .065); however, a preliminary confirmatory factor analyses revealed that the factor structure significantly differed across groups, not even achieving configural invariance. While there were consistent items across groups for Factors 1 and 2 (self-transcendence and integration), little consistency was found for factors 3 & 4. Preliminary analyses suggest that these factors reflect age-appropriate developmental tasks, but the results need to be replicated in larger, more heterogeneous samples.

WHEN DOES THE NORMATIVE DECLINE IN SOCIAL CONTACT OCCUR? FINDINGS FROM THE VA NORMATIVE AGING STUDY

N. Toyokawa1, C.M. Aldwin1, A. Spiro2, A. Acocella1, S. Choun1, R. Nath3, J. Oregon State University, Corvallis, Oregon, 2. Boston University, Boston, Massachusetts

Socioemotional selectivity theory (Carstensen et al., 2006) hypothesized that there is a normative decline in the frequency of social contact in later life. However, most studies have been cross sectional. The current longitudinal study examined the trajectories of social contact men from the Normative Aging Study whose age ranged from 50 to 70 years old (M=59.64, SD=5.52) at the baseline survey in 1985. Follow-up data were collected in 1988 and 1991. The data was reorganized by age, and preliminary frequencies suggested the existence of a spline or sharp deflection around age 64 (M=16.01, M=16.74, M=15.80). Accordingly, two latent growth curve were computed to examine the trajectories of the middle-aged (age 50-63, n=653) and older participants (age 64-70 in 1985, n=749). For the middle-aged participants, the intercept was 16.15, p<.001, but the slope was not significant, S=0.062, ns. In contrast, for the older men, the slope was significantly negative, S = -.13, p<.001. In terms of random effects, both intercept and slope were significant for the middle-aged men, I=18.79, p<.001 and S=0.15, p<.05, but the slope was not significant for the older men, S=.02, SE=.05, p>.05. Thus, there are individual differences in the intercept for both the middle-aged and older men, for both fixed and random effects, and there are also individual differences in the slopes in midlife. However, there was a normative decline in the frequency of social contact after the age of 64.

SESSION 440 (POSTER)

DIFFICULT DECISIONS: END-OF-LIFE CHOICES

WILLINGNESS-TO-PAY FOR COMMUNITY END-OF-LIFE CARE AMONG CHINESE OLDER ADULTS

L. Chu, S.M. McGhee, J. Luk, P. Chiu, J. Chau, Division of Geriatrics, Department of Medicine, The University of Hong Kong, Hong Kong, China

Background: There is no previous study on the “Willingness-To-Pay” for community end-of-life care among older adults. The objectives of this study were to investigate the preference and willingness-to-pay of older Chinese adults for community end-of-life care in the nursing home rather than the hospital and the trade-offs that they were willing to make between attributes of care in the end-of-life care program. Methods: 1540 older Chinese adults from 140 nursing homes were interviewed. Four hypothetical questions were asked to explore their preferences for end-of-life care. Using a discrete choice approach, specific questions explored acceptable trade-offs between three attributes: availability of doctors on site, attitude of the care staff and additional cost of care per month. Results: Approximately 35% of respondents preferred end-of-life care in the nursing home, while 23% of them would consider it in a better nursing home. A good attitude of staff was the most important attribute of the care site. Respondents were willing to pay an extra cost of US$5 (HK$39) per month for more coverage of doctor’s time and US$49 (HK$379) for a better attitude of staff in the nursing home. Respondents on government subsidy valued the cost attribute more highly, as expected, validating the hypothesis that those respondents would be less willing to pay an additional cost for end-of-life care. Conclusion: Older Chinese adults would be willing to pay an additional fee for community end-of-life care in nursing homes, if better facilities and services were available, particularly a good attitude of care staff.

CONFLICT, DECISION-MAKING, AND SOCIAL SUPPORT DURING LUNG CANCER: THE ROLES OF AGE AND SPOUSAL RELATIONSHIPS

L.M. Miller, S. Hiatt, K.S. Lyons, Oregon Health & Science University, School of Nursing, Portland, Oregon

Age is an important part of the disease context for lung cancer—the majority of patients are over 65 and the median age at diagnosis is 70. Older adults with lung cancer have a poorer prognosis due to co-morbidities and age-related factors, which both complicates and hastens the end of life process for people who already struggle with an aggressive disease. The patient’s ability to determine their desired plan of care depends upon strong social support systems, effective decision-making, and minimized family conflict. The aim of this investigation is to describe the role of age in aspects of the coping process, including social support, decision-making, and family conflict, among lung cancer patients. Data obtained from 115 lung cancer patients ranging in age from 31 to 95, and their family caregivers, showed that adults with lung cancer over the age of 75 have significantly less social support than their counterparts aged 75 and under. Across all ages, having a spouse as the primary caregiver was significantly associated with less family conflict, overall greater social support, and an easier decision-making process (e.g. more listening and cooperating, and less tension and guilt). Cognitive impairment was not significantly correlated with decision-making, family conflict or social support. Findings will be discussed in regard to identifying and supporting the families most at risk for discordance during the end of life process.

“THE WHOLE POWER OF ATTORNEY”:
UNDERSTANDING ADVANCE DIRECTIVES AMONG NEXT-OF-KIN IN VA MEDICAL CENTERS

A.R. Wittich1, B.R. Williams1, L.L. Woody2, K.L. Burgio1, J. Birmingham VAMC, Birmingham, Alabama, 2. University of Alabama at Birmingham, Birmingham, Alabama

PURPOSE: Advance Directives are important components of end-of-life (EOL) care planning. We explore next-of-kin’s (NOK) understanding of Advance Directives and its impact on the NOK’s perception of the EOL decision-making process. METHODS: In 2005-2010, we conducted interviews with 78 next-of-kin of deceased veterans in 6 VA Medical Centers in the Southeast U.S. We used content analysis to explore NOK’s experience with the EOL decision-making process. RESULTS: NOK were predominately female (78%) and white (60%). 40% of NOKs were surviving spouses, 31% adult children, and 17%
sibings of the deceased. 60% of NOK stated the deceased had Advance Directives at the time of death (n=47). Of those NOK, 40% (n=19) indicated being at peace with the EOL decision-making process. An EOL communication with clinical staff was reported by 38% (n=30) of all NOK. The communication encounter was perceived as helpful and emotionally supportive by 29% (n=23). Among the 23 NOK perceiving the communication experience as positive, 83% (n=19) reported that the deceased had an Advance Directive. Misunderstanding the legal technicalities of Advance Directives is prevalent among NOK. Of those NOK who’s love one had advance directives, 45% indicated an inadequate understanding of Advance Directives, particularly with respect to the difference between estate and health care durable powers of attorney. CONCLUSION: Emotionally positive communication experiences with clinical staff regarding Advance Directives may enhance the NOK’s perception of the EOL decision-making process. Future research should examine the role of health literacy in NOK’s understanding and perception of Advance Directives in VA settings.

NURSE EXECUTIVES PERCEPTIONS OF END-OF-LIFE CARE FOR HOSPITALIZED PATIENTS
K.K. Garner1, J.A. Goodwin1, J. McSweeney3,4, J.E. Kirchner5,6, J. GRECC - Little Rock, Department of Veteran Affairs, Little Rock, Arkansas, 2. University of Arkansas for Medical Sciences - Department of Geriatrics, Little Rock, Arkansas, 3. University of Arkansas for Medical Sciences - College of Nursing, Little Rock, Arkansas, 4. University of Arkansas for Medical Sciences - College of Public Health, Little Rock, Arkansas, 5. University of Arkansas for Medical Sciences - Department of Psychiatry, Little Rock, Arkansas, 6. VA South Central MIRECC, Little Rock, Arkansas

Specific Aims - 1) Explore hospital-based nurse executives perceptions of end-of-life care provided in the acute care setting. 2) Explore nurse executives’ perceptions of the educational needs of nurses providing end-of-life care in an acute care setting. Methods - Pilot descriptive, naturalistic qualitative study using in person interviews to capture nurse executives’ understandings, beliefs, and perceptions of providing end-of-life care in the acute care setting. Results - Participants reported that patients, families and caregivers experienced end-of-life issues differently based on previous experiences, level of uncertainty in prognosis and ability to manage symptoms. They also identified unique educational needs of acute care nurses providing end-of-life care. Participants identified that individualizing care and improving the communication skills of all healthcare providers as essential to improving end-of-life care. Nurse executives perceived that the acute care setting continues to play an important role in providing end-of-life care. They also perceived that nurse executives role as very important in facilitating this process due to their knowledge, experience and ability to affect change in the provision of care in the acute care setting. Conclusions - Nurse executives identified many challenges to providing comprehensive end-of-life care in the acute care setting. A proactive presence of nurse executives is integral to incorporating training, establishing appropriate policies and implementing and maintaining systemic change of end-of-life care provided in the acute care setting.

THE RELATIONSHIP BETWEEN PAIN AND ADVANCE DIRECTIVES IN THE NHHCS
R.C. Intieri, P. Goodwin, Psychology, Western Illinois University, Macomb, Illinois

The 2007 National Home and Hospice Care Survey (NHHCS) represents survey data collected from home health and hospice agencies as well as current patients and discharges. Survey data were collected from agency directors and staff between August 2007 and February 2008. Patient data were abstracted from medical records. The current analysis focuses on the 4,733 individuals that received hospice services. Mean age of the sample was 77.36 (SD=13.70). The sample consisted of 2,117 men (M=74.98; 13.48) and 2,616 women (M=79.28; SD=13.57). The current analysis examines the relationship between pain and the presence/absence of an advance directive. Pain level was assessed twice (at time of admission and prior to discharge). At time of admission, 1,876 (44.8%) patients reported pain while 2,315 (55.2%) patients reported no pain. At the last assessment, 1,035 (31.7%) patients reported pain while 2,327 (68.3%) patients reported no pain. 87.6% of hospice patients had some type of advance directive. Chi square was used to examine differences in the presence/absence of an advance directive based on reported pain. Results were significant (χ2(1) = 6.555; p = .012), with patients reporting pain at first assessment less likely to have an advance directive than patients without pain at the time of discharge. Results were similar for pain at the last assessment prior to discharge, with those reporting pain less likely to have an advance directive (χ2(1) = 11.004; p = .001).

DOES COUNSELING INFLUENCE THE LIKELIHOOD OF AN ADVANCE DIRECTIVE IN THE NHHCS
P. Goodwin, R.C. Intieri, Western Illinois University, Macomb, Illinois

The 2007 National Home and Hospice Care Survey (NHHCS) represents survey data collected from home health and hospice agencies as well as current patients and discharges. Survey data were collected from agency directors and staff between August 2007 and February 2008. Patient data were abstracted from medical records. The current analysis focuses on the 4,733 identified individuals that received hospice services. Mean age of the sample was 77.36 (SD=13.70). The sample consisted of 2,117 men (M=74.98; 13.48) and 2,616 women (M=79.28; SD=13.57). The current analysis examines the relationship between pain and the presence/absence of an advance directive. Pain level was assessed twice (at time of admission and prior to discharge). At time of admission, 1,876 (44.8%) patients reported pain while 2,315 (55.2%) patients reported no pain. At the last assessment, 1,035 (31.7%) patients reported pain while 2,327 (68.3%) patients reported no pain. 87.6% of hospice patients had some type of advance directive. Chi square was used to examine differences in the presence/absence of an advance directive based on reported pain. Results were significant (χ2(1) = 6.555; p = .012), with patients reporting pain at first assessment less likely to have an advance directive than patients without pain at the time of discharge. Results were similar for pain at the last assessment prior to discharge, with those reporting pain less likely to have an advance directive (χ2(1) = 11.004; p = .001).

ETHNICITY AND END-OF-LIFE DECISION-MAKING IN THE NHHCS
R.C. Intieri, P. Goodwin, Psychology, Western Illinois University, Macomb, Illinois

The 2007 National Home and Hospice Care Survey (NHHCS) represents survey data collected from home health and hospice agencies as well as current patients and discharges. Survey data were collected from agency directors and staff between August 2007 and February 2008. Patient data were abstracted from medical records. The current analysis focuses on the 4,733 identified individuals that received hospice services. Mean age of the sample was 77.36 (SD=13.70). The sample consisted of 2,117 men (M=74.98; 13.48) and 2,616 women (M=79.28; SD=13.57). The current analysis examines the relationship between pain and the presence/absence of an advance directive. Pain level was assessed twice (at time of admission and prior to discharge). At time of admission, 1,876 (44.8%) patients reported pain while 2,315 (55.2%) patients reported no pain. At the last assessment, 1,035 (31.7%) patients reported pain while 2,327 (68.3%) patients reported no pain. 87.6% of hospice patients had some type of advance directive. Chi square was used to examine differences in the presence/absence of an advance directive based on reported pain. Results were significant (χ2(1) = 6.555; p = .012), with patients reporting pain at first assessment less likely to have an advance directive than patients without pain at the time of discharge. Results were similar for pain at the last assessment prior to discharge, with those reporting pain less likely to have an advance directive (χ2(1) = 11.004; p = .001).

64th Annual Scientific Meeting
were identified as African-American, and 79 (1.7%) members were identified as other or unknown. Results were statistically significant ($\chi^2(3) = 71.163; \ p < .0001$). African-American patients were less likely as a group to endorse any type of advance directives. Results examining specific advance directive tools were similar. For example, only 10% of African-Americans sampled endorsed the use of a Living Will ($\chi^2(3) = 97.316; \ p < .0001$). Similar racial/ethnic differences across other advance directive tools (e.g., DNR, Do not Hospitalize, Feeding Restrictions, Medication Restrictions, Power of Attorney, Proxy Decision Making, and Comfort measures) were found.

**SESSION 445 (POSTER)**

**ECONOMICS OF AGING: ISSUES OF WORK, RETIREMENT, AND ECONOMIC STABILITY IN OLD AGE**

**LONGITUDINAL TRAJECTORIES OF FINANCIAL RETIREMENT PLANNING OF BABY BOOMER WOMEN: THE ROLE OF SES**

E. Jung1, C.M. Kelly2, K. Choi3, I. University of Nebraska, Lincoln, Nebraska, 2. University of Nebraska, Omaha, Nebraska, 3. Columbia University, New York City, New York

**PERCEPTIONS OF EXPECTED QUALITY OF LIFE IN RETIREMENT**

H. Gutierrez, D.A. Hershey, Psychology, Oklahoma State University, Stillwater, Oklahoma

Research on expected retirement quality of life has focused on the perceptions of older pre-retirees. Understanding individuals’ expectations of late life is important, because one’s perceptions of the future can shape important life planning behaviors—such as the extent to which one plans and saves for retirement (Kemp, Rosenthal & Denton, 2005). This study examined the perceived retirement quality of life among 1,559 undergraduate students (Mage = 19.5 yrs.) attending a large Midwestern state university. A theoretically-driven, hierarchically-structured path model was tested, in which individuals’ perceptions were regressed on indicators of financial knowledge, future time perspective, financial risk tolerance, and parental financial values. The model was successful in accounting for 23 percent of the variance in individuals’ perceptions of retirement quality of life. Particularly influential predictors of perceptions included parental values ($\beta = .38$) and future time perspective ($\beta = .25$). Financial knowledge and financial risk tolerance had a lesser, albeit statistically significant, impact on the dependent measure. These findings are consistent with previous studies, where future time perspective and financial knowledge have been shown to be significant predictors of future quality of life (van Dalen, Henkens & Hershey, 2010). This study suggests that younger adults with less than optimal perceptions of old age are likely to have low levels of financial knowledge, a present time orientation, an aversion to investment risk, and poor parental role models. The results of this research have clear implications for retirement counselors and intervention specialists, who seek to cultivate positive perceptions of later life.

**EVALUATING ECONOMIC SECURITY AMONG OLDER ADULTS**

J.E. Mutchler, E.A. Bruce, A. Gottlieb, J. Lyu, Gerontology, UMass Boston, Boston, Massachusetts

The Elder Economic Security Standard Index (the Elder Index) is a new measure designed to assess a modest cost of living standard for independent, community-dwelling older individuals and couples. The measure was developed by researchers at the University of Massachusetts Boston in conjunction with Wider Opportunities for Women. Innovative features of the Elder Index include its geographic specificity—it provides estimates of cost of living at the county level—and its focus on income adequacy, based on assessments of required expenditures for necessary goods and services. Moreover, the Elder Index can be calculated using publicly available data that is routinely generated by federal agencies and, as such, can be readily updated. In this paper we present the Elder Index for 2011 for the six New England states (Massachusetts, Maine, New Hampshire, Vermont, Rhode Island, and Connecticut). Based on the Elder Index, we compare estimated cost of living throughout the region, both in absolute terms and relative to the benchmarks of typical Social Security income in the area, and typical income in retirement. We document the extent to which cost of living throughout New England falls short of the resources available to many seniors living in the community. We summarize the geographic and sociodemographic patterns of economic insecurity based on the Elder Index, and compare these patterns to those based on the poverty cut-offs. A range of potential uses of the Elder Index for research, policy development, and policy evaluation are discussed.

**TRANSITIONING TO PART-TIME EMPLOYMENT IN LATER LIFE: FINDINGS FROM THE HEALTH AND RETIREMENT STUDY**

D.C. Carr, Institute on Aging, University of North Carolina at Chapel Hill, Chapel Hill, North Carolina

The year 2011 marks the beginning of the time when baby boomers reach traditional retirement age (i.e., 65). With such a large proportion of the population expected to retire over the next two decades, labor force shortages are a growing concern. With a growing majority of older adults able to expect to live twenty or more years beyond the age when they can receive Social Security benefits, complete retirement of millions of Americans could be economically devastating to society. In terms of individual benefits (i.e., well-being and overall health), alternatives to retirement may also have considerable appeal. Thus, continued employment on a part-time basis may be more realistic and beneficial for some baby boomers and could help society better adapt to deficits in labor force participation brought forth by population aging. This study uses longitudinal data from the 2006 and 2008 waves of the Health and Retirement Survey (HRS) to examine how personal resources and situational factors that influence labor force transitions in later life. Specifically, this study examines the transition to part-time employment (i.e., working 20 hours or fewer) from full-time employment (i.e., working more than 20 hours) as opposed to full retirement during later life. Findings describe health behaviors that facilitate transitioning to part-time employment as opposed to retiring, and situational characteristics
DOES UNEMPLOYMENT STILL MATTER? THE RELATIONSHIP BETWEEN STATE UNEMPLOYMENT RATES AND THE LABOR FORCE PARTICIPATION OF OLDER PERSONS
S.P. DeViney, J. Deichert, Gerontology, University of Nebraska at Omaha, Omaha, Nebraska

The reversal of the decade long term trend of declining age of retirement did not seem to be affected by the high unemployment rates of the recent American Recession. In 2009 the labor force participation rate for workers 65 and over increased from 17.2 % in 2007 to 17.5 % percent in 2009 the period of peak unemployment. The labor force participation of workers ages 62 to 64 grow from 55.2% to 59.1% in the same period. This brings into question the assumed role of retirement in the reduction of unemployment by removing other workers from the labor force. To test for the relationship between unemployment rates and individual retirement, we tested multi-level models of retirement by respondents ages 55 to 75 in the American Community Survey in 2007 (n= 632,586) and 2009 (n=676,586) using both individual level data and state level unemployment data. The data was structured as a hierarchical model with persons nested in states and hence a range of unemployment rates (from 4.3 to 13.6 in 2009). Labor force participation was divided into 3 categories: in the labor force (47.2%), not in the labor force but with a source of retirement income (43.4%), and not in the labor force but without a source of retirement income (9.3%). In 2009, the probability of being retired was greatly affected by individual level variables of age, education, health, source of health insurance, and marital status. The second level effect of state unemployment rates, while statistically significant due to the large sample, was only marginally related to retirement or being out of the labor force without retirement income. Including data from 2007, a period of low unemployment, to increase the variance in unemployment did not alter our results. The relationship between retirement and unemployment rates remained marginal. We conclude that in a changing retirement environment with increase uncertainty concerning age of, time to retirement and variation in the form of retirement, that retirement will play less of a role in regulating unemployment rates.

WIVES’ MIDLIFE WORK EXPERIENCE AND COUPLES’ JOINT RETIREMENT DECISION IN LATER LIFE
J. Ho, Sociology, National University of Singapore, Singapore

With the greater lifelong labor force participation of women and an increase in dual earner families, couples have two retirements to coordinate in later life. While an increasing number of studies has examined covariates of couples’ retirement decision, little is known on wives’ midlife work experience. This is important because wives’ midlife work experience will vary how couples arrange their retirements chronologically by influencing conditions of retirement. Interrupted labor force participation due to family responsibilities often results in insufficient retirement wealth accumulation and ineligibility to retirement benefits. Also, once their children leave home and family responsibilities is lessened, wives who have prioritized family role over worker role during childrearing years may want to devote their later life to career. Therefore, this study aims to examine associations between wives’ labor force participation experience in midlife and couples’ retirement coordination in later life. I hypothesize that a wife’s greater midlife work experience will predict a higher incidence of joint retirement of couples in later life. I measure the midlife work experience by following variables: the number of years of labor force participation, occupational status, and earnings. I will rely on longitudinal data from the Wisconsin Longitudinal Study that contains vast information on wives’ midlife work experience during their 30s to 50s as well as couples’ retirement decision in their 60s. Preliminary analyses suggest that wives with longer years of work experience in midlife are more likely to retire jointly with their husbands than to retire later than their husbands’.

THE INFLUENCE OF FINANCIAL LITERACY AND NUMERACY ON THE USE OF MONEY AND TIME ACROSS LIFESPAN
P. Liu, M. O’Bryan, Y. Hanoch, S. Wood, Claremont Graduate University, Pomona, California, 2. University of Plymouth, Plymouth, Devon, United Kingdom, 3. Scripps College, Claremont, California

This study examined propensity to plan for both money and time across lifespan. Research has demonstrated a relationship between credit card scores and a propensity to plan for money use (Lynch Jr. et al., 2009). However, there is limited research related to older adults and planning, although there is evidence that older adults approach planning differently than younger adults. The online survey conducted included the propensity to plan for time and time scale, a financial literacy assessment, and a numeracy scale. Currently, 265 participants have responded to our online survey. The participant age range is between 18 to 93 years old. We hypothesized that proficient skills in financial literacy and numeracy correlate with a high propensity to plan for money and time in the short-term and long-term across a person’s lifespan. In addition, older adults are better planners in short-term money and time use. Preliminary analysis demonstrated that age, financial literacy, and numeracy predict short-term money and long-term time propensity to plan (p < .01). In addition, older adults perform more poorly than younger adults in numeracy. Although older adults believe themselves to be better at financial literacy, they do not differ with younger adults on financial literacy.

CHANGES IN PLANNED RETIREMENT AGE AFTER THE 2008 STOCK MARKET CRASH
L.A. Martin, M.E. Szinovacz, A. Davey, Gerontology, Univ. of Massachusetts Boston, Boston, Massachusetts, 2. Temple University, Philadelphia, Pennsylvania

During the recent recession and the following stock market crash, many Americans experienced significant declines in their financial assets. The millions of individuals nearing retirement may have been hit the hardest, given what little time they have left to recover. Using data from the 2008 wave of the Health and Retirement Study (HRS), we explored whether timing of the interview (and thus exposure to divergent shifts in the stock market) influenced individuals’ reported probability of working after age 65. The HRS is a nationally representative dataset which surveys older adults bi-annually and thus lends itself to a natural experiment for study. Interview dates should be random and thus not be associated with retirement plans. Nevertheless, our results suggest that the 2008 stock market crash was a distinct event that influenced people’s retirement objectives. Our findings show that those interviewed in October 2008 or later reported significantly higher (a rise of approximately 7-8%) expectations of working beyond age 65 than those interviewed earlier in 2008. Results are robust and persist after adjusting for age and other demographics, health, pension type, income and assets, health insurance coverage, and diverse job-related variables. Multiple imputations were used to model incomplete data and analyses accounted for the complex survey design. These results suggest that planned retirement age responds to fluctuations in the economy. Future research should consider the how these differences in retirement expectations alter actual retirement behavior and adjustment. This presentation was supported by NIH grant R01AG013180, M. Szinovacz, PI.
DYNAMICS OF SOCIAL CONTEXTS AND CHANGES IN INDIVIDUAL EXPECTATIONS ON AGEING AND LATER LIFE IN TIMES OF WELFARE STATE REFORMS AND ECONOMIC CRISIS
A. Motel-Klingebiel, J. Simonson, O. Huxhold, German Centre of Gerontology (DZA), Berlin, Berlin, Germany

Resources, needs and evaluations are core dimensions of quality of life and pre-conditions for autonomy and life planning. Projections of older people’s future living standards in Europe predict declining levels and increasing inequality. Recent data from the German Ageing Survey (DEAS) demonstrate stable socio-economic resources and increasing inequalities. The most important trend is the increase in concerns about future living standards which is significant for social policy and social gerontology. Based on this data, the presentation calls for its sources and conclusions to be drawn. It presents descriptive information and results from multi-level modelling. It heightens awareness of changes in later life due to reforms and crises and will contribute to a wider understanding of multi-level interactions between individual resources, evaluations and societal dynamics. The hypothesis of social structure effects, the hypothesis of cohort change as well as the hypothesis of regional differentiation of inequality patterns are tested and mainly supported by the study. Analyzes apply structure equation modelling with longitudinal (autoregressive) cross-lagged models. Multiple group contrasts are used to differentiate between age groups. Individual panel data come from the German Ageing Survey (DEAS) – an enduring representative cross-sectional and longitudinal survey (40+, n=8,200 in 2008) in Germany, funded by the Federal Ministry for Family Affairs, Senior Citizens, Women and Youth (BMFSFJ). Investigations show that concerns and their development over time are unequally distributed and they interact with income and portfolio structures. However, they are partly independent of education and gender. Moreover, regional dynamics mirror strong context effects.

BOOMER MEN: PROSPECTIVE NEEDS FOR SERVICES
E.E. MaloneBeach, M. Hakoyama, Human Development and Family Studies, Central Michigan University, Mount Pleasant, Michigan

Baby boomers are expected to eschew the current array of senior services but no clear understanding of their future service needs has emerged. Boomer men (N = 32) aged 53 – 59, randomly selected from a larger study of prospective service users (N=225), were interviewed regarding their anticipated wants and needs as they approach retirement and later life. Qualitative questions addressed retirement/work, education, volunteerism, help, health, and aging. These participants, both those financially prepared and unprepared to retire, were unconcerned about what senior services they would use; they did not foresee needing services for another 20 to 30 years, if ever, and viewed services as something more appropriate for their parents. Nor did they see senior centers as a place for social activity or education; they felt that they had established good friendships already. Further, they felt that if they wanted to learn something, they could do it on their own. Some (76%) expected retirement to permit more family time, especially with spouses and grandchildren. Many hoped for a brief period of self-selected solitude, renewed attention to health and exercise, and social and church activity. Even those who reported that they were financially unprepared to retire expected to travel. Plans for volunteerism in retirement were typified by continuity in long-standing interests rather than by the addition of a new philanthropy. These findings were rife with negative stereotypes and suggest that senior centers may need an “image lift” even as they modify programming to meet the pending needs of boomer men.

UNDEREMPLOYMENT OF KOREAN OLDER IMMIGRANTS IN LOS ANGELES
M. Rhee, USC-Earth Sciences, Los Angeles, California

Despite the fact that employment is one of the critical components throughout people’s life course that affects their quality of life, little attention has been paid to the employment issues of ethnic minority older immigrants. Moreover, for Asian older immigrants who are known to be internally the most heterogeneous population groups, the uniqueness of many sub-ethnic Asian groups has been lost as they have often been lumped into Asians or Non-Whites. According to the existing literature, they face multiple employment barriers such as age and race discriminations in the labor market, lack of English sufficiency and limited social network. In addition, these barriers that they face in the labor market often lead them to underemployment. Thus, it is imperative to explore the quality of employment of Asian older immigrants. In order to fill such research gap, this study aims to examine the quality of employment of Korean older immigrants in Los Angeles. This study employed a mixed method approach of using both qualitative and quantitative data obtained from 36 Korean immigrants in Los Angeles who are 50 and older. The result of the study showed that 56.3% of the employed Korean older immigrants were identified as underemployed. Most of these underemployed Korean older immigrants were working part-time involuntarily. In addition, even those who worked full-time were engaged in jobs of minimum wage, jobs that did not reflect their career or education and jobs that had poor working environment such as long work hours and heavy workload without any fringe benefits.

AGE-RELATED CHANGES IN WORK MOTIVES AND IMPACTS ON WORK PERFORMANCE
D. Yeung1, H. Fung2, D. Chan2, 1. City University of Hong Kong, Hong Kong, Hong Kong, 2. The Chinese University of Hong Kong, Hong Kong, Hong Kong

This study investigated age-related changes in work motives among Chinese workers and examined their impacts on work performance. The study consisted of 355 Chinese clerical workers aged between 23 and 60 years (M = 40; SD = 9.1). Participants completed a set of questionnaires on work motives and work performance. Preliminary analysis demonstrated that older workers reported more intrinsic motives (r = .251, p < .001) and fewer achievement-oriented motives (r = -.106, p < .05) than younger workers. Age differences were also found in organizational citizenship behaviors (r = .106, p < .05) but not measures of core performance. Result findings of this study would contribute to the understanding of work motives of older workers and help to debunk the aging stereotypes that older workers do not perform as good as their younger counterparts.

SESSION 450 (POSTER)

FAMILIES, CARE WORK, AND EMPLOYMENT

FAMILY CONFLICT AND DISAGREEMENT EXPERIENCED BY HISPANIC FAMILY CAREGIVERS: A THEMATIC ANALYSIS
S.S. Koerner, Y. Shirai, R. Pedroza, Family Studies and Human Dev., University of Arizona, Tucson, Arizona

Research highlights the importance of family when Hispanic older adults are in need of care. Hispanic family caregivers (HCS) hold stronger familism beliefs than their non-Hispanic White counterparts, are less likely to use professional services, and hold off institutionalization in favor of family home care for longer periods. Despite the salient role of family in the Hispanic caregiving experience, surprisingly few research studies have investigated the possible negative aspects of family involvement from the perspective of HCs. To obtain a nuanced, emic look at family conflict/disagreement regarding care in the lives of HCs, we posed an open-ended question to 67 HCs of Mexican-descent, living in southern Arizona. 86.6% cared for an older parent; mean age of the caregivers and care-recipients (CRs) was 59.2 and 80.6 years, respectively. The caregivers described (in English or in Spanish) an example of a disagreement they have had with a family member regarding the care of their relative. Inductive thematic analyses conducted by a bilin-
gradual/bicultural coder (confirmed by a secondary coder) yielded 5 categories with 2-6 codes each. Example categories/codes include: (a) family non-involvement in caregiving (e.g., lack of interest, unwillingness to help); (b) family lack of understanding (e.g., unaware of CR’s health problems/needs); (c) opinion differences regarding CR or care arrangement (e.g., finances, placing CR into a facility); and (d) criticizing the caregiver (e.g., routine care, medical decisions). The range and emotional intensity of the responses weakens the idealized view of the Hispanic family caregiving experience. Implications for research and intervention are discussed.

**SIBLING CAREGIVING IN FAMILIES INCLUDING AN ADULT WITH INTELLECTUAL DISABILITY**
J.E. Mutchler1, C. Coyle1, J. Kramer2, 1. Gerontology, UMass Boston, Boston, Massachusetts. 2. Institute for Community Inclusion, UMass Boston, Boston, Massachusetts.

In this study we explore issues of sibling caregiving within aging families that include an adult with intellectual and developmental disabilities (IDD). In the 1930s, individuals with IDD had a mean age at death of 18.5 years; by 1993, the mean age at death was 66.2 years and many adults with IDD are now expected to live into their 70s. The increased longevity of persons with IDD—coupled with the relatively novel expectation that they will be life-long residents of the community with the support of appropriate services and informal assistance—prompts a rethinking of how support will be provided to this vulnerable population in later life. Indeed, current adults with IDD are among the first cohorts to routinely experience the frailty and death of their own parents—original and often primary supports—raising questions about how their siblings will respond. We report on a series of focus groups conducted with middle-aged and older adults who are caregivers of a sibling with IDD. Themes developed include “crises in care” that may occur when a parent becomes unable to provide support, or when conflicts with parents occur regarding support arrangements; challenges associated with socioemotional transitions in the sibling role, as the “parallel” relationship of sibling becomes more parent-like; and the search for supplementary support as the aging sibling with IDD experiences progressively greater need for support and services. Implications are discussed with respect to populations aging with disability, and sibling caregiving in later life.

**FAMILY RESILIENCE IN FAMILIES CARE FOR FRAIL OLDER ADULTS IN JAPAN**
F. Ishihara1, S. Shinomiya2, H. Osada1, 1. J.F. Oberlin University Graduate School, Tokyo, Japan. 2. Osada Laboratory, Tokyo, Japan.

Family caregiving for frail older adults can be demanding, and often caregiving responsibilities fall on a primary caregiver in the family. A family resilience approach expands such individualistic focus on a primary caregiver to involve all family members as a caregiving team. The concept of family resilience has been recently gaining attention in Japan; however, it has not been adequately applied to the caregivers for older adults. We conducted a preliminary study to examine whether the concept of family resilience was recognized and regarded as worthwhile by family caregivers. We interviewed two primary family caregivers. We made 55 items based on Walsh’s key processes (2006) in family resilience, and asked the caregivers how well they felt each item described their families. We also asked them whether they thought the concept of family resilience would help caregiving or not. Some of the items were “approaching caregiving as a shared challenge”, “seeing difficulties as understandable”, “having a hope”, “accepting what cannot be changed”, “having a mutual respect”, and “respecting individual needs”. Both participants were women and cared for their parents with dementia. Initially they appeared to have hard time thinking about caregiving in the perspective of family resilience, and tended to focus on responsibilities and challenges they had by themselves. However, they gradually grasped the idea of family resilience and possibility of applying it to caregiving. With more data, the development of a checklist for caregivers to help improve their family resilience might be needed in further study.

**INTERPERSONAL FUNCTIONING IN PARKINSON’S DISEASE: A DYADIC ANALYSIS OF VETERANS AND CAREGIVERS**

Objectives: Parkinson’s disease (PD) significantly impacts both patient and caregiver emotional and physical health. However, despite the importance of social relationships for wellbeing, few studies have examined the association between caregiver and patient-related characteristics and interpersonal functioning in PD. This pilot study sought to examine both PD caregivers’ and patients’ perceptions of positive and negative aspects of their marital relationship and the association between various patient and caregiver characteristics and relationship functioning. Methods: Participants included 25 married veteran-caregiver dyads. All veterans were diagnosed with idiopathic PD and received care at the Philadelphia VA Medical Center. Couples completed an assessment battery that included measures of sociodemographics, physical and mental wellbeing, caregiver burden, mastery, satisfaction, and marital/relationship functioning. Results: The majority of the sample was older (MVeteran=72.3 yrs, MCaregiver=68.4 yrs) and Caucasian. Veterans had PD for an average of 11.8 years (SD=7.0). Compared to their caregivers, veterans reported greater marital satisfaction (p=.04). There was also a trend whereby veterans reported more negative exchanges with their partners (p=.07), and significantly more exchanges marked by unsympathetic/insensitive behavior (p=.05) and unwanted advice/intrusion (p=.003). Correlates of veterans’ and caregivers’ relationship indices included caregiver mood (e.g., anxiety, depression) burden, mastery, and satisfaction. Overall life satisfaction and perceived benefits of having PD also were associated with relationship functioning. Veteran mood and physical functioning were unrelated to relationship variables. Conclusions: Perceptions of relationship functioning and quality relate to wellbeing and vary across PD patients and caregivers, with caregiver characteristics having a significant association with marital functioning for both groups.

**AN ALZHEIMER’S DISEASE CAREGIVER’S DILEMMA: REASONS FOR PROVIDING CARE AT HOME OR IN A NURSING HOME**
M.C. Miller1,2, M. Lane3, D. Davis1, 1. Epidemiology and Biostatistics, University of South Carolina, Columbia, South Carolina. 2. Office for the Study of Aging, Columbia, South Carolina.

A qualitative study was conducted to determine reasons that caregivers of individuals with Alzheimer’s disease (AD), eligible for nursing home placement, decide to care for their loved one at home or in a nursing home. Cases (n=384) were identified as caregivers of a nursing home residents and controls (n=312) were identified as caregivers of individuals staying in the community. Participants’ comments were independently reviewed and analyzed by two researchers (MM and DD) using QSR NVIVO7. The researchers identified themes based on supporting comments, then met on a frequent basis to discuss and compare the themes they separately identified. The researchers discussed inter-rater coding issues until agreement was reached. The results of the qualitative analysis showed that cases most frequently reported the following themes: health problems of the individual with AD (n=219), behavior
problems of the individual with AD (n=121), and caregiver feelings of being overwhelmed (n=117). The controls most frequently reported the following themes: sense of obligation to the individual with AD (n=161) and belief of better care at home (n=148). These results suggest that both the caregiver’s situation and the needs of the individual with AD play a major role in the decision where to care for the individual with AD.

PERSPECTIVES ON AGING: HOW CAREGIVING INFLUENCES ADULT DAUGHTERS’ VIEWS ON LATER LIFE

N. Pope, Social Work, Ohio University, Athens, Ohio

Planning ahead for long-term care needs is vital to health and well-being in later life. Approximately 70% of people who live beyond age 65 will need some type of assistance in their daily functioning (USDHHS, 2008). Planning ahead for aging is influenced by contextual factors such as access to resources, the cultural emphasis on acute rather than chronic conditions, and quality of family relationships (Pinquart, Sorensen, & Peak, 2004; Roberto, Allen, & Bleizner, 2001; San Antonio & Rubenstein, 2004). However, caring for an aging parent is one contextual factor that has been given limited attention in the research on planning for old age. Therefore, the purpose of this study was to explore how being a caregiver affected adult daughters’ perspectives and subsequent decision making about their own late life. This qualitative study utilized an interpretive design and included in-depth interviews with 15 participants who were selected using criterion sampling. The sample included female caregivers between the ages of 50 and 65 who self-identified as the primary caregiver to a parent or parent-in-law with an illness and disability. Interview transcripts were analyzed individually and then collectively using open and focused coding, constant comparison, and memo-writing. Analysis revealed that caregiving for a parent influenced daughters in five ways including making them aware of aging and provoking age-related fears. Implications based on these findings will be presented and as well as recommendations for future research.

THE ROLE OF EMPLOYMENT AND WORK DISRUPTION IN MENTAL HEALTH OF DEMENTIA CAREGIVING DAUGHTERS

L.J. Ficker, P.A. Lichtenberg, Wayne State University Institute of Gerontology, Detroit, Michigan

The objective of this study was to examine the patterns and context of employment and work disruption and understand the extent to which these contextual variables relate to mental health among dementia caregiving daughters. Data were extracted from the REACH study (Resources for Enhancing Alzheimer’s Caregiver’s Health) that gathered information from dementia caregivers at six research sites across the nation. Close to half the sample of 486 dementia caregiving daughters was White Non-Hispanic (44.9%), and the other half was roughly evenly divided between African American (29.8%) and Latino daughter caregivers (24.3%) with an average age of 51.8 years (SD = 10.09 years). Results for employment status indicated that caregiving daughters who were employed reported the lowest number of depressive symptoms and chronic health conditions. In contrast, the unemployed and homemakers were most vulnerable to mental and physical health problems, despite being virtually the same age, having care recipients with similar levels of ADL impairment, and similar amount of leisure activities as the employed caregivers. Work disruption was associated with being single, and it was related to higher rates of financial strain, poor physical health and depression. Traditionally, work has been conceptualized as a role strain for caregivers, however; it appears that employment plays a role in preventing role engulfment for these middle-aged filial caregivers and that work disruption increased risk of depression.

TRAUMA AND AGING: EXPLORING THE EXPERIENCES OF FAMILY CAREGIVERS OF HOLOCAUST SURVIVORS

K.A. Anderson, N.L. Fields. College of Social Work, The Ohio State University, Columbus, Ohio

Researchers and practitioners often note the importance of family history in understanding the experiences of family caregivers to older adults. In many cases, family history helps to determine who provides care, the manner in which care is provided, and the way that caregivers and care recipients fare in process. In the current study, the researchers explored the experiences of family caregivers to older adults with a unique history, specifically older adults who survived the Holocaust. While a substantial body of research has focused on Holocaust survivors, far less is known about the impact of this early life trauma on the caregiving process. Using qualitative methods, the researchers conducted telephone interviews with 17 family caregivers to Holocaust survivors (N = 17). Content analysis revealed several themes, including: (a) caregiver stress and burden, often related to the early life trauma; (b) strong feelings of obligation to care for this group given their history; and, (c) guilt in complaining about the stress of caregiving. These findings suggest that while family caregivers to Holocaust survivors may feel a heightened sense of duty and high levels of burden, they may also feel reluctant to seek support and assistance in light of the past trauma endured by the care recipients. While Holocaust survivors are certainly a special population, additional research may reveal that family caregivers to survivors of other types of trauma (e.g., veterans, refugees) may enjoy similar reactions to providing care – an important consideration for professionals working with families with such histories.

TAKING CARE OF A PARENT WITH MILD COGNITIVE IMPAIRMENT: AN EXPLORATION OF COPING MECHANISMS

L. Ermann, N. Brossoie, K.A. Roberto, R. Blieszner, Center for Gerontology, Virginia Tech, Blacksburg, Virginia

Caregiving is a dynamic process of transitions and changes that evolves over time. Guided by Montgomery and Kosloski’s Caregiver Identity Theory (2000), we explored the coping mechanisms employed by adult children providing support to a parent with Mild Cognitive Impairment (MCI) and changes in the use of coping strategies over time. In-depth qualitative interviews were conducted with 27 adult children soon after their parent received a diagnosis of MCI and again approximately 12- and 24-months thereafter. Two primary findings emerged from our analysis: adult children of parents with MCI (1) employed a variety of coping mechanisms to manage their stress at different times in the care process that included avoidance (i.e., distancing), psychological reframing (i.e., acceptance), self-care (i.e., exercise), and external engagement (i.e., seeking support) and (2) often struggled with their care partner role and the additional and sometimes unexpected responsibilities like managing money, providing transportation, and assisting with household tasks. Many adult care partners responded to their changing roles by expressing frustration or disappointment, although some still viewed their care partner experiences as generally positive. Consistent with the Caregiver Identity Theory, study participants discussed the stress generated by a perceived incongruity between their expected roles as adult children and the reality of their roles as care partners. Findings suggest that social workers and other mental health professionals who work with adult children of parents with MCI can better assist their clients by educating families about MCI and exploring effective coping mechanisms for dealing with stress.

COUPLES PERCEPTIONS OF FIBROMYALGIA SYMPTOMS: THE ROLES OF DEPRESSION, CONCEALMENT AND COMMUNICATION

K.S. Lyons, K.D. Jones, R. Bennett, S. Hiatt, L.M. Miller, Oregon Health & Science University, Portland, Oregon

Fibromyalgia (FM) is a common, debilitating and costly rheumatic pain syndrome, with lifetime prevalence in women nearing 7%. Cur-
rent treatments are often ineffective in alleviating symptoms and restoring long-term functioning. The challenges of chronic pain on the married couple increase the need to identify those at risk and provide appropriate interventions to the couple. Patients can feel stigmatized by family members who feel the validity of their illness, yet symptom incongruence in couples with chronic pain is not well understood. The primary goal of the study was to examine PT-Spouse (SP) incongruence in perceptions of PT pain, fatigue, and function. Using multilevel modeling, Level 1 data on 188 couples (aged 26 to 84) revealed that SPs, on average, rated PT fatigue significantly lower than PTs, whereas incongruence was not significantly different from zero, on average, for pain interference and physical function. There was significant variability around the average for all three variables (p < .001). Level 2 models found PT depression and SP role overload to be significantly associated with how high the couple rated each symptom and PT depression, quality of the relationship, and couple communication to be significantly associated with incongruence between PT and SP. Additionally, higher levels of communication problems and concealment within the couple were significantly associated with higher levels of depression, anxiety, and anger in both spouses, lower social support for the couple, and occurred more often in younger couples. Findings will be discussed in light of PT depression and need for communication-based interventions.

**VIEWING FAMILY CAREGIVING THROUGH TWO METHODOLOGIC LENSES: EPIDEMIOLOGIC VERSUS FEMINIST**

E. Byun, University of Pennsylvania School of Nursing, Philadelphia, Pennsylvania

Family caregiving is an increasingly common phenomenon throughout the world since the life expectancy of human beings has increased. In the United States, approximately 66 million people serve as informal caregivers of family or friends who are elderly, chronically ill, or disabled. Approximately 66% of caregiving to family members is provided by women. The purpose of this poster is to compare and contrast the phenomenon of family caregiving through two methodological lenses: epidemiologic and feminist differences in how the two types of inquiry approach the phenomenon of family caregiving differently are identified and analyzed. The phenomenon of family caregiving can be investigated objectively through epidemiologic methods to describe family caregivers, their geographical distribution, the causes or trends of family caregivers’ health-related issues, and the experiences of populations of family caregivers. The epidemiologic perspective is limited in its ability to provide a clear understanding of individual experiences. A feminist methodology can reveal and explain experiences and interpretations of individual family caregiving from a woman’s perspective. Feminist methodology can also frame other questions: “Is there gender equality in primary family caregiving?” and “What power dynamics between genders make women more often become family caregivers?” No single perspective, however, can fully explain the phenomenon of family caregiving. Comparing findings using both epidemiologic and feminist methodologies offers insight into the population of family caregivers as well as into individual family caregivers’ experiences and can influence policymakers addressing health policy for family caregivers.

**INFORMAL ELDER CARE AND ABSENTEEISM AT THE WORKPLACE**

U. Schneider, M. Zaba, B. Trukeschitz, Research Institute for Economics of Aging, Vienna University of Economics and Business, Vienna, Austria, Austria

Taking up care responsibilities often involves formal and informal adjustments of the employment situation by employees with caregiving commitments and/or their employers. The effects of care obligations on worker behaviour have been the subject of various studies in care research. Yet research tends to focus on carers’ labour force participation rates, working hours or hourly pay rates. Our work focuses on the impact of informal elder care obligations on workplace behaviours, with a specific focus on absenteeism. Although caregivers’ higher probability to miss days at work is often assumed in the literature few studies provide empirical evidence. We use data from the European Working Conditions Survey to investigate the relation between informal elder care and the occurrence of absenteeism in 31 countries. We analyse the impact of caregiving on the likelihood of absenteeism and on the duration of health related absenteeism (number of sick days), paying specific attention to effects of the workplace environment on this relation. We hypothesize that caregivers exhibit a higher degree of absenteeism than non-caregivers and that the factors influencing absenteeism differ between caregivers and non-caregivers. In addition we draw on Austrian data to explore other workplace effects of informal caregiving. Our results clearly indicate that caregivers are more likely to miss days at work than non-caregivers. Furthermore, different variables are significant in carers’ and non-carers’ absenteeism equations. Thus improving the reconciliation of work and care clearly needs to be addressed in policy development and firms’ human resources management.

**WORKING WOMEN’S DECISIONS TO WORK OR TO CARE**

O.H. Jolanki, Social Sciences and Philosophy, University of Jyväskylä, Jyväskylä, Finland

This study looks at working women’s decisions to work or give up work for care responsibilities. The data come from 48 qualitative interviews of middle-aged Finnish women helping older parent(s) or in-laws. Discourse analysis offered the method to study the interviewees’ self-identification with work and care. The findings showed that the interviewees did not necessarily identify themselves as care givers but as workers. The decisions not to give up work were supported with several arguments such as financial, social and personal meaning of work. Work was constructed important as a source of income and for social relations but also for the work itself as a meaningful activity. Own age was also given as a reason not to leave work. Work opportunities were constructed as precarious and re-employment unlikely ‘at my age’, which implies experiences of ageism at the work-life. Those who identified with care giving constructed caring as meaningful activity while work had lost meaning with age or due to work re-organisation.

**SESSION 455 (POSTER)**

**GENDER ISSUES**

**PHYSICIANS’ BELIEFS ABOUT BARRIERS TO CORONARY ARTERY DISEASE CARE**

To understand the barriers to coronary artery disease (CAD) care women face, from a physicians’ perspective, one hundred physicians, half cardiologists, and half primary care providers currently treating women with CAD were surveyed about their experiences and perceptions involving patients with CAD via an online survey tool. These physicians were members of a physician-only online panel and were asked about their experiences and perceptions involving patients with CAD. Physicians were paid $50-$60 for their participation (cardiologists received the $60 rate). The physicians had a mean age of 40 years and were 80% male; about 52% were part of a large practice and 86% practiced in a metropolitan area. About half (54%) of the physicians said their female patients face barriers to CAD care that their male patients do not. Of these, nearly all (90.7%) responded that most or some of their female patients have denial of their heart problems while 88.9% said most or some had a fear of treatment. Most (79%) indicated they
saw differences between their male and female patients’ CAD symptoms. The most common difference (36.7%) was atypical/different symptoms among women. However, only 15% indicated there was a difference in the treatment prescribed. When asked what differences they noticed between their male and female patients’ reactions to being told of their CAD diagnosis, 40.9% responded that there was “More surprise / Disbelief among women”. Women face unique challenges when it comes to receiving care for CAD including atypical presentation and fear or denial of the disease.

EXPLAINING EXCESS DISABILITY IN THE HISPANIC EPESE
A.R. Aiken1, J.L. Angel2, T.P. Miles2. 1. Public Policy, University of Texas at Austin, Austin, Texas. 2. University of Louisville, Louisville, Kentucky

Older women suffer excess lower-body dysfunction (LBD) compared to men. Established risk factors for LBD include age, chronic disease, and incontinence, yet traditional models do not take obstetrical history into account. Thus, the effects of pregnancy on LBD in populations with high fertility rates, such as the Mexican-American population, are unknown. We hypothesize that a high number of pregnancies is associated with increased LBD beyond the standard risk factors. We employ the HPESE cohort to study the relationship between obstetrical history and LBD, and use ordinal logistic regression to estimate the association between number of pregnancies and chair-rise dysfunction. A set of five models is presented, examining the impact of pregnancy in the context of other explanatory variables. A higher number of pregnancies is associated with increased difficulty performing the chair-rise, even when a wide range of established risk factors is taken into account: beta=0.035, p=0.0186, lambda= Best-Good -1.15 74; Good-Moderate -0.2321; Moderate-Poor 0.4601; Poor-Unable to do 1.6394. Our results have direct implications for explaining a key source of gender inequality in LBD. We propose that pregnancy induces pelvic damage which distally unmasks as functional reserves decline with age. Furthermore, the women in our study are of both US-born and foreign-born origin, and further analyses will explore the possibility of differential effects of nativity, and life-course stage of migration, on LBD.

HEALTH-AWARENESS AS AN AGE-BASED POWER RESOURCE: GENERATIONAL RELATIONS IN INTERVIEWS WITH YOUNGER WORKING-CLASS MEN
H. Ojala1, I. Pietila1. 1. School of Social Sciences and Humanities, University of Tampere, Tampere, Finland. 2. University of Tampere - School of Health Sciences, Tampere, Finland

Demographic changes reshape age relations in Western Europe and USA. In many disciplines longer life-expectancy has recently increased life interest in later life. Despite this it is also worth considering how age relations are undergoing reformulation among the working-aged population. This paper focuses on interpretations of age and health on the basis of interviews with Finnish male industrial workers under 40 years old. The interviews were analyzed to explore how these men conceptualize the interrelations between age and health, and the age-categories constructed thereby. As ‘health’ is quite an abstract term for healthy young men, our interviewees approached age and health by considering other men, not themselves. When referring to older men, they often depicted their fathers’ generation in terms of frailty and irresponsibility for health. The study suggests that health-awareness is becoming a constituent of age relations involving dimensions of inter-generational gendered power.

MASCULINITY AND UNEMPLOYMENT: GENDER STYLE AND AGE DIFFERENCES
B.F. Turner, Gerontology Institute, University of Massachusetts Boston, Newton Highlands, Massachusetts

This timely study uses life course perspectives to examine gender style and age differences in men’s responses to the stresses of unemployment and underemployment. The cross-sectional Boston Gender Study of 237 men aged 19-87 years applied Huyck’s gender style measures to qualitative responses of personally defined gender; data were gathered during a recession with accompanying job and income loss. Analyses focused on men coded for 3 culturally conventional masculine styles: Leaders, who define their masculinity in terms of work achievement; Family Men, who define it in terms of protecting and providing for their families; and Macho men, who define their masculinity in terms of physical strength and aggression. In this sample, most men’s wives were employed. Research commonly shows that family abuse and conflict rates increase when men lose their jobs; Macho men may be more likely than other men to respond this way. Stage of the family life cycle was central for laid-off Family Men; though they still felt stressed, if the kids had completed college then, implicitly, their job as family men was mostly done. Age and family life cycle differences were muted among Leaders. Among Macho men, blue-collar men and alcoholic men tended to exit the workforce in midlife; men in recovery programs such as AA were less likely to report recent domestic violence. Quotes illustrate patterns of gender style and age differences in masculine self-assessments when men lose their jobs.

THE ASSOCIATION BETWEEN BODY SATISFACTION AND DEPRESSION AMONG AGING AFRICAN AMERICAN AND EUROPEAN AMERICAN WOMEN
N. Sabik. psychology, University of Michigan, Ann Arbor, Michigan

Body image is an important predictive variable, as many researchers have linked feelings about the body to self-worth and well-being. In particular, there is a significant association between body dissatisfaction and various forms of psychopathology, particularly depression, among younger women (Santos, Richards, & Bleckley, 2007). However, there has been little research that has examined the impact of body image on mental health among older women (Peat, Peyerl, & Muehlenkamp, 2008), and to date, no empirical studies have tested the association between aspects of body satisfaction and depression among older women. This project addresses this absence by examining how body satisfaction in two domains—appearance (e.g., skin complexion, hair color, facial features) and function (e.g., muscle tone and definition, physical strength, physical coordination)—are associated with depression among African American and European American women ages 65 and older (n=250). Regression analyses indicated that for both European American and African American women, satisfaction with body function was significantly associated with depression. Interestingly, satisfaction with body appearance was not related to depression. These findings indicate that for older women, aspects of the body that are relevant for predicting depression concern with the functionality of the body, and appearance is less relevant. These findings differ from those reported about younger women, for whom appearance concerns are central in predicting depression. The implications of this pattern unique to older women will be discussed.

AGING IS SKIN DEEP: AFRICAN AMERICAN WOMEN’S PERCEPTIONS OF SUCCESSFUL AGING AND MARGINALITY
J. Manning Dantis, Sociology and Gerontology, Miami University, Oxford, Ohio

Despite a large body of information on successful aging, there still remains a disconnect in the understanding of how marginalization of individuals based on the intersection of socially constructed identities, old, female and black/African American, influences their perceptions of successful aging. Norms that are set by society have resulted in negative typecasting of minority aging. In order to understand these issues, older African American/black women were recruited to participate in this qualitative study. First, their perspectives of successful aging based on intersecting identities of race, gender, and age were explored. Second, their views of identities were examined using a positive margin-
variable. Significant racial/ethnic differences were found in prevalence was conducted using binge drinking in the past year as the dependent variable. Data were drawn from the 2007 California Health Interview Survey (CHIS). A hierarchical logistic regression analysis by race/ethnicity. The results have potential implications for feminist gerontology exploring aging body issues.

**MASCULINE DEPRESSION SCALE DETECTS ADDITIONAL SYMPTOMS IN OLDER MEN WHO ENDORSE HIGH MASCULINITY**

E. Price, J.J. Gregg, M. Smith, P. Prentice, T. Fallen, S. Nazem, A. Fiske, West Virginia University, Morgantown, West Virginia

The prevalence of depression is higher in women than in men at all ages. A range of biological, cognitive, and environmental differences may explain the lower rates of depression in men. Alternatively, it has been proposed that social role differences may lead to under-detection of depression in men. The Gendered Responding Framework suggests that individuals who more strongly endorse a masculine gender role may be more likely to display externalizing symptoms (e.g., anger or substance use) and less likely to report traditional depressive symptoms (e.g., crying) in response to negative life events (Addis, 2008). Magovcevic & Addis (2008) developed the Masculine Depression Scale (MDS) in order to assess symptoms thought to be more common in masculine individuals. The aim of this study was to examine the relation of adherence to masculine gender role to responses on the MDS and a well-established measure of depression, the Center for Epidemiologic Studies Depression Scale (CES-D). Eighty-eight community-dwelling men and women (Mean age = 74.74, SD = .17) completed paper-and-pencil questionnaires. Among men, but not women, masculine gender role endorsement moderated the relation between CES-D and MDS scores, F (3, 24) = 15.83, p = < .001. The relation between the MDS and the CES-D was stronger for men with lower scores on the masculine gender role measure than for men with higher masculine gender role endorsement. Our results suggest that traditional measures of depressive symptoms may under-detect externalizing symptoms of depression in masculine older adult males, especially in those who report few traditional symptoms.

**SESSION 460 (POSTER)**

**HEALTH RISK IN OLD AGE**

**RACIAL/ETHNIC DIFFERENCES IN PREVALENCE AND CORRELATES OF BINGE DRINKING AMONG OLDER ADULTS**

A.N. Bryant, G. Kim, Psychology, The University of Alabama, Tuscaloosa, Alabama

This study examines how binge drinking among older adults varies by race/ethnicity. Data were drawn from the 2007 California Health Interview Survey (CHIS). A hierarchical logistic regression analysis was conducted using binge drinking in the past year as the dependent variable. Significant racial/ethnic differences were found in prevalence rates: bingeing was most common among non-Hispanic Whites (11.9%), followed by Latinos (10.8%), American Indian / Alaskan Natives (9.8%), Blacks (8.0%), and Asians (4.2%). Being a current smoker was found to be the strongest predictor of bingeing and was significant for all racial/ethnic groups with the exception of American Indian / Alaskan Natives. Demographic predictors that appeared to be consistent throughout different racial/ethnic groups included younger age and being male. Racial/ethnic specific predictors were also found such as the presence of psychological distress for non-Hispanic Whites and obesity for Asians. Identification of more racial/ethnic predictors may be important for the development of racial/ethnic appropriate interventions.

**A COMPARISON OF RISK FACTORS AND HEALTH OUTCOMES ACROSS THREE GENERATIONS OF WOMEN: FINDINGS FROM THE AUSTRALIAN LONGITUDINAL STUDY ON WOMEN’S HEALTH**

J.E. Byles, N.A. Pachana, L. Tooth, Faculty of Health, The University of Newcastle, Newcastle, New South Wales, Australia. 2. The University of Queensland, Brisbane, Queensland, Australia

This paper presents longitudinal data on changes in the health of three large cohorts of women as they age, and compares health trajectories of women in their 20’s-30’s, 40’s-50’s and 70’s-80’s. The three cohorts are from the Australian Longitudinal Study on Women’s Health and were born in 1921-26 (aged 70 to 75 years when the study began in 1996), 1946-51, and 1973-78. The women have now been surveyed five times over 14 years providing a large amount of data on their lifestyles, use of health services and health outcomes. The data provide a unique opportunity to explore health and health behaviours at three critical stages in women’s lives, and to compare the differences between cohorts. Both age and cohort effects are apparent in the results. While older women have the highest prevalence of chronic conditions and health care needs, there are major differences in the risk factor profile, lifestyle factors, and disease incidence of the younger cohorts that foreshadow that these women may have different health needs and higher rates of disability as they age. A most striking difference is the increasing incidence of overweight and obesity among the women in the youngest cohort. This impact of this problem for women in the study can already be seen in the strong associations between overweight and obesity and chronic disease, poorer mental and physical health, and higher health care costs. The implications of these changes, and opportunities for prevention at different points in the lifespan will be discussed.

**HEALTH-BEHAVIOUR CHANGE IN OLDER NEW ZEALANDERS: FINDINGS FROM THE HEALTH, WORK AND RETIREMENT STUDY**

F. Alpass, C. Stephens, A. Towers, Psychology, Massey University, Palmerston North, New Zealand

Smoking, alcohol consumption and physical activity are key health behaviours and important determinants of poor health outcomes in older adults. A number of factors have been identified that influence change in such health behaviours including demographic factors, social factors and public policy. We examined how demographic and socioeconomic factors influenced the likelihood of quitting smoking, reducing alcohol consumption and becoming physically inactive for New Zealanders aged 55 to 70 years. Participants (N=2,484) from the two waves of the New Zealand Health, Work and Retirement Study completed surveys in 2006 and 2008. Income was a factor in smoking cessation with those on higher incomes more likely to have stopped smoking over the 2-year survey period. Women with problematic drinking were more likely to have reduced their alcohol consumption over the same period compared to men, however they were also more likely to become physically inactive. Reductions in smoking and alcohol consumption were unrelated to health-related quality of life (SF36) however, those that remained physically active reported higher mental and physical health scores on the SF36 than those who became inactive over the two-year survey period. Possibilities for targeted health interventions are discussed.
ALCOHOL USE IN OLDER AGE: DOES MODERATE CONSUMPTION PROMOTE HEALTH-RELATED QUALITY OF LIFE?

There is mounting evidence that low to moderate alcohol consumption in older age is associated with reduced mortality and is protective against the onset of certain chronic health conditions. However, few studies have examined the causal association between moderate alcohol consumption and health-related quality of life (HRQL) over time. Data came from the Canadian biennial National Population Health Survey (1994-2008). HRQL was assessed with Health Utilities Index Mark 3 (HUI3), a validated, multidimensional instrument. Moderate alcohol consumption was defined as < 15 or < 8 drinks per week for males and females, respectively. The prospective study design focused on individuals aged 50 and older at baseline who were in good health (i.e., absence of major chronic conditions and excellent, very good, or good self-reported health) with stable moderate drinking behavior for at least 6 years prior to baseline (n = 1,495). Correlational analysis was performed to assess the direction and strength of the relationship between moderate alcohol use and HUI3 data cycles (2000, 2004, and 2008). Surprisingly, moderate alcohol consumption and HUI3 were nearly independent (r < 0.10, p = n.s.) after adjusting for variability in pre-baseline HRQL and consumption levels. The cross-lagged path analysis revealed similar results and showed the absence of a reciprocal relationship between alcohol use and HRQL. In a nationally representative sample of community dwelling older adults, this study suggests that moderate alcohol use and HRQL are largely unrelated to one another. The strengths, weaknesses, and implications of the results are discussed.

DAILY ALCOHOL USAGE, STRESS, AND HEALTH: FINDINGS FROM THE NATIONAL STUDY OF DAILY EXPERIENCES

M. Horn Mallers1, S. Neupert2, L. Zettel-Watson3, 1. Human Services, CSU Fullerton, Fullerton, California, 2. Penn State, College Park, Pennsylvania, 3. CSU Fullerton-Psychology, Fullerton, California

Given the increasing prevalence of later-life problem drinking and its subsequent health consequences, the present study extends current scientific understanding of the interconnections between alcohol use, stress, and health outcomes across adulthood. While previous literature documents a strong link between health outcomes and at-risk binge drinking (5 or more drinks for men and 4 or more drinks for women), little is known about the relationship between moderate drinking and well-being. The limited literature on the latter topic comes primarily from small samples, which limit the ability to generalize findings or draw accurate conclusions. Thus, to explore the link between stress, health, and moderate alcohol use (daily consumption of 3-4 drinks for men, and 2-3 drinks for women), daily diary data was collected from over 1000 people aged 25-64 from the National Study of Daily Experiences (NSDE), a sub-sample take from the Midlife in United States (MIDUS) study. Overall, respondents engaged in moderate drinking on 13.68% of study days, and alcohol use was related to both daily physical health symptoms and mood, as well as social network stressors. Stressorreactivity models shedding light on coping processes among aging adults will be presented. Given the large number of middle-aged adults in the U.S. and their present alcohol use, such findings will be critical from a public health perspective as this cohort (i.e., the baby boomers) enters later life.

THE LEVEL OF FRAILTY RISK IN JAPANESE ELDERLY WOMEN AND ITS RELATED FACTORS

H. Uchida1, Y. Fujiwara1, S. Shinkai1, Y. Yamashita1, Y. Hori1, T. Nishigaki1, H. Toji1, Y. Hasegawa1, 1. University of Hyogo, Himeji, Japan, 2. Tokyo Metropolitan Institute of Gerontology, Tokyo, Japan, 3. Department of Long term care insurance, Himeji City Office, Himeji, Japan, 4. Himeji City Aboshi Health and Welfare Service Center, Himeji, Japan

This study was to determine the level of frailty risk and to clarify its related factors among the community-dwelling Japanese elderly women. The participants were 120 (aged 73.2±4.3) elderly women who lived in Himeji City, Hyogo, Japan. We distributed a questionnaire including age, family structure, self-rated health, short version of Geriatric Depression Scale (GDS), lifestyle behaviors (hobbies, gardening, walking, sports activities etc.), and frailty checklist (homeboundness, falls and poor nutrition), and also measured height, body weight, body mass index and physical fitness tests (grip strength, walking speed, standing on one leg with eyes open). We carried out a survey in November and December 2010. Selected variables were compared after dividing the participants into “Frailty high risk group (HR)” and “low risk group (LR)”. The number of “HR” was 19 (15.8%). HR had significantly higher “age” (P<0.05) and “GDS score” (P<0.01), and lower frequency of “walking” and shorter time of “standing on one leg with eyes open” (P<0.05, respectively) than those of LR. From the results of multiple logistic regression analysis using the step-wise method, there was a significant relationship between HR and high score of GDS (Odds ratio: 1.239, 95%CI: 1.029-1.492) and low frequency of walking (Odds ratio: 3.405, 95%CI: 1.16-10.389), adjusted for age and standing on one leg with eyes open. This study found that walking activity and mental health status were predictive of frailty risk in the community-dwelling elderly women and that these associations were independent of related factors.

SESSION 465 (POSTER)

HEALTH, MORBIDITY, AND MORTALITY TRENDS AMONG OLDER ADULTS

AGE AND DISTANCE TO DEATH AS PREDICTORS OF HEALTH AND FUNCTIONING IN NONAGENARIANS – TRENDS FROM 1996 TO 2007

M. Jylha, T. Sarkela, T. Luukkaala, M. Hurme, A. Hervonen, School of Health Sciences, University of Tampere, Tampere, Finland

The life expectancy is increasing also in the oldest-old, but trends of health and functional status are not clear. This study concentrates on the last five years of individuals aged 90 years or older. In the Vitality 90+ study, information was collected of functional status, major diagnoses and self-rated health of all home-dwelling individuals aged 90+ in the city of Tampere in 1996 and 1998, and of both home-dwelling and institutionalized people in 2001, 2003, 2007. In each wave, the response rate was ca 80% Mortality, including dates of death, was followed until 2010. Our research questions are, (1) to what extent are health and functioning in nonagenarians dependent on age and the distance to death, respectively, and (2) are there time trends in health and functioning in nonagenarians in the last years of life? The results reflect the complex dynamics between increasing life expectancy and health at the end of life, and imply that both age and distance to death are important determinants of functioning.
SOCIAL INEQUALITIES IN COMPLEX HEALTH PROBLEMS AMONG THE OLDEST OLD IN SWEDEN 1992 - 2002
S. Fors, B. Meinow, M.G. Parker, M. Thorslund, Aging Research Center, Stockholm, Sweden

A growing body of research now show that substantial social inequalities in health prevail into old age. However, the bulk of these studies have used conventional health indicators, thus disregarding the complex nature of health in very old age. This study examines social inequalities in complex health problems among the oldest old (aged 77+) in Sweden during the period 1992 to 2002 and explores the development of these inequalities during this period. Data from the Swedish panel study of living conditions of the oldest old (SWEOLD) from 1992 and 2002 were used to study the association between socioeconomic position and a composite measure of complex health problems (encompassing three different health domains: a) diseases and symptoms, b) impaired mobility, and c) impaired cognition and communicative abilities). The main results were threefold: i) the prevalence of complex health problems increased over the period, ii) the social inequalities in the risk of having problems in one health domain decreased during the period whereas, iii) the social inequalities in having simultaneous problems in several health domains remained unchanged. The results suggest that the social inequalities in single domain health problems among the oldest old problems decreased, whereas the social inequalities in multidimensional health problems remained constant over the period. These findings illustrate the importance of using health indicators that adequately reflect the complex nature of health in later life when studying health inequalities among the oldest old.

RACE, DEPRESSION, AND PERFORMANCE-BASED MOBILITY OVER TIME: THE HEALTH, AGING, AND BODY COMPOSITION STUDY
L.C. Barry†, R. Thorpe†, K. Yaffe‡, B. Penninx§, C.R. Womack‡, A.B. Newman*, E.M. Simonsick*, 1. Internal Medicine, Yale University School of Medicine, New Haven, Connecticut, 2. Johns Hopkins Bloomberg School of Public Health, Baltimore, Maryland, 3. University of California, San Francisco, San Francisco, California, 4. VU University Medical Center, Amsterdam, Netherlands, 5. University of Tennessee, Memphis, Tennessee, 6. University of Pittsburgh, Graduate School of Public Health and School of Medicine, Pittsburgh, Pennsylvania, 7. National Institute on Aging, Baltimore, Maryland

The inverse association between depressive symptoms and physical functioning in older persons is well-established, yet whether race modifies this association is unknown. We evaluated the association between depressive symptoms and performance-based mobility, within race strata, over 6 years. Participants included the 2,324 members of the Health, Aging, and Body Composition study (52% female; 38% black; mean age 73.5±2.9 years) who were administered the 10-item Center for Epidemiologic Studies Depression scale (CES-D) at years 1 (baseline), 3 and 5. Performance-based mobility was assessed at years 2, 4, and 6 using 20-meter and 400-meter walks. Using repeated measures generalized linear mixed models, blacks’ average CES-D scores were 0.43 points higher than whites’ scores (p<0.001). After adjusting for baseline demographics, chronic conditions, body mass index, and cognitive status, every 1-point increase in CES-D score was associated with increases of 0.04 (p<0.001) and 0.40 (p<0.03) seconds, to walk 20 meters and 400 meters, respectively. Blacks took 1.76 and 20.72 seconds longer on average, than whites. However, in race stratified analyses, among whites, every 1-point increase in CES-D score was associated with a 0.07 second and 0.53 second increase in time to walk 20 meters (p<0.001) and 400 meters (p=0.01) respectively. No association was found in blacks. These findings suggest that the association between depressive symptoms and mobility in older persons differs by race. Research is needed to understand why the typically observed association between depressive symptoms and functional performance is absent in older blacks.

APPROACHING RETIREMENT AGE: HEALTH AND RESOURCES OF 50 TO 64-YEAR-OLDS FROM 1968 TO 2000
M.G. Parker, S. Kelfve, C. Lennartsson, NYS, Karolinska Institut & Stockholm Univ. Aging Research Center, Stockholm, Sweden

This study compares the health and health-related resources of middle-aged persons in four waves of a Swedish national survey. Can we expect coming cohorts of elderly people to be healthier than current cohorts? Representative samples of over 1000 persons aged 50 to 64 years were interviewed in 1968, 1981, 1991 and 2000. Trends in health varied by indicator. Significant improvement was seen in mobility and dental status. Most improvement occurred between 1968 and 1991. Significant increases in prevalence rates were seen for hearing impairments, diabetes and overweight. Trends showed age and gender differences. Over the time studied, there were significant increases in years of education and the percent of white-collar workers. There were also increases in the percentage of persons visiting physicians and dentists. Smoking decreased significantly among men but increased among women. While the results show some signs of better health among more recent cohorts approaching retirement age, there are also signs that these cohorts have more of some chronic conditions requiring medical management and that they will be more likely to utilize care services. Results are discussed in relation to the questions of raising the retirement age and the future need for care services in the aging population.

WORK-RELATED STRESS MAY INCREASE THE RISK OF VASCULAR DEMENTIA

Background: We examined job control, job demands, social support at work, and job strain (ratio of demands to control) in relation to dementia, Alzheimer’s disease (AD), and vascular dementia (VaD) in the population-based Study of Dementia in Swedish Twins. Methods: A total of 257 dementia cases (167 AD, 46 VaD) and 9,849 non-demented individuals were included. Dementia diagnoses were based on telephone screening for cognitive impairment followed by in-person clinical work-up. An established job exposure matrix was applied to main occupation. Generalized estimating equations were used with the entire sample (to adjust for the inclusion of complete twin pairs) and paired-samples t-test with only complete twin pairs discordant for dementia status. Findings: In models adjusted for age, gender, education, and cardiovascular disease, lower job control was associated with greater risk of dementia (odds ratio [OR]: 1.13, 95% CI:1.03-1.28), AD (OR:1.13, 95% CI:1.03-1.28), and VaD (OR:1.15, 95% CI:1.00-1.31), and VaD (OR:1.14, 95% CI:1.00-1.31), and VaD (OR:1.28, 95% CI:1.02-1.60). Greater job strain was associated with increased risk of VaD only (OR:1.28, 95% CI:1.02-1.60), especially in combination with low social support (OR:1.35, 95% CI:1.11-1.64). Results were not explained by work complexity or manual work. No differences in work stress scores were observed in twin pairs discordant for dementia. Interpretation: Work-related stress may increase the risk of dementia, particularly VaD. Genetic and early-life factors may mediate these associations.
MORTALITY IN THE ELDERLY BY COMBINED MARITAL- AND COHABITATION STATUS – NEW GENERATIONS NEW TRENDS?
M. Kriegbaum, R. Lund, Section of Social Medicine, Institute of Public Health Science, University of Copenhagen, Copenhagen, Denmark

The married elderly have lower all cause mortality, but the associations vary by subgroups of the unmarried (Manzoli et al. 2007). Non-married cohabitation is increasing, also among the elderly, but few studies have investigated if cohabitation is as protective as marriage and results were mixed (Joutsenniemi et al. 2006, Koskinen et al. 2007). This study investigates if mortality in subgroups of the unmarried differs depending on cohabitation status and whether patterns differ age-by-age and gender.

Methods: Register data on marital status and cohabitation status was retrieved for all Danish residents 60 years old or older in 2000 (N=1,088,687). The categories of unmarried were divided in those living with a partner (WP) and those who did not live with a partner (NP) and compared to the married (ref). Follow-up for all-cause mortality was until 31 Dec 2008. Poisson regression was used to estimate relative excess mortality risk (RR). Analyses were stratified by age and gender and adjusted for education, income and ethnicity. Results: Cohabitation among the unmarried decreased with increasing age (60-69 years 14%, 70-79 years 6%, 80+ 2%). The RR was lower in those living with a partner than in those who did not live with a partner. Results for men aged 60-69 were: widowed (1.04 (WP)/1.69(NP), divorced (1.33 (WP)/2.10(NP) and never married (1.28 (WP)/1.93(NP). The unmar-ried who lived with a partner generally had significantly higher RR compared to the married. The patterns were similar for men and women. The RR were smaller in the oldest (80+) compared to the married. The patterns were similar for men and women. The RR were smaller in the oldest (80+) compared to the married.

KOREAN BABY BOOMERS PANEL STUDY SERIES 2: HOW HEALTHY ARE KOREAN BABY BOOMERS?
J. Kim1, H. Choe1, K. Eun1, J. Lee2, S. Joo3, G. Han4, J. Translational Gerontology and Retirement Research Center, Seoul National University, Seoul, Republic of Korea, 2. Chonnam National University, Kwangju, Republic of Korea, 3. Seoul National University, Seoul, Republic of Korea, 4. Ewha Womans University, Seoul, Republic of Korea

Korean Baby Boomers are expected to spend more than 10 years of unhealthy life in their old age because of the gap between life expectancy and disability-free health expectancy, leading to increasing health care burden. Concerning these problems, promoting health status of Boomers is urgent issues in Korea. Purpose of this study was to examine current health status of Baby Boomers and to explore the determinants of health status. Data used in this study are from the first wave of Korean Baby Boomers Panel Study. A total of 4,668 respondents born 1955-1963 were surveyed in face-to-face interviews using structured questionnaires, from May to August in 2010. About 34% of respondents had major chronic conditions, such as hypertension, diabetes and arthritis. In terms of mental health, 13% of respondents had experienced depression. Categorizing Boomers into 4 groups according to their physical and mental health status, 60% of respondents belonged to the “Healthy Group”, those having neither major chronic condition nor depression. About 33% of respondents had either major chronic condition or depression (‘only mental-health-problem group’, ‘only physical-health-problem group’), and the remaining 7.2% were categorized in the ‘Double-risk Group’, suffering from both physical and mental health problems. Compared to ‘Healthy Group’, ‘Double-risk Group’ were more likely to be women, those having neither spouse nor job, less educated and those in the lowest quartile of household income. These results suggest that women and people who are socially isolated and in lower SES are in higher possibility of pathological aging. Further implications are discussed.

FEASIBILITY OF COLLECTING FASTING BLOOD AND 24-HOUR URINE IN CAREGIVERS OF HIP FRACTURE PATIENTS
J. Lloyd1, D. Alley1, L. Fredman2, T. Kramer1, D. Orwig1, 1. Epidemiology and Preventive Medicine/Gerontology, University of Maryland, Baltimore, Baltimore, Maryland, 2. Boston University, Boston, Massachusetts

Biomarkers are increasingly used in studies of caregivers, but most studies have focused on dementia caregivers. We evaluated the feasibility of collecting 24-hour urine and fasting blood among caregivers aged 60 and older of patients recently hospitalized for a hip fracture. These caregivers reflect an acutely stressed population, whose compliance with these measures is unknown. Hip fracture patients and their caregivers were recruited from eight Baltimore-area hospitals. Baseline caregiver home-based interviews were conducted within 30 days of patient’s hospital admission for fracture. Blood and urine samples were obtained within seven days of the interview. The caregivers’ mean age was 71.4; the majority were female (59.1%), white (88.6%), and the patient’s spouse (50%) or adult child (27.3%); 40% were new caregivers. Their mean Perceived Stress Scale and CES-D scores were 19 (+/-7.9) and 9.6 (+/-7.6), respectively. Participants were asked to fast 10 hours before blood collection and to collect all urine over a 24-hour period. Of 44 caregivers currently recruited, 31 (71%) provided both blood and urine. Blood was obtained from 36 caregivers; mean hours fasting was 11.6. Urine was obtained from 32 caregivers; 83% reported providing a complete sample (no missed collections). Respondents who provided blood were younger than those who did not (mean age = 70 versus 76, p=0.10). While 73% of spouse caregivers provided both specimens, adult children were more likely to provide blood (100%) than urine (81%). Discussion will address reasons for missed collection and successful strategies to increase compliance.

SESSION 470 (POSTER)
MENTAL ILLNESS IN LATER LIFE
THE IMPACT OF VOCATIONAL REHABILITATION IN IMPROVING ACCESSIBILITY TO COMPETITIVE EMPLOYMENT FOR OLDER PEOPLE WITH SEVERE MENTAL ILLNESS

Background: Most consumers with severe mental illness (SMI) want to be competitively employed, but less than 25 percent receive any type of vocational assistance and fewer than 15 percent are employed competitively at any time. While research demonstrates the importance of employment in recovery and healthy aging, people with SMI continue to struggle to find work that matches their abilities and career goals and those who have a job often have difficulty retaining it. Objective: This pilot project involving the Connecticut Bureau of Rehabilitation Services (BRS) and the Department of Mental Health and Addiction Services (DMHAS) examines employment outcomes, systems changes and attitudinal changes brought about by a co-located team model at two local mental health authorities. Methods: Consumer and Counselor surveys were the primary method of data collection and were augmented by a focus group and key informant interviews. Data analysis compared employment outcomes of intervention participants age 45 and older (n=26) to those under 45 (n=36). An additional analysis of BRS administrative data compared employment outcomes of age 45 and older intervention group participants to BRS clients in the control group (n=297). Results: Compared to younger intervention participants, a greater percentage of older participants were working by the end of the program (43% vs. 73%, respectively), but fewer older participants agreed that working with a counselor helped them find work opportunities that fit their abilities (36% vs. 50%, respectively). Conclusions: Compelling
THE ROLE OF AGE AND MENTAL ILLNESS IN RISK OF PREVENTABLE HOSPITALIZATION AMONG ASSISTED LIVING RESIDENTS

M.A. Becker, T. Boaz, R. Andel, A.E. DeMuth, Aging & Mental Health Disparities, University of South Florida, Tampa, Florida

Hospitalizations for assisted living residents are very costly, often traumatic, and increase risk for iatrogenic disorders for those involved. Hospital expenditures account for one third of total national healthcare spending. Hospitalizations for ambulatory care-sensitive (ACS) conditions are considered preventable, as these are physical health conditions that can often be treated safely at a lower level of care or occur due to lack of timely, adequate treatment at a lower level of care. This study examined risk factors for hospitalization for an ACS condition among Medicaid-enrolled younger and older AL residents during years 2003–2008. The sample included 16,208 ALF residents, 7,991 (49%) of whom were 65 years of age or older. Study participants had 22,114 hospitalizations, 3,759 (17%) of which were for an ACS condition. Sixteen percent of residents (N=2,587), about 12% of the younger residents and 20% of the older residents, had at least one ACS hospitalization. ACS hospitalizations made up 13% of all hospitalizations for the younger residents and 22% of all hospitalizations for the older residents. Using Cox proportional hazard regression, we found that for both age groups, increased age, being Hispanic or of other race/ethnicity, and having comorbid physical health conditions were associated with a higher risk of ACS hospitalization. For older residents, having a dementia diagnosis and being African-American reduced the risk of ACS hospitalization, whereas for younger residents having a major psychotic disorder reduced the risk of ACS hospitalization. Results highlight the need for increased education, communication and future research on these predictive factors.

CHARACTERISTICS AND TREATMENT FLOW AMONG OLDER ADULTS INVOLUNTARILY COMMITTED FOR PSYCHIATRIC TREATMENT

E.A. DiNapoli1, J. McPherson1, N.G. Regier2, P. Parmelee2, 1. Center for Mental Health and Aging and Department of Psychology, Tuscaloosa, Alabama, 2. University of Alabama, Tuscaloosa, Alabama

Specialized psychiatric services for older adults are rare; systematic study of process and outcomes of existing services is even rarer. This presentation is a preliminary examination of characteristics and selected outcomes among individuals involuntarily committed to a state-supported in-patient psychiatric treatment unit for persons aged 65+. Data for 1607 current and former patients were drawn from an in-house administrative database developed to track patient flow, treatment and quality management at the 100-bed facility. Despite the special circumstances that bring these seriously ill elders into the treatment system, the sample did not differ significantly from older adults statewide in terms of age (M = 73 years), gender (53% female), race/ethnicity (67% white) and residential geography (31% rural). Primary psychiatric diagnoses include the dementias (52%), schizophrenia spectrum (32%), bipolar (9%) and major depressive disorders (5%); common secondary diagnoses are schizophrenia (22%), dementia (15%) and substance abuse disorders (13%). Medical comorbidities are common, the most frequent being hypertension, dementia and diabetes. Significant racial/ethnic differences in length of stay and readmission rates were driven by nonwhites’ longer stays and more frequent readmission. Latency to readmission was longer among women than men, and race X sex interactions emerged for some variables. These patterns further varied complexly with diagnosis. Common barriers to community placement included problems with medical insurance (26%), financial problems (7%), unsuccessful trial placements (19%) and behavioral problems (7%), unsuccessful trial placements (19%) and behavioral problems (7%), unsuccessful trial placements (19%) and behavioral problems.
INFLUENCES OF AGING ON HOARDING AND CLUTTERING BEHAVIORS
M. Eckfield, M.I. Wallhagen, UCSF School of Nursing, San Francisco, California

Individuals with hoarding and cluttering behaviors have difficulty discarding items, acquiring such a large number of items that their home environments become severely cluttered. Severe clutter interferes with activities of daily living and often causes distress to those living in the environment. Once viewed as personal lifestyle preferences, these behaviors are currently recognized as a mental health disorder associated with anxiety disorders and cognitive dysfunction. While hoarding and cluttering behaviors affect individuals of all ages, older adults are at increased risk of isolation, injury and other poor outcomes as a result of these behaviors. However, very little is currently known about the influence of age-related factors on hoarding and cluttering behaviors. To address this gap in our understanding, a qualitative study using Grounded Theory Methodology was conducted. Twenty-two adults age 65–91 with hoarding and cluttering behaviors were interviewed in their homes. Interviews were transcribed verbatim and analyzed using Atlas Ti software. All participants noted long-standing problems with hoarding and cluttering but narratives suggested how aging contributed to their current situation. Three core categories emerged which describe this dynamic between hoarding disorder and the aging process: Changes in Health Status; Changes in Social Context; and Changes in Home Environment. Generally, age-related factors contributed to worsening of the behaviors or outcomes, although some participants indicated that aging had a positive impact. By identifying these key factors, clinicians will be able to develop more targeted interventions to reduce the risk of harm to older adults living in severely cluttered homes.

GENDER, EDUCATION, AND QUALITY OF LIFE IN OLDER AFRICAN AMERICANS WITH MENTAL DISORDERS
T.L. Peterson, Social Work, Western Kentucky University, Bowling Green, Kentucky

This study used secondary data from the National Survey of American Life (NSAL) (Jackson et al., 2004a) to examine demographic characteristics and perceptions of quality of life among older African Americans with lifetime mental disorders. The sample consisted of 168 older African Americans, aged 55 to 74, who reported at least one lifetime mental disorder. Demographic characteristics included gender, education, marital status, and employment status. The dependent variables assessed were life satisfaction and general happiness. The results revealed no significant differences for life satisfaction. However, one-way analysis of variance (ANOVA) showed statistically significant differences between education on general happiness [F(3, 163)=2.78, p=.04]. In the two-way ANOVAs, gender and education emerged as significant for general happiness alone. There was a statistically significant main effect for gender [F(1,164)=5.02, p=.03] but not marital status. When controlling for gender, the main effect for education [F(3, 159)=2.77, p=.04] was statistically significant. Additionally, there was a significant main effect for education F(3, 160)=3.21, p=.03] but not marital status. Overall, older African American males reporting a lifetime mental disorder with less than a high school education reported more general happiness. These findings suggest a need to reexamine the relationship between gender, education, and quality of life in older African Americans with lifetime mental disorders.

ATTRIBUTION THEORY AND THE STIGMATIZATION OF MENTALLY ILL OLDER ADULTS
A. Webb1, J.M. Jacobs-Lawson2. 1. J. Ohio University, Athens, Ohio, 2. University of Kentucky, Lexington, Kentucky

The purpose of this study was to examine the extent to which Attribution Theory (AT) could explain the stigmatization of mentally ill older adults. AT (Weiner, 1980) posits that whether or not an individual is blamed for his or her condition influences emotional and behavioral reactions toward that individual. Although it has been utilized to explain stigma toward depressed individuals, AT has not been applied to the study of stigma against mentally ill older adults. Participants (N = 276, Mage = 49.88) were presented with vignettes depicting older adults with one of four mental illnesses. After reading the vignettes, participants responded to a series of questions that assessed (a) perceived responsibility for the condition, (b) emotional reactions (anger and pity), and (c) behavioral intentions (willingness to help and social distance). Partial support was found for AT in that increased perceived responsibility was associated with increased anger, and increases in anger predicted lower desire to help and higher desired social distance. Links were also found between pity and desire to help and between perceived responsibility and pity. Contrary to AT, however, higher levels of pity actually increased desired social distance. Overall, the results suggest that AT only partially accounts for stigmatization of mentally ill older adults. A new theory that takes into account the variety of factors that can influence stigma toward mentally ill older adults may need to be developed.

GAMES IN HEALTH PROMOTION AND MOTIVATION TO SUSTAIN SELF-CARE PRACTICES OF AGING PSYCHIATRIC PATIENTS
J. Da Silva, M. Jardim, A. Marins, L. Fernandes, L.F. Mesquita, T. Silva, R. Cotofo, School of Nursing, UFRJ - Federal University of Rio de Janeiro, Petrópolis, Rio de Janeiro, Brazil

Study developed using modified games to teach health themes and motivate psychiatric aging patients, to sustain physical and mental self-care practices. Objectives: Promote self-care, self-efficacy and control of co-morbidities in the aging process of two groups of participants: (i) inpatients being prepared for hospital discharge and (ii) outpatients attending ambulatory and day hospital settings. Method: Exploratory descriptive study based on the needs of 150 psychiatric patients who had one or more physical co-morbidities and presented physical and mental accelerated aging process, discrepant from their chronological age in the lifespan. Clinical diagnosis and objective laboratory values evidenced risks and were used to determine themes and games to be developed and implemented by the research team under the light of self-efficacy. In phase one material and methods were developed by a nurse researcher with graduate and undergraduate nursing students and in phase two joined the team a psychology faculty and undergraduate students. The interdisciplinary team conducted weekly workshops a teaching psychiatric day hospital. Results / Findings: Preliminary analysis of laboratory results, physical exams, cognitive and psychiatric evaluations improved substantially. Patients reported better understanding on the importance of sustaining self-care towards harm reduction and health promotion. Unanticipated results were (i) family members and mental health care providers reported improvement in mental and physical health of those community-dwelling patients who participated in the workshops and (ii) request of patients, families, undergraduate nursing students and the hospital administration for the workshop series to be offered on a permanent basis.

PSYCHOTHERAPY PARTICIPATION AND EFFECTIVENESS FOR INDIVIDUALS WITH SEVERE COMPULSIVE HOARDING AND LATE LIFE DEPRESSION
C. Egan, R. Mackin, P.A. Arean, C. Mathews, University of California, San Francisco, San Francisco, California

Background: Severe Compulsive Hoarding (SCH) is a behavioral syndrome that frequently co-occurs in older adults with mood and anxiety disorders. As SCH is often conceptualized as resulting from frontally-mediated cognitive dysfunction, determining the impact of cognitive dysfunction on treatments for depression and anxiety represents an important area of study. The purpose of this study was to evaluate the degree to which therapists felt cognitive dysfunction in individuals with SCH impacted their participation in psychotherapy. Methods: Participants included 45 individuals with late life depression...
(LLD) and seven participants with LLD and severe compulsive hoarding behaviors (LLD+SCH). Therapist perception of participants’ cognitive functioning was assessed by a structured questionnaire. Results: The mean age of the sample was 72.9 (SD=9.9), mean years of education 15.6 (SD=3.1), and 71% of participants were female. There were no significant group differences on demographic characteristics. Therapists rated SCH+LLD participants as having significantly more difficulty with overall participation in psychotherapy when compared to LLD participants (p =.01). In addition, they rated SCH+LLD participants as having significantly more difficulty with six behaviors related to executive functioning important to successful participation in psychotherapy (p<.05 for all). Therapists also rated SCH+LLD participants as showing significantly more cognitive improvement over the course of psychotherapy than LLD participants (p = .02). Conclusions: Cognitive dysfunction associated with SCH may have a deleterious effect on psychotherapy participation. As a result, psychotherapeutic interventions for individuals with SCH may be more effective if accommodations for specific cognitive inefficiencies are made.

### SESSION 475 (POSTER)

## PERSPECTIVES ON RELIGION, RELIGIOSITY, AND SPIRITUALITY

### THE MEDIATING EFFECT OF SOCIAL SUPPORT ON THE RELATIONS BETWEEN SPIRITUALITY/RELIGIOUSNESS AND LIFE SATISFACTION AMONG ELDERLY KOREAN IMMIGRANTS

Previous studies have indicated the positive role of social support to nurture life satisfaction in later life. Based on the relationship perspective, the objective of this study is to empirically investigate whether social support mediates the relationship between spirituality/religiousness and life satisfaction among elderly Korean immigrants. The Brief Multidimensional Measure of Religiousness/Spirituality was employed to measure six domains of spirituality/religiousness: daily spiritual experiences, values/beliefs, forgiveness, private religious practice, religious/spiritual coping, and religious support (Fetzer Institute/NIA, 1999). Social support was measured by the Lubben Social Network Scale-Revised (Lubben et al., 2001). The Satisfaction with Life Scale (Diener, 1985) was used to assess life satisfaction. We hypothesized that the factors of spirituality and religiousness would lead to life satisfaction among elderly Korean immigrants via social support. The study used data from 200 Korean immigrants aged 65 to 89 (Mean=72.5, SD = 5.10) who reside in New York City and participated in the face-to-face interviews. The results of the structural equation modeling analysis showed that social support partially mediated the relationship between spirituality/religiousness and life satisfaction in elderly Korean immigrants, which was verified by the significant indirect effect. The chi-square value for overall model fit was 69.70 with 49 degrees of freedom (p<.05) and the CFI and RMSEA values were .98 and .05 respectively, which provides a good model fit. These findings reflect that spiritual and religious coping resources and social support may be the key predictors of life satisfaction among elderly Korean immigrants in the metropolitan New York City area.

### A STUDY ON THE EFFECTS OF RELIGIOSITY ON LIFE SATISFACTION AMONG ELDERLY KOREAN IMMIGRANTS: MEDIATING EFFECTS OF OPTIMISM AND DEPRESSION

J. Ahn1, B. Kim2, 1. UCLA, Los Angeles, California, 2. Hoseo University, CheonAn, Republic of Korea

**BACKGROUND:** The purpose of the study is to analyze the mediating effects of optimism and depression on the relationship between religiosity (organizational, private and subjective religiosity) and life satisfaction among elderly Korean immigrants. **METHOD:** Data were collected from a cross-sectional survey of 220 elderly Korean immigrants (age≥65) drawn from community, adult day health care centers, and churches, in Los Angeles County. The statistical analysis was performed by a path analysis using LISREL statistical program. **RESULTS:** The results are fivefold. First, organization religiosity exerted negative effects on depression, whereas it exerted positive effects on optimism. Second, subjective religiosity exerted positive effects only on optimism. Third, private religiosity did not have significant direct effects either on optimism or on depression, yet showed direct, positive effects on life satisfaction. Fourth, organizational and subjective religiosity did not exert significant, direct effects on life satisfaction but only indirect effects via optimism (significant mediating effect). Finally, depression exerted negative effects on life satisfaction, whereas optimism showed positive effects on life satisfaction. And the effects of optimism on life satisfaction were greater than those of depression. **IMPLICATIONS:** These results suggest practical implications. First, they demonstrate that to improve life satisfaction among elderly Korean immigrants, social service and mental health agencies as well as welfare policies should focus on developing and implementing diverse programs geared for enhancing religiosity and optimism. Additionally, religiosity and/or spirituality sensitive practice need to be warranted in the field of social work and mental health. Limitations and directions for future research are also discussed.

### ETHICAL MATTERS RELATED TO SPIRITUALITY & END OF LIFE CARE WITH OLDER ADULTS: GUIDANCE FOR HEALTH CARE PROFESSIONALS

Geriatric health providers need to develop competencies related to spiritual assessment and incorporation of spiritual care into their practice, particularly when these arise in the form of ethical conflicts. These issues are important because of population aging, growing religious diversity, and because spiritual issues, including those related to life’s meaning, may become central to those facing life-limiting illness. We present four composite clinical case studies involving spiritual issues derived from our clinical experiences. These cases include: 1) an older man hospitalized with a serious illness; 2) an older Jehovah’s witness patient for whom discussions about the appropriateness of blood transfusion have become challenging; 3) an older Korean woman whose children had conflicting end-of-life religious views; and 4) a child who encountered the death of a peer in the hospital. Implications from these cases disclose the need for greater training in spirituality and religion as a component of clinical care, the importance of considering religious preferences in medical decision making, the challenges of addressing cross-cultural conflicts within families concerning different belief systems, and the imperative to recognize and to appreciate the way in which spirituality is expressed during the illness process. We conclude with a discussion of general ethical principles and practical considerations that...
THE BAD DAYS WON’T LAST FOREVER: A QUALITATIVE ANALYSIS OF RELIGIOUS / SPIRITUAL COPING AND MEANING IN THE STRESS PROCESS

G. Harris, R.S. Allen, P. Parmelee, L.L. Dunn, Department of Psychology, The University of Alabama, Tuscaloosa, Alabama

People living with an advanced, chronic illness and loved ones caring for this group often report experiencing both positive and negative emotional outcomes as a result of their situation. The Folkman (1997) Stress Process Model suggests that meaning-based coping is the mechanism that leads to positive emotions among this group. Religious/spiritual coping and meaning play an important part in Folkman’s model. This study represents an attempt to attain an in-depth understanding of religious coping and meaning in the stress process within a unique sample. Participants included 35 non-demented care recipients with advanced, chronic illness and 35 family members providing care to this group. This sample included approximately equal numbers of Caucasians and African Americans. In-person interviews were conducted to get an individualized account of each participant’s religious coping styles, relationship to God, involvement in the church, and description of meaning in life. A content analysis was conducted on the qualitative narratives by a coding team to uncover the salient themes. Throughout the coding process comparative methods were used to illuminate similarities and differences in the data. Three higher-order themes emerged across responses to questions: participants’ spirituality/religion/relationship with God is extremely important, God was described as a provider, and participants’ relationship with God was described as true, intimate, and personal. In addition, salient themes emerged within questions that illuminated participants’ use of and benefits of religious coping as well as their personal understanding of meaning in life. Notably, themes varied by race and relationship (caregiver or care recipient).

PRAYER, CHURCH ATTENDANCE, AND DEMENTIA CAREGIVER WELL-BEING

L. Rather1, G. Tremont1, J. Davis1, K.E. O’Connor1, C. Grover2. 1. Behavioral Medicine, The Miriam Hospital, Providence, Rhode Island, 2. Rhode Island Hospital, Providence, Rhode Island, 3. Warren Alpert School of Medicine, Brown University, Providence, Rhode Island

As part of coping, caregivers may go to church, develop spiritual relationships, or ask God for help. Religious resources can influence how caregivers perceive and handle situations. Extant research on the relationship between religion and caregiver well-being yields unclear results. We examined the influence of prayer and church attendance in dementia caregivers enrolled in a telephone intervention (N = 114; M age = 63.03, SD = 12.45; 79% female) who provided at least 4 hours of direct supervision daily for at least 6 months. Outcomes included burden (Zarit Burden Interview), depression (CES-D), and perceived self-efficacy (SEQ). There was a significant difference in perceived burden with individuals attending religious services weekly or more reporting less perceived burden (M = 33.42, SD = 15.14) than those who attended less than weekly (M = 39.02, SD = 14.17), p = .029. Caregivers who prayed a few times per week or more showed significantly higher levels of self-efficacy for symptom management and for support services (p = .03 and .01, respectively). More frequent prayers also showed a trend for less depression (M = 13.46, SD = 10.26) than caregivers who prayed more infrequently (M = 17.40, SD = 10.09), p = .06. Praying frequency was also inversely correlated with level of depression (r = -.19, p = .04). Findings support the use of prayer and church attendance as adaptive coping strategies for caregivers.

SPIRITUALITY REVISITED: TEN-YEAR FOLLOW-UP STUDY OF IMPLICIT THEORIES IN JAPAN

M. Takahashi, Psychology, Northeastern Illinois University, Chicago, Illinois

In 2001, we carried out an empirical study in Japan exploring the meanings of “seishin-sei/rei-sei,” an official translation of “spirituality” in Japanese. In the past several years, “supirichuariti,” its phonetic translation, emerged as a part of common Japanese lexicon. However, due to popular books and TV programs, the new word is used primarily within a context of occultism (e.g., ghost hunting, fortune telling, etc.). In this study, we examined the extent to which the semantic framework of “seishin-sei/rei-sei” has been influenced by this emerging concept. A total of 247 Japanese participants from three generations (young: mean age=20.18; middle-aged: mean age=49.61; and old: mean age=77.12) rated the similarity of ten spirituality related descriptors. Multidimensional scaling analysis in conjunction with hierarchical cluster analysis revealed that the current overall semantic framework of “seishin-sei/rei-sei” and its related descriptors was relatively consistent with the framework of ten years ago. For example, the older adults were more likely to conceptualize spirituality as less abstract than were the other two cohorts. It was also found that “supirichuariti” was viewed in the same context as religious and the official translation of spirituality (“seishin-sei/rei-sei”). However, only the older adults conceptualized this new word as distant in meaning from the other two descriptors in the cluster. These findings are discussed, in addition to the outcomes of self-assessments of spirituality and religiosity across three generations.

BEREAVEMENT, RELIGIOUSNESS, DOUBT, AND MENTAL AND PHYSICAL HEALTH

J. Henrie, J.H. Patrick, West Virginia University, Morgantown, West Virginia

Previous research suggests links between religiousness and health (e.g., Powell et al., 2003) and bereavement and health (e.g., Hall & Irwin, 2001). Bereaved (N = 138) and non-bereaved (N = 135) adults in three age groups, younger (N = 133, mean age = 20.24), middle-aged (N = 89, mean age = 49.69), and older (N = 51, mean age = 65.41), provided data for the current study. A series of hierarchical regressions were conducted to investigate relations among age, gender, bereavement, religiousness, doubt, and subscales of the SF-12 (Ware et al., 1996). The regressions predicting Mental Component Scores (F(5, 261) = 5.15, p < .001, R2 = .090), Physical Role Limitations (F(5, 265) = 3.03, p = .011, R2 = .054), and Emotional Role Limitations (F(5, 265) = 5.34, p < .001, R2 = .091) were significant, with religious doubt (β = -.326, -.240, and -.329, respectively) and religious meaning (β = -.166, -.208, and -.189, respectively) emerging as unique predictors in each of the regressions. Bereavement (β = -.127) emerged as an additional unique predictor of Emotional Role Limitations. The regression predicting Mental Health was also significant (F(5, 265) = 4.82, p < .001, R2 = .083), but religious doubt was the only unique predictor (β = -.310). Results are discussed in terms of the potential impact of experiencing doubts about one’s worldview on one’s well-being.

RELIGION AND “GOOD AGING” IN A EUROPEAN SUNBIRD COMMUNITY

J. Spannari, University of Helsinki, Helsinki, Finland

The debate on “aging well” has in the recent years extended its scope towards values, morality and spirituality — elements traditionally sustained by and interlocked with religion. This paper takes a multi-dimensional approach both to good aging and religion in the lives of older adults from a European perspective. The study is based on qualitative data (texts and interviews) and ethnographic observation of the Finnish sunbird community in the Spanish Costa del Sol. The active community attracts particularly older adults and other pensioners, to reside permanently or during the winter season. Specific features of the commu-
nity include the prominent role of Finnish religious organizations at the hub of social life and the abundance of engagement with religious activities among persons considering themselves none too religious. The data demonstrates that spirituality, religious activities and religious communities play various roles in the social and personal lives of older adults, and that religion in its multiple forms can promote various dimensions of good ageing. This paper aims 1) to point out the factors contributing to this phenomenon, 2) to identify the processes where these factors promote good aging and 3) to suggest ways to support these processes in other communities. Also the future of religion as an element of well-being for the older adults is discussed.

VALIDATION OF THE SPIRITUAL DISTRESS ASSESSMENT TOOL IN OLDER HOSPITALIZED PATIENTS

S. Monod1, E. Martin, B.E. Spencer, E. Rochat, C.J. Bula1, 1. Service of Geriatric Medicine and Geriatric Rehabilitation, Lausanne University Medical Center, Lausanne, Switzerland, 2. Institute of Social and Preventive Medicine (IUMSP)University Hospital Center and University of Lausanne, Lausanne, Switzerland

Background: The Spiritual Distress Assessment Tool (SDAT) is a 5-item instrument developed to assess spiritual distress in hospitalized elderly persons. The objective of this study was to investigate the SDAT psychometric properties. Design: Cross-sectional study. Setting: Geriatric medicine ward. Participants: Patients (N=203) aged 65 and over with MMSE score20 consecutively admitted over a 6-month period. Measurement: Data on health, functional, cognitive, affective and spiritual status were collected upon admission. Interviews using the SDAT (score from 0 to 15, higher scores indicating higher distress) were conducted within 3 days of admission by a trained chaplain. Factor analysis and measures of internal consistency and reliability (test-retest and inter-rater) were performed. Criterion-related validity was assessed using the FACTIT-Sp and the single question “Are you at peace?” as criterion-standard. Concurrent and predictive validity were assessed using the GDS scale and hospital length of stay (LOS), respectively. Results: SDAT scores ranged from 1 to 11 (mean 5.6±2.4). A two-factor solution explained 60% of the variance. Inter-item correlations ranged from 0.11 to 0.41 (eight out of ten with P<0.05). Item-to-total correlations ranged from 0.57 to 0.66 (all P<0.05). Cronbach alpha was acceptable (0.60). Test-retest and inter-rater reliabilities were high (ICC ranging from 0.87 to 0.96). SDAT correlated significantly with the FACTIT-Sp, the question “Are you at peace?”, the GDS (Rho -0.45, -0.33, and 0.43, respectively, all P<.001) and hospital LOS (Rho 0.15, P=.03). Conclusions: SDAT has acceptable psychometrics properties and appears to be a valid and reliable instrument to assess spiritual distress in elderly hospitalized patients.

AGE-RELATED CHANGES IN THE FACTORIAL STRUCTURE OF RELIGIOUS ORIENTATION

C. Moran, P. Lam, N.F. Keeler, A. Futterman, Psychology, College of the Holy Cross, Worcester, Massachusetts

Since Allport and Ross (1967) researchers have refined measures of religious orientation. Measures of three distinct religious orientations have emerged – religion as an end in itself, religion as a means to other ends, and religion as a quest for meaning. While religious orientation, like other aspects of personality, cognition, and coping, are thought to change with age (e.g., Fowler), few researchers have attempted to, 1) systematically validate ends, means, and quest religiousness in later life, or 2) assess changes in religious orientation in later life. The current study examines the factorial structure, convergent validity, and age-related changes in the three-factor, ends-means-quest model of religious orientation using a random sample of 352 community-dwelling adults in Worcester, MA. The sample was median split into two age groups – late middle-aged (60-75) and older adult (75 and older). The ends-means-quest model was confirmed in the late middle-aged sample, then cross-validated in the older adult sample. Standard measures of religious orientation load predictably on ends, means, and quest factors in both older adult samples. Results indicate that relationships among ends, means, and quest factors differ from those typically reported in younger samples. Ends and quest religiousness are not associated in younger adults (correlations between -.10 and .10), while among middle-aged and older adults in our sample the correlation was .24 and -.27, respectively. This shift in the relationship between ends and quest is discussed in light of changes in religiousness predicted by normal development and age-related changes in stress and coping.

RELIGION INDICATORS, SOCIAL SUPPORT, AND THEIR ASSOCIATION WITH CURRENT AND PAST SUICIDALITY AMONG DEPRESSED OLDER ADULTS

N. Collins1, E. Corsentino1, N. Sachs-Ericsson1, D.C. Steffens2, 1. Florida State University, Tallahassee, Florida, 2. Duke University Medical Center, Durham, North Carolina

Objective: Older adults with major depression are at elevated risk for suicide. Religious involvement has been shown to favorably impact a wide range of health outcomes, including reducing the odds of death by suicide. However, little is known about the effects of religious involvement on suicidal ideation in the elderly or the particular aspects of religiosity that are beneficial. Method: Participants were 248 depressed patients 60 years and older enrolled in the Neurocognitive Outcomes of Depression in the Elderly (NICODE) study. Current suicidality was assessed with the suicidal thoughts item from the Montgomery-Asberg depression rating scale (MADRS). Past history of suicide attempts, public religious activity, importance of religion, private religious activities, and control variables were assessed via self-report. Results: Increasing church attendance, or public religious activity, above and beyond religious importance, private religious practices and social support, was associated with reduced current suicidality. Increasing subjective social support was also associated with reduced current suicidality and partially mediated the relationship between public religious activity and suicidality. None of the religion indicators was predictive of retrospective reports of past attempts. Conclusions: The immediate benefits of religious activity on current suicidality are specific to church attendance rather than other religious indicators and are partially mediated by subjective social support. Clinicians should consider public religious activity patterns when assessing for other known risk and protective factors for suicide and in developing treatment plans.

FAITH AS A PROTECTIVE FACTOR: EXPLORING THE CONNECTIONS BETWEEN SPIRITUALITY AND RESILIENCE FOR WOMEN IN LATE LIFE

L.K. Manning, Sociology and Gerontology, Miami University, Oxford, Ohio

Demographic changes in the U.S., such as the decrease in fertility rates and the increase in life expectancy, have created a growing aging population. Living into advanced old age is undoubtedly a remarkable accomplishment. Research suggests that spirituality is important to a large percentage of the older adult population and serves a promoter of healthy aging. Against the backdrop of a dramatic increase in the number of individuals living longer, particularly older women, it is vital that researchers explore the intersection of spirituality and resilience. In this qualitative study of 6 women aged 82 and older I explore, using multiple, in-depth interviews, the interplay between spirituality and resilience over the life course. A grounded theory analysis of the interviews was performed and provided insights into how the women used their spirituality as a tool to promote and maintain resilience in late life. The results are presented as an interpretation of the participants’ perceptions of their spirituality and their reliance on faith. For the women in this study, faith is protective factor and supports: optimism, coping and subjective well-being. Implications for understanding the connections between spirituality and resilience are and the role they play for older adults is considered.
GENETIC AND ENVIRONMENTAL INFLUENCES ON RELIGIOSITY IN A MIDDLE-AGED TWIN COHORT
M.D. Grant1, M.R. Franz2, W.S. Kremen3, C.E. Franz2, M.S. Panizzon2, H. Xian4, M. Tsuang2, M. Lyons1, 1. Psychology, Boston University, Boston, Massachusetts, 2. University of California, San Diego, La Jolla, California, 3. Center for Behavioral Genomics, University of California, San Diego, La Jolla, California, 4. Washington University School of Medicine, St. Louis, Missouri

Behavior genetic studies have demonstrated that genetic factors play a moderate role in explaining individual differences in religious traits. Heritability estimates in adult cohorts have ranged from .27 to .62 with higher heritability reported for religious attendance, attitudes, and behaviors. The purpose of this study was to examine the genetic, familial, and individual-specific environmental influences on three different domains of religiosity. This analysis examined 1237 participants from the Vietnam Era Twin Study of Aging (VETSA). Mean age of the sample was 55.4±2.5 (range 51-60). The three religiosity constructs included: Intrinsic Religiosity (integrating religion into one’s life), Non-Organizational Religiosity (time spent in private prayer or meditation), and Organizational Religiosity (frequency of formal religious service attendance).

Heritability estimates were .64, .42, and .67 for Intrinsic, Non-Organizational, and Organizational religiosity, respectively. Unique environmental influences explained .34, .40, and .33 percent of the variation in Intrinsic, Non-Organizational, and Organizational religiosity, respectively. The parameter estimates for variance attributable to the familial (shared) environment was not statistically significant for any of the three religiosity constructs. This study identified moderate to strong genetic influence on religiosity in a middle-aged twin cohort. Interestingly, experiences shared by twins in their family of origin did not have an enduring, detectable influence. Religiousness is associated with numerous behavioral, psychological, social, and physical health outcomes and remains an important variable in aging research. Future research should continue to explore the complex genetic and environmental influences on different domains of religiosity.

THE RELATIONSHIP BETWEEN RELIGIOSITY AND DIETARY ADHERENCE AMONG OLDER MEXICAN-AMERICANS WITH TYPE 2 DIABETES
S.L. Strawhecker, K.J. August, D. Sorkin, Health Policy Research Institute, University of California, Irvine, Irvine, California

Studies have found religiosity to have a protective effect on health by improving individuals’ health behaviors. Little research, however, has evaluated how religiosity is associated with health behaviors in an ethnically-diverse sample of older adults, particularly among Latinos, where religiosity is an important part of their culture. The current study sought to examine the extent to which religiosity was associated with dietary adherence among older Mexican-American patients with type 2 diabetes. Data were analyzed from a sample of 407 Mexican-American older adults (55+ years) with type 2 diabetes who received their primary diabetes care at one of seven university-affiliated clinics. Compared to their younger counterparts (55-64), older Latinos (65+) were more likely to attend religious services (Mean=3.1 vs. 3.5, p=0.008), and engage in private meditation (Mean=3.9 vs. 4.5, p=0.003). Older Mexican-Americans were less likely to report cheating on their diets (p=0.005). The results from hierarchical linear regression analyses revealed a significant association between frequency of religious attendance and cheating on diet, which was modified by age (β for interaction=−0.31, p=0.001). Specifically, more frequent religious attendance was associated with less cheating on diet for Mexican-Americans aged 55-64 years, but was unrelated to cheating on diet among Mexican-Americans over the age of 65. The time older Mexican-Americans spent in private religious activity was not associated with dietary adherence in either group. Analyses adjusted for gender, marital status, education, disease burden, and duration with diabetes. Implications for future research include identifying possible mechanisms by which religious attendance influences older adults’ health behaviors.

SESSION 480 (POSTER)
RESIDENTIAL ISSUES: TRANSITIONS, ENVIRONMENTS, AND TYPES

SPATIAL ANALYSIS OF HOME FOR THE AGED POOR IN KOREA AND THE U.S.: MAKING HOME IN AN INSTITUTIONAL SETTING
J. Shin, Design Studies, University of Wisconsin-Madison, Madison, Wisconsin

This cross-cultural ethnographic study examines two retirement homes in the American Midwest and two in Korea, all run by the same French-based, international Catholic order, to examine how regional cultures interact with ideals on eldercare brought in by this organization and how this relationship is manifested in building design and usage. The study explores the meanings of each facility as they are constructed by the local people, the manifestation of cultural interactions in facility design, daily life experience within these homes, and the social processes involved in creating homes for the aged poor. The data was collected through participant observation, interviews with the residents and providers, and archival analysis. A qualitative content analysis was utilized. The findings indicate that the governance from the motherhouse in France encourages similar architectural designs regardless of the local contexts. Nevertheless, critical differences are identified. First, a strong sense of independence in America allows the homes to be a culturally legitimate form of eldercare. The expectation of intergenerational co-residency in Korea stigmatizes the homes as an inappropriate place for aging parents. Second, the prevailing meaning of ‘home’ in America, particularly with its emphasis on individualism, helps the residents quickly develop a sense of home, mainly at the room level. In Korea, the notion of collective identity rooted in the idea of home results in a sense of home at the building level. Finally, the medical model in America, with its staged care hinders the process of developing a sense of home, which was not found to be true in the Korean examples.

LINKING AFFORDABLE SENIOR HOUSING AND COMPREHENSIVE CARE SERVICES
C. Flores1,2, R. Newcomer1, D. Werdgær1, K. Skultety3, N. Weed3, A.J. Caldwell4, 1. Social and Behavioral Sciences, UC San Francisco, San Francisco, California, 2. Institute on Aging, San Francisco, California

This study was designed to research a newly opened Affordable Housing Plus Services (AHPS) model, the Senior Campus, a partnership between a non-profit housing developer and a non-profit service provider in California. AHPS links older residents in subsidized multi-unit housing to health and supportive services to promote successful aging in place. The housing complex consists of 150 apartments and two groups of residents, seniors (i.e., 55 years of age and older) from diverse cultural backgrounds and of low to moderate income. One group, with significant frailty, consists of residents enrolled in a Program for All-Inclusive Care for the Elderly (PACE). The other group consists of seniors meeting age and income qualifications for housing who may or may not be utilizing available long-term services and supports (LTSS) such as Case Management, Home Health Care, Adult Day Services, or In-Home Supportive Services. This presentation will 1) provide the background information on the development of the Senior Campus; 2) characterize the first cohorts of residents accepted with a comparison group of those eligible, but not chosen for residency; 3) describe the health status, service utilization, and quality of life (e.g., measures of well-being, sense of loneliness and isolation) of the cohorts; and 3) discuss implications of the early findings for program development and longer term outcome studies. The goal of this project is to advance the
RELOCATION TO A RETIREMENT VILLAGE: RESIDENTS’ PERSONAL REFLECTIONS ON EXPECTATIONS AND EXPERIENCES

D. Crisp1, T. Windsor2, K. Anstey1, P. Butterworth1. 1. Centre for Mental Health Research, Australian National University, Australian National University, Australian Capital Territory, Australia. 2. Flinders University, Adelaide, South Australia, Australia

Accommodating for the needs of older adults, retirement villages combine the features of security, independence and communality to offer residents an attractive option for ‘ageing in place’. The present study examined the relocation of 83 older Australians (aged 57-90 years) to independent living units within a newly constructed retirement village, and uses both qualitative and quantitative data to explore the benefits, difficulties and concerns anticipated prior to relocating and personal accounts of the experience 1-month post-move. While prospective residents anticipated benefits such as i) reduced home maintenance responsibilities; ii) increased social contact; and iii) healthcare and support for the future; concerns were held in relation to the re-adjustment to the new living environment and the process of downsizing to a reduced living space. At 1-month, benefits experienced were largely consistent with expectations; however, unanticipated problems related to maintenance and obtaining access to utilities, along with the process of downsizing, increased the stress associated with the relocation for some residents. Further follow-up at 12-mths indicates social connectedness is maintained as a significant benefit to retirement village life. Identifying the expectations and fears of older adults that relate to aged care accommodation, as well as the experiences of residents, is important for the monitoring and continued improvement of housing options for older adults.

DEFINING ANEW THE TYPES OF RETIREMENT COMMUNITIES

E.K. Smith, D. Ekerdt. Gerontology, University of Kansas, Lawrence, Kansas

Current literature utilizes a variety of terms to refer to independent living communities designed for older adults. The range and ambiguity of terms used to describe these communities often leads to confusion in identifying the type of community being described or studied. It is important to provide concise and clear definitions of these communities in order to accurately interpret study results and address policy needs. This paper introduces standard definitions to describe older adult independent living communities. Independent living communities, comprised of mainly older adult residents, are commonly referred to as retirement communities. Four types have been identified in previous literature: naturally occurring retirement communities, leisure oriented retirement communities, active adult communities, and continuing care retirement communities. These types can be defined using four attributes identified by Phillips et al. (2001): a retirement component, a community component, residential collectivity, and a degree of autonomy with security. A grid presenting the four community types by the four attributes serves to clarify the distinctions between types and also identify the similarities among them. For example, a naturally occurring retirement community consists of an area mainly comprised of older adult residents, where there is a formal and/or informal support structure. This new definitional framework for retirement communities will allow researchers to utilize a common, precise language in their references to these settings.

IMPROVING HOME ENVIRONMENTS FOR ELDERS WITH CHRONIC DISEASE: FINDINGS FROM A 2009 NATIONAL SURVEY

Y. Ahn1, H. Kim1. 1. University of Virginia, Charlottesville, Virginia. 2. East Carolina University, Greenville, North Carolina

Introduction: Most elders with chronic diseases are cared for at home until their conditions require medical supervision. Few studies have investigated how home environments are modified to support this trend from both healthcare and construction perspectives. This study investigated predictors of home improvement decisions for elders with chronic disease. Method: This secondary data analysis utilized the National Alliance for Caregiving/American Association of Retired Persons database for 2009. Descriptive statistics, inter-correlation analysis, and a hierarchical binary logistic regression analysis were performed on data collected from 736 elders, 242 of whom were aged without or 494 with 5 chronic diseases (dementia, arthritis/back pain, cardiovascular diseases, cancer, and diabetes). Results/Findings: Although 47.3% of participants had modified their homes to facilitate elder care, there were no statistical differences among the normal aged and five disease groups (P = 0.45). The overall logistic regression model explained 19.5% of the variance of home improvement (P < 0.01). Care-recipient characteristics (age and functional impairments) explained 13.5% of the variance and caregiver characteristics (age and duration of caregiving) did 5.0% (P < 0.01), while disease type did not explain it (P = 0.43). Discussion & Conclusions: Compared to healthy elders, disease type was not a predictor of home-improvement. However, demographic characteristics of both care-recipients and caregivers strongly influenced the decision to implement home improvements to facilitate aging in place. These findings highlight the need to develop comprehensive assessments rather disease-specific and patient-oriented strategies in order to provide concomitant benefit to care-recipients and caregivers.

DECENNIAL CENSUS GROUP QUARTERS ENUMERATION: ETHNOGRAPHIC EVIDENCE OF POPULATION TRANSITIONS AND BARRIERS TO RESIDENT SELF REPORT IN HOSPICE AND SKILLED NURSING FACILITIES

S. Salari, Family & Consumer Studies, University of Utah, Salt Lake City, Utah

Resident enumeration in group quarters has historically presented a challenge to the Census Bureau. Accuracy and efficiency is a goal, but the needs differ from independent households. Institutional populations are often counted with administrative lists, an option which requires staff time, and very little resident involvement. Self report would require a selection process for residents capable and willing to participate. This research used ethnographic techniques to collect focus group interviews and observational data from 72 hours in two skilled nursing homes and an in-patient hospice facility. Under a government contract, the researcher observed the 2010 decennial census enumeration. Field notes indicated the condition of residents, population transitions, enumerator perspectives and the philosophy of the administration. Person-centered resident rights were overlooked in the process to save time. Conflict erupted in one facility, where the use of resident lists was challenged by the administrators. In hospice, the use of lists was welcomed as a way to spare the resident. Even with lists, population transitions associated with admissions, discharges, and deaths complicated the count of facility residents. Medicare rehabilitation short stays and respite care increased the transitory nature of residence on the census date. Recommendations include the collection of admission dates and noting last known residence to prevent duplicate counts. In-person resident visits are encouraged, and there is a potential need for staff compensation for assistance provided. A model is introduced to help predict the potential for resident self report. The demands of census enumeration can be minimized by adequate facility preparation.
ONSET OF MOBILITY LIMITATIONS IN OLD AGE. THE COMBINED EFFECT OF SEP AND SOCIAL RELATIONS

C.J. Nilsson1, K. Avlund2,3, R. Lund2,3, 1. Department of Public Health, University of Copenhagen, Section of Social Medicine, Copenhagen K, Denmark, 2. Center for Healthy Aging, Copenhagen, Denmark, 3. Danish Aging Research Center, Copenhagen, Denmark

Purpose of the Study: To examine the combined effect of cohabitation status and social participation respectively and socioeconomic position (SEP) on onset of mobility limitations in a prospective study among older Danes. Methods: Logistic regression analyses with combined exposure variables were performed in a study population of 2,839 older men and women from the Danish Intervention Study on Preventive Home Visits. Results: Among men low SEP, living alone or having low social participation significantly increased the odds ratios (OR) for onset of mobility limitations. Among women only low SEP and low social participation significantly increased the OR’s for onset of mobility limitations. Analyses with combined exposure variables showed that simultaneous exposure to low SEP and poor social relations (living alone or low social participation) significantly increased the OR’s for onset of mobility limitations among both genders, yet the tendencies appeared stronger for males. In particular, men with simultaneous exposure to low SEP and low social participation had increased odds ratios for onset of mobility limitations, OR=5.36 (2.51-11.47), compared to the non-exposed (high SEP and high social participation). Conclusion: The study suggests that future interventions to increase social participation might alleviate the negative effects on mobility experienced by older people in low SEP, perhaps especially among older males.

DECLINING HEALTH AND FRIENDSHIP: SALIENT THEMES

M.S. Moss, S. Moss, H.K. Black, Arcadia University, Glenside, Pennsylvania

Although much research has documented the positive impact of social interaction, particularly with friends, on health and well-being in old age, there has been little attention to the ways that declining health is associated with patterns of and meanings of friendship. Yet, friendship rather than being placed in the shadow of family relationships, has distinct meanings and value in the world of old persons. To explore this, two qualitative ethnographic interviews were held with each of 6 old persons (4 men and 2 women) asking them to describe their perceptions of friendship, and how they viewed themselves as friends. Respondents, age 78-90, included African American (2) and European American (4) elders, married, widowed, & never married, with different levels of health and functioning, each of whom couched their perceptions of friendship as rooted in their personal past lives. Three themes emerged:

1. Decline in own health and/or decline in health of a close friend may affect the meaning of friendship.
2. Closeness and boundaries operate within friendship around issues of declining health.
3. Holding on and letting go are played out in friendship ties. Each theme expands understanding of the meaning of being a friend and having friends in old age.

EFFECTS OF SOCIAL ENGAGEMENT ON THE PHYSICAL HEALTH OF SENIOR CITIZENS IN JAPAN

K. Abe1, A. Ohashi2, C. Ohi3, K. Mizuno4, Y. Azai2, 1. Kansai University of International Studies, Hyogo, Japan, 2. Chubu Gakuen University, Gifu, Japan

Objectives: Social engagement is an important research topic in the field of gerontology. Many studies have examined the relationship between social engagement and the physical health of senior citizens. However, this aspect is not entirely clear with regard to senior citizens in Asian countries. Therefore, this study aims to examine the relationship between local social engagement and the physical health of senior citizens in Japan. Method: Data of the 2010 Healthy Life Survey of senior citizens in Gujo city were used. Located approximately in the center of Japan, this city is an intermountain region in the Tokai area. From a total of 3,483 residents aged 65 years or above, 3,424 were surveyed. The collection rate and valid response rate were 95.3% and 95.1% respectively. Responses with a large number of missing values were excluded from the analysis. Thus, the data of the remaining 2,488 residents were analyzed. Results: Several forums for local social engagement had significant correlations with the activities of daily living (ADL) of senior citizens: the senior citizens’ club, health class for senior citizens, and Tanomoshi (a type of rotating savings, credit, and microcredit association). In addition, the stepwise regression analysis showed that the local senior citizens’ club, age, and annual income had significant effects on their ADL. Discussion: The results of this study clarified the effects of social engagement on the physical health of senior citizens in Japan.

A COMMUNITY MATTER: OLDER ADULTS’ SOCIAL CAPITAL AND HEALTH

Social capital has been linked to health outcomes; however, little is known of its association with the health of older adults. Given the frequent isolation and co-morbidity of older adults, there is a need to assess the value of social capital building as a health-related component in community development. Based on 45 key informant interviews of community leaders in aging services in Denver, Colorado, we found isolation and limited access to resources were among the most challenging issues for community-dwelling older adults. In response, our pilot study of older men and women, aged 55+, in community meetings across the Denver metropolitan area investigates if the relationship between social capital and health varies by community socio-economic status (SES). To date, 13 older adults participated in qualitative discussions based on the World Bank Social Capital Assessment Tool (SOCAT). Fifteen older adults completed the Sense of Community Index-II (SOCI-II: Chavis, Lee, and Accosta, 2008) and demographic and health information surveys. Participants from higher SES communities were younger, in better health, and more likely to be Caucasian, with a greater sense of community and more community collaboration. Additionally, community SES differences existed in cognitive and physical functioning, influencing participants’ understanding of our surveys and their community participation. These early results suggest the importance of building social capital among older adults in low SES communities, where community collaboration and reciprocity may help to maintain health, counter isolation, and reduce resource difficulties.

SOCIAL SUPPORT AMONG U.S. CHINESE OLDER ADULTS: FINDINGS FROM A CHINESE COMMUNITY NEEDS ASSESSMENT

E. Chang1, M.A. Simon2, E. Wong1, B. Wong1, X. Dong1, 1. Rush University Medical Center, Chicago, Illinois, 2. Northwestern University Medical Center, Chicago, Illinois, 3. Chinese American Service League, Chicago, Illinois

Background: Research on social support and its relationship to health and well-being in older ethnic groups has focused on African Americans and Latino communities. However, study is sparse on social support among U.S. Chinese older immigrants who may be at higher risk of psychosocial distress. Methods: A community-based participatory research (CBPR) approach was utilized in this NIH-funded Partnering in Research project. Academic investigators and community stakeholders...
constitute a community advisory board to explore key health concerns facing Chinese older adults, one of which is the topic of social support. Data were collected from focus group interviews with 78 older Chinese adults, aged 60 and older, in the Chinese community. Social support was assessed using a validated social support instrument. Results: Among surveyed participants, the mean age was 74.8 and 53% were women. Mean education level was 10.7 years of schooling. With respect to social support, 61% of participants lack someone to get advice from, 78% of participants lack someone to help with chores, 33% of participants lack someone they can trust, 65% lack someone to provide emotional support, 53% lack someone to show love and affection. Conclusion: Our results call for in-depth studies to better understand social support in the contexts of cultural, familial and psychological factors. Further understanding of the influence of social support on U.S. Chinese older adults’ physical and psychological well-being is also needed. Service implications will be discussed based on these findings.

HEALTH AND TRENDS IN SOCIAL RELATIONSHIPS AMONG OLDER US ADULTS
G. Pavela, Sociology, University of Florida, Gainesville, Florida

The positive association between the social aspects of aging and health is well documented. Greater social network size, social engagement, and social support are associated with improved health, including self-rated health and mortality. Less known, however, are the effects of health status on trends in the social aspects of life. While previous research has often taken the perspective that the flow of causality is from social capital to health, this research adopts the perspective that health affects social capital. Specifically, this research examines the associations between health and trends in three aspects of social relationships: social embeddedness, enacted support, and perceived support. Using data from the Second Longitudinal Study of Aging, hierarchical linear models are used to describe the associations between baseline health status and trends in these three dimensions of social relationships. Measures of health at baseline include physical health (ADLs and IADLs), mental health (depression), and self-rated health.

SOCIAL NETWORK TYPES AND HEALTH SERVICE USE OF AMERICAN OLDER ADULTS
S. Park, R. Dunkle, university of michigan, Ann Arbor, Michigan

We examined the role of network type of older adults in their health service use. By investigating how social network type, as convenient and parsimonious construct, promote or inhibit health service use, individuals most at risk could be identified and interventions can be designed to meet the needs of those at risk. We used the 2006 data of the RAND release of the Health and Retirement Study, focusing on respondents aged 65 who are non institutionalized. The analytic sample was N=4865. Social network types were derived by Ward hierarchical and K-means cluster analysis based on a range of social network characteristics. As a result, we derive four network types: Marriage-Diverse type (n=1703, 39%), Friend-Diverse type (n=1037, 24%), Marriage-Restricted type (n=1267, 29%), and Family type (n=319, 7%), and Non Marriage-Restricted(n=611, 14%). Health utilization was measured on hospital admissions, physician visits, dentist visits, prescription drug use, outpatient surgery, and other medical service use, along with home health care and nursing home stays. Logistic regression analysis, examining the influence of predisposing, needs, and enabling factors based on the health behavior model of Anderson and Newman showed that when compared with the reference category (Non Marriage – Restricted network), showed that older adults in the two restricted networks, both marriage and non-marriage-focused types, used health services the most. Two major findings are 1) a common network typology can be identified. 2) people with more health needs are in a restricted network type and they used health services most.

SPOUSES’ DAILY SUPPORT AND CONTROL OF DIABETES MANAGEMENT: ARE THE 2 BETTER THAN 1?
C. Khan1, M.P. Stephens2, M. Franks3, K.S. Rook4, J.K. Salem1, 1. Psychology, University of California, Santa Barbara, Santa Barbara, California, 2. Kent State University, Kent, Ohio, 3. Purdue University, West Lafayette, Indiana, 4. University of California, Irvine, Irvine, California, 3. Summa Health System, Akron, Ohio

Spouses are often involved in their partner’s illness management by providing social support to reinforce ongoing healthy behaviors and social control to increase engagement in healthy behaviors when they are intermittent. However, spouses’ support and control can have distinct and opposite effects on health behaviors. Yet, when spouses’ provide both support and control, it is less clear if they counter each other’s beneficial health effects or facilitate each other’s beneficial health effects. Either of these possibilities could have implications for managing type 2 diabetes, which requires several healthy behaviors on a daily basis—the most challenging of which may be physical activity. In a 7-day, daily diary study of older adults with diabetes and their non-diabetic spouses (N = 70), we investigated how spouses’ support and control interact to affect patients’ minutes of exercise, confidence that they will exercise tomorrow, and energy expenditure on a daily basis. Multilevel analyses revealed that on days in which spouses provided higher-than-average levels of support, their control was associated with patients’ greater confidence about exercising tomorrow and with an increase in patients’ energy expenditure the next day. At lower-than-average levels of support provision, spouses’ control was not linked to patients’ confidence or energy expenditure. The interaction between spouses’ support and control did not predict patients’ minutes of exercise; however, spouses’ support was associated with more exercise that same day. Taken altogether, findings from this study suggest that the degree to which spouses’ control improves patients’ health behaviors may depend on spouses’ level of support.

DEPRESSION AND COGNITIVE FUNCTIONING AS PREDICTORS OF SOCIAL NETWORK SIZE
J. Shouse, S.V. Rowe, B.T. Mast, Dept. of Psychological and Brain Sciences, University of Louisville, Louisville, Kentucky

Prior research suggests that social networks change with age and may affect physical and mental health outcomes. Few studies have examined the impact of cognitive functioning and depressive symptoms on social network sizes among older adults. This study examined the impact of cognition (Mattis Dementia Rating Scale; Hopkins Verbal Learning Test) and depression (Geriatric Depression Scale) on the social networks of sixty-five community dwelling older adults from the Study of Thinking and Relationships (STAR). Social network size, including total, inner, middle and outer concentric circle sizes, were measured using Antonacci’s Convoy method. Consistent with study predictions, participants with lower cognitive functioning scores had significantly fewer outer circle social contacts (HVLT-R, r =-.341, p<.01; DRS-2, r =-.301, p<.05). Higher depressive symptomatology was associated with smaller numbers of close, inner circle relationships (r =-.361, p<.01). Age did not significantly impact social network size. These results suggest potentially greater social network changes in older adults experiencing depressive symptomatology or cognitive decline, albeit in different aspects of the social network (inner vs. outer circle, respectively). A smaller number of emotionally rewarding, inner circle relationships (the pattern observed with depression), may be particularly difficult for elderly individuals relying on the provision of emotional and instrumental support. These findings further imply that poorer cognitive functioning may accelerate the reduction of outer circle social network size which is typically associated with advancing age in prior research on socioemotional selectivity.
GENDER, SOCIAL RESOURCES, AND HEALTH OUTCOMES AMONG URBAN-DWELLING SENIORS: FINDINGS FROM A LOW-INCOME, SUBSIDIZED HOUSING SAMPLE
A.J. Hostetler, L. Ackerson, Psychology, University of Massachusetts Lowell, Lowell, Massachusetts

This paper investigates gender differences in the relationship between social support and health outcomes within a sample of low-income seniors living in subsidized housing in a mid-sized city in the Northeast (N=622). Previous research indicates that social support may be beneficial in preventing serious health conditions such as heart disease, cancer, stroke, and diabetes. Possible mechanisms for this association of social support with improved health include shared health-promoting information, shared resources, and the reduction in psychosocial stress. However, the benefits that accrue from close social relationships may differ according to gender. Previous studies have found that women have been socialized to provide more support in close social relationships while men are more likely to be recipients of such support. Consequently some studies have shown that men may benefit more from close social ties than women. Some studies have shown, for example, that widowed men tend to live shorter lives than their married male counterparts, while widowed women tend to live longer lives than married women, indicating that the support of marriage in later life tends to flow primarily from wives to husbands. Employing self-report data, we find: 1) Some exceptions to the established general pattern of gender-related health disparities, suggesting that this sample reflects a somewhat distinct population; 2) the expected, general association between social ties and health outcomes related to cancer stroke, heart disease, and diabetes; and; 3) unexpected three-way interactions (gender X type of support X specific health outcome), indicating a complex relationship between social support and health. We discuss these interactions with reference to the different causal mechanisms that might be involved.

EXPRESSIVE MASKING PREDICTS SOCIAL ENJOYMENT IN NARRATIVES OF PEOPLE LIVING WITH PARKINSON’S DISEASE
L. Tickle-Degnen, Occupational Therapy, Tufts University, Medford, Massachusetts

A common problem of the movement disorder of Parkinson’s disease (PD) is expressive masking, a reduction of motor activity responsible for the expression of emotion, motivation and personality. Reduction of expressivity can create an impression of an apathetic, asocial person who fails to reciprocate others’ warmth and interest. Little research has investigated the trajectory of the social lives of people with PD, and no work has studied how expressive capacity predicts this trajectory. It was hypothesized that expressive capacity protects the maintenance of an enjoyable social life during the progression of the disease. To provide a preliminary test of this hypothesis, 29 older adults with PD who varied in degree of expressive masking were videotaped four times—baseline, 6 weeks, 14 weeks and 30 weeks follow-up—while describing a recent enjoyable event. Facial, vocal and body expressivity were assessed at the beginning of the study. Enjoyable social life outcomes were assessed using Linguistic Inquiry Word Count (Pennebaker, Booth & Francis, 2007) to determine the proportion of social, positive emotion and leisure words in the transcripts of the enjoyable event descriptions at each time point. The results supported the hypothesis: the higher the initial degree of expressivity (lower masking), particularly in facial and vocal behavior, the less the decrease in the proportion of social, positive emotion and leisure words over the 30 week period (p’s < .05). Higher expressive capacity may protect against decline in the enjoyment of social life among individuals with PD.
experienced more emotional distress when they encountered daily network stress on 8 consecutive days. Hypotheses were tested by performing secondary data analysis on 787 participants aged 35-84 from the National Survey of Midlife Development in the United States (MIDUS; 1995-2005) who participated in its companion study, the National Study of Daily Experiences II (NSDE-II; 2004-2009). Two-level multilevel structural equation modelling analysis revealed that although there was an association between daily network stress and negative affect (b = -.44, SE = .19, p < .01), greater childhood emotional support from mothers attenuated this negative emotional response to daily network stress (b = -.09, SE = .03, p < .01). In addition, individuals who recalled more childhood emotional abuse from their mother also reported a higher average level of daily negative affect almost a decade later (b = -.05, SE = .02, p < .01). These effects did not differ significantly by sex of respondents. These findings are discussed in relation to theories of attachment and implications on stress and coping across the lifespan.

THE CUMULATIVE EFFECT OF EDUCATION DISRUPTION AND ASSAULT ON HOMELESSNESS AMONG AFRICAN AMERICAN MIDLIFE AND OLDER ADULTS
L. Thomas, J. Warren-Findlow, M.E. Thompson, M. Clapsadl, University of North Carolina at Charlotte, Charlotte, North Carolina

Trauma and educational disruption contribute to homelessness, yet few studies have addressed their cumulative effect on older adults. Using data from the MIDUS II Milwaukee African American oversample (n=592), this study examined the association of physical and sexual assault on homelessness. We hypothesized that childhood school expulsion increased the odds of homelessness among individuals who had experienced assault. Approximately 3% reported that they had been homeless at some point during the last 10 years. In multivariate models (adjusting for sex, age, and military service), the odds ratio (OR) for participants who had experienced physical assault but no expulsion with homelessness was 10.94 (95% CI= 1.95-61.23). For those expelled but not assaulted the odds of experiencing homelessness were 15.66 times greater (95% CI=3.19-76.82). The combined effects of experiencing education disruption and physical assault suggested no interaction (OR =21.53; 95% CI=4.11-112.84). Among participants who experienced sexual assault but no expulsion, the odds of reporting homelessness were 7.97 times greater than for those who experienced neither of those events (95% CI=1.50-42.46). For those expelled but not sexually assaulted, the odds of homelessness were 9.31 times greater (95% CI=2.41-36.07). Participants who had been expelled and experienced sexual assault had 28.11 times the odds of homelessness (95% CI=5.61-140.95), indicative of a strong (nearly two-fold) interaction among sexual assault and educational disruption. This study extends the examination of trauma and homelessness to older adults and supports the growing literature on cumulative adversities.

PREDICTING PTSD SYMPTOMS, TRUST, AND LIFE SATISFACTION FOLLOWING HURRICANE KATRINA
B.L. Perkins, G.I. Caskie, Counseling Psychology, Lehigh University, Center Valley, Pennsylvania

Although previous studies have found that experiencing a natural disaster can be related to negative changes in mental health, little research has been done that focuses on the specific experiences of middle aged and older adults following a disaster. Therefore, the present study explores the degree to which demographic variables, social network size, and pre-disaster life satisfaction predict post-traumatic stress disorder symptoms, trust of other people, trust of government figures, and post-disaster life satisfaction in a sample of middle and older aged adults located in regions impacted by hurricane Katrina. Secondary analysis was conducted using the baseline Hurricane Katrina CAG Study data that were available for a sample of 728 adults (343 males, 385 females) aged 40 to 86 years. Regression analyses indicated that being female (p<.001), having higher educational attainment (p=.006), younger age (p=.005), having an income closer to poverty level (p=.003), and greater pre-disaster life satisfaction (p=.043) significantly predicted greater number of PTSD symptoms. Younger age significantly predicted greater levels of trust in others (p=.043) while pre-disaster life satisfaction significantly predicted greater trust in government officials (p=.041). It was also found that being female (p=.010), pre-disaster life satisfaction (p<.001), and being unmarried (p=.007) significantly predicted greater post-disaster life satisfaction. Thus, the predictor variables explained greater variance in both PTSD symptoms (10%) and post-disaster life satisfaction (12%) than in either trust in others (2.3%) or trust in government officials (2.5%). How these relationships vary by severity of disaster exposure will also be discussed.

SESSION 495 (POSTER)

DEMENTIA/DELIRIUM

CLINICAL, COGNITIVE, NEUropsychiatric AND GENETIC PREDICTORS OF CONVERSION FROM AMNESTIC MILD COGNITIVE IMPAIRMENT TO ALZHEIMER’S DISEASE IN CHINESE OLDER ADULTS
L. Chu, W. Mok, Y. Song, J. Division of Geriatrics, Department of Medicine, The University of Hong Kong, Hong Kong, China, 2. Queen Mary Hospital, Hong Kong, Hong Kong

Background: There was a paucity of published data on the predictors of conversion of amnestic mild cognitive impairment to dementia in Chinese populations. Objective: To investigate the predictors of conversion from amnestic mild cognitive impairment (aMCI) to Alzheimer’s disease (AD) in Southern Chinese older adults. Methods: Design: one-year cohort study; Setting: Ambulatory setting. Subjects: Chinese older adults, aged 55 to 93 years old, with aMCI by the Petersen’s criteria. Measurements: Baseline demographic, clinical and neuropsychiatric behavioral factors, as well as the apolipoprotein E (APOE) genotype. All subjects were followed for one year. AD was diagnosed by the

64th Annual Scientific Meeting

159
NINCDS-ADRDA criteria for probable AD. Results: 243 Chinese older adults with aMCI were recruited. 16.5% (n=40) of them were converted to Alzheimer’s disease at the end of one year. Bivariate analyses showed that advanced age, low body mass index (BMI), low MMSE and delayed word recall test (DWRT), low Alzheimer’s Disease Cooperative Study – Activity of Daily Living (ADCS-ADL) score, high ADAS-cog and Neuropsychiatric Inventory (NPI) scores, and APOE4 status increased the risk of conversion to AD significantly (all p <0.005). After adjustment for confounders, logistic regression analyses showed that the APOE4 genotype (RR=2.51, 95% CI 1.01, 6.25), DWRT (RR=0.61, 95% CI 0.46, 0.82), ADCS-ADL total score (RR=0.91, 95% CI 0.86, 0.97), and NPI total score (RR=1.07, 95% CI 1.02, 1.12) were significant independent predictors for MCI conversion to AD. Conclusions: In Chinese older adults, the presence of APOE4 genotype, poor performance in delayed word recall tests, poor dementia-related ADL performance and neuropsychiatric behavioral symptoms predict increased risks of aMCI conversion to AD.

DOES SOUND IMPACT AGITATION IN PEOPLE WITH DEMENTIA?
L.L. Joosse, University of Wisconsin-Milwaukee, Milwaukee, Wisconsin

Despite advances in dementia care some residents of nursing homes are still suffer from agitation. Exposure to non therapeutic levels of stimulation needs further exploration. Therefore, examining the extent that sound and space may impact agitation in people suffering from dementia is warranted. This study examined sound levels in nursing homes and their impact on agitation. Factors were chosen based on the Environmental Vulnerability Theory. Fifty-three participants from four Midwestern nursing homes participated in this study. Participants age ranged from 61-103 years with moderate (n=16) to severe dementia. Data collected included; observed level of agitation, sound levels, and sources of sound, location of sounds, and space where sounds occurred. Data analyses included Pearson product moment correlations and multiple regression models. Sound was a significant predictor of mid-day agitation (F (5, 47) = 4.312, p ≤ .005 and adjusted R2 = .422). Nineteen percent of the variance in mid-day agitation was uniquely accounted for by mid-day sound levels. The accumulation of sound predicted agitated behavior and explained 16% of the variance (F (5, 47) = 4.520, p ≤ .001 and adjusted R2 = .253). The findings of this study indicate that sound is a contributing factor to agitation. Therefore, it would seem important for organizations to evaluate levels of sound and the potential impact it may be having on levels of agitation. With practice changes, the comfort and well-being of people with dementia living in a nursing home facility can be improved.

OUTCOMES OF AN ACUTE DELIRIUM DETECTION, PREVENTION, AND TREATMENT INTERVENTION
L. Benedict, A. Sabo, S. Hazelett, C. Holder, S. Germano, S. Fosnight, K. Allen, Senior Services, Summa Health System, Akron, Ohio

Background: Ranges of hospital delirium prevalence has been reported from 10-24%. Literature is sparse regarding models identifying, preventing and managing delirium. Purpose: Evaluate outcomes of an acute delirium detection, prevention, and intervention initiative. Methods: Interdisciplinary clinicians devised a “delirium protocol”, tested on an Acute Care for Elders unit, as part of a hospital initiative. Outcomes were obtained 2 weeks pre (n=102) and post (n=97) protocol implementation. Intervention: Upon admission, all patients were screened for delirium risk using the Six Item Screener (SIS)© and assessed for delirium every shift using the Nursing Delirium Screening Scale (Nu-DESC)©. High-risk patients had delirium protocols placed on their charts outlining interventions and pharmacist consult. Patients testing positive for delirium had an order set implemented which included a haloperidol loading dose. Findings: Post protocol implementation, delirium prevalence decreased from 9.6% vs. 7.3%. Aver-age length of stay for delirious patients dropped from 5.7 to 3.8 days. After protocol initiation, percent of delirium related deaths decreased from 23% to 9.5%, ICU transfers dropped from 18% to 0%, and patients returning home increased from 23% to 48%. Thirty day readmission rate for delirious patients dropped from 31% to 5%. Percentage of delirious patients receiving high-risk medications decreased from 58% to 40%, those receiving new benzodiazepines decreased from 23% to 19% and those receiving an antipsychotic increased from 23% to 57%. Implications: Although sample size was small, results suggests delirium protocol implementation decreased delirium incidence and improved outcomes. Implementation on medical/surgical, telemetry and rehab units began in 2010.

SCREENING AND CARE MANAGEMENT FOR DEMENTIA PREVENTION/MANAGEMENT IN VA PRIMARY CARE PATIENTS WITH VASCULAR RISK

Introduction: Vascular compromise, including diabetes and hypertension, increases dementia risk. Care management is an established approach to chronic conditions, but untested as a means of dementia prevention. We describe an innovative care management project in VA primary care. Methods: VA patients with diabetes and hypertension, with at least one condition poorly controlled (systolic blood pressure>140 or Hemoglobin A1c >6.9), were recruited from primary care and screened for memory impairment (MiniCog/MoCA). Veterans scoring in the impaired range completed additional neuropsychological testing to determine the presence of Mild Cognitive Impairment (MCI), thought to represent prodromal dementia, or frank dementia. Veterans with MCI or dementia were randomized to nurse-led care management or to usual care. The ongoing 6-month care management program includes individualized nursing assessments of psychosocial needs and barriers to adherence, and care coordination with other VA providers (pharmacy, social work, medical specialty, etc.). Results: We screened 50 patients in VA primary care clinics. Twenty-four (48%) failed cognitive screening; of these, 13 agreed to participate in the study. Of these 13, 12 were diagnosed with MCI, 1 with cognitive disorder NOS. Six additional patients were referred from specialty (memory) clinic. Conclusions: Veterans with poorly controlled diabetes and hypertension are at risk for cognitive impairment; nearly half of these patients had MCI. Screening and detection of cognitive impairment helps define a group of Veterans who may benefit from care management aimed at improving control of these vascular conditions, and potentially delay or prevent their conversion to dementia.

EMOTIONAL STATE OF NURSES TO THE DECISION OF DNR IN KOREA
M. Lee1, K. Park2, H. Park2, 1. Keimyung University Dongsan Hospital, Daegu, Republic of Korea, 2. Keimyung University College of Nursing, Daegu, Republic of Korea

Purpose: The purpose of this study is to describe nurses’ emotional state to DNR decision process and provide basic data to develop nursing guidelines of the DNR decision making process and nurses roles after the decision is made. Method: The design of this study is a descriptive study and a convenient sampling was used. Two hundred twenty nine nurses of four hospitals in D-city had participated in this study. To measure emotional state of nurses, Profile of Mood State (McNair, Loom, & Droppleman, 1992) was translated to Korean (Kim, 2003) and used for this study. Data was analyzed using χ2-test, t-test, and ANOVA. Results: Most nurses were under 30 years old (47.6%), not married (57.6%), Christian (60.3%), having working experience (58.5%), and those receiving an antipsychotic increased from 23% to 57%. Implications: Although sample size was small, results suggests delirium protocol implementation decreased delirium incidence and improved outcomes. Implementation on medical/surgical, telemetry and rehab units began in 2010.
64th Annual Scientific Meeting by guest on 30 April 2018

the nurses received the consultation request (51.5%) and offered CPR to clients even after DNR decision made (51.5%). Most nurses responded that the DNR is necessary (94.3%) and DNR guideline establishment (89.1%) is necessary. Conclusion: Based on the findings of the study, a continuously organized education program on DNR is required for undergraduate nursing students. For nurses in clinical area, a nursing guideline regarding DNR decision making process, nurses roles on the process, and the enhancement plan of their coping skills is necessary.

RELIGIOUS PRACTICES AND RESOURCES FOR CAREGIVERS OF PERSONS WITH DEMENTIA
R.S. Conner1, L.S. Nemeth2, E.J. Amella3, B. Edlund4, B.M. Egan2, J. CON, MUSC, Charleston, South Carolina, 2. MUSC - COM, Charleston, South Carolina

Background: The evidence base regarding the influence of religious beliefs, commitments, and resources on stress among caregivers of persons with dementia (CPWD) is limited. The purpose of this study was to explore these domains among CPWD. Methods: An exploratory descriptive design was used, framed by Lazarus and Folkman’s (1984) Stress and Coping Theory; data collection involved a mixed methods approach with questionnaires and semi-structured interviews. Sample: 22 CPWD from the southeast, identified through snowball and purposive sampling. Qualitative content analysis was undertaken to identify perceptions regarding beliefs, commitments, and resources related to coping; and faith community resources CPWD that might alleviate stress. Results: Belief in God and religious practices were identified as very important among the majority of participants. Three main constructs emerged overall: 1) impact of belief in God related to their caregiving role; comfort and strength was dominant theme, 2) the influence of religious beliefs on their commitment to caregiving role; biblical promise was the principal theme, 3) recommended resources from the faith community to decrease caregiver stress; key theme was the desire for parishioner support to assist with domestic, social, respite, and educational needs. Conclusion: Caregiver commitment in this population was influenced by a strong belief in God. Faith communities could offer support services that would reduce caregiver stress.

INTENSIVE CARE UTILIZATION AMONG NURSING HOME RESIDENTS WITH ADVANCED COGNITIVE IMPAIRMENT
A.T. Fulton1,2, P.L. Gozalo1, S.L. Mitchell1, V. Mor3, J.M. Teno1, J. Warren Alpert Medical School of Brown University, Providence, Rhode Island, 2. Butler Hospital, Providence, Rhode Island, 3. Brown University program in Public Health, section of Health Services, Policy, and Practices, Warren Alpert Medical School of Brown University, Providence, Rhode Island

Background: Dementia is a chronic, progressive terminal illness. The inevitable disease trajectory is debilitation and dependence with ADLs. Our goal is to examine ICU utilization in the last month of life among nursing home (NH) residents with advanced cognitive impairment. Methods: Medicare Claims Files and Minimum Data Set (MDS) were used to identify a cohort of decedents between 2000 and 2007, who were in the nursing home 120 days prior to death, and MDS assessment indicating advanced cognitive impairment as identified by Cognition Performance Scale>=5. ICU utilization in the last 30 days of life was based on Claims. To examine the time trend, we constructed a multivariate logistic regression model adjusting for age, gender, and race. Robust variance estimators were applied; estimates were calculated clustering decedents within hospital referral region. Results: Among 685,305 Medicare NH residents with advanced cognitive impairment 2000-07, we observed an increase in ICU utilization from 6.6% in 2000 to 9.8% in 2007. The Adjusted Odds Ratio of being in an ICU within the last 30 days of life increased to 1.58 in 2007 compared to 2001 after adjustment for age, gender, and race (95% CI 1.49-1.66). Conclusion: From 2001 and 2007, there was a substantial increase in ICU utilization among persons with advanced cognitive impairment.

ESTIMATING THE EFFECTS OF PSYCHOACTIVE MEDICATIONS ON DELIRIUM PERSISTENCE VIA MARGINAL STRUCTURAL MODELS
L.H. Ngo1, E. Marcantonio1, R.N. Jones2,1, 1. Medicine, Beth Israel Deaconess Medical Center & Harvard Medical School, Boston, Massachusetts, 2. Hebrew SeniorLife, Institute for Aging Research, Boston, Massachusetts

Psychoactive medications are associated with delirium incidence, but their associations with delirium persistence are unknown. We used data from the Delirium Abatement trial to examine the relationship between 5 psychoactive medication classes and CAM delirium status 2 weeks and 1 month after post-acute admission. Because delirium status and medication exposures at earlier time points affect later status and exposures, we used marginal structural models, which use probability-of-medication weighted estimators to determine medication exposure effects on delirium status. 457 elderly patients with delirium (mean age 83.8±6.9) had the following medication exposures in the first 2 weeks: sedative hypnotics (SH) 36%, antipsychotics (AP) 22%, anticholinergics (AC) 11%, antidepressants (AD) 17%, and opioids (OP) 36%. Between 2-week and 1-month, the respective exposures reduced to 21%, 11%, 8%, 17%, and 17%. Prevalence of delirium at 2-week and 1-month was 67%, and 56%, respectively, Marginal structural models, adjusted for age, gender, delirium severity at baseline, Charlson comorbidity index, and dementia status produced odds ratio of SH on delirium at 2-weeks 0.51 [0.41-0.65], at 1-month 1.65 [1.30-2.09], AP 1.13 [0.91-1.42] and 1.23 [0.99-1.54], AC 0.91 [0.71-1.17] and 0.90 [0.70-1.16], AD 1.02 [0.81-1.28] and 0.84 [0.67-1.06], and OP 1.04 [0.83-1.31] and

INFLUENCES OF PSYCHOTIC SYMPTOMS ON THE FUNCTIONAL ACTIVITIES OF INDIVIDUALS WITH ALZHEIMER DISEASE
M. Tran1, M. Bedard2,3, S. Dubois1, B. Weaver1, C. Gibbons1, J. St. Joseph’s Care Group, Thunder Bay, Ontario, Canada, 2. Lakehead University, Thunder Bay, Ontario, Canada, 3. Northern Ontario School of Medicine, Thunder Bay, Ontario, Canada

OBJECTIVES: Psychotic symptoms associated with Alzheimer Disease (AD) contribute to excess functional dependence. Longitudinal studies have generally examined the association between rates of functional decline and the occurrence of psychotic symptoms from either a single evaluation or from multiple evaluations rather than through changes in frequency and severity of symptoms. Although the presence or absence of psychotic symptoms at initial or follow-up examinations may be associated with changes in functional status, the nature of the relationship between changes in these domains cannot be inferred. We examine the association between changes in the frequency of psychotic symptoms and changes in dependence in activities of daily living (ADL) over a period ranging from 0.1 to 6.9 years (mean = 2.3). METHODS: Data from a cohort of 257 individuals referred to a memory clinic were analyzed using hierarchical linear modeling. Information on ADL, psychotic symptoms, depressive symptoms, and cognition was collected. RESULTS: An increase in the number of psychotic symptoms was significantly associated with declines in the ability to perform both basic and instrumental ADL after controlling for demographic variables and changes in cognition and depression (B = -.003, p < .001 for basic ADL; B = -.004, p < .01 for instrumental ADL). CONCLUSION: Changes in psychotic symptoms are associated with increased dependence in basic and instrumental ADL over time. These findings may have ramifications for studies and treatment plans for individuals with AD who demonstrate psychotic symptoms.
We found SH were associated with delirium resolution at 2 weeks, but persistence at 1 month. AP were borderline associated with persistence at 1 month, while OP were associated with resolution at 1 month. Further research is needed to confirm these findings, and to evaluate the variable relationship of SH with delirium over time.

**COGNITIVE, COMMUNICATION, AND FUNCTIONAL ABILITIES IN PERSONS WITH ALZHEIMER’S DISEASE**

S.J. Barnes1,2, B.J. Holtzclaw3, 1. Kramer School of Nursing, Oklahoma City University, Oklahoma City, Oklahoma; 2. University of Oklahoma Health Sciences Center, Oklahoma City, Oklahoma

**Background and Significance:** Providing meaningful and appropriate care for those with Alzheimer’s disease (AD) is challenging. Barriers are erected between caregiver and patient by effects of the disease process which affect multiple layers of interaction. Effective interpersonal communication supporting strong relationships depends on communication competency involving both propositional and affective components of language (words, syntax, affective prosody and gestures). Affective prosody signals the emotional and attitudinal state of the speaker through use of intonation patterns, stress, timing, rhythm, differential pausing, and voice quality. Research findings show that AD causes early changes in interpersonal communication that affect comprehension of affective, but not propositional, aspects of language. As severity of AD increases, behavioral problems accompany loss of affective prosodic comprehension. Purpose: This correlational descriptive study was designed to examine relationships between cognition, communication, and functional abilities, in a convenience sample of 30 patients with Alzheimer’s and Pick’s Disease patients. Findings: Strong correlations existed between key variables/measurements: cognitive functioning (Cognition Sensitive Approach to Dementia and MMSE), affective prosody (Ross’s Affective Prosody Scale modified for AD patients), propositional language function (Boston Naming, short version) and functional ability (FAST). Of particular significance was demonstration that persons with AD are able to produce affective prosody well into the mid-range to advanced level of the disease, but do not retain ability to interpret emotional content of vocalization directed towards them. This finding may provide useful information for bridging communication barriers between patient and caregiver.

**DECREASING PROBLEM BEHAVIORS: GROUP DEMENTIA CAREGIVER PROGRAM**

M. Lewis1, P.C. Griffiths1, K. Hepburn1, 1. Emory University, Atlanta, Georgia; 2. Atlanta Veterans Medical Center, Atlanta, Georgia

Problem behaviors in persons with dementia exact a significant toll on caregivers’ health and influence earlier nursing home placement. While a large body of literature addresses interventions to reduce negative caregiver outcomes, fewer studies target specific troubling behaviors and provide caregivers with tools to modify them. Effective interventions have frequently been resource-intensive individually-tailored in home programs. Partners in Caregiving, a NIH-funded group caregiver intervention, had an effect on the frequency of difficult behaviors in persons with dementia as measured by the Revised Memory and Behavior Problem Checklist (RMBPC). We examined RMBPC scores for the composite total and three sub-scales (memory-related, depressive, and disruptive behaviors) and calculated pre-post intervention change scores indicating decrease, no change or increase in the frequency of caregiver-reported troubling behaviors. As expected, the intervention had no effect on total RMBPC frequency of behaviors scores or pre-post intervention change in the memory and depressive sub-scales. The intervention had an effect on the disruptive behaviors sub-scale. The percentage of caregivers reporting a decrease in disruptive behaviors differed by intervention group, χ² (2,N=171) = 7.12, p = .03. Forty-seven percent of caregivers in the intervention group reported a decrease in disruptive behaviors following the intervention versus 27% of controls at one year follow-up. Caregiver reactions (the degree to which they were “bothered” by disruptive behaviors) followed the same pattern with a greater percentage of the intervention (53%) than control caregivers (34%) reporting a decrease in disruptive behavior reaction scores one year post intervention, a non-significant trend χ²(2,N =171)=5.13, p=.06.

**PHYSICIAN BELIEFS, BEHAVIORS, AND PREPAREDNESS IN THE MANAGEMENT OF DEMENTIA: RESULTS OF A NATIONWIDE SURVEY**

E. Coghill, M. Schapira, Geriatrics, Medical College of Wisconsin, Milwaukee, Wisconsin

By 2030 more than 7.7 million Americans over the age of 65 will have dementia, and the majority of dementia management will fall to primary care physicians. Previous research on how prepared primary care physicians feel to manage dementia in light of this increase and their attitude toward dementia treatments is very limited. This study seeks to determine whether primary care physicians feel prepared to manage dementia in light of the projected increase in prevalence and to examine their attitudes toward dementia treatments. We administered a survey to 800 primary care physicians in family practice, internal medicine, and geriatrics in the United States with a response rate of nearly 40 percent. Only 50% of physicians surveyed feel very prepared to initiate prescription of medications for dementia and to diagnose dementia. Less than 50% of physicians feel very prepared to discuss risks and benefits of treatment and manage side effects of medications. Ninety percent of physicians surveyed feel that all patients with dementia should be offered treatment, but 40% feel that current available treatments are effective in treating cognitive and functional decline. Factors significantly associated with offering treatment include age, gender, and primary specialty. These findings raise important concerns about the preparedness of primary care physicians to manage dementia in light of the projected increase in prevalence. It is important to develop and pilot educational interventions aimed at improving primary care physician comfort in the management of dementia.

**REGIONAL DEMENTIA NETWORKS: DEVELOPMENT AND EVALUATION**

M. Otero, I. Draskovic, M. Olde Rikkert, M. Vernooij, Radboud University Nijmegen Medical Centre, Nijmegen, Netherlands

Background and objectives Being complex and multidisciplinary, dementia care requires an integrated approach. Dutch National Dementia Programme (NDP, 2005-2008) aimed at setting up regional dementia networks to serve as a back-bone for better co-ordinated, more coherent, and more demand-driven dementia care. The present study investigates the impact of this programme on a number of indicators pertaining to these aspects in dementia care. Design: Cross sectional study. Setting: Community care Participants: Professionals involved in the National Dementia Program in six regions in the county of Gelderland, The Netherlands Methods and materials: Questionnaires were developed in order to assess experienced changes in professionals’ competences, integration of care, and work conditions, emanating from NDP. Results: 107 professionals returned the questionnaires. In their experience, NDP brought about important changes in their competences. From the 7 participating professional groups, nurses indicated highest positive change on the three scales of competences while specialists and GP’s reported the lowest change. Furthermore, participants experienced a major improvement in the quality of dementia care in general and in integration of dementia care in particular. Only moderate changes in work conditions were experienced. Conclusions: Important, NDP brought about positive changes in professionals experiences regarding integration of care as well as their competences. Our findings underline the importance of developing workable formats for the integration of care. NDP-format may prove suitable for other chronic illness as well.
EVALUATION OF AN EDUCATIONAL MODEL TO IMPROVE NURSE DETECTION OF DELIRIUM: PILOT STUDY
J.M. McCrow1, E.R. Beattie1, K. Sullivan1, D.M. Fick1, J. Park1. 1. School of nursing and midwifery, Queensland University of Technology, Kelvin Grove, Queensland, Australia, 2. Pennsylvania State University, Pennsylvania, Pennsylvania

Delirium is a serious issue associated with high morbidity and mortality in older hospitalised people. Early recognition enables diagnosis and treatment of underlying cause/s, which can lead to improved patient outcomes. Research shows accurate nurse recognition of delirium is poor. This pilot study tested the usability and effectiveness in terms of improving nurse recognition of delirium of a web-hosted learning site that was designed using constructivist learning principles. A convenience sample of consenting Registered Nurses (RNs) (N=35) from an acute care facility in Brisbane, Australia were recruited. At baseline participants completed a battery of questionnaires including delirium recognition and knowledge tests. Following baseline assessment participants accessed and used the www.learnaboutdelirium.com.au website for a five-week period. At the end of this period delirium knowledge and recognition were assessed together with a participant evaluation of the website. Data analysis of the final sample (N=25) showed participants spent a median time of 60 minutes online. End-users reported high levels of satisfaction and site usability. Overall percentage correct scores from the delirium knowledge questionnaire increased from 58.24% (M = 19.84; SD = 3.47) before the educational intervention to 71.74% (M = 24.4; SD = 3.24). Delirium recognition increased from 55.2% correct (M = 2.76; SD = 1.23) to 90.4% (M = 4.52; SD = .653). These results were statistically significant (p<.001; paired-sample t-test). This pilot demonstrated that the www.learnaboutdelirium.com.au website improved delirium knowledge and recognition scores and was well received by RNs. These results will inform a methodologically rigorous RCT.

THE DEMOGRAPHIC AND MEDICAL CORRELATES OF PLASMA Aβ42 AND Aβ42/Aβ40

Background: Plasma amyloid-beta 42 (Aβ42) and Aβ42/Aβ40 are increasingly recognized as biomarkers for cognitive decline and Alzheimer’s disease (AD), with low levels carrying increased risk. Surprisingly, little is known about the demographic and medical correlates of plasma Aβ40 and Aβ42 level, especially in non-demented older adults. Methods: 997 community-dwelling older adults from the Health, Aging and Body Composition (Health ABC) study with measured Aβ42 and Aβ42 were included in this cross-sectional study. We determined the association between a wide range of demographic and medical variables with Aβ40 and Aβ42 level. Results: The mean±SD (pg/ml) Aβ40 level was 191.6 ±50.3, and of Aβ42 was 33.9±6.6. Low Aβ40 was significantly associated with younger age (3.6±3.0 years for low tertile vs. 74.5±2.9 for high tertile, p=0.0001), Black race (60.4% vs. 44.1%, p=0.0001), shigh school education (67.2% vs. 59.5%, p=0.03), and lower creatinine (mg/dl, 1.0±0.2 vs. 1.2±0.5, p=0.0001), but was not associated with: gender (p=.78); literacy (p=0.79); history of stroke (p=0.25), myocardial infarction (MI) (p=0.07), diabetes (p=0.69), depression (p=0.09), or smoking (p=0.99); body mass index (BMI) (p=0.35); APOE e4 status (p=0.77); or c-reactive protein (CRP) level (p=0.42). Low Aβ42 was significantly associated with Black race (65.2% vs. 45.4%, p=0.0001), shigh school education (71.1% vs. 58.2%, p=0.003), a history of diabetes (29.6% vs. 21.1%, p=0.04), ≥1 APOE e4 allele (37.9% vs. 23.2%, p=0.003), and lower creatinine (mg/dl, 1.0±0.22 vs. 1.1±0.55, p=0.0001), but did not differ on: age (p=0.12); gender (p=0.08); literacy (p=0.06); history of stroke (p=0.57), MI (p=0.31), depression (p=0.17), or smoking (p=0.20); BMI (p=0.32); or CRP level (p=0.21). Conclusions: A critical step in fully realizing the potential role of any biomarker is understanding the correlates of the biomarker, and how it changes in the general population.

THE DEVELOPMENT OF DIRECT-CARE STAFF SOCIAL INTERACTION CODING SCHEMAS
H. Kim, D.L. Woods, J. Mentes, J.L. Martin, A. Moon, L.R. Phillips, School of Nursing, UCLA, Los Angeles, California

Few reliable instruments available to measure the direct-care staff’s social interaction competence in caring persons with dementia of diverse cultures, two social interaction coding schemas were developed to measure the dementia appropriate social interaction (DSI) and culturally appropriate social interaction (CSI) of direct care nursing home (NH) staff in a Korean American (KA) NH. A pilot study was conducted to assess: 1) content validity; 2) inter-rater reliability; and 3) feasibility, ease of use of the DSI and the CSI. An expert panel evaluated the content validity of each coding schema considering the relevance and clarity of each item. Six non-Korean direct-care staff were recruited for the pilot study. To assess inter-rater reliability, two trained research assistants observed and recorded staff’s social interaction behaviors simultaneously during routine care activities. Observations were recorded using a handheld device with coding schemas installed. Ease of use of coding schemas was assessed by interviewing the RAs. The total number of resident morning care interactions was 23 over 3 days by 6 direct care staff. The Index of Content Validity score for the DSI and the DSI was .80 and .88, respectively. The inter-rater reliability for the CSI varied from 0.69 to 0.82 for Cohen’s Kappa and 76.92% to 84.21% for percentage agreement. Inter-rater reliability for the DSI varied from 0.73 to 0.83 for Cohen’s Kappa and 75% to 84.62% for percentage agreement. This study suggests that both CSI and DSI coding schemas show good to very good inter-rater reliability are feasible, and easy to use.

ILLNESS REPRESENTATIONS, COPING, AND HEALTH OUTCOMES IN OLDER ADULTS WITH MILD COGNITIVE IMPAIRMENT
F. Lin, S.M. Heidrich, University of Wisconsin-Madison, Madison, Wisconsin

Little is known about older adults’ experience of Mild Cognitive Impairment (MCI). The purpose of this study was to 1) describe illness representations of MCI, coping with MCI (general coping strategies and self-care behaviors), and health outcomes (objective and subjective physical functioning, and psychological well-being) in older adults with MCI, and 2) examine relationships between illness representations, coping, and health outcomes. An exploratory cross-sectional study was conducted. Thirty-three participants diagnosed with MCI (Mean age = 81) were interviewed using structured assessments of beliefs about MCI (Illness Perception Questionnaire-MCI), general coping strategies (Brief COPEPE, self-care behaviors (checklists of dementia prevention behaviors, memory aids, and supportive services), objective physical functioning (Timed Instrumental Activities of Daily Living tasks), and subjective physical functioning and psychological well-being (SF-12). Participants endorsed average 12 symptoms and 7 causes related to MCI. They tended to believe MCI was chronic but controllable by personal behaviors, but did not agree about consequences, emotions, or understanding of MCI. Participants used problem- and emotion-focused coping, but few dysfunctional coping strategies. They engaged in dementia prevention behaviors and memory aids, but few services. After controlling for education, gender, symptom experience, depression, comorbidity, and global cognition, self-care behaviors predicted objective physical functioning (change of R square = .14), while illness representations (change of R square = .26) and general coping strategies (change of R square = .12) predicted psychological well-being. Results
suggest areas to target psychoeducational interventions to improve health and well-being outcomes in older adults with MCI.

COPING IN OLDER INDIVIDUALS WITH MILD COGNITIVE IMPAIRMENT
F. Lin, L. Hanna, S.M. Heidrich, University of Wisconsin-Madison, Madison, Wisconsin

Most patients diagnosed with Mild Cognitive Impairment (MCI) live in the community and are faced with the complication and uncertainty related to their diagnosis. Little is known about how older adults with MCI cope with this diagnosis. The purpose of this descriptive project was to describe how older adults with MCI cope with their diagnosis and examine correlates (demographic and health) of coping. Sixty three older adults with MCI (M age= 81) completed a checklist of dementia prevention behaviors, memory aids, and supportive services and the Brief-COPE Inventory (Carver, 1997). Participants reported dementia prevention behaviors (Mean = 9 out of 12) and memory aids (Mean = 6 out of 8), and used few services (Mean = 2 out of 9). Participants used more problem- and emotion-focused strategies than dysfunctional strategies (t = 11.87, p < .001; t = 6.78, p < .001). Most domains of coping strategies were significantly correlated to each other, except service use. Dementia prevention behaviors was significantly related to being male, married, higher education, higher household income, and lower depression. Memory aids was associated with being male and higher global cognition (the Montreal Cognitive Assessment). Problem- and emotion-focused coping were both associated with experience of using prescribed medications to control cognition. Overall, persons with MCI used numerous behavioral and cognitive strategies to cope with their MCI. Future research should investigate the impact of these strategies on successful management of MCI and nursing interventions to assist older adults with MCI and their families.

REDUCTION OF AGITATION IN SENIORS WITH DEMENTIA USING NON-PHARMACOLOGICAL INTERVENTIONS
S. Janzen, A.A. Zecvici, University of Western Ontario, London, Ontario, Canada

Behavioural changes accompanying dementia, such as agitation, can be alleviated with both pharmacological and non-pharmacological interventions (NPIs). Due to poly-pharmacy and harmful side effects, medications should be, but frequently are not, used as a last resort for reducing agitation. The purpose of this phenomenological study was to understand the barriers and facilitators for the implementation of NPIs designed to reduce agitation in long-term care (LTC) residents with dementia. Two privately and three publicly funded LTC facilities participated in the study. Using a survey, interviews and focus groups, the perspectives of 43 LTC staff and managers were captured. Participants included recreational therapists, activation staff, nurses, personal support workers, and dementia unit coordinators. Content analysis was used to identify predominant themes. Results indicate that NPIs were used at all LTC facilities in adjunct to medications, and their implementation was strongly influenced by funding policies and care practices. The most frequent NPIs for agitation were calming music, horticultural, pet and reminiscence therapy which were all regularly scheduled programs. For already agitated individuals, in addition to PRN medications, verbal and re-approaching NPIs were preferred. Main barriers for NPI use were: staff’s lack of time, documentation requirements and the diffusion of responsibilities between staff; while main facilitators were: the importance of the residents’ well-being, previous successes using NPIs and lack of regulatory requirements in the privately funded homes. Staying informed about the most recent NPI research and implementation strategies was dependent on the staff’s personal initiative and disseminated informally within LTC facilities.

DEMENTIA IN THE ED: EXAMINING THE PROCESS OF CARE
C. Cleenger, T.A. Chu, 1. Department of Veterans’ Affairs Medical Center, Decatur, Georgia, 2. Emory University, Atlanta, Georgia

Among older emergency department (ED) patients, 26-40% will have dementia. Persons with dementia who access the ED are theorized to have poor discharge potential and have limited ability to provide a health history. Outcomes of the ED visits by persons with dementia have been described with higher likelihood of admission; however, no study of the process of care has been undertaken to date. This study aims to measure the process of ED care for persons with dementia including length of stay, volume of ancillary testing, admission rates, and the number of ED visits over the year. The study employs a retrospective chart review of persons over age 70 who accessed the ED of an academic medical center in 2009 for complaints of moderate severity. The full medical record was available to the study team for the ascertainment of dementia status. Of the 189 records included in this analysis, 53 had documentation of dementia. Those in the dementia group were older (81.1 vs 79.8), more likely to be female (66% vs 58%) and more likely to reside in assisted living or nursing home than in a private residence (21% vs 12%). There were small, non-significant differences in length of stay and number of diagnostic/screening tests performed. Those with a record of dementia were more likely to be admitted to the hospital (60.3% vs 49.3) and had significantly more ED visits over the year than those without a record of dementia (3.25 vs 1.89, p=0.000).

DIFFERENCES IN PREDICTORS OF A DEMENTIA DIAGNOSIS AMONG HISPANIC AND NON-HISPANIC WHITE OUTPATIENTS
P. Sayegh, B.G. Knight, University of Southern California, Los Angeles, California

The aims of this study were to examine factors that predict a dementia diagnosis among a sample of 444 Hispanic and 11,081 non-Hispanic White patients evaluated at Alzheimer’s Disease Research Centers nationwide and test for cross-cultural differences in the factors. A random sample of 444 non-Hispanic White patients was extracted from the total sample to reduce the chances of significant findings due to high power and increase comparability across groups. The predictor variables were neuropsychological test performance, informant-reported scales assessing patients’ neuropsychiatric symptoms and functional abilities (i.e., instrumental activities of daily living), and a binary variable indicating whether informants reported memory decline among patients. When controlling for age, gender, education, and evaluation site, logistic regression analyses for each ethnic group revealed that all key predictor variables except for informant-reported neuropsychiatric symptoms were significantly associated with a dementia diagnosis among both groups. However, there were no significant cross-cultural differences regarding the associations of the key predictors and diagnosis. Non-Hispanic White women were more likely to be diagnosed with dementia than non-Hispanic White men, as were Hispanics with higher levels of education compared to Hispanics with lower levels. Though caution should be used in making clinical inferences from this research database, these findings suggest that clinicians may not rely heavily on informant-reported neuropsychiatric symptoms when diagnosing dementia. In addition, clinicians may be reluctant to diagnose Hispanics with lower levels of education with dementia perhaps out of cautiousness given the limitations of some diagnostic tools that rely heavily on education and English proficiency.
DOES PAST FRAILTY STATUS PREDICT PROGRESSION OF FRAILTY AND MORTALITY?

A.B. Mitnitski, X. Song, K. Rockwood, Department of Medicine, Dalhousie University, Halifax, Nova Scotia, Canada

Background: Despite the importance of understanding changes in functional status over time, little is known about the course of frailty. Our goal was to investigate how sequential information about frailty status might help to predict two outcomes: mortality and frailty progression. Methods: We analyzed the data of 14,713 people aged 15-90 recruited at ambulatory clinics. The anthropometric and performance parameters were collected at baseline and 1 year thereafter. The participants were randomly selected from 3,378 community-dwelling elderly women aged 65-84 and living in Hatoyama town, Saitama Prefecture, Japan. As a result, 750 participants were included in this study. To evaluate the condition of frailty, we used Frailty Index comprising 15 easy-to-answer items with the cut-off point of 3/4. SES included subjective social status (SSS), living circumstance, educational level and occupational class. Results: Of 750 participants, 10% were evaluated as frail. There was no significant association between sex and frailty using chi-square test. Multiple logistic regression analysis showed that lower SSS and worse living circumstance were significantly associated with frail, even after adjusted for demographic, physical, psychological and social factors. The other hand, educational level and occupational class were not significantly related to frail. Conclusions: This finding suggested that it would be important to take individual SES into consideration in developing the frail prevention activities.

SESSION 500 (POSTER)

FRAIL, MINORITY, AND VULNERABLE ELDERS

PREVALENT FRAILTY AND SOCIOECONOMIC STATUS AMONG THE JAPANESE ELDERLY

H. Murayama, M. Nishi, M. Kim, Y. Shimizu, Y. Fujiwara, S. Shinkai, Research Team for Social Participation and Community Health, Tokyo Metropolitan Institute of Gerontology, Tokyo, Japan

Purpose: Frailty is known as an important risk factor for adverse health outcome in later-life. Japan faces a serious rapid aging of population, and the number of frail elderly will grow dramatically. Moreover, social disparity has been growing steadily in recent Japan. Several studies reported the association between frailty and low socioeconomic status (SES). However, there is no empirical evidence in Japan. The purpose of this study was to examine the relationship frailty and SES among the Japanese elderly. Method: We used the baseline data of Hatoyama Cohort Study, conducted in September 2010. Participants were randomly selected from 3,378 community-dwelling elderly who were aged 65-84 and living in Hatoyama town, Saitama Prefecture, Japan. As a result, 750 people were recruited in this study. To evaluate the condition of frailty, we used Frailty Index comprising 15 easy-to-answer items with the cut-off point of 3/4. SES included subjective social status (SSS), living circumstance, educational level and occupational class. Results: Of 750 participants, 10% were evaluated as frail. There was no significant association between sex and frailty using chi-square test. Multiple logistic regression analysis showed that lower SSS and worse living circumstance were significantly associated with frail, even after adjusted for demographic, physical, psychological and social factors. On the other hand, educational level and occupational class were not significantly related to frail. Conclusions: This finding suggested that it would be important to take individual SES into consideration in developing the frail prevention activities.

64th Annual Scientific Meeting
Between Gender (P=0.06). Additionally, Being Older, Having Weaker Quadriceps Muscle Strength, Thigh Muscle Index, And Longer Timed Up&Go Test Were Associated With Frail Status (All P-Value < 0.05). Dominant Thigh Muscle Index Was An Independent And Protective Factor Associated With Frailty After Age Adjusted. Conclusions: Using The Equation With Anthropometric Measurements Is A Simple And Non-invasive Method For Thigh Muscle Volume Estimation. Thigh Muscle Index Can Early Detect Frailty Stage And Minimize Gender Difference.

THE ASSOCIATION BETWEEN SLEEP DURATION AND FRAILTY AMONG HIGH-FUNCTIONING ELDERLY IN TAIWAN
K. Tsai1, C. Wen2, H. Kuo3, 1. Family Medicine, Chi-Mei Medical Center, Tainan, Taiwan, 2. National Taiwan University Hospital, Taipei, Taiwan. 3. National Health Research Institutes, Taipei, Taiwan

Method: We analyzed data in a group of high-functioning older adults over 65 years old who participated in the Health Examination for the Elderly Program (HEEP) in the National Taiwan University Hospital (NTUH), a tertiary medical center in Taipei, Taiwan. Participants were excluded from the study if they were demented or dependent in daily living. Sleep duration, sociodemographic data and medical history were assessed through questionnaire; anthropometric data, physical measures, and laboratory examination were collected. Frail or pre-frail status was determined according to Fried’s criteria. Subjects were defined as frail if they meet 3 items from the criteria, and as pre-frail if they meet 1 or 2 items. Result: There were 260 subjects included in our study, the mean age was 72.2 (65–88) years, and 135 female participants represented 51.9% of the study population. The mean sleep duration was 6.56 (±1.48) hours per day, and 6 (±1.26) hours per night. Among the study population, only 2 subjects were frail, and 54 persons (20.8%) were pre-frail. After multiple logistic regression, we found that frailty or pre-frailty were independently associated with longer sleep duration (over 8.5 hours/day). The odds ratio (OR) is 2.78 (95%CI: 1.10–7.01). We also found a linear association between frailty or pre-frailty and daily sleep duration (hours) among male subjects, the OR is 1.66 (95%CI: 1.096–2.505) after adjusting with confounders. This association was not significant among female subjects. Conclusion: We found an independent association between longer self-report sleep duration and frail status among high-functioning older adults in Taiwan. Physicians may take sleep duration into consideration when evaluating frail older patient, especially when they are male.

BIOELECTRICAL IMPEDANCE FOR ESTIMATING BODY COMPOSITION IN NON-FRAIL AND PRE-FRAIL OLDER ADULTS
M. Nemoto1, N. Yabushita1, T. Matasuo1, M. Kim2, S. Seino1, S. Jung3, T. Tsujimoto1, K. Tanaka1, 1. Graduate School of Comprehensive Human Sciences, University of Tsukuba, Ibaraki, Japan, 2. Tokyo Metropolitan Institute of Gerontology, Tokyo, Japan

Objective: Few studies have demonstrated that BIA was sensitive enough to detect body composition for older adults, especially pre-frailty. The purpose of this study was to compare body composition measured by bioelectrical impedance analysis (BIA) and dual-energy X-ray absorptiometry (DXA) in non-frail and pre-frail older adults. Methods: 60 older adults (75.0 ± 5.7 years, 41 women and 19 men) were classified according to Fried’s definition: non-frail (34 older adults, 74.5 ± 6.6 years) and pre-frail (26 older adults, 75.5 ± 4.5 years). Percentage of fat mass (%FM), fat mass (FM), and fat-free mass (FFM) were estimated by BIA (DPXL, GE Lunar) and BIA (MC-190, Tanita, Japan). Results: No significant difference was observed between DXA and BIA for FM (39.0 kg vs. 39.6 kg), and there were significant differences for %FM (28.0 % vs. 29.0 %) and FFM (15.5 kg vs. 16.6 kg). DXA-derived body composition parameters were significantly correlated with those determined by BIA in non-frail and pre-frail older adults (%FM: r = 0.96, 0.91; FM: r = 0.94, 0.97 and FFM: r = 0.98, 0.97, p < 0.01, respectively). Bland-Altman plots demonstrated no systematic bias for body composition parameters except FM for pre-frail older adults (e.g. FM: r = −0.11, p = 0.56, r = −0.39, p = 0.05; non-frail, pre-frail, respectively). Conclusion: These results suggest that compared with DXA, BIA accurately evaluated body composition in non-frail and pre-frail older adults, although FM had proportional biases. It could be a convenient and practical approach for assessment in clinical settings.

COGNITIVE DECLINE AND DIABETES: POSSIBLE COMORBIDITIES OF THE FRAILTY PHENOTYPE?
M.E. Cano, E. Crimins. USC-Gerontology, Los Angeles, California

Age-associated declines in insulin sensitivity have been hypothesized to prompt hypercatabolism. Such metabolic breakdowns of skeletal muscle may manifest clinically as sarcopenia, a primary factor of the frailty syndrome. Research also suggests that disruptions of the insulin-signaling pathways may alter cognitive functioning. The present study sought to investigate whether a diabetic state acts as a mediator in the association between frailty and cognitive decline. Subjects included 2578 adults over age 60 from the National Health and Nutrition Examination Survey (NHANES 1999-2002). Frailty was operationalized as a presence of three or more of the five criteria making up its clinical definition—weakness, slowness, exhaustion, low physical activity and weight loss. Preliminarily, ordinary least squares regression verified the association between cognitive functioning and diabetes. Next, logistic regression using two models tested for a relationship between frailty and cognitive functioning. In order to investigate changes in predictive power between the two models to assess whether or not diabetes was mediating the association between cognition and frailty, diabetes status was excluded from the first model and only included in the second model. All analyses controlled for possible confounders including age, race/ethnicity, sex and education. While results demonstrated that diabetes status is associated with frailty and lower cognitive functioning, diabetes did not significantly mediate the relationship between them. Given that frailty is complex and multifaceted, its concurrence with cognitive decline may result from multiple physiological disruptions, rather than a single underlying factor.

PREDICTORS OF CAREGIVER BURDEN IN MILD COGNITIVE IMPAIRMENT
B.A. Springate1,2, G. Tremont1,2, 1. Psychiatry, Rhode Island Hospital, Providence, Rhode Island, 2. Brown University, Providence, Rhode Island

Estimates suggest up to 50% of dementia caregivers experience significant feelings of caregiver burden. However, caregiver burden has not been extensively studied among caregivers of patients with mild cognitive impairment (MCI), even though these patients experience cognitive decline as well as behavioral and emotional changes. This study examined the relationship between caregiver burden and patients’ cognition and behavioral and emotional functioning in 43 patients with MCI [M age = 75.86 (SD = 3.37); 74% female] and their caregivers [M age = 63.33 (SD = 13.25); 65% female; 63% live with MCI patient]. Patients underwent a comprehensive neuropsychological evaluation, and caregivers completed the Frontal Systems Behavior Scale and a measure of functional impairment about the patient as well as measures of their own mood and perceived burden. Results showed 30% of caregivers reported clinically significant burden. Caregiver burden was positively correlated with caregiver depression (r = 0.38), patient frontal systems behavioral problems (r = 0.44), and inversely correlated with patient functional abilities (r = −0.35). Surprisingly, caregiver burden was not associated with patients’ neuropsychological performance or depression. In addition, caregiver burden was not higher among caregivers living with the care recipient. Regression analyses indicated that frontal systems behavioral problems, in particular disinhibition, and impairments in basic activities of daily living were the strongest predictors of caregiver burden. These findings confirm the presence of caregiver bur-
FAMILY CAREGIVING FOR DEPENDENT OLDER PERSONS IN THAI FAMILIES

N. Wongswang1,2, S. Lagampan1, B. Bowers3, P. Lapwongwatta1, D. O’Neill4,5, N. Wongsawang1

1 Mahidol University, Bangkok, Thailand, 2. School of Nursing, University of Wisconsin-Madison, Madison, Wisconsin

Thai families are acknowledged to provide care for dependent older persons. Changes in Thai families such as: a decrease in family size, multigenerational co-residence and increasing workforce participation of women, are likely to shape the future of family caregiving. Lack of knowledge about caregiving families’ experience point of view limits practical understanding of how to support caregiving families. This presentation reports on a Grounded Theory study that explored how Thai families care for dependent older persons. Thirty families including thirty family members participated in the study. Dimensional analysis and the constant comparative method were used to analyze transcripts. Several types of caregiving were identified and explored, including being with, providing hand on care, being available on call, organizing, monitoring, visiting, financial supporting and emotional supporting. Three processes of caregiving, “Mobilizing family members to meet the need”, “Providing selected type of care”, and “Remobilizing caregiving members to maintain caregiving in the family” were discovered. The findings suggest conditions and consequences of involvement in each distinct caregiving process. Promoting, strengthening and supporting caregiving families through each caregiving process should be considered by health care providers and policy makers in order to establish, perform and maintain caregiving systems for dependent older person. A conceptual model of family caregiving for dependent older persons in Thai families was developed from the analysis.

SELF-NEGLECT AND ELDER ABUSE: RELATED PHENOMENA?

D. O’Neill1, M. Bartley2, J.G. O’Brien2, 1. Centre for Ageing, Neuroscience & Humanities, Trinity College Dublin, Dublin, Ireland, 2. University of Louisville, Louisville, Kentucky

Self-neglect among older people remains an under-recognized and under-reported problem. We hypothesized that it is likely to share common features with the clinical approach to the prevention and management of elder abuse, and evaluated Irish and Scottish geriatricians’ clinical experience of self-neglect among older people in their country, and its possible relationship with elder abuse. A 33 item questionnaire was administered electronically to members of the Irish Society of Physicians In Geriatric Medicine (n=65) and the British Geriatric Society (BGS) Scotland (n=196). Questions addressed prevalence and types of self-neglect, aetiology, referral processes and interplay with elder abuse, adequacy of training and identifying their primary role. Most respondents (>90% in both samples) had encountered cases of self-neglect within the last year. Up to 40% of cases incorporated an element of elder abuse. Personal neglect (poor hygiene) and refusal of services were the commonest types of self-neglect encountered. Dementia was considered by health care providers and policy makers in order to establish, perform and maintain caregiving systems for dependent older persons. Sixty seven individuals agreed to participate in a post-use questionnaire, 51% (n=18) reported using the CPG in their practice. Twenty six percent of participants reported using the CPG for other clinical issues. Training was reported by 20% as lacking in sufficient ethical and technical skills to deal with self-neglect. Comprehensive Geriatric Assessment was identified as the geriatrician’s primary role. Self-neglect is commonly encountered by geriatricians in Ireland and Scotland and often co-exists with elder abuse. These results identify a need for increased co-ordination of services and education to address this complex problem. Drawing on the combined insight and experience of geriatricians can help to improve understanding of this syndrome.

MECHANISMS OF BRUISING AND INJURY PATTERNS IN PHYSICAL ELDER ABUSE

C.E. Ziminski1, A. Wiglesworth2, L. Mosquera3, 1. University of California Los Angeles, Los Angeles, California, 2. University of California Irvine, Irvine, California

Bruising resulting from physical elder abuse has potential as a forensic marker. The purpose of this study was to evaluate attributes of bruises as potential forensic markers in a sample of physical elder abuse victims (n=67) and examine the mechanism of injury in the victims who sustained bruising (n=48). A research nurse conducted assessments and documented the presence and characteristics of bruises. Data was collected using the revised Conflicts Tactic Scales (CTS2) physical assault scale, and victims were asked to describe the abusive incident. The three most commonly reported mechanisms of injury on the CTS2 were “a family member or other adult I know pushed or shoved me” (50.7%), “grabbed me” (34.3%), and “punched or hit me” (31.3%). Attempted strangulation or choking was reported by 9% of the victims. Victims’ odds of having head and neck bruises were greater when reporting being choked (7.71 OR, 95% CI 1.29-45.90, p=0.039), punched (13.53 OR, 95% CI 2.55-71.80, p=0.001) and beat up (5.60 OR, 95% CI 3.26-74.45, p=0.001). The odds of having lateral/anterior arm bruises were 8 times greater when the victim reported being grabbed (8.43 OR, 95% CI 2.67-26.65, p<0.001). The findings highlight injury patterns that victims sustain, and can be informative for professionals working with elder abuse victims.

IDENTIFYING RISK FOR ELDER INVESTMENT FRAUD AND FINANCIAL EXPLOITATION: CLINICIAN’S POCKET GUIDE

W.L. Mills1,2, R. Roush3, J. Myce4, N.L. Wilson1,2, M.E. Kunik1,2, K.R. Cassidy5, G.E. Taffet1,2, A.D. Naik1,2, 1. Houston Health Services Research & Development Center of Excellence, Michael E. DeBakey VA Medical Center, Houston, Texas, 2. Department of Medicine, Baylor College of Medicine, Houston, Texas, 3. Huffington Center on Aging, Baylor College of Medicine, Houston, Texas, 4. Veterans Affairs South Central Mental Illness Research, Education, and Clinical Center, Michael E. DeBakey VA Medical Center, Houston, Texas

Elder investment fraud and financial exploitation (EIFFE) is the illegal or improper use of another individual’s resources for personal profit or gain. Due to aging or age-related illnesses, particularly cognitive impairment, older adults may experience declines in financial capacity making them more vulnerable to EIFFE. With a past-year prevalence of 4-5%, EIFFE has recently been identified in the literature as a clinical issue. Clinicians see patients on a regular basis, which puts them in a unique position to identify individuals who are vulnerable to exploitation. We describe the preliminary evaluation of a Clinician’s Pocket Guide (CPG) and Continuing Medical Education (CME) program for clinicians to assist them in identifying older adults at risk for EIFFE. Practicing clinicians (n=128) were shown the CME presentation and given copies of the CPG. During the pre-use evaluation 40% (n=52) planned to use the CPG during visits with patients. Sixty seven individuals agreed to participate in a post-use evaluation four months later. Of the 35 respondents who returned questionnaires, 51% (n=18) reported using the CPG in their practice. Twenty six percent of participants reported using the CPG for both patient visits (n=9) and having other staff members use the guide (n=9). Respondents also provided insights on the usefulness of the individual sections of the guide. These findings highlight the need for increased co-ordination of services and education to address this complex problem. Drawing on the combined insight and experience of geriatricians can help to improve understanding of this syndrome.
and importance of providing clinicians with financial capacity education, to make use of a pocket guide for screening elders potentially at risk for EIFFE, and to raise awareness for this underappreciated but growing problem.

A SCREENING TOOL FOR CAPACITY TO LIVE SAFELY AND INDEPENDENTLY IN THE COMMUNITY

W.L. Mills1,2, T. Regev1, M.E. Kunik1,3,4, N.L. Wilson1,2, J. Moye6, L.B. McCullough4, A.D. Naik1,3, J. Houston Health Services Research & Development Center of Excellence, Michael E. DeBakey VA Medical Center, Houston, Texas, 2. Department of Medicine, Baylor College of Medicine, Houston, Texas, 3. Quentin Mease Community Veterans Hospital, Harris County Hospital District, Houston, Texas, 4. Veterans Affairs South Central Mental Illness Research, Education, and Clinical Center, Michael E. DeBakey VA Medical Center, Houston, Texas, 5. VA Boston Healthcare System and Department of Psychiatry, Harvard Medical School, Boston, Massachusetts

The capacity to live safely and independently in the community is a primary goal for older adults. Capacity is generally defined as an individual’s ability to understand, retain, and weigh information relevant to a decision in order to arrive at a choice and communicate the decision. Despite their lack of training in social, functional, and cognitive assessment, clinicians are often asked to make determinations regarding an individual’s capacity. The Making and Executing Decisions for Safe and Independent Living (MED-SAIL) tool was developed using focus groups and trial in-field use by community social service providers. Theory-based assessments of decision-making capacity, problem solving, and judgment are used to systematically evaluate and score MED-SAIL domains. Furthermore, MED-SAIL uses pragmatic scenarios related to an older adult’s daily life to contextualize functional and executive capacity evaluation. MED-SAIL was included in a pilot test of a geriatric capacity assessment clinic, which provided comprehensive capacity assessments for living safely and independently in the community to 41 older adults over a two year period. Preliminary findings reveal that MED-SAIL scores are positively correlated with the final determination of capacity (r(34)=.593, p<.001), Independent Living Scales (r(28)=.424, p=.024), and instrumental activities of daily living (r(34)=.411, p=.016). These findings provide preliminary insight into the usefulness of MED-SAIL as a tool to screen for capacity to live safely and independently in the community.

BREAKING THE SILENCE: EXAMINING BARRIERS TO SELF-REPORTING OF ELDER PHYSICAL ABUSE IN COMMUNITY-DWELLING ELDERS

C.E. Ziminski1, V.F. Rempusheski2, J. Nursing, University of California, Los Angeles, Los Angeles, California, 2. University of Delaware, Newark, Delaware

Approximately 12.5% of elders experience physical abuse in their lifetime. Yet, for every case of elder abuse that is reported another five go unreported. An author developed vignette scale was used to present three types of physical abuse and three barriers to reporting for each of three living situations (CVI= 1.0). Elders (n=76) rate perceptions of whether or not the situation is abusive, likelihood of reporting and likelihood of reporting when presented with each of three barriers on a 4-point Likert scale. The results show elders have a consistent perception of physical abuse. However the barriers affected elders’ likelihood of reporting, which varied across types and situations. For example, while 91.8% of elders would report abuse committed by a paid caregiver, when considering the barrier of nursing home placement reporting dropped to 77.3%. The results suggest reporting abuse is multifactorial and has implications for screenings.

AGE AND RACE DIFFERENCES IN MEDICAL DEBT PROBLEMS

Medical debt (MD) limits access to care, contributing to adverse health outcomes. Medicare/Medicaid appears to buffer the impact of MD among the elderly (65+); however, the impact of MD within racial/ethnic age groups is unclear. Using a 2007 national survey, this study examined age and race/ethnicity differences in incurring MD and five financial hardships associated with MD. Adjusted regression analysis indicated middle-aged (45-64) and elderly respondents were less likely to incur MD (OR=0.81, 95% CI: 0.68-0.97 and OR=0.19, 95% CI: 0.14-0.27, respectively) than young (18-44) respondents. Compared to the young, the elderly were less likely to report being contacted by a collection agency, putting off major purchases, and borrowing money because of MD. Middle-aged respondents reported more problems paying for necessities than young respondents. There were no significant differences between young and elderly respondents in using savings and paying for necessities. African Americans (AAs) were more likely than Whites to incur MD (OR=1.95, 95% CI: 1.50-2.54); there were no significant differences between Hispanics and Whites. There were no significant differences between AAs and Whites in the five financial hardships associated with MD. Among young respondents, AAs (OR=1.47, 95% CI: 1.04-2.09) were more likely than Whites to incur MD. Middle-aged AAs were more likely than their Whites counterparts (OR=2.47, 95% CI: 1.60-3.80) to incur MD. Elderly AAs (OR=5.88, 95% CI: 3.46-10.00) also incurred more MD than elderly Whites. Middle-aged AAs and Hispanics were more likely to put off major purchases and had problems paying for necessities than their young counterparts.

MIDLIFE AND ELDERLY AFRICAN AMERICAN WOMEN PERCEPTIONS OF PHYSICIAN TRUSTWORTHINESS: A FACTORIAL SURVEY APPROACH

Low trust in doctors may partially account for African Americans’ (AAs) adverse health outcomes. It is hypothesized that patient-provider physical concordance can promote higher patient trust and favorable health outcomes. There have been few empirical studies of AAs’ preference for physicians of the same physical characteristics. This study examined the effects of physician race (White versus AA), age (old versus young), and gender on AA women’s perceptions of fidelity, competence, honesty, confidentiality and global trust. Women were presented (via laptops) with vignettes of contrived medical visits (routine visit and a visit involving a serious medical concern) where the physicians’ race, gender, and age were randomly manipulated. A community-base sample of 313 women aged 45+ in Madison, WI was surveyed. Overall, trust scores were higher for male versus female physicians, old versus young, and AA versus White physicians and higher in the sick visit versus the routine care visit. However, assessment of the preventive visit vignette indicates that AA women were more trusting of White-old-female physicians and less trusting of White-young-male physicians. With regards to the sick visit vignette, AA women were more trusting of White-old-male and AA-old-male physicians and less trusting of White-old-female and White-young-male physicians. AA women scored White-young-male physicians less favorably on trust items assessing fidelity, honesty, confidentiality and global trust. Our findings sug-
gest that older AA women trust in physicians may be influenced by physician characteristics and context of their medical visit.

THE RELATIONSHIP OF ACCULTURATION (ENGLISH PROFICIENCY AND DIETARY CHANGE) TO HEALTH OUTCOMES (CURRENT SELF-RATED HEALTH AND HEALTH BEHAVIOR) AMONG AFRICAN IMMIGRANT ADULTS: A LIFE-COURSE PERSPECTIVE

M.C. Okafor, Division of Gerontology, University of Maryland Baltimore, Baltimore, Maryland

Objective: This research was designed to investigate potential associations between acculturation and health outcomes in the context of the life-course, among African immigrant adults. Methods: A cross-sectional, mixed methods secondary data analysis was performed on baseline data from the African immigrant adult subsample (n=763) of the 2003 New Immigrant Survey, a longitudinal study of immigrants granted lawful permanent residence. Results: Limited English proficiency (LEP) immigrants had higher odds of rating their health good/fair/poor (OR: 0.282, 95%CI: 0.158-0.503, p<.0001) and engaging in poor health behavior than English proficient (EP) immigrants (OR: 0.310, 95%CI: 0.165-0.685, p<.0003). EP women had lower odds of engaging in poor health behavior than EP men (OR: 0.3446, 95%CI: 0.2129-0.5576, p<.0001). Immigrants reporting moderate dietary change had higher odds of rating their current health as good/fair/poor than those with low dietary change (OR: 1.903, 95%CI: 1.143-3.170, p=0.0134). Immigrants residing in the U.S. >5 years had higher odds of engaging in poor health behavior than those in the U.S. <5 years (OR: 2.030, 95%CI: 1.314-3.135, p=0.0014). Immigrants >41 years of age at immigration had higher odds of rating their health as good/fair/poor than those who arrived at a younger age (OR: 4.293, 95%CI: 1.830-10.071, p=0.0008). Immigrants with chronic disease had higher odds of rating their current health as good/fair/poor than those without chronic disease (OR: 4.173, 95%CI: 2.525-6.897, p<.0001). Conclusions: LEP, moderate dietary change, increased DOR, older age at immigration, being male, poor pre-migration health and chronic disease were associated with increased risk for poor health outcomes. More culturally/linguistically competent health promotion and interventions in this population are needed.

LATINO DIABETICS: BARRIERS TO STUDY ENROLLMENT AND FA VORABLE HOSPITAL-TO-LATINO DIABETICS: BARRIERS TO STUDY ENROLLMENT AND FAVORABLE HOSPITAL-TO-COMMUNITY TRANSITIONS

M. Siciliano, S. Enguidanos, Leonard Davis School of Gerontology, University of Southern California, Los Angeles, California

Nearly 24 million people in the U.S. suffer from diabetes mellitus, with costs of care estimated at $116 billion. Diabetes-related problems account for 11% of hospital readmissions among Medicaid patients, with Latinos disproportionately impacted by diabetes and at a significantly higher risk for hospital readmissions. This session presents barriers to enrollment in a study seeking to improve the quality of transitions between care settings among Latino diabetics, including follow-up after hospital discharge and care plan adherence. Participants are randomly assigned to either standard medical care or a brief transitions intervention provided by a diabetes-trained bilingual health educator. Of 995 patients screened, 799 (80%) were ineligible to participate in the study. Of the 196 eligible patients, 88 (45%) consented to participate and 108 (55%) refused to participate. Patient reasons for refusing to participate in the study included inability to comprehend the study/non-responsive/unable to be awakened (39%); refusal or lack of interest (17%); wanting to think about the study (15%); help not needed/already receiving sufficient help (14%); homelessness (4%); traveling back and forth to Mexico or never home (4%); outside service area (4%); and reluctance to have someone come to their home (3%). Most barriers to study enrollment also represent significant barriers to follow-up care. Addressing study barriers will help insure successful hospital-to-community transitions. These issues will be presented along with case studies illustrating the need for innovative strategies to improve care setting transitions among monolingual Latino diabetics.

RACIAL DISPARITIES IN ADULT BMI TRAJECTORIES: THE ROLE OF LIFECOURSE SOCIOECONOMIC POSITION

T.Z. Insaf1, B. Shaw1, R. Yuce1, L. Chasan-Taber2, D. Strogatz1,1, J. State University of New York at Albany, Rensselaer, New York, 2. University of Massachusetts, Amherst, Massachusetts, 3. Bassett Research Institute, Cooperstown, New York

Despite evidence for racial disparities in the impact of lifetime socioeconomic position (SEP) on body mass index (BMI), the differential effects by race for lifetime SEP (LSEP) on adult BMI trajectories have not been assessed. Therefore, we evaluated this association using longitudinal data from 2,052 participants in the American Changing Lives Study (1986-2002) who were aged 24-91 years at baseline and provided information on childhood SEP. We used mixed effects models with random effects for intercept and slope. Childhood SEP was measured by parental education and perceived childhood socioeconomic status. Adult SEP was assessed by baseline education and time varying income, financial stress, and wealth. Because BMI trajectories have a different pattern in early vs later adulthood, age was modeled as a linear spline. Baseline BMI was higher in males, and among blacks. Baseline BMI was 0.16 kg/m2 higher with increasing baseline age but the effect was smaller in magnitude (0.01 kg/m2/year) among those older than 40. Racial differences in baseline BMI decreased from 1.9 kg/m2 to 1.45 kg/m2 after adjusting for LSEP. Among whites, BMI trajectories were highest among those with a high childhood SEP and low adult SEP. The difference in BMI trajectories between LSEP levels was narrower among white males as compared to white females. Among black females, those with low childhood and adult SEP levels had the highest BMI. In contrast, among black males those with high childhood and adulthood SEP levels had the highest BMI. LSEP has differential effects on BMI in adulthood by race.

LIFE COURSE EXPERIENCES OF PAIN AND SUFFERING AMONG MEXICAN AMERICAN WOMEN WITH DISABILITIES

J.L. Walker, S. Guy, T. Harrison, School of Nursing, The University of Texas at Austin, Austin, Texas

The life course experiences of Mexican American women (MAW) may have lasting impact on pain and suffering in later life. The purpose of this mixed-method study was to understand pain and suffering from a life course perspective as described by MAW with mobility impairments. The sample included 54 MAW, ages ranging from 55 to 75 (M=66, SD=6.23) with mobility impairment. Further, a 56-year-old Mexican American woman from the sample was chosen as an exemplar for case-study analysis. All participants completed a battery of reliable tools including the McGill Pain Index Scale and four separate biographical interviews. Descriptive statistics were used to characterize pain levels in the group and content analysis was done to describe one participant’s experiences with pain. Findings suggest that the words fear (M=1.61, SD=.783) and constrictive pressure (M=3.40, SD=1.2) most frequently described their pain, and they rated their pain a mean of 3.1(SD=1.37) on a scale of 1 to 5. From the case analysis, three categories developed to describe the participant’s life course experience with pain: Emotional Pain, Quitting and Cocooning. Life course experience may intensify current levels of pain and suffering among MAW, which added to the knowledge gained from quantitative assessment. Acknowledgement: This study was supported by NIH/NINR R01 NR010360

SESSION 505 (POSTER)

NURSING, INCONTINENCE, AND END OF LIFE

FACTORS ASSOCIATED WITH DISENGAGEMENT DURING ACTIVITIES IN NURSING HOME RESIDENTS WITH DEMENTIA

N.L. Hill, A.M. Kolanowski, M. Litaker, J. Penn State University, University Park, Pennsylvania, 2. University of Alabama, Birmingham, Alabama

Recreational activities are an essential component of quality care in the nursing home. This is especially true for residents with dementia, as they often lack the ability to actively engage in leisure pursuits. Unfortunately, not all residents can be successfully engaged in recreational activities, even when attempts are made to individualize these activities. The purpose of this study was to identify characteristics of residents with high and low rates of disengagement during recreational activities. Data from a RCT that tested the efficacy of activities for reducing behavioral symptoms of dementia were used to describe the profile of these residents (N=128). Counts of disengagement (0 to 4) were taken from video recordings of activities delivered twice a day for 20 minutes over 15 days. Residents who had high rates of disengagement per session (mean of 1.9 (0.9); N=46) had significantly greater cognitive impairments (p=0.01); greater physical impairments (p=0.0003); greater levels of passivity (p=0.02 to 0.001); and a trend toward lower agreeableness and openness on the NEO –Personality Inventory compared to residents with low rates of disengagement per session (mean of 0.2 (0.2); N= 82). There were no differences in age, gender, race, years of education, or agitation between the groups. Functional impairments, greater passivity and possibly certain personality traits place residents at risk for decreased activity engagement and poor quality of life. Efforts to promote sustained attention through personality style of interest matched activities may improve capacity for engagement.

FACIAL EXPRESSION AS PREDICTORS OF PAIN FOR PATIENTS WITH DEMENTIA

L. Lin, Institute of Clinical and Community Health Nursing, National Yang-Ming University, Taipei, Taiwan

Background: The purpose of this study was to compare the facial expressions of pain between residents with dementia and cognitive intact residents, and to investigate the association of facial expressions and pain of patients with dementia. Methods: Eight hundred and nine residents including 573 residents with dementia and 236 cognitive intact residents were chosen from long-term care facilities from northern Taiwan. Self-reported pain, Doloplus-2, and verbal descriptor were used to determine the consistency of action unit (AU) of facial expressions and the above pain assessment instruments. Each subject received five days observation to collect data regarding their facial expressions of pain and a self-report pain scale. Results. In the cognitive intact and residents with dementia groups, the prevalence of existing pain was 46.4% and 43.9% (excluding unable to communicate) respectively. In both the cognitive intact and cognitive impaired groups, comparing self-reported pain with AU4 (Brow lowerer), AU6+7 (Orbit tightening), and AU9+10 (Nose wrinkler and upper lip raiser) yielded significant relationships. In the cognitive impaired group, the action unit AU25+26+27 (open mouth) also showed a significant relationship with self-reported pain. Additionally, AU4, AU6+7, AU25+26+27, and AU9+10 can be used in conjunction with, or in lieu of, self-reported pain. Doloplus-2 or verbal descriptor scales testing with cognitive impaired patients when assessing pain. Conclusion. This study established better clarity in facial movement descriptive classifications that indicate pain. The findings should contribute to further efforts in developing and evaluating pain scales, advancing the accuracy and consistency of pain assessment, as well expanding clinical utility.

TARGETED, TAILORED AND TIMELY SYMPTOM MANAGEMENT FOR OLDER MEN WITH PROSTATE CANCER

Radiation therapy for prostate cancer may be associated with significant side effects. This pilot study, guided by Armstrong’s Symptom Experience Model, tested the feasibility and initial efficacy of providing targeted, tailored and timely (T3) symptom management as compared to usual care in 50 men who were completing radiation therapy (+/- androgen deprivation therapy) for prostate cancer. Eligible participants reported at least a moderate level of symptom distress after completing 36 to 40 Gy. Using an experimental “patient preference” design with repeated measures, participants were randomly assigned to two study groups in a 2:1 ratio: (1) the T3 symptom management intervention which allowed patients to choose their preferred learning method and (2) usual care. Data were collected at the time of screening and enrollment and weekly during the 6 week intervention period. Due to variability in type of symptom, 5 outcome variables included number of symptoms, average severity, average distress, maximum severity, and maximum distress. Participants ranged in age from 52 to 85 (mean = 68; SD = 7.7); they were mostly non-Hispanic white (86%), and married (82.6%). We compared T3 to usual care using growth curve models for each outcome variable in MPlus. Acceptable model fit statistics resulted, even with the limited sample size. There were significant treatment group differences in the slope and quadratic terms for average and maximum symptom distress. Results support the efficacy of T3 in reducing the symptom experience during the 6 weeks of the intervention. A larger randomized clinical trial is recommended. (NCI R21 CA120896-01A1).

COMPROMISE: A THEORY OF HOSPITALIZED OLDER ADULT EATING BEHAVIOR

E.F. Furman, University of Massachusetts, Amherst, Massachusetts

Lack of eating contributes to inadequate dietary intake, which is a risk factor for undernutrition. Undernutrition contributes to negative health outcomes such as increased morbidity and mortality in older adults. The hospital environment represents a setting where older adults are at risk for undernutrition secondary to inadequate dietary intake despite access to food and therapeutic nutritional intervention. The aim of this research was to develop substantive theory that describes the social process that influences the eating behavior of hospitalized older adults. A grounded theory methodology was used. The Quality Health Outcomes Model was used to guide the study. The basic social process identified was that of compromise. During mealtimes, the hospitalized older adult must choose to compromise either their nutritional health or alternatively compromise their acculturated foodways. The theory of compromised eating behavior has five stages: older adult self-indication, older adult-healthcare provider joint action, healthcare provider self-indication, negotiation, and dietary intake. The knowledge gained from this research will be used to educate older adults and their healthcare providers, plan nutritional interventions, and build a research tradition.

SLEEP IN FAMILY CAREGIVERS OF INDIVIDUALS WITH DEMENTIA: A SYSTEMATIC REVIEW

H. Peng, Y. Chang, SUNY-Buffalo, Amherst, New York

Purpose: This paper was to systematically review the evidence that has been published about sleep in family caregivers of individuals with dementia. Background: An estimated 10.9 million family members and friends provided care for a person with dementia in 2010. The caregiving role comes with emotional strain, physical demands for care, inter-
rupted schedules, employment, income, and financial security concerns, and altered roles, in particular, for the primary caregiver. Sleep disturbances are common among caregivers of people with dementia. Attaining adequate sleep is critical to maintaining the health and well-being of family members as they perform their caregiving role. Method: To identify relevant articles, a search was conducted on the CINAHL, MEDLINE, PubMed, and PsychINFO databases using the following keywords both singularly and in multiple combinations: caregivers, family, sleep, sleep disorders, insomnia, sleep initiation and maintenance disorders, sleep disturbance, sleep deprivation, circadian rhythm, dementia, and Alzheimer’s disease. Databases searched, limited to the years 1982 and 2011. Results: Among 22 studies reviewed, 14 studies used a cross-sectional design without intervention and 8 studies used a longitudinal study design with intervention. Caregivers’ sleep disturbances are highly prevalent among family caregivers. Multiple factors act singly or in combination to cause a complaint of sleep disturbances in caregivers of individuals with dementia. These factors were classified into three categories including demographic, psychosocial, and care recipient factors. The effect size in intervention studies was small and lacked random clinical trials. Longitudinal study design is needed because caregivers’ sleep pattern could be changed over time.

A PRELIMINARY STUDY OF THE APPLICATION OF 6-MINUTE WALKING TEST IN PATIENTS WITH COPD IN CHINA
S. Zhang, J. Peking University People’s Hospital, Beijing, China. 2. Peking University, Beijing, China
Background: Lung function parameters including FVC, FEV1, FEV1%, FEV1/FVC, RV and RV/TLC have been considered as effective and accurate indicators of lung function for patients with chronic obstructive pulmonary disease (COPD). However, they are more complicated and expensive rather than easily applicable. Six-minute walking test (6MWT) has been applied as an effective and efficient indicator to evaluate the lung function for COPD patients in Western countries, but few studies have been done in China to test its application. Purposes: To verify the application of 6MWT among patients with COPD in China to assess patient’s quality of life. Methods: 22 patients with COPD completed both 6MWT and pulmonary function test. The six-minute walking distance percentage of the predicted distance (6MWD%) was then calculated in order to reduce the influence of age, sex, height, and weight on the six-minute walking distance (6MWTD). The correlation between 6MWD% and the indexes of pulmonary function was analyzed. Results: The correlation coefficients between 6MWD% and FVC, FEV1, FEV1%, FEV1/FVC, RV and RV/TLC were 0.534 (p<0.05), 0.678 (p<0.01), 0.655 (p<0.01), 0.598 (p<0.01), -0.673 (p<0.01) respectively; differences on 6MWTD and 6MWD% between the group of grade II and III/V were significant. Conclusions: 6MWT can be used as a simple and efficient method to evaluate lung function of patients with COPD. The effect of nursing interventions maintaining or strengthening lung function of COPD patients could be evaluated by using 6MWT, a easily applicable lung function test. Future extended study is needed to verify the conclusion.

NURSE AND PATIENT CHARACTERISTICS ASSOCIATED WITH NURSE TALK TIME IN THE ICU
M. Nilsen, M. Happ, S. Sereika, University of Pittsburgh, Pittsburgh, Pennsylvania
Rationale: Communication interactions between intensive care unit (ICU) nurses and mechanically ventilated patients are typically brief (1-5 minutes). Factors associated with length of nurses’ verbal communication (talk time) have not been investigated. This secondary data analysis explored the association between nurse/patient characteristics on nurse talk time. Methods: We utilized data on 89 nurse-patient dyads from the Study of Patient-Nurse Effectiveness with Communication Strategies (SPEACS), a clinical trial to test nurse-patient communications interventions in the ICU. Data included twice daily video-recorded observations over 2-days (AM/PM) for each dyad, and nurse/patient characteristics obtained from medical charts, observation records, and nurses’ self-report. Nurse talk time was measured as the time a nurse talked during a 3-minute period. Data were analyzed using exploratory, group comparative, and repeated measures analyses. Results: Patients were 29-82 (Mean=56.8, SD=5.68) years old; 37% >60 years. Nurse talk time generally increased over the 2-day period (F(3, 238)=4.12, p=.007). Patients’ age was not significantly associated with talk time. Days intubated prior to observation, Glasgow Coma Score (GCS), and the nurse’s years of ICU experience were jointly associated with talk time. The longer the patient was intubated prior to observation and GCS <14 were negatively associated (t=-2.67, p=.01; t=-2.35 p=.02 respectively). Nurse’s years of ICU experience had a curvilinear association with talk time (Linear: t=1.95, p=.05; Quadratic: t=-2.37, p=.02). Conclusion: Length of time intubated, GCS, and a nurse’s years of ICU experience may be moderators of communication, important considerations for future studies of communication with older ICU patients. ETHICAL, LEGAL, AND CLINICAL ISSUES SURROUNDING COVERT MEDICATION ADMINISTRATION IN LONG-TERM CARE SETTINGS
H. Farrar, B.J. Holtzclaw, University of Oklahoma HSC, Oklahoma City, Oklahoma
Rights of mentally competent patients to give or refuse consent to medical treatment is an accepted standard in healthcare institutions. However, covert medication administration occurs widely in settings where older adults may lack the capacity to consent because of cognitive decline, dementia, or psychiatric disorders. In a UK study, 90% of healthcare workers found covert medication justifiable. Rationale often given for this practice includes convenience, dysphagia problems, patient confusion, and need to calm behavioral disturbances that could harm patients. Ethical tensions exist between providing paternalistic optimal care “for the good of the patient” providing patient consent and self-determination in long term care. Purpose: A systematic review of research was done to determine the state of the science regarding 1) prevalence of covert medication administration in long-term care settings, 2) scope of ethical guidelines for practice, 3) levels of prescriber-treatment team collaboration, 4) evidence of drug-disguising practices, 5) consent practices addressing covert medication, and 6) paternalistic indicators in medication administration decisions. Methods: MEDLINE, CINAHL, EMBASE, PubMed, and PsychINFO databases were searched using terms: covert, disguised, administration, and concealed (10) paternalistic indicators in medication administration. Results: Covert medication administration occurs widely in settings where medical treatment is an accepted standard in healthcare institutions. How-ever, covert medication administration occurs widely in settings where medical treatment is an accepted standard in healthcare institutions. However, covert medication administration occurs widely in settings where older adults may lack the capacity to consent because of cognitive decline, dementia, or psychiatric disorders. In a UK study, 90% of healthcare workers found covert medication justifiable. Rationale often given for this practice includes convenience, dysphagia problems, patient confusion, and need to calm behavioral disturbances that could harm patients. Ethical tensions exist between providing paternalistic optimal care “for the good of the patient” providing patient consent and self-determination in long term care. Purpose: A systematic review of research was done to determine the state of the science regarding 1) prevalence of covert medication administration in long-term care settings, 2) scope of ethical guidelines for practice, 3) levels of prescriber-treatment team collaboration, 4) evidence of drug-disguising practices, 5) consent practices addressing covert medication, and 6) paternalistic indicators in medication administration decisions. Methods: MEDLINE, CINAHL, EMBASE, PubMed, and PsychINFO databases were searched using terms: covert, disguised, coerced, and hidden, combined with drugs, administration, therapeutics, and prescriptions, and retrieved articles provided additional references. Findings: Research concerning covert medication administration is limited, containing gaps and controversies, but acknowledged to be common in long-term dementia care. However, despite legislation, such practices and appropriate consultation are not documented. Key findings are: pharmacologic implications and adverse sequelae of crushing medications during covert medication administration, covert administration during behavioral emergencies, and policies regarding long-term care patient rights and provider responsibilities.

HEALTH LITERACY NEEDS OF HEALTHCARE PROVIDERS RELATED TO INCONTINENCE AND SKIN CARE IN INDIVIDUALS WITH DEMENTIA
D.Z. Bliss1, C. Rolnick2, J. Jackson2, C. Arston1, J. Mullins3, K. Hepburn3, 1. School of Nursing, University of Minnesota, Minneapolis, Minnesota, 2. HealthPartners Research Foundation, Bloomington, Minnesota, 3. Emory University, Atlanta, Georgia
Incontinence and associated skin damage can develop in Alzheimer’s disease or dementia (AD) and alter lifestyle. Healthcare (HC) providers

64th Annual Scientific Meeting
may be unaware of non-pharmacological management of these problems, so their communication with caregivers—who are typically reluctant to raise such issues—may not promote health literacy and may miss therapeutic opportunities. This study describes the health literacy needs about incontinence and skin care of HC providers of AD patients. Interviews of 11 HMO providers were audiotaped and transcribed. Content analysis was conducted and themes identified. HC providers were 8 physicians (4 geriatricians, 3 internists, 2 family practice, 1 neurologist, 1 urologist), 2 nurse practitioners, and 1 pharmacist; 64% female; age = 53 (10) (mean (sd) years); 91% white/not Hispanic, 9% Asian; and professional experience = 23 (12) years. Themes of health literacy needs related to knowledge/skill, resources for patients, and attitudes. Examples of knowledge/skill needs were evidence-based information about conservative therapies for incontinence and effects of urinary incontinence medications on cognition, absorbent products, topicals for preventing and treating skin problems, and terms used by patients/families to refer to these problems. Resource needs included a short pre-visit questionnaire to cue inquiry about these problems and modular handouts with drawings/pictures. Attitude needs related to concerns about introducing topics too early and frightening patients/families, wanting patients present with family when discussing management, and supporting patients/families when they express a variety of feelings. HC providers identified specific health literacy needs to improve communication and management of incontinence and skin damage in AD for which assistance is being developed.

COMPLEMENTARY AND ALTERNATIVE THERAPIES FOR URINARY SYMPTOMS IN A DIVERSE QUALITATIVE SAMPLE

This study examines the use of Complementary and Alternative Therapies (CAT) to relieve urinary symptoms—specifically, who uses CAT, types of remedies used, and how CAT is used in relation to allopathic care. Qualitative interviews were conducted with 151 respondents who had reported at least one urinary symptom in a larger epidemiological study (Boston Area Community Health survey). The qualitative sample included 25 black men, 25 black women, 25 Hispanic men, 25 Hispanic women, 25 white women, and 26 white men. Respondents were asked to describe how they managed their urinary symptoms as well as their experiences with seeking help from family/friends and healthcare providers. Approximately one quarter of respondents reported using CAT to relieve urinary symptoms, and more than half of them were age 55 or older. Black men were most likely and white women were least likely to use CAT. Respondents used not only popular products like cranberry juice but also less well-known remedies, such as moabi, maize silk, and cat’s claw. Respondents used CAT in several ways vis-à-vis allopathic care: a replacement, an initial strategy for symptom management, or a secondary strategy for symptoms not relieved by allopathic care. This study describes a diverse range of CAT being used to relieve urinary symptoms. Healthcare professionals can use these findings to learn about how patients are using CAT for urinary symptoms and, in turn, enhance their communication with patients. This is particularly important as many CAT users learn about these remedies through social networks rather than healthcare providers.

THE MODERATING EFFECT OF NURSING STAFF FACTORS ON THE RELATIONSHIP BETWEEN ACTIVITIES OF DAILY LIVING AND URINARY INCONTINENCE
J. Yoon,1,2 B. Bowers2 1. School of Nursing, Univ of Wisconsin-Madison, Madison, Wisconsin, 2. Health Insurance Review and Assessment Services, Seoul, Republic of Korea

Research indicates activities of daily living (ADL) status as a major risk factor of urinary incontinence (UI), and that higher total nursing staff levels and greater registered nurse (RN) ratio decreases the probability of UI. However, little is known about the influences of nursing staff factors on the relationship between ADL status and UI probability. This study examined the moderating effect of total nursing staff levels and RN ratio on the relationship between ADL and the probability of UI in Korean long-term care hospitals (LTCHs). Data were monthly LTCH patient assessment reports, and hospital information from 44,627 patients over 65 years old in 563 LTCHs in July 2008. Controlling other patient variables (e.g., age, gender, cognitive function etc.) and hospital variables (e.g., ownership, location, bed capacity etc.), two hierarchical logistic regression analyses were conducted separately for each interaction effect: “nursing staff level X ADL status”, and “RN ratio X ADL status”. Both were significant. In facilities with higher levels of nursing staff, the relationship between ADL status and UI was weaker than in facilities with lower levels of nursing staff. In facilities with a greater RN ratio, the relationship between ADL status and UI was weaker than in facilities with a lower RN ratio. This study provides additional explanatory information for the relationship between nurse staffing factors and UI probability. In particular, both a higher level of nursing staff and a greater RN ratio minimize the impact of ADL status on the probability of UI in Korean LTCHs.

ALLOW NATURAL DEATH (AND) VERSUS DO NOT RESUSCITATE (DNR): PREFERENCES OF Chronically ILL OLDER ADULTS
E.M. Lee, V.T. LeBaron, M.J. Mohler, Medicine, University of Arizona, Tucson, Arizona

Background: When discussing resuscitation status, terminology is crucially important. Discomfort with “do not resuscitate” (DNR) has prompted a change to “allow natural death” (AND) in some settings. There is minimal literature to indicate which is preferred and why. Purpose: AND and DNR terminology preference and reasons behind that preference Sample: 50 outpatients > age 55 with at least 2 chronic conditions, or their caregivers at a university medical center Methods: After IRB approval all participants were consented. Participants were interviewed regarding resuscitation terminology at appointment end. Caregivers responded as surrogates if patients had cognitive or language barriers. Subjects were asked to compare DNR and AND. Participants were then told the phrases were sometimes used interchangeably and asked their preference, and why. Responses were transcribed verbatim, and analyzed using content analysis into four thematic categories. Two independent reviewers validated category assignment. Results: Of 50 participants, 37 patients (74%) and 13 surrogates (26%), 25 chose AND, 16 chose DNR, and 9 had no preference. 18 patients chose AND, 10 chose DNR, and 9 had no preference. 7 surrogates chose AND, 6 chose DNR, and none chose no preference. The thematic categories were: 1) negative associations, such as harshness of language, 2) positive associations, such as liking “natural” in AND, 3) those with both positive and negative associations, and 4) no preference. Conclusion: There is no consensus on terminology preference regarding resuscitation status in older adults with chronic illnesses. Preferred terminology and reasoning can be determined to assist in goals of care conversations.

AN INTERACTIVE DECISION AID TO FACILITATE THE PROCESS OF ADVANCE CARE PLANNING
S.L. Tennstedt1, A. Volandes,2, L. Welch3 1. New England Research Institutes, Watertown, Massachusetts, 2. Massachusetts General Hospital, Boston, Massachusetts

This study evaluated a prototype interactive decision aid to facilitate advance care planning (ACP). The decision aid combines video, audio, and text. Inclusion of video allows presentation of actual health states and EOL treatments to inform ACP decisions better than the typical verbal or text presentation of hypothetical situations. Presented on a Tablet PC, the prototype included an introduction to ACP, documentary video of a patient with a common advanced-stage condition (demen-
COMMUNICATING ABOUT PALLIATIVE CARE IN LONG TERM CARE HOMES
S. Kaasalainen, M. Kelley, K. Brazil, McMaster University, Hamilton, Ontario, Canada

Aims: As the population continues to age, more people will die in long term care (LTC) homes. Minimal research has focused on the current experiences of staff, LTC residents and their family members related to how palliative care is managed for this unique population as well as the inherent challenges in this sector. The purpose of this study was to explore how palliative care is currently managed in LTC homes. Methods: A qualitative descriptive design was used to collect data in four LTC homes in Ontario, Canada. Data was collected using 12 focus groups (6 with nurses, 6 with personal support workers) and 72 individual interviews (10 with residents, 62 with family members). Data were analysed using thematic content analysis. Findings: The major themes that emerged from the data were all focused on the importance of 'Talking About Palliative Care'. Staff, family members and residents spoke of their desire to manage symptoms for residents as residents' health status declined. To do this effectively, relationships needed to be developed among all of them. These relationships became increasingly important as residents approached their death and all participant groups highlighted the need to spend more time with residents and their families during this time. Learning about palliative care and working as a team were critical to promoting quality care for residents and their family members. However, staff, residents and their family members all acknowledged the challenges in the current system that necessitated optimizing limited time and resources in LTC. Conclusions: These study findings highlight the limited conversations about palliative care that occur in LTC homes. Future interventions aimed at encouraging more conversations about palliative care among staff, residents and their family members are needed so that the their quality of life in LTC, can be improved.

KOREAN NURSES’ PERCEPTION OF END-OF-LIFE CARE IN CLINICAL SETTING
S. Kim, J. Lee, M. Choi, H. Kim, D. Kim, College of Nursing, Yonsei University, Seoul, Republic of Korea

Background: End-of-life (EOL) care becomes important for nurses who care dying patients and families when they are in critical situations to meet the optimal death. However, there is a lack of study examined perception of EOL care among Korean nurses. Objectives: To assess nurses’ perception of facilitators and barriers of EOL care in clinical settings. Methods: We distributed self-administered questionnaires to a convenience sample of 400 nurses working at tertiary hospitals in Seoul, Korea. Results: The mean age was 31 years and the mean year of clinical experience was 7.7 years. Almost half of nurses responded that they received EOL care education previously. The 3 highest scoring items of facilitators of EOL care were: ‘family members’ patient dying accept ance’, ‘having time to prepare the family for the patient’s expected death’, and ‘having the physician meet in person with the family after the patient’s death to offer support and validate the given care’. Five of the top 10 barriers were related to dealing with patients’ families issues that make nurses providing EOL care difficult, such as ‘families not accepting what the physician is telling them about the patient’s prognosis’ and ‘dealing with angry family members’, Nurses who received EOL care education reported a higher score of perception of facilitators than nurse who did not (t=2.158, p=0.032). Conclusions: EOL care for patients and their families can be a challenge and nurses need to be trained to manage in this area. Thus nursing education should be provided to facilitate nursing practice.

PERCEPTIONS OF END-OF-LIFE CARE BETWEEN HOSPICE AND SKILLED NURSING FACILITY STAFF UTILIZING DEDICATED TEAMS
A.A. Gerding, K. Martz, Nursing, Boise State University, Boise, Idaho

Purpose: To examine the perceptions of hospice staff and skilled nursing facility (SNF) staff using dedicated teams to provide end of life care. Differences in regulations and philosophies between hospice care and skilled nursing care can hinder continuity of care, communication and coordinated efforts directed at end-of-life care for the dying resident. Methods: A Likert scale survey (Cronbach alpha = 0.858) was used to explore the perceptions of end-of-life nursing care between hospice and SNF staff (n=175). Data were analyzed to determine differences in staff perceptions of those with (n=103) and without (n=72) designated teams on multiple variables. Results: Both hospice and SNF staff perceived they had effective knowledge and skills to care for the dying patient. ANOVA results demonstrated significant differences in collaboration between hospice and SNF designated teams and those without designated teams when examining hospice as a benefit to the SNF resident, continuity of care, support of resident’s advance directives, SNF practice of hospice philosophy & pain management (p≤0.03). Differences in regulations and communications were found to be the greatest barriers of collaboration. Implications: Collaboration between SNFs and hospice requires alignment of clinical goals and effective communication around residents’ changing care needs. Regulations
are conflicting and have implications for changes in policy. Development of dedicated teams to improve communication, coordination, alignment of clinical goals and continuity of care is a reasonable intervention that will expand care for the dying resident.

ETHICAL CONFLICTS EXPERIENCED BY HEALTH CARE PROVIDERS WHO PROVIDE HOME-BASED PALLIATIVE CARE

K. Brazil, J. Ploeg, S. Kaasalainen, D. Marshall, McMaster University, Hamilton, Ontario, Canada

Health care providers regularly encounter situations of moral conflict and distress in their practice. Moral distress may result in unfavorable outcomes for both health care providers and those in their care. The purpose of this study was to examine the experience of moral distress from a broad range of health care occupations that provide home-based palliative care. Identifying the antecedent conditions for moral distress in the practice of community palliative care represents the initial step of addressing the issue. A qualitative, descriptive study was conducted. A critical incident approach was used in the interviews to elicit the healthcare provider’s experiences on moral distress. Five home visiting organizations in south central Ontario, Canada participated in the study resulting in eighteen health care workers who completed individual interviews. Most participants described at least two critical incidents in their interview generating a total of 47 critical incidents. Analysis of the critical incidents revealed 11 issues that triggered moral distress which clustered into three themes, (a) the role of informal caregivers, (b) challenging clinical situations and (c) service delivery issues. The findings suggest that the training and practice environments for health care providers need to be designed to recognize the moral challenges related to day-to-day practice.

PREDICTION OF COMFORT OF PATIENTS DYING FROM DEMENTIA BY FAMILIES’ AND PHYSICIANS’ PERCEPTIONS OF DEMENTIA

J.T. van der Steen1,2, B. Owueta-Philipsen2, M. Ribbe1, L. Deliens2,3, I. VU University Medical Center, EMGO Institute for Health and Care Research, Department of Nursing Home Medicine, Amsterdam, Netherlands, 2. VU University Medical Center, EMGO Institute for Health and Care Research, Department of Public and Occupational Health, Amsterdam, Netherlands, 3. End-of-Life Care Research Group, Vrije Universiteit, Brussels, Belgium

Families’ understanding of the poor prognosis and clinical course of dementia may be related to the treatments patients receive at the end of life. It is unknown if such understanding is related to one of the most relevant outcomes, which is dementia patients’ comfort when dying. Moreover, physicians’ perceptions have rarely been addressed. Between 2007 and 2010, we conducted a prospective study with surveys at regular intervals from nursing home admission. Seventeen nursing homes across the Netherlands participated. We performed preliminary analyses with the first 119 deceased patients in the study, their families and physicians. Patient’s comfort was assessed by staff with the validated End-of-Life in Dementia Comfort Assessment in Dying (CAD) scale. We further assessed perceptions of dementia as a disease you can die from, perceptions of prognosis assessed by understanding of complications, life expectancy, and counselling, comfort care goal, potentially burdensome interventions, and possible confounding factors such as family education. Of the families, 46% agreed that dementia is a disease you can die from; 93% of physicians agreed. Only families’ and physicians’ perception of dementia was independently associated with patients’ increased comfort (adjusted beta 0.9, 95% CI 0.2;1.6, and 1.2, CI 0.3;2.0, respectively). We will present results in the full dataset, including more patients who died years after admission. Further study is needed on how a broad perception of dementia translates into different care practice. Nevertheless, family education may be a promising strategy to improve quality of dying in dementia.

RURAL ALABAMA VETERAN ADVANCE DIRECTIVE BEHAVIOR AND DESIRE FOR HELP COMPLETING AN ADVANCE DIRECTIVE

A.F. Mahaney-Price1, M.M. Hilgeman2, S. Kertesz2, L. Davis1,4, I. Tuscaloosa VA Medical Center, Tuscaloosa, Alabama, 2. University of Alabama at Birmingham, Birmingham, Alabama, 3. Birmingham VA Medical Center, Birmingham, Alabama, 4. University of Alabama School of Medicine, Tuscaloosa, Alabama

1. Objectives: To identify characteristics of rural Alabama veterans who (1) have an Advance Directive, and (2) desire help completing an Advance Directive. 2. Design: Survey. Descriptive. Convenience sample. 3. Methodology: Two-hundred-and-six veterans (M = 55.3 years old, 91.3% male, 40.3% Black/African American) who had either never enrolled or were not utilizing VA health services in >2 years were recruited from rural Alabama residences. Outreach workers conducted a battery of assessments that included two survey items related to Advance Directive behavior and desire for help completing an Advance Directive. 4. Results: Only 12.6% had completed an Advance Directive in the past. Of those who did not have an Advance Directive, 34% expressed interest in receiving help to complete one in the future. Crosstab analyses revealed significant Pearson Chi-Square statistics for race, education, and income, such that African American/Blacks, those with less education, and those with lower income were less likely to have an Advance Directive. Similar patterns emerged for interest in receiving help. Interestingly, the majority (70.4%) of individuals had been to a primary care provider in the past year. Forty-four (21.4%) of the respondents reported that they trust information about health or medical topics from a health care professional only “some” or “a little.” Of those 44, only 6 had an Advance Directive. 5. Significance: The number of rural Alabama veterans who are expressing a desire for help completing Advance Directives suggests an unmet need. Development of a nursing intervention is underway.

SESSION 510 (POSTER)

ECONOMICS OF AGING

A COMPARISON OF POVERTY AND ECONOMIC INSECURITY AMONG OLDER ADULT SINGLES AND COUPLES IN MICHIGAN

T.B. Jankowski, J.C. Booza, C. Leach, Institute of Gerontology, Wayne State University, Detroit, Michigan

Developed by the Gerontology Institute at UMass Boston in conjunction with Wider Opportunities for Women and Elder Law of Michigan, the Michigan Elder Economic Security Standard™ Index, or Elder Index, is a measure of income sufficiency that takes into account the housing circumstances and health status of single and married elders, as well as geographical variations in the cost of living across the state’s 83 counties. We apply the Elder Index to population estimates derived from the 2006-2008 American Community Survey to compare the rate of economic insecurity it indicates in Michigan senior-headed households to that suggested by the official federal poverty measure in the same survey. We find that economic insecurity as indicated by the Elder Index is much more widespread than the official poverty rate would indicate, and that differences between poverty and Elder Index threshold rates are the greatest in areas with the highest cost of living.

THE ECONOMY, HEALTH AND PAIN: A TWO YEAR EVALUATION OF BLACK ELDERS IN DETROIT

C.R. Green1, L.A. Chadiha1, T.A. Hart-Johnson1, P.A. Lichtenberg2, J. Jackson1, 1. Anesthesiology, University of Michigan, Ann Arbor, Michigan, 2. Wayne State University, Detroit, Michigan

In economic hard times the elderly, racial minorities and women may suffer a larger burden than others, but this is rarely quantified. Community-dwelling blacks in Detroit, Michigan were recruited through
Financial Literary in Older African Americans: Findings from Healthier Black Elders in Detroit

S. Neufeld, P.A. Lichtenberg, Wayne State University, Detroit, Michigan

Introduction: The extant literature on financial literacy at retirement focuses overwhelmingly on personal saving for retirement and on optimal investment strategies. However, these topics are less relevant to low-income, often minority, older adults with relatively few financial resources. Yet, their financial literacy needs are potentially great because inadvertent mismanagement or even misappropriation of their meager finances by others has a proportionally larger negative effect on their lives. Methods: In 2010-2011 we surveyed 120 African Americans age 65+ selected from our Healthier Black Elders study in Detroit. Survey topics included: realized versus expected financial resources in retirement, perceived financial needs and responses to challenges, and financial decision-making preferences. Findings: Major findings included: (1) Many (53%) research participants were surprised that their retirement income (especially from Social Security and DB pension plans) was less than expected (on average 42% less). The shortfalls resulted in significant adjustments during retirement such as downsizing the household (13%), reducing other housing expenses (16%), spending on transportation/travel/recreation (47%), and even food (9%); (2) Participants demonstrated an unwillingness to evaluate straightforward financial options, making it difficult to assess their understanding of notions of financial risk. Discussion: Social Security and defined pension plan payouts are knowable in advance of retirement. Yet many of our research participants did not know what their income from these sources would be, and therefore needed to make significant and unexpected adjustments to their lives. Coupled with their difficulties in assessing financial options, our findings suggest a pressing need for financial recovery has not trickled to black elders in the Detroit area.

ECONOMIC WELL-BEING AMONG OLDER IMMIGRANTS

Y. Nam, University at Buffalo, Buffalo, New York

Background: Older immigrants are growing but vulnerable population. Earnings of immigrants are significantly lower than their native counterpart with comparable education and skill level, which is expected to reduce their retirement savings. Substantial proportion of older immigrants who immigrated at old age are not eligible for Social Security. Despite economic vulnerability, we know little about their economic conditions, especially asset ownership. Method: This study conducts secondary data analyses using individual level data from the Current Population Survey, collected from 2003 to 2008. The sample consists of 71,161 older adults. This study categorizes older adults by immigration status (native-born versus immigrants), citizenship status (naturalized citizens versus noncitizens) and recency of immigration (established immigrants versus recent immigrants). This study employs various indicators of economic well-being: household income, poverty status, homeownership, and asset income (income from assets such as interests and rental properties). Results: Older immigrants’ economic conditions are worse than native-born older adults in all indicators. Poverty rate is 20.42% among noncitizens and 21.97% among recent immigrants while it is 9.52% among native older adults. Homeownership rate is 61.74% among noncitizens and 54.87% among recent immigrants, about half of that of native older adults. While the majority of native older adults (61%) have asset income, only 48% of older immigrants do so. Median asset income is $103 among native older adults, $0 for all types of immigrants except from naturalized citizens ($6). Conclusions: The results indicate that older immigrants, especially noncitizens and recent immigrants, are at high risk of economic hardship.

THE EVAPORATION OF A MYTH OF THE AMERICAN MIDDLE CLASS

L.H. Nitz, Political Science, University of Hawaii at Manoa, Honolulu, Hawaii

Growing up in a working class Michigan suburb in the 1950s gave young people a vision of the American middle class of Horatio Alger proportions—The craft and skilled industrial workers of the day joined industry with their trade school and high school shop course education and came back into the community as adults with an immense toolbox of trade, industrial and engineering techniques with which they built their middle class perches. It seemed the rare craftsman or industrial skilled tradesman who did not have a well repaired house, a running automobile, and a cottage somewhere “up North” in the woods. If this mythic view is correct, we should see that the crafts of today also show asset stocks in homes, second homes, and other real estate that exceed the acquisitions of those who mastered only the skills of the office and the retail store. The myth, however seems unsupported. Examining asset holdings of participants in the Health and Retirement Study by occupational groupings (craft, finance, and other) The expected advantage from craft skills does not appear. As researchers at the Michigan Retirement Research Center have shown, financial skills appear to predict real wealth. Counter-hypotheses can be created to focus on finer definitions of occupation, controls for income and general wealth, contributions of spouse, and the like. No counter-hypothesis receives general support. We must conclude that the cabin in the woods of the 1950s is for our times a myth—whatever its truth value at that time.

ECONOMIC CHALLENGES FACED BY GRANDPARENTS RAISING GRANDCHILDREN: IMPLICATIONS FOR POLICY DEVELOPMENT

There is a growing body of research on grandparents raising grandchildren, ranging from early studies of kinship care in formal foster care systems to more recent analysis of impacts on health and mental health of both caregivers and children, and behavioral and educational impacts on children. However, there has been little analysis of the economic impact on grandparent caregivers when they become the primary caregivers of one or more children, and this will be addressed in this session. For example, one important question that is discussed anecdotally is whether caregivers are more likely to reduce work in order to provide child care, or take on additional work, or return to work after retiring, in order to meet the new financial responsibilities of caring for children a ‘second time around’. Programs providing services to grandparent caregivers report both types of responses to the new responsibilities, but there is little systematic work to identify which choice is predominant or demographically who is most likely to make one choice.

64th Annual Scientific Meeting
or the other. This workshop will address these questions using an analysis of the Health and Retirement Study, a national sample of Americans 50 years and older that has recorded participants answers to key questions about their lives and behavior over a period of 16 years. Since it is a randomly selected sample, the results are generalizable to the U.S. population as a whole.

THE EFFECT OF RESIDENCE MODE ON HEALTHCARE COSTS FOR THE ELDERLY IN CHINA
W. Xue, Peking University, Beijing, China

The purpose of this study was to examine the healthcare costs of different residence mode of the elderly, and identify which residence mode would be optimal in China. Using data from the 2008 wave of the Chinese Longitudinal Healthy Longevity Survey (CLHLS), this paper defined the dependent variable as the healthcare cost for seniors, which included the direct cost and the opportunity cost of the caregiving. The opportunity cost was calculated by time spent on seniors’ healthcare. The independent variable was the residence mode divided into “with household member(s), alone, and in an institution”. Based on weighted by proportion of different residence mode, this study created a robust regression model including dependent variable, independent variable, and controlling variables consisted of health status, demographic and socio-economic variables, and community variables. The results revealed that in the condition that the relevant independent variables were controlled, different healthcare costs for the elderly lied significantly in different residence type. Costs for the elderly who lived with household member(s) were significantly lower than costs for other seniors ( ), as well as costs for the elderly who lived alone were not significantly different with the costs for the elderly who were in an institution. Following by these, this study also demonstrated that more than half (56.1%) of the elderly were willing to live with their children, and 27.3% were willing to living alone (with spouse) and with children living nearby. These results above were clearly useful for professionals and policy makers. From now on, we should greatly develop home-based healthcare mainly including medical, transportation, shopping, cleaning, cooking, and housing adaptation services for seniors instead of institution-based healthcare. On the meanwhile, we should encourage community power to take part in these things.

BUMPS IN THE ROAD: THE IMPACT OF NEGATIVE HEALTH EVENTS ON ECONOMIC SECURITY FOR OLDER ADULTS
L.A. Sullivan, Heller School for Social Policy and Management, Brandeis University, Waltham, Massachusetts

While the study of the impacts of socio-economic status (SES) on health has been an area of interest for researchers for some time, more recently scholars have begun to look at the impacts of health declines on economic status, particularly among older adults. Using frameworks which highlight the importance of life course events on income and savings, this analysis utilizes the Health and Retirement Study to measure the effects of health declines on household wealth. Among adult households age 51+, households in which the primary respondent was healthy (self-reported) had an average of $241,000 in total net worth in 2008, almost 4 times greater than the average wealth of households with a respondent who had poor health. Following households for a decade (1998-2008), pooled times series analysis using fixed effects and selecting initially healthy households only to diminish the possible impact of previous health declines on wealth, reveals that among households (51+ in 1998) a health decline is associated with a $50,867 drop in wealth (p=0.013). Additional analysis by race and ethnicity reveals that African-Americans (p=0.054), Latinos (p=0.0078), and whites (p=0.045) all experience significant, negative impacts on wealth as a result of health declines; however, the losses are approximately twice as great in nominal dollars among whites ($52,739) compared to African-Americans ($24,014) and Latinos ($26,385), who hold substantially fewer assets overall. This study reveals the substantial negative effects health declines may have on household finances and proposes policy solutions to lessen the impacts.

SESSION 515 (POSTER)

END-OF-LIFE

NURSING HOME-BASED END-OF-LIFE CARE: THE “LIVING-DYING” INTERVAL
D. Waldrop, N. Kusmaul, School of Social Work, University at Buffalo, Buffalo, New York

One in four Americans who reach the age of 65 will die in a nursing home and estimates suggest that annually, about 37,800 residents receive end-of-life care in this setting. Enhanced care during the transition from routine to palliative care is important for permanent nursing home residents and their family members. Critical periods of distress for family caregivers may accompany a resident’s dying process, yet little has been known about their experiences, needs and concerns as a loved one is dying. Guided by concepts from the Living-Dying Interval (Pattison, 1977) this study sought to explore family members’ experiences with a dying nursing home resident. In-depth interviews were conducted with 31 caregivers of residents who had died. Interviews involved open ended questions, were audiorecorded, transcribed and entered into Atlas ti software for data management and coding. The themes which illuminate family’s experiences on the living-dying interval are: an Acute Medical Crisis (Trigger events, Pile-up of stressors, Level of care crisis); the Living-Dying Phase (Advance care planning, Rehospitalization, End-stage decisions); and the Terminal Phase (Beginning of the end, Awareness of dying). Participants’ words were used to develop a revised model of the Living-dying Interval which illuminates the dying process in nursing homes. There is growing recognition of the importance of a palliative care approach which encompasses the resident and family as a unit of care together. In addition, a focus on the assessment and treatment of suffering is central to improving nursing home based-end-of-life care.

COMMUNICATION IN LATE-STAGE CANCER: CONSIDERING HOSPICE
D. Waldrop1, M. Meeker2, J. Kutner1, 1. School of Social Work, University at Buffalo, Buffalo, New York, 2. University of Colorado, Denver, Colorado

Cancer is the second leading cause of death in people over age 65; 60% of all newly diagnosed malignant tumors occur annually in this age group. Estimates indicate that 387,515 people over age 65 died from cancer in 2006. Advancements in medical technology and health care delivery have increased life expectancy and provided new options for care at life’s end. As a result, older cancer patients increasingly have more choices about how and where they die. The purpose of this study was to explore and describe how, when and with whom, older cancer patients communicate their concerns and needs for care during the advanced stages of the illness. The study was guided by the concepts from a decision-making framework that was developed by Carroll and Johnson (1990). Interviews were conducted with 50 hospice patients who had been on the program for 7 days or more and their caregivers. The interview guide included objective measures of well-being (Katz ADL Scale and QLQ-30) as well as open ended questions about the stages of decision-making. Interviews were audiotaped, transcribed and entered into Atlas ti for data organization and coding. Study results illuminate the stages of decision-making: (1) Recognition that cancer is terminal, (2) Formulation of the need for end-stage care, (3) Alternative generation-identifying options, (4) Information search about services needed, (5) The choice- who makes the decision, (6) Action- hospice enrollment and (7) Outcomes—sat-
The purpose of this study was to describe the preferences of Korean American older adults for end-of-life treatment. A cross-sectional study with a probability sample of 116 participants was conducted. Participants were asked about preferences for palliative treatments based on their condition and potential consequences. Only 20.9% of participants said they would want life-prolonging medication, such as chemotherapy, that might cause nausea, fatigue or constant pain, if they had an incurable disease and were close to the end of life. Over half (54.3%) said they would want pain medication if they were in very bad pain all the time, even if it shortened their life and 32.8% said they would not want pain medication under these circumstances. Most participants (80.0%) were unsure whether they would want life-prolonging medical treatments if they were in a coma with no hope of waking up. Only two participants had completed both a health care proxy and a living will and most had not discussed their end-of-life treatment preferences with their physician or family. Despite the overwhelming preference for palliative rather curative treatment, virtually none of the participants had an advance directive. Gender, age, and ability to speak English were associated with end-of-life treatment preferences. Participants will understand: 1) preferences for end-of-life advance treatment by Korean American older adults; and 2) implications for culturally competent practice for advance care planning with older adults.

HEALTHCARE DECISIONS IN END-STAGE DEMEN TIA: HOW CAN WE DO BETTER

E. Chichin, J. Reinhardt, M.E. Paggi, Jewish Home Lifecare, New York, New York

End-of-life decision making is a major challenge in advanced dementia care, in part due to difficulties recognizing when the disease is near its final stage, and clarifying the pros and cons of specific decisions. While most recommendations focus on comfort care for advanced dementia, persons with dementia (PWD) and their families may not have discussed treatment issues and finalized decisions. We used information about cognitive status and functional ability from the Minimum Data Set (MDS) to identify nursing home residents with advanced dementia as part of a larger investigation. This study reports on medical record reviews of health care decisions over a 12-month period for some of these elders (N=29) to see if the number and types of specific health care decisions increased over time. Despite having “terminal prognoses,” findings reveal that these patients / surrogate decision-makers did little over time with respect to decisions to enhance comfort, beyond requests for Do Not Resuscitate/Do Not Intubate (DNR/DNI) Orders. Initially, 68.9% had DNR orders. One year later, all had resuscitation discussions with their health care teams, and all but one requested DNR. Initially, approximately half opted against a ventilator for the PWD, which increased to almost 80% 12 months later. Although the literature suggests aggressive treatments are burdensome in end-stage dementia, only 1/4 initially requested no hospitalization and only about 1/3 did so 12 months later. Fewer decision-makers chose no feeding tubes or intravenous therapy or specifically requested comfort care. The implications of these decisions for research and practice are discussed.

IMPACT OF NON-CLINICAL FACTORS ON PRESCRIBING DECISIONS IN PERSONS WITH END-STAGE DEMENTIA

K.L. Lapane1, L.A. Daiello2, C. Motzkus1, C. Parsons3, C.M. Hughes4, 1. Epidemiology and Community Health, Virginia Commonwealth University, Richmond, Virginia, 2. Lifespan Hospital, Providence, Rhode Island, 3. Queens University, Belfast, Northern Ireland, United Kingdom

Background: Few studies relating to the importance of rationalization of medications in patients with advanced dementia nearing the end-of-life exist. Little is known about the impact of non-clinical factors on prescribing decisions. Objective: To evaluate the extent to which nursing home placement, family involvement, and advanced directives influence prescribing decision-making in patients with end-stage dementia. Methods: A multidisciplinary team developed 4 vignettes of patients with end-stage dementia with specific questions relating to discontinuation or initiation of specific medications. Using a modified Drinnman approach, we invited a sample of primary care physicians with an active Virginia medical license to participate and 274 responded. Physicians were emailed surveys randomly assigned three factors: 1) Place of residence of the patient (community-dwelling, nursing home); 2) Presence/absence of an advance directive; and 3) Family desires active measures, family desires supportive measures, no family involvement. Chi-square analyses were performed as balance of potential confounders was achieved through randomization. Results: Continuation of therapies not likely conferring benefits (e.g. statins) was commonplace, regardless of randomly assigned factors. Physicians were less likely to initiate therapy for patients with advanced directives (e.g treating pneumonia with fever: 59% with advanced directives vs. 75% without (p-value=0.01). Medication initiation was not influenced by family involvement. For 3 of the 4 vignettes, residents in nursing homes had decreased likelihood of initiating a medication relative to community-dwelling elders. Discussion: Prescribing decisions for patients with end-stage dementia may be influenced by non-clinical factors. Guidance on strategies to discontinue medications may be warranted.

THE PUBLIC HEALTH STRATEGY FOR PALLIATIVE CARE: AN EMPIRICAL EVALUATION

S. Mwangi, Miami University, Oxford, Ohio

In 1990, the WHO pioneered a public health strategy for integrating palliative care into healthcare systems for national governments around the world to adopt under four different contexts including culture, disease demographics (i.e., mortality rates), socioeconomics, and healthcare systems. By 2006, only 15 percent of countries, mostly developed ones, in the world had their palliative care services approaching integration with their healthcare systems. Unfortunately, few studies evaluated how the public health strategy has influenced the development of palliative care globally. This study employs logistic regression analysis using country-level data from the WHO and the World Bank to investigate the factors associated with the presence/absence of palliative care services in all countries. Results show that significant correlates of palliative care services include a higher old-age dependency ratio, a rising number of non-communicable diseases, a greater healthcare worker density (i.e. physicians and nurses per 1,000 of population), a greater proportion of government expenditure on healthcare, and a higher gross domestic product per capita growth rate. These findings are congruent with the recommendations of the WHO’s strategy in regard to the socioeconomics and healthcare systems contexts. However, for the disease demographics context, mortality rates were not significant predictors of presence/absence of palliative care. Instead, higher prevalence of advanced chronic diseases was a significant predictor of presence/absence of palliative care services. Findings from this study have important implications to palliative care decision makers, especially those in developing countries (e.g., resource allocation for healthcare workers and using the existing healthcare structures to provide palliative care).
TO REFER OR NOT TO REFER: LOOKING BEYOND PHYSICIAN DEMOGRAPHICS TO IDENTIFY FACTORS THAT INFLUENCE PATIENT REFERRALS TO END-OF-LIFE CARE

A. Coulourides Kogan1, S. Enguidanos1, R.D. Brumley2, 1. Davis School of Gerontology, University of Southern California, Los Angeles, California, 2. Kaiser Permanente, Bellflower, California

Documentation of patient preferences for home as the site of end-of-life (EOL) care has resulted in increased enrollment in hospice. However, recent studies continue to document varying rates of physician referrals to hospice care, with one study finding that only 53% of stage IV lung cancer patients had a hospice discussion with their provider. More information is needed to understand factors influencing patient-physician communications about hospice. This study reports findings from a web-based survey among a sample of health maintenance organization physicians who had a patient die within six months of last seeing the patient. In 2008, 2,099 physicians were contacted via email and provided a link to an anonymous survey on referral behaviors to EOL services, comfort level discussing EOL services with patients, and personal/family experience with hospice. Among those completing the survey (n=554), most were U.S.-born (69.1%), married (83.8%), and male (66.0%) with a mean age of 47 years (SD=8.9). About half were Caucasian (51.7%). Regression analysis revealed that age, medical practice specialization, and comfort discussing EOL care were predictors of referrals to hospice. Gender, ethnicity, nativity, and personal/family experience with hospice were not significantly associated. Physicians’ lack of comfort with conducting EOL discussions reveal a need for better training and organizational support to encourage appropriate patient-physician dialogue. Divergent EOL referral behaviors among emergency-type and specialty care physicians may also point to a lack of training or more significantly, a disassociation between one’s field of practice and their perceived role in hosting these discussions.

PAIN TRAJECTORIES FOLLOWING INPATIENT PALLIATIVE CARE CONSULTS: DOES INITIAL PAIN INFLUENCE PAIN CONTROL?

J. Laugan1, S. Enguidanos1, R.S. Goldstein2, 1. University of Southern California, Los Angeles, California, 2. Kaiser Permanente, Bellflower, California

Inpatient palliative care (IPC) teams have been found to be effective in reducing and maintaining control of patient pain during hospitalization. Studies have documented average pain change reductions among cohorts of hospitalized patients, however little is known about the influence of the IPC team on pain trajectories among varying levels of initial pain intensity. This study examines pain trajectories among 484 managed care patients, ages 65 years or older, receiving IPC consults. Using the 11-point NRS pain rating scale, patients were grouped into three categories based on initial/baseline pain intensity (0=no pain; 1-4=mild pain, 5-10=moderate-to-severe pain), and then reassessed for pain intensity at four follow-up time points (two- and 24-hours following consult, immediately prior to hospital discharge, 10 days post-discharge). Results revealed that patients with no pain at baseline reported no significant changes in pain intensity during hospitalization. Patients with mild and moderate-to-severe pain at baseline reported significantly lower pain intensity during hospital follow-up assessments (F=19.963, p<.05; F=91.275, p<.05, respectively). Ten-days following hospital discharge, mean increases in pain intensity were observed among all groups; however significant increases were found among the no baseline pain (t=-7.092, p<.05) and moderate-to-severe baseline pain (t=-2.642, p<.05) groups only. This study is among the first to analyze the impact of IPC on varying initial levels of patient pain. Results support IPC team capacity to control patient pain regardless of initial intensity. Reported increases in pain intensity following hospital discharge further substantiate the need for additional studies investigating patient transitions from IPC to subsequent care settings.

REVIEW OF EXISTING DATA FOR INPATIENT HOSPICE RESEARCH

S. Lysaght, School of Nursing, University of Pennsylvania, Philadelphia, Pennsylvania

End-of-life care is growing at a substantial rate, specifically in the increased use of formal hospice services. Within hospice, there has been a steady rise in number of patients using the general inpatient level of hospice care. Increased attention to quality measurement for end-of-life care parallels this growth. The use of secondary analysis data in hospice research is a way to minimize participant burden, efficiently use data already collected, and expand health services research in end-of-life care. This poster addresses the following question: What is the availability and feasibility of using existing data in quality measurement for the general inpatient level of hospice care? Included in this analysis will be administrative data, a previous large national study, and the future utility of electronic medical records. Existing data sets evaluated include Medicare Standard Analytic Files (SAF), the National Data Set (NDS), the National Home and Hospice Care Survey (NHHCS) and the National Hospice Outcomes Project (NHOOP). Additionally, the use of Electronic Medical Records (EMR) is examined. Options for answering research questions about the general inpatient level of hospice seeking patient-level data are limited. For patient specific data, the Medicare SAF is recommended, however the NDS and NHHCS offer some guidance for institution level comparison. Medicare SAF data available two years from now will be even richer because of the increasing reporting requirements for claims. Use of EMR in end-of-life care is increasing at the provider level, however research will be limited by known problems in data collection and retrieval.

WHY MINORITY ELDERS DO NOT USE HOSPICE CARE: FINDINGS FROM A META-ANALYSIS

H. Noh, University of Wisconsin-Madison, Madison, Wisconsin

Despite a continued growth in the number of racial and ethnic minority elders and the majority population overall, lower use of hospice care by minority elders than that of their white counterparts has been evidenced in previous studies. The purpose of this study is to explore what causes minority elders’ lower participation in hospice care. A meta-analysis was performed using comprehensive health and social science database such as CINAHL, SociIndex, PubMed, and, ProQuest. Articles were selected using key words including, end-of-life care, palliative care, hospice, minority, old, and, elderly. Findings of identified studies that report on the reasons of minorities’ lower use of hospice care were categorized into three groups. The first reason is ‘structural barriers’ in accessing hospice care, such as, lack of health insurance and limited income, immigration status, Medicare caregiver requirement, lack of knowledge of hospice care, low referral rate by physicians, and, other logistic barriers. The second reason is ‘minority elders’ end-of-life healthcare preferences’, which include differences in spiritual/religious beliefs, acculturation, family-centered culture of care, and, mistrust and medical racism. Finally, the last reason is ‘minority elders’ cultural preferences’ regarding how they receive the care, such as, lack of health care among health care providers and language differences. Understanding these possible reasons for minority elders’ lower use of hospice care will assist healthcare providers in hospice care setting with promoting the access to and use of hospice care by this population.

END OF LIFE GUIDELINES FOR DEMENTIA

S.M. Cahill1, D. Doran2, M. Watson3, 1. Trinity College, Dublin, Ireland, 2. Quality Initiatives, Belfast, Ireland, 3. University of Ulster, Belfast, Ireland, Ireland

One in three people over the age of 65 will die with some form of dementia and the majority will be located in nursing homes (NHs) at time of death. Yet compared with other groups, people dying with dementia in NHs have attracted limited research interest. Indeed little is known about their end of life (EOL) care experiences nor are there any demen-
FLYING BENEATH THE RADAR OF HEALTH REFORM: HEALTH CARE POLICY AND FINANCING

SESSION 520 (POSTER)

HEALTH CARE POLICY AND FINANCING

FLYING BENEATH THE RADAR OF HEALTH REFORM: THE COMMUNITY LIVING ASSISTANCE SERVICES AND SUPPORTS (CLASS) ACT

E.A. Miller, Gerontology, Univ. of Massachusetts Boston, Boston, Massachusetts

The purpose of this analysis is to evaluate the benefits and drawbacks of the Community Living Assistance Services and Supports (CLASS) Act, a national voluntary LTC insurance program administered by the Federal government. The CLASS Act will provide a LTC benefit applicable to both the elderly and younger disabled people with disabilities. It also has the potential to provide a uniform national benefit available to qualified enrollees anywhere in the U.S. The CLASS Act is intended to supplement rather than supplant assistance received from other payers. Furthermore, its reliance on a cash benefit allocated by beneficiaries with the assistance of counseling services makes it consistent with the consumer-directed philosophy favored by the LTC advocacy community. Several issues could limit the impact of the CLASS Act, however. It is likely that the government will face substantial challenges promoting take-up, automatic enrollment in participating workplaces notwithstanding. It also is likely that voluntary enrollment combined with a lack of medical underwriting could lead to disproportionate numbers of high cost enrollees. Moral hazard and gaming could prove problematic as well, further contributing to higher than expected costs. Barring making the program mandatory there are a number of comparatively minor changes policymakers could make to strengthen the risk pool, although there could be a tradeoff between attracting better off risks while eschewing those likely to need the benefit most. Given prevailing challenges it is likely that the CLASS Act will add but a small enhancement to the existing patchwork of financing options available.

STATE AGE-FRIENDLINESS: INFLUENCES OF LEGISLATOR SEX AND ETHNICITY

J. Giles-Sims1, C. Lockhart1, J. Green2, 1. Sociology, Texas Christian University, Fort Worth, Texas, 2. Texas Christian University, Fort Worth, Texas

Purpose: We examine the influences of sex and ethnicity among legislators with respect to their support of policies responsive to older citizens. Previous research has found that women and minority legislators tend to vote cooperatively in support of policies favoring education and families, and women legislators extend this support to various dimensions of “state age friendliness.” This paper examines whether ethnic minorities follow women in extending this cooperation to “state age-friendly” policies. Design and methods: Data include legislative decisions from the 50 American states related to three dimensions of state age friendliness used as dependent variables: 1)meaningful contributions and supportive communities, 2)sustaining health and accessible long-term care, and 3)finding accessible and high-quality medical care, as well as home and community based expenditures divided by Medicaid nursing-facility expenditures. Independent variables include: women’s legislative influence, blacks’ legislative influence, and control variables that previous research finds also influence legislative decisions. Regression analyses test several hypotheses. Results: Controlling for the most prominent alternative factors generally shaping state orientations and policies, female legislators are selectively supportive of dimensions of state age friendliness, but minority legislators (African-Americans in this study) do not share this orientation. Implications: Women and minority legislators may have specific divergent priorities with regard to elders and women and black legislators in different states may have distinctive cultures. Implications include recommendations for further research and education and for strategic efforts to improve elders social policy options.

CASH FOR CARE IN EUROPE – IMPLICATIONS FOR CLASS

P. Nadash1, P. Dovy2, K.J. Mahoney1, 1. Gerontology, University of Massachusetts, Boston, Boston, Massachusetts, 2. ASPE/DHHS, Washington, District of Columbia, 3. Boston College, Chestnut Hill, Massachusetts

This paper presents data from programs in Austria, England, France, Germany, and the Netherlands that pay cash to people with long term services and support needs, addressing the question of what lessons their programs might have for the United States, which, under the 2010 Patient Protection and Affordable Care Act (PPACA), is introducing a new, federally administered, voluntary public insurance program: Community Living Assistance Services and Supports (CLASS). Data from program administrators and policy researchers were collected to understand key
program parameters: how benefit levels were set; whether project expenditures matched projections; how administrative costs were controlled; how the use of benefits was regulated; and what protections were offered to workers. We present data on program enrollment and expenditures, which show that cash for care programs continue to grow. We also set the programs in the context of each country’s social support system and political culture. All devolve some responsibilities to the local level and all are concerned about the political impact of benefit abuse—in particular, the emergence of a grey market of care. No country has been successful in projecting expenditures and all lack data that would allow a full understanding of program operations. We also find that the structure and level of benefits have important distributive effects, which translate into political concerns. These findings suggest that the United States should carefully consider how its method for tracking expenditures is implemented. Moreover, we should consider the use of fixed benefit levels and payment mechanisms that build in accountability.

SOURCES OF REGIONAL VARIATION IN MEDICARE PART D PRESCRIPTION DRUG SPENDING

Medicare Part D drug spending varies significantly across regions; however, the sources of variation are unknown and may reflect regional differences in health status, use of effective treatments, or prescribing of expensive brand-name drugs over lower cost generic substitutes. We examined sources of regional variation in Part D spending overall and in commonly-used drug classes among 4.6 million enrollees in Part D in 2008. We conducted cross-sectional analyses of utilization and expenditures across 306 hospital referral regions (HRRs), adjusting for differences in socioeconomic status, demographics, and health status. Most (87.3%) of the variation in per capita drug spending in Part D was due to differences in mean cost/prescription ($54 vs. $63 in the lowest and highest spending HRRs). Small differences in the total number of prescriptions filled annually (44.7 vs. 47.5) explained the remainder of the difference. Variation in the cost/prescription was due to greater use of branded drugs in some regions. One-third of antidepressant prescriptions were filled for brand name drugs but the range was from 24% to 55% across regions. Branded use of statins for lowering cholesterol varied from 29% to 61% across regions. Regional differences in branded use have important cost implications given the 5-fold price difference for branded vs. generic drugs. Regional variation in Part D spending appears to reflect differences in the cost of drugs prescribed rather than the number of prescriptions. The greater reliance on expensive branded drugs in some regions is a potential target for benefit design changes in Part D plans.

RACIAL AND GENDER DISPARITIES IN MEDICATION NONADHERENCE: A PRE/POST MEDICARE PART D COMPARISON

This longitudinal study examined how gender and racial disparities in cost-related medication nonadherence (CRN) have been impacted by the Medicare prescription drug benefit (Part D). Prior to Medicare Part D, older Blacks and females have reported greater CRN in comparison to older Whites and males. This study examined whether disparities in CRN continue since the policy’s enactment. Data from the 2005 and 2007 waves of the Prescription Drug Study (PDS), a subsample of the Health and Retirement Study (HRS), were used to evaluate changes in CRN before and after the implementation of Medicare Part D. The analysis was conducted using mixed-effects logistic regression models. Results indicated that older Blacks and females were significantly more likely to report CRN both before and after Medicare Part D compared to older Whites and men. While the rate of CRN for females significantly decreased over time in comparison to males, there was no change in the rate for Blacks relative to Whites. The introduction of variables related to socioeconomic status, health status, and prescription insurance coverage had little mediating effect on these findings. The results suggest that racial and gender disparities in CRN continue to persist despite the presence of Medicare Part D.

FAMILY LEGACY EFFECTS ON YOUNGER AND OLDER INDIVIDUALS’ SUPPORT FOR SOCIAL POLICIES
J. Rozanova1,2, A. Fox2, M. Schlesinger2. 1. University of British Columbia, Vancouver, British Columbia, Canada. 2. Public Health, Yale University, New Haven, Connecticut

Background: Older and younger individuals may have fewer family risk buffers than individuals in midlife, and therefore want more government involvement in risk protection. This paper explains how availability of nuclear and extended family mediates older and younger individuals’ support for risk protection social policies (RPSP). Methods: Data comes from the Spring 2009 Wave of the Survey of Economic Risk Perceptions and Insecurity (N=2,493), a supplement of the National Election Panel Survey. Support for RPSP was measured across A) Current economic risks (employment and healthcare), B) Future economic risks (retirement and long-term care). Family risk buffers were assessed through nuclear (Single; Always Married; Fragmented; Reconstituted) and extended family status (relatives that could assist in need). Age was stratified (18 to 59; 60 and over) and we used ordered logistic regression to test age-related effects of family status on support for RPSP introducing control/explanatory variables sequentially. Findings: Marriage legacy effects and mixed age effects were found on support for RPSP. Reconstituted are more supportive than Single of policies that protect against later life risks. Reconstituted are more supportive of long-term care, but less supportive of retirement policies than Always Married. Older persons were significantly more likely to support programs in areas of health advocacy and job retraining, but less likely to support government responsibility across all risk domains. Implications: Older individuals with fewer family risk buffers are more supportive of RPSP, but less likely to support policies that buffer against long-term risks, which they may already be benefiting from.

IMPACT OF MEDICARE PART D ON RACIAL DIFFERENCES IN DIABETES TREATMENT AND OUTCOMES IN OLDER ADULTS

Medicare Part D, which improved medication adherence among older adults, may help to alleviate racial disparities in treatment and health outcomes for chronic conditions. Our objective was to determine whether there were racial differences in Part D’s effect on drug coverage, diabetes medication treatment, and glycemic control (HbA1c>7) in 702 black and white elders with diabetes mellitus in the Health Aging and Body Composition (ABC) study, a longitudinal cohort of elders half of whom were black. We used generalized estimating equations to examine racial differences in outcomes pre (2003/04) vs. post-Part D (2006/07) adjust-
ing for demographics, socioeconomic and health status, body mass index, and access to care. Blacks experienced a substantial increase in drug coverage after Part D (50.3% to 88.0%), as did whites (62.0% to 93.9%). Rates of antidiabetic medication use did not change after Part D for blacks (65.4% to 65.0%) or whites (62.0% to 60.4%) (Adjusted Ratio of Odds Ratio (AROR) = 1.05, P-value = 0.26). Blacks, who received higher intensity medication treatment (e.g., insulin) before Part D, experienced no change (18.9% vs. 18.7%) whereas whites increased insulin use (12.7% to 16.1%), a statistically significant difference in trend (AROR = 0.59, p = 0.02). In spite of greater treatment intensity, blacks had worse glycemic control than whites before Part D (47.1 vs. 26.5%), a difference that persisted after 2006 (46.4% vs. 27.1%, AROR = 0.94, p = 0.30). Medicare Part D did not appear to have a different effect by race in this longitudinal cohort of diabetic elders.

FACTORS PREDICTING NON-ENROLLMENT IN MEDICARE PART D DUE TO PERCEIVED PROGRAM COMPLEXITY

Objective: Despite Medicare Part D (MPD) being available to most seniors, the complexity of the program may create a barrier for many seniors to enroll. The purpose of this study was to identify seniors at risk for non-enrollment in MPD because they report being overwhelmed by the program’s complexity. Methods: Data were drawn from the 2007 Medicare Supplemental wave of the Wisconsin Longitudinal Study. Selection of risk factors was guided by the Andersen Behavioral Model. Predisposing variables included: age, sex, marital status, education, employment, and personality traits. Enabling variables included: perceived healthcare access, perceived financial difficulties, shared responsibility for enrollment decision, and rurality. Need variables included: physical and mental disability (SF-12), number of diagnosed illnesses, and prescription medication count. Multivariate logistic regression was used to model non-enrollment due to perceived program complexity as a function of predisposing, enabling, and need variables. Results: Of the seniors not enrolled in MPD (n=2,543), over 10% reported MPD was too complex to enroll (n=287). Adjusted logistic regression revealed the following risk factors for non-enrollment due to complexity: only obtaining a high-school degree versus some college (odds ratio [OR] 1.52, P-value <0.00); poor perceived healthcare access (OR 1.37, P-value <0.00); and a trend for seniors reporting no involvement in enrollment decisions (OR 1.54, P-value 0.09) Conclusions: Our results suggest that older adults perceiving poor healthcare access, having less understanding of MPD, and those not actively engaged in enrollment decisions are at greater risk for non-enrollment in MPD because they report being overwhelmed by the program’s complexity.

THE EFFECT OF CARE CONTINUITY ON READMISSIONS FOR ELDERS LIVING IN THE COMMUNITY
J. Gaudet, J. Perloff, C.E. Bishop, Brandeis University, Waltham, Massachusetts

In addition to quality of life benefits, reducing hospital readmissions can reduce health care costs. Care continuity, measured as the degree to which a patient receives care from a single provider, may be part of a strategy to reduce readmissions among the chronically ill given the greater complexity and need for coordination associated with their care. This study uses Cox proportional hazard modeling to examine whether care continuity has an impact on time to readmission for previously hospitalized Medicare beneficiaries with chronic illness. Using Medicare claims data from 2003-2004, patients were assigned to the provider from whom they received the most evaluation and management (E&M) services. Patients were then categorized into high, medium, or low care continuity, based on what proportion of all their E&M services were provided by that provider. Results show that the average time to readmission was 64 days and 48% of the sample had a readmission within 30 days of discharge, consistent with previous research. Cox proportional hazard model estimates showed that high continuity was associated with lower risk of readmission: those with high continuity had a 6 percent lower risk of all-cause readmission, controlling for demographic, chronic illness, and geographic factors. Tests of interactions between care continuity and indicators for chronic illness or illness severity revealed a significant but small interaction effect for medium continuity and the ACG risk adjuster. Study results point to the potential value of care continuity for reducing readmissions.

NURSING HOMES AND PAY-FOR-PERFORMANCE

Pay-for-performance (P4P) is defined as “financial incentives to nursing homes that demonstrate delivery of high quality care or improvement in care.” In the research presented, we provide some descriptive information of nursing home P4P initiatives and examine Nursing Home Administrators (NHAs) opinions of P4P. P4P programs are shown to be comprised of several key components including how the payments are structured, the payment rates, and the measures used. The primary data from NHAs includes opinions on the measures used, efficiency, reliability, and potential behavior changes. Data used in this investigation primarily came from a survey of NHAs conducted in 2010. The survey was based on a conceptual framework linking program characteristics with NHA behavior and performance changes. The survey was developed using focus groups, cognitive testing, and a pilot survey. The survey was sent to 2,000 NHAs working in nursing homes with P4P systems in 2010 and 2,000 NHAs working in nursing homes without P4P systems (RR=66%). Overall, NHAs did not view P4P favorably. Most did not understand the metrics used. Moreover, the quality metrics used were viewed as weak and often not associated with actual quality. The reimbursement given for performance improvement was seen as very inadequate. Some differences did exist across provider types and experience with P4P. The highest quality providers were least opposed to P4P. And, NHAs with the most experience with p4P were least opposed. This information is important, for NHAs responses to P4P likely influence outcomes of these programs.

NURSING HOME FINANCIAL PERFORMANCE: MEDICARE COST REPORTS VS. MEDICAID COST REPORTS
J. Epane, R. Pradhan, R. Weech-Maldonado, Health Services Administration, University of Alabama at Birmingham, Birmingham, Alabama

US nursing homes (NHs) continue to operate in a financially challenging environment, and the situation is likely to worsen as federal and state governments grapple with budgetary deficits and reduce nursing home reimbursement. Financial distress has been associated with nursing home closures, and quality may also suffer as NHs attempt to reduce costs. Therefore it is important to monitor the financial condition of NHs. The Centers for Medicare and Medicaid Services’ (CMS) Medicare Cost Report (MCR) provides national, financial data on NHs, but it is limited to facilities serving Medicare residents. As such, the MCR does not capture data from NHs that serve only Medicaid residents, which are likely to face greater financial risk. This study examines the financial performance of facilities not captured by the MCR. The study analyzed data for the state of Washington from the Long-Term Care Focus, CMS Medicare Cost Report, and Medicaid Cost Report in 2007. Financial performance measures included total margin (TM), return on assets (ROA), and return on equity (ROE). Of the 217 Medicare and Medicaid certified NHs, 23 NHs (11%) did not have MCR data. NHs not captured by the MCR had significantly worse financial performance than those included. NHs captured by the MCR had TM, ROA, and ROE of 1.8%, 7.4%, and -21.8%, respectively, while those not captured had TM, ROA, and ROE of 1.8%, 7.4%, and -21.8%, respectively.
THE EFFECTS OF MEDICARE PAYMENT INCENTIVES ON THE QUALITY OF HOSPITAL CARE
J. Huang, G.A. Jensen, Wayne State University, Detroit, Michigan

BACKGROUND: To reduce the costs of Medicare spending and to improve the quality of hospital care, CMS is designing and implementing a value-based purchasing to build a positive relationship between Medicare payment and quality of hospital care. Under this new model, CMS will reward hospitals who provide higher performance and reduce payments on hospitals that provide lower quality of care. Yet, little is known about whether the financial incentive is effective at improving the quality of inpatient care. This study examines this issue empirically for hospitals stay with diagnoses of heart failure and heart attacks.

METHODS: The testable hypothesis is that this new financial incentive will have a positive impact on the quality of hospital care. We then test this by estimating the impact of Medicare’s payments for heart failure on the quality of heart failure care, and the impact of Medicare’s payments for heart attacks on the quality of heart attack care. Data on more than 3000 U.S. acute hospitals observed from 2006 to 2009 fiscal years from the “Hospital Compare” data base maintained by CMS are used for this analysis, and were linked with data from the Hospital Impact File maintained by CMS, and the Area Resource File maintained by the Bureau of Health Professions. A regression model is designed to address peculiarities in the distribution of care quality across the sample hospitals. Each of the estimated quality models controls for market and hospital characteristics, as well as for Medicare’s reimbursement.

RESULTS AND IMPLICATIONS: We find a significant positive relationship between Medicare’s payment rate and care quality for some hospitals in heart failure care but not for heart attack care. For hospitals that are very highly paid for heart failure and hospitals that treat large numbers of heart failure, we find a positive and significant relationship. For such hospitals, which likely derive substantial revenue from heart failure care, an increase in Medicare’s payment rate leads to a small improvement in the quality of care provided. For hospitals with average characteristics, the effects of payment on the quality of heart failure and heart attack care both are insignificant.

FAVORABLE SELECTION, RISK ADJUSTMENT AND THE MEDICARE ADVANTAGE PROGRAM
M.A. Morrisey, M. Kilgore, D.J. Becker, W. Smith, E.S. Delzell, Lister Hill Center for Health Policy, University of Alabama at Birmingham, Birmingham, Alabama

This paper examines the effects of changes in Medicare policy on the Medicare Advantage (MA) program over the years 1999 - 2008. During this period CMS (1) implemented changes in baseline payments to plans, (2) phased-in of a more sophisticated risk adjustment mechanism called Hierarchical Condition Categories (HCC) in place of the Adjusted Average Per Capita Costs, and (3) required an annual open enrollment period in place of unlimited plan switching. The effects of these policy changes on enrollment/enrollment and on the claims experience of individuals switching into and out of MA relative to those remaining in traditional Medicare are estimated. Data are drawn from the longitudinal five percent sample of Medicare Part A and Part B claims over the period 1999 through 2008. Favorable/ adverse selection is measured as the average claims in the six months prior to switching into MA of all those switching in divided by the average claims experience of those in the same county-month-year who remained in traditional Medicare. An analogous measure was computed using the six months of claims for those switching back to traditional Medicare. County-year fixed-effects regression models with robust standard errors are used. Ten percent higher payments were associated with 9.6% greater annual enrollment; disenrollment decreased dramatically. The HCC resulted in more new enrollees but no meaningful change in favorable selection among them, and in fewer MA disenrollees who were now more concentrated in the expensive extreme tail of the claims distribution. The shift to 12-month enrollment periods yielded only small effects.

SESSION 525 (POSTER)

IMPROVING QUALITY IN HEALTHCARE SERVICES

STAFF PERCEPTIONS OF QUALITY IMPROVEMENT IN A RESIDENTIAL CARE PROGRAM FOR PERSONS WITH DEMENTIA
D.J. Monahan1, M. Koenig2, K. Cahill2, 1. School of Social Work, Syracuse University, Syracuse, New York, 2. Loretto-The Heritage, Syracuse, New York

Designing effective residential interventions for older adults with a dementia diagnosis requires an ongoing evaluation of the organizational environment to assess program quality. The purpose of this paper is to examine how staff perceptions changed during a 12 month quality improvement evaluation. Qualitative methods were used to examine the organizational environment and identify the organizational culture using the Kotter “culture of change” model. The program adapted a web-based educational intervention from the New York State Department of Health, Office of Continuing Care EDGE (Electronic Dementia Guide for Excellence) Program. Its primary objective was to improve the process of caring for residents with dementia in long term care by teaching all persons who deal with the resident “how to obtain the highest quality of life possible.” Methods used to assess program quality included turnover, resident satisfaction, staff knowledge of dementia, communication with clients and behavioral problems, among others. Staff participated in several training days to review resident care guidelines to increase their knowledge of dementia care. Staff incentives to participate and implement their client “quality of life” skills were assessed. Major findings included the number of staff reporting satisfaction with the quality improvement training and morale. Further analysis needs to be done to examine the extent of turnover and whether long term reductions in staff turnover have occurred.

QUALITY INDICATOR DEVELOPMENT FOR AN EFFECTIVE OCCUPATIONAL THERAPY PROGRAM FOR PEOPLE WITH DEMENTIA
C.M. Dopp1,2, N. van’t Leven1, M. Graff1,2, M. Kajen1, B. de Swart4, 5, M. Olde Rikkert1,6, M. Vernooij1,2,3, 1. Rotterdam University of Nijmegen Medical Centre, Department of Primary and Community Care, Nijmegen, Netherlands

Background: A community occupational therapy (COTiD) program was proven to be both effective and cost-effective. Adherence of OTs to the COTiD program is crucial in reaching optimal benefits with regard to patient and caregiver outcomes and healthcare costs. Objective: To develop a set of quality indicators representing the key elements of the COTiD program which can serve to evaluate the quality of the occupational therapy treatment of people with dementia and their informal caregiver. Methods: The RAND / UCLA Appropriateness Method was used as a guideline to develop the quality indicators (QIs). Review of the literature and a first expert round (n= 6) were used to create a first
set of indications. A second expert group (n=7) was asked to rate the relevance and necessity of each indicator on a 9-point scale. Indicators with a median lower than 7 or indicators on which raters did not agree were either removed from the set of rephrased according to expert suggestions. Last, the feasibility of the set of QIs was evaluated by reviewing patient records (n=30) of past treatments conducted during the study of Graff et al (2006) as these were considered the most accurate as the treatments were conducted by experts. Results: The literature search and meeting with experts resulted in a conceptual set of 28 process indicators and 3 structure indicators. Currently we are working on creating a final and more concise set of indicators. The final set of quality indicators will be available at the conference.

DEVELOPING DEMENTIA NETWORKS: A QUALITATIVE STUDY ON FACILITATORS AND BARRIERS

I. Draskovic, M. Otero, G. Hesselink, M. Olde Rikkert, M. Vernooij
Primary Care, Radboud University Nijmegen Medical Centre, Nijmegen, Netherlands

Objective. To gain insight into factors affecting development and functioning of dementia networks. Design. Qualitative study using focus groups and semi-structured interviews. Analyses are performed using grounded theory approach. Setting. Community dementia care in The Netherlands. Participants. Dementia care professionals from five regional dementia networks. Results. Three focus group interviews and three face-to-face interviews were conducted with 17 professionals representing a variety of professional disciplines from 5 dementia networks. Analysis revealed five facilitators for the development and functioning of dementia networks: intrinsic motivation to collaborate on improving dementia care, client centeredness of the improvement projects, team climate, sufficient financial support and long term embedding of the improvement projects, and quality of the National Dementia Programme. In addition, a number of barriers emerged: demotivation, market mechanisms and competitive organisational culture, and insufficient funding of improvement projects. Conclusions. Facilitators for and barriers for the development and functioning of dementia networks were found at individual, social, organisational, and societal levels. We hypothesise that development and maintenance of dementia networks, aimed to facilitate continuous improvements, are not independent of societal trends. These trends determine the level of inter-organisational collaboration and commitment, which, in turn, affect the motivation for active participation at individual level. Future programs addressing healthcare improvements by means of network formation may use this model to chart the main facilitators and barriers beforehand and to adapt their strategies accordingly.

USING ADMINISTRATIVE CLAIMS DATA TO IDENTIFY ADVERSE MEDICAL EVENTS AMONG OLDER ADULTS

M. Carter, F.W. Forell, M. Zhu, J. West Virginia University, Morgantown, West Virginia, 2. University of Massachusetts Boston, Boston, Massachusetts, 3. West Virginia University, Morgantown, West Virginia

Estimates suggest that 98,000 avoidable deaths may occur each year as the result of adverse medical events (AME). Older adults appear to be especially vulnerable, with research indicating a higher incidence and poorer outcomes following AME in comparison with younger populations. However research to date has focused on acute care episodes using limited data sources, leaving broader questions about the risk of AME and the subsequent outcomes of such events largely unanswered. In response, this study draws upon eight years (1998-2005) of administrative claims data from the Medicare Current Beneficiary Survey to identify AME among older adults. Importantly, because medical use histories are constructed from longitudinal claims files, AME first identified in ambulatory settings are included in this study. Random Effects Logistic Regression models were estimated to identify AME risk factors. Marginal models using GEE techniques were used to model the long-term consequences of AME. Results indicate that nearly 20% of the more than 12,000 Medicare beneficiaries experienced at least one AME during panel participation. Older age, male gender, African-American race, poorer health and greater disability levels were associated with increased risk of AME. After adjusting for population casemix differences, marginal model results suggested that AMEs were associated with long-term increases in Medicare costs and use patterns. Study findings also indicate that expenditures remained higher than would otherwise be expected in months following an AME episode. Considered together, findings suggest that claims-based approaches may provide critical insight into the frequency and burden of AME among older adults.

INTERDISCIPLINARY GERIATRIC AND PSYCHIATRIC CARE REDUCES POTENTIALLY INAPPROPRIATE PRESCRIBING IN-HOSPITAL: INTERVENTIONAL STUDY IN 150 ACRUTELY ILL ELDERLY PATIENTS WITH MENTAL AND SOMATIC CO-MORBID CONDITIONS

P. Lang, N. Vogt-Ferrier, J. Michel. Department of rehabilitation and geriatrics, Medical school and University hospitals of Geneva, Geneva, Switzerland

Design: Prospective and interventional study. Setting: Medical-psychiatric unit in an academic geriatric department. Participants: 150 consecutively acutely ill patients aged on average 80 years suffering from mental comorbidities and hospitalized for any acute somatic condition. Intervention: From admission to discharge, daily collaboration provided by senior geriatrician and psychiatrist working in a usual geriatric inter-disciplinary care team. Measurements: PIM and PO were detected and recorded by a trained independent investigator using STOPP/START criteria at admission and discharge. Results: Compared to admission, the intervention reduced the total number of medications prescribed at discharge from 1,347 to 790 (p<.0001) and incidence rates for PIM and PO reduced from 77% to 19% (p<.0001) and from 65% to 11% (p<.0001) respectively. Independent predictive factors for PIP at discharge were being faller (odds ratio (OR) 1.85; 95% confidence interval (CI) 1.43–2.09) and for PO, the increased number of medication (OR 1.54; 95% CI 1.13–1.89) and a Charlson co-morbidity index > 2 (OR 1.85; 95% CI 1.38 – 2.13). Dementia and/or presence of psychiatric co-morbidities were predictive factors for both PIM and PO at discharge. Conclusion: These findings hold substantial promise for the prevention of IP and OP in such co-morbid and polymedicated population.

CAREGIVER BURDEN AMONG MEDICARE PATIENTS WITH ATRIAL FIBRILLATION

Purpose: To describe patient characteristics and caregiver burden among Medicare patients with atrial fibrillation (AF). Methods: Data from Medicare Current Beneficiary Survey 2001–2006 were analyzed, and patients with AF (ICD-9-CM: 427.31) and age- and gender-matched controls were identified. Sociodemographic and clinical characteristics, limitations in (instrumental) activities of daily living (ADL/IADL), and caregiver utilization were compared. Sample population weights were applied to obtain national representative estimates for the US Medicare population. Results: The 2990 AF patients identified represented 6.7 million Medicare beneficiaries. Using 1:2 matching, 5980 age- and gender-matched control patients were identified. Distribution of race, employment status, and geographic region significantly differed between cohorts; patients with AF exhibited a higher median Charlson Comorbidity Index score (3.3 vs 1.5; P<0.05) and a higher prevalence of comorbidities, including congestive heart failure, upper gastrointestinal conditions, diabetes, and dementia (P<0.05). AF patients incurred higher mean annual total healthcare costs ($21,898 vs $8204; P<0.05) and used more medications (means, 9.7 vs 6.4; P<0.05). Patients with AF reported
more ADL/IADL limitations than controls and required more assistance with ADL/IADL (P<0.05). Among patients with caregivers, the mean number of caregivers per patient (1.35 vs 1.29; P<0.05) and the mean number of tasks requiring assistance (2.7 vs 2.2; P<0.05) were higher among AF patients. Conclusion: Medicare patients with AF had more comorbidities, greater annual healthcare costs, more ADL limitations, and were more likely to require caregiver assistance. This greater burden of care should be considered when making therapy decisions, in order to minimize patient or caregiver burden.

EVALUATING OUTCOMES OF A PATIENT-CENTERED CARE MODEL IN A LONG TERM HOME HEALTH CARE PROGRAM

Research suggests frail, complex patients want to remain in their own homes as long as possible, while policy makers seek to provide long term care away from costly institutional settings, preferring to support patients aging in place in the community. One large not-for-profit home health care agency piloted a practice change project among nurses and interdisciplinary clinicians to better serve the geriatric patients in their long term home health care program (LTHHCP). The ensuing Patient-Centered Care Model (PCCM) included a combination of coaching techniques, assessment tools, and patient-centered evidence-based transitional care practices to provide clinicians with skills and competencies to support patients and partner in their care. The longitudinal, quasi-experimental design hypothesized that patients in the pilot group will demonstrate lower hospitalization rates and ED visits, with higher levels of stability or improvement in functional status, knowledge of their medications, and patient readiness. 49 patients met pilot eligibility criteria, were tracked over 6 months, and compared to a similar control group. The average patient was 79 years old, with 83% female, 52% English as the primary language, and averaging 6 co-morbidities. Post-intervention data analysis revealed that compared to the control, the pilot group had notably lower ED visits (6.2% vs 19.5%) and hospitalization rates (10.5% vs 21.3%), as well as significantly better understanding of their medication. Functional status among pilot patients remained unchanged for both groups, reflecting the complex conditions of long term patients. Next steps include assessing patient health literacy, consistent clinician implementation, and updating coaching and communication strategies.

SESSION 530 (POSTER)

REBALANCING LONG TERM CARE SYSTEMS

THE TORTOISE AND THE HARE: TRACKING OHIO’S RUN TO LONG-TERM SYSTEM BALANCE

R. Applebaum, S. Mehdizadeh, J. Straker, I.M. Nelson, Scripps Gerontology Center, Miami University, Oxford, Ohio

For almost two decades Ohio has been working to change its approach to how it provides long-term services and supports. In 1993, over 92% of Medicaid recipients age 60 and older who received long-term care services did so in an institutional setting. In 2009, that proportion had dipped to 60%. While Ohio still lags the nation in the proportion of Medicaid funds spent on home and community-based services, the changes to the system have been substantial. This paper, based on longitudinal data collected from home care providers, assisted living facilities, and nursing homes, presents utilization patterns that demonstrate major changes in how long-term services and supports is now delivered. Data document the tremendous growth in home care, but also the dramatic changes in how nursing homes are used. For example, Ohio’s 70,000 nursing home admissions recorded in 1992 had grown to more than 210,000 by 2009. The rise of short-term nursing home care has been dramatic, with almost 60% of residents staying three months or less. These shifts in use patterns have important implications for long-term system structure and reform. This paper will both describe where long-term care has been, and where the provision of long-term services and supports is going in the future.

CULTURE CHANGE: A COLLABORATIVE EXPLORATION

K. Niles-Yokum, M.B. Ligon, York College of PA, York, Pennsylvania

According to the U.S. census bureau, Pennsylvania ranks third in proportion of elders and fifth in terms of numbers of elders as compared to other states. Given the demographic rational and the increased demand for a person-centered environment, it is important to evaluate and explore readiness for change. York College of PA has entered into a partnership with a long term care, not-for-profit agency serving south central PA to assist in evaluating current practices that support or detract from person-centered care. This session will focus on the process of engaging in applied research within the local community, involving gerontology students in the research process, and outcomes of an assessment of the current status of person-centered care from the providers’ perspective. Findings reveal that staff readiness toward tenets of culture change influences not only current organizational culture but future readiness. Additional findings indicate that gerontological competencies are an important component of the culture change plan.

IS BALANCING ENOUGH? PROJECTIONS FOR MAKING OHIO’S SYSTEM OF LONG-TERM SERVICES AND SUPPORTS WORK IN THE FUTURE

S. Mehdizadeh1,2, R. Applebaum1,2, 1. Department of Sociology & Gerontology, Miami University, Oxford, Ohio, 2. Scripps Gerontology Center, Miami University, Oxford, Ohio

Based on the projected number of people in need of long-term services and supports paid for by Medicaid, this study contends that balancing is not enough to solve future cost and care challenges. The public cost of long-term services and supports is a major concern in Ohio as in all other states. If the consumption patterns remain the same and the annual inflation rate is only 1.5%, we project that the cost of Medicaid long-term services and supports will be about $6.7 billion in 2020, up from $4.7 in 2007. The more likely scenario indicates that the cost of LTSS in the long-run will increase between 3% to 4% annually, escalating the total Medicaid long-term care expenditures to $8.6 billion, an increase of 83% over 2007 Medicaid LTSS expenditures. There has been considerable emphasis on balancing the system of LTSS in states, our research shows that Ohio has been steadily moving toward a more balanced system for all people with a disability, and has achieved balance in the overall numbers of people using facility-based versus community-based care. While the dollar amounts spent on institutional care continue to require reform, our projections indicate that even if better balance does occur the cost challenges will continue. In an era of shrinking state budgets and an increasing number of people in need of care states will need to consider even more innovations to assist individuals in remaining independent longer.

THE IMPLEMENTATION OF LONGITUDINAL METRICS FOR MONEY FOLLOWS THE PERSON

I. Stockwell, The Hilltop Institute, Baltimore, Maryland

In 2008, Maryland began participating in CMS’s Money Follows the Person (MFP) program, which is designed to promote the reduction of barriers to receiving long-term services and supports in community settings. Recently, work was undertaken to provide an overview of the characteristics of Medicaid recipients who transitioned from a long-term care (LTC) facility, and assess the change in these individuals since the implementation of MFP. The study cohort contained individuals who transitioned to the community and received Medicaid home- and community-based services. Individuals were grouped by age, disability category, and MFP participation. Claims and eligibility data from the state’s Medicaid Management Information System were then ana-
MEASUREMENT OF TRANSITION CHALLENGES: FROM MONEY FOLLOWS THE PERSON TO OTHER CARE TRANSITION SETTINGS

Care transitions of all types, including those from institutions to community or from hospitals to home, are fraught with risk. Numerous challenges arise that slow or prevent successful transitions. Understanding the types and frequency of specific challenges is critical for successful program implementation. As part of Connecticut’s Money Follows the Person (MFP) Rebalancing Demonstration, the state designed an innovative standardized transition challenge tracking tool that identifies and measures each consumer’s challenges. MFP Transition Coordinators complete a cumulative transition challenges checklist in a web-based consumer tracking system. During the first 25 months of CT’s MFP program, there were 500 transitions from institutions to community (“Transition Group”) and 746 cases closed without transitioning (“Closed Group”). Physical health was the most frequently-recorded challenge for both groups, reported for 54% of the Transition Group and 40% of the Closed Group. The Transition Group also experienced frequent challenges with housing (50%), HCBS waivers (44%), and mental health issues (41%). The Closed Group faced significant challenges with HCBS waivers, consumer engagement and life skills (39% each), and mental health issues (32%). In 2010, CT’s pilot Care Transitions Intervention adopted the transition challenges tool for those receiving an intervention while transitioning from hospital to home. Of the 29 people who received the intervention, most experienced at least one challenge: the most frequently-recorded challenge was physical health (44%). Other states have adopted or are considering adoption of the tool. Strategies for program managers to use the tool to detect and remove barriers to successful transitions will be discussed.

UNDERSTANDING TERMINATION FROM HOME AND COMMUNITY-BASED CARE: DECISION MAKING, RISK SCENARIOS AND FUNDING ISSUES

J. Vaughan, F. Alvarez, Y. Decelis, N. Lender, E. Patridge, P. Sanusi, W. Scott, D. Wheeler Ramos, Gerontology Institute, University of Massachusetts Boston, Boston, Massachusetts

Home and community-based services (HCBS) are a range of long-term care (LTC) options that enable older adults to “age in place” in their communities. A majority of funding in most states, however, is allocated to institutional care. Care managers are key personnel in the decision-making process of transferring elders from HCBS to nursing homes. Building on a 2010 UMass Boston study of in-depth interviews with care managers, the purpose of this study was to gain further insights through an electronic, Massachusetts statewide care manager survey (n=322). While most respondents indicated that services in their region were “somewhat sufficient,” they noted the lack of 24/7 supervision, and the lack of informal supports as the greatest gaps they faced in trying to maintain older adults in their homes. A majority stated that the cost of a care plan is not a factor in deciding if an elder client needs a nursing facility (62%), but noted a lack of adequate state funding for community-based services. Scenarios reported that trigger discharge to institutional care included the need for 24/7 supervision and episodes of wandering behavior. Results indicate that there are service gaps in home and community-based programming but that care managers feel that their elder clients are remaining in the home and community longer today than in previous years. Findings add to our understanding of care managers’ perceptions of HCBS and suggest that LTC spending policies should reflect the wishes of older adults to receive the care of their choice.

 MASSACHUSETTS HOME CARE PROGRAMS AND REASONS FOR DISCHARGE INTO NURSING HOMES

C. Wong, N.M. Silverstein, A. Norman, J. University of Massachusetts Boston, Boston, Massachusetts, 2. Mass Home Care, Burlington, Massachusetts

Reasons for discharge of clients enrolled in home and community-based services (HCBS) programs to institutional settings were explored by examining multiple data sources in one state. The 2010 study presents a profile of clients enrolled in three main home care programs in Massachusetts: Home Care Basic, Choices, and Enhanced Community Options Program (ECOP), and concludes with recommendations that may enhance the delivery of HCBS. Three sources of data were used: qualitative data from in-person interviews with 18 care managers, aggregate data from the Comprehensive Data Set (CDS) provided by the Executive Office of Elder Affairs (n= 42,201), and a sample of care manager journal entry notes (15 clients, 150 entries). In FY 2010, an estimated 14.5% of clients were discharged into nursing homes. Clients were predominantly older women (75%), widowed (48%), and lived alone (62%). Doctors (2.5%) and hospitals (9.4%) accounted for very few referrals to HCBS. The majority of clients (85%) did not have advance directives. Over a third of clients were taking nine or more medications. Further, 75% of clients were not physically able to shop, cook, or feed themselves. Findings from the in-depth interviews suggest elders were discharged because they needed 24/7 care, lacked sufficient informal caregiver support, were a safety risk, or had medical problems that overwhelmed caregivers. Journal notes also reveal that need for 24-hour care is a reason for discharge. Recommendations include improved coordination with medical providers, need for 24/7 in-home supports, and enhancement in identifying and clarifying safety issues.

NURSING HOME DIVERSION PROGRAMS: CHALLENGES, SUCCESSES, AND NEXT STEPS

N. Brossoe, K.A. Roberto, Center for Gerontology, Virginia Polytechnic Institute and State University, Blacksburg, Virginia

In 2009, Virginia received AoA funding to establish a community living program (CLP) to provide at-risk persons who are not Medicaid eligible with an array of services to help them remain in their homes and avoid nursing home placement and spend-down. Virginia offered 63 CLP participants a monthly expense account to purchase support from an array of 15 services (e.g., personal care, chores, home modifications, and groceries). Services were provided through local agencies or individuals hired by participants. This study examines the implementation process and evaluates the outcomes of the program after the first two years. Sources of information included weekly meetings minutes, discussions with administrators and staff, participant files, and consumer satisfaction surveys completed by participants or their proxies. Process findings indicated project tasks often occurred simultaneously and completed tasks frequently needed to be revisited as implementation challenges arose or new project goals emerged (i.e., updating business rules, communicating new goals, providing technical and professional support to staff). The greatest challenges involved development, installation, and training on computer-based reporting systems. Results
from the outcome evaluation indicated that participants and their family members were enthusiastic about the program, satisfied with the services, and appreciated selecting services they felt they needed to stay in their homes. Reductions were noted in participant out-of-pocket expenses for care, falls, and hospitalizations. Study findings provide both researchers and practitioners insight into the needs of a growing aging population and better positions service providers to identify alternative approaches to community-based support.

SESSION 535 (POSTER)

TECHNOLOGY

MEMORY AID TO STRUCTURE AND SUPPORT DAILY ACTIVITIES FOR PEOPLE WITH DEMENTIA
Y.J. Kerkhof1, F. Rabiee2, C. Willems1, I. Saxion University of applied sciences, Enschede, Netherlands, 2. Birmingham City University, Birmingham, United Kingdom

Main content of paper: To develop the memory aid a user centered development process was used. After the first development cycle was completed the resulting digital planning boards were placed in the living room of a small scale housing facility for people with dementia and in private rooms of the residents. This session provides the experiences of the users, issues around implementation and further development.

Method: A qualitative method was chosen, data was collected using semi structured individual interviews with the residents (n=6) and focus groups interviews with informal carers (n=5) and members of professional staff (n=6). Findings: The occurrence of installation errors, insufficient use, limited ease of use and a lack of knowledge regarding the function and use of the memory aid are highlighted as the most important findings. The majority of the residents were happy with the use and function of the memory aid. The informal carers although not very positive, indicated opportunities for improvement. The staff, saw an added value for the current use of the device but expected improved functioning. The findings highlighted shared views for improvement of technical functioning and additional technological applications such as Internet connectivity, adding videos and photos and improving accessibility.

Conclusions: Lessons are learned about the use and transferability of this innovation in general health care setting as well as in people with dementia. The cyclic process of user centered design and development will be continued to obtain solutions that can be effectively implemented in their living environment.

GOING DIGITAL: ADOPTION OF ELECTRONIC INFORMATION SYSTEMS IN ASSISTED LIVING COMMUNITIES
A.A. Holup1, D. Dobbs2, A. Temple2, K. Hyer1, 1. University of South Florida, Tampa, Florida, 2. James Madison University, Harrisonburg, Virginia

Concerns for patient safety and improvements in quality of care have prompted the use of electronic information systems (EIS) within the healthcare system. However, little is known about the use of EIS in long-term care settings, particularly assisted living (AL) communities. The present study uses descriptive, bivariate, and multivariate regressions to explore the association between AL community characteristics and EIS use. Primary survey data were collected from a randomly selected sample of AL communities in Florida (n=76) during 2009-2010. Seven components of EIS (resident demographics, physician notes, nursing assessments, medication lists, problem lists, discharge summaries, and advance directives) were selected based on items from the National Ambulatory Medical Care Survey. Descriptive results indicated that AL communities used EIS for medication lists (47.4%), resident demographics (39.5%), nursing assessments (25%), and problem lists (25%); whereas fewer AL communities used EIS for discharge summaries (21.2%), advance directives (18.4%), and physician orders (14.5%).

Correlations indicated that organizational characteristics including size, profit status, and resident case mix were associated with the use of at least one EIS component and no community characteristics were associated with discharge summaries or advance directives. Regression analyses indicated that for profit, publicly traded status was significantly associated with EIS utilization for resident demographics, nursing assessments, problem lists, and medication lists when controlling for other structural characteristics. Organizational structures do play a role in EIS utilization as a process of care in ALs. Future research should explore organizational structures that facilitate the implementation of EIS in AL communities.

RELATIONSHIP BETWEEN HEALTH SERVICE USE AND HEALTH INFORMATION TECHNOLOGY USE AMONG OLDER ADULTS
N.G. Choi, Social Work, University of Texas at Austin, Austin, Texas

This study, based on data from the 2009 National Health Interview Survey, examined the relationship between older adults’ use of health services and their use of the Internet for health-related activities. The rates of 12-month health information technology (HIT) use were significantly lower among the 65+ age group (n = 5,294) compared to the younger age groups, although the 55-64 group was not too different from those younger. The rates of HIT use decreased from 32.2% in the 65-74 group to 14.5% in the 75-84 group and 4.9% in the 85+ group and were significantly lower among racial/ethnic minority older adults and low-income older adults. Multivariate binary logistic regression analysis showed that having seen or talked to a general practitioner increased the odds of HIT use for both genders. However, having seen or talked to a medical specialist, eye doctor, and PT/OT were significantly associated with HIT use only for older women, while having seen or talked to a mental health professional marginally increased the odds of HIT use only for older men. Having visited or talked to a chiropractor and having had overnight hospitalization, surgery, and/or homecare services were not associated with increased HIT use.
HEALTH INFORMATION TECHNOLOGY IN US NURSING HOMES: AVAILABILITY AND USE

We present findings from an innovative, national study of the availability and use of HIT. Previous studies of HIT adoption report on generic technologies such as ‘electronic medical records.’ Our approach has been to develop a very granular model of the ways that HIT can be used to support decision making and quality improvement for specific clinical conditions. In 2009, we selected a random sample of 599 nursing homes in 12 states (grouped into eight geographic regions) and solicited responses from the nursing home administrators (NHA) and directors of nursing (DON). Our final sample included 363 facilities with at least one respondent (221 NHAs and 245 DONs). The survey instrument includes a taxonomy of HIT domains that was developed through a series of focus groups with different types of nursing home staff. We found that the availability of basic functionality is high, but ‘regular’ use is low. Specifically, facilities use on average 41% of available features for identifying residents at risk of common clinical problems (e.g., infections, pressure sores, falls, etc.). By contrast, only 17% of features for generating prospective alerts about changes in resident health are used on a regular basis. In summary, although useful HIT features are available in over 50% of nursing homes covered by this study, most respondents indicate that these features are under-used. Many facilities have not implemented technologies that could improve quality of care despite considerable investment. Top management should consider barriers and facilitators to implementation in order to improve the quality of care.

RESIDENT RIGHTS AND ELECTRONIC MONITORING
S. Shashidhara, Sociology, University of North Texas, Denton, Texas

Purpose: Due to ethical concerns, there is a debate on whether video cameras should be utilized in nursing facilities. This exploratory study examines resident and staff perceptions of electronic monitoring and their effect on Resident Rights. Design and Methods: Data were drawn from interview questions of 53 residents and self-administered questionnaires of 104 staff from four North Texas nursing facilities. Three types of NFs were utilized: one NF has residents who utilize video cameras in their rooms, two NFs have video cameras in their common rooms and one NF did not utilize video cameras. Both instruments were in regard to the participant’s perceptions of electronic monitoring, perceived risks and benefits of video cameras, awareness of Resident Rights and consciousness of potential risks to Resident Rights. Data were analyzed using a mixed methods approach. Thematic analysis was used to analyze resident responses. Cross tabulation and logistic regression were used to analyze staff responses. Results: Study findings revealed that residents and staff are aware of the potential benefits of electronic monitoring in NFs. While respondents are hesitant to have electronic monitoring in resident rooms, they are interested in utilizing electronic monitoring in common areas. Residents and staff believe that electronic monitoring compromises Resident Rights. Those staff members that are more directly involved in resident care are less accepting of electronic monitoring compared to staff that have episodic visits with residents. Among staff members, nursing facilities with prior experience with electronic monitoring are less accepting of electronic monitoring.

EXAMINING THE POSITIVE BENEFITS OF DIGITAL GAMING: A REVIEW OF THE LITERATURE
J. Vaughan, K. Barton, L. Richardson, M. Nguyen, Gerontology, University of Massachusetts Boston, Stoneham, Massachusetts

Playing computer and videogames is enjoyable and in many families fosters intergenerational interaction and socialization. Some posit that it may even provide health benefits for older gamers. Given the alarming prevalence of chronic diseases related to sedentary lifestyle factors the identification of tools that contribute to increased physical activity and cognitive training is needed. As the baby boomers age, the generational digital divide should narrow as this cohort is more technologically knowledgeable than previous generations. The purpose of this study was to conduct a literature review to examine what, if any, positive health benefits are related to computer gaming in late life. Using EBSCOhost, PubMed, Science Direct, PsychLit, AgeLine, and Google Scholar Database search terms “videogames”, “technology”, and “older adults” were used to identify 515 English, peer-reviewed articles published from January 2001 to March 2011. Then the title and abstract were reviewed in order to determine whether the article met inclusion and exclusion criteria. Exclusion criteria were: non-English language articles, not including adults age 50 years and older and not reporting data on physical or cognitive outcomes. A total of 42 articles were reviewed. Results showed that benefits of videogame and computer use include: a greater sense of well-being, faster reaction times, and new methods of thinking, positive attitudes towards technology and acceptance. Further research is needed to understand the motivations and demographics of older adult computer and videogame users, settings where computer and videogames are commonly played, and the impact of playing digital games in terms of generational solidarity.

ADOPTING MEDICATION TECHNOLOGY WITHIN AGENCIES SERVING OLDER ADULTS: LESSONS FROM THE TRENCHES
M. Siciliano1, L. Redington2, D. Lindeman3, P. Housen3, S. Enguidanos1, I. University of Southern California, Los Angeles, California, 2. Center for Technology and Aging, Oakland, California, 3. Partners in Care Foundation, San Fernando, California

More than 90% of older adults take one or more medications and an estimated 41% take 5 or more medications, with rates of medication problems rising with number of medications taken. Medication problems have been found to affect between 12 to 40% of community-dwelling elders and can result in injury and death. Yet studies demonstrate that 28 to 95% of medication problems can be prevented through medication optimization technologies. In an effort to promote adoption and diffusion of medication optimization technologies, the Center for Technology and Aging, with funding from The SCAN Foundation, funded five projects aimed to improve medication use in older adults with chronic health conditions through the use of one or more technologies. This study presents the challenges and facilitators encountered by older adult service agencies in adopting use of medication technology. Interviews were conducted among project leaders at each site and were audio-recorded and transcribed. Transcripts were coded for themes. Facilitators included project compatibility with organizational goals and structure, having a site champion and technology support (including electronic health records), and gaining clinical staff buy-in from the planning stage. Challenges included lack of technology infrastructure, staff resistance, limitations arising from scope of practice, licensing and regulatory issues, and limited planning and implementation time during the grant period. These learnings can help guide other health and social service agencies in strategic planning in adopting technology into their clinical practices.
ANOREXIA OF AGING: APPETITE, FOOD INTAKE AND NUTRIENT SENSING IN THE AGED

Co-Chair: M. Yee, Boston University School of Medicine, Boston, Massachusetts

Anorexia is typically associated with adolescents. However, proper nutrition is a major concern in elderly patients. This session will cover aspects of anorexia in aging individuals. Specifically, speakers will present information on the factors involved in the aberrant nutrient signaling that occurs with aging (decline in sensitivity) as well as information on the causes of anorexia and current treatments. In addition, psychosocial aspects of anorexia in the elderly will be addressed.

ANOREXIA OF AGING

J.E. Morley, St. Louis University, St. Louis, Missouri

Weight loss is a major problem in older persons. It is often triggered by a physiological anorexia of aging. While alterations of taste and smell play a role in this, the major effectors are gastrointestinal factors. Alternations in fundal compliance due to declining nitric oxide synthase, leads to increased antral stretch and early satiation. Increased CCK levels and increased CCK effectiveness further increase satiety. In males hypoogonadism leads to an increase in leptin levels. Multiple diseases, such as depression, can aggravate the physiology of aging. Centrally alterations in opioid neurotransmitters decrease feeding in older animals. Cachexia with cytokine increase leads to further anorexia and weight loss.

HYPOTHALAMIC CONTROL OF THE ANOREXIA OF AGING

T. Wolden-Hanson, 1. VA Puget Sound Healthcare System, Seattle, Washington

Aging is associated with dysregulation of energy homeostasis in response to physiologic and environmental disturbances, which can lead to unintentional weight loss in the elderly. Weight losses after surgery or illness in the elderly increase morbidity and mortality, in part due to the anorexia of aging. Few treatment options are available that significantly increase caloric intake in elderly patients. The anorexia of aging is regulated by neuronal circuits in the hypothalamus, where endogenous levels of the orexigenic neuropeptides NPY and AGRP are diminished in aged individuals. We have been using the Brown Norway rat model to study treatments that increase food intake and body weight in aging animals after metabolic challenges such as standardized surgery or 72h food deprivation, using NPY, AGRP and the appetite-stimulating hormone ghrelin. We conclude that AGRP represents an excellent therapeutic target for anorexia in general and the anorexia of aging in particular.

LEPTIN RESISTANCE: PREDISPONING FACTOR IN DIET-INDUCED OBESITY AND INFLUENCE WITH AGE

P.J. Scarpace1, N. Tumer2, 1. Pharmacology, University of Florida, Gainesville, Florida, 2. Department of Veterans Affairs Medical Center, Gainesville, Florida

Leptin resistance predisposes animals to exacerbated high-fat (HF) induced obesity. With age, the F344 x BN rat displays a steady increase in body weight and adiposity from 3 to 24 months followed by a decline thru 30 months. Despite hyperleptinemia with age, obesity persists, and these aged-obese rats exhibit little anorectic or weight loss responses to leptin. There are reduced hypothalamic leptin receptors and decreased maximal leptin signaling with age. When challenged with a HF diet, aged animals demonstrate an extended period of hyperphagia resulting in exacerbated obesity and fat gain compared with young rats. This observation suggests that leptin resistance reinforces “reward eating” beyond the caloric energy requirements. A minor amount of voluntary wheel running (WR) in aged rats effectively curtails HF consumption and deters dietary weight gain, whereas higher amounts of WR in obese young rats are without beneficial effect. This is associated with increased leptin signaling in the ventral tegmental area (VTA). Conceivably, WR in aged rats substitutes for the positive-reinforcing effects of palatable food, potentially through enhancing leptin action in the VTA. (Supported by NIH grant AG26159).

AGE-RELATED CHANGES IN TENDON, CARTILAGE AND BONE IN MYOSTATIN NULL MICE

M. Yee1, S. Bhassin2, A. Lee1, S. Wong1, R. Jasuja1, D. Adams4, A. Miller1, W. Guo1, 1. Boston University School of Medicine, Boston, Massachusetts, 2. Boston Medical Center, Boston, Massachusetts, 3. University of Connecticut Health Center, Farmington, Connecticut, 4. Harvard Medical School, Boston, Massachusetts

Myostatin (mstn) is a member of the TGFbeta superfamily known to negatively regulate muscle growth. Numerous mstn inhibitors are in development for treatment of sarcopenia. To determine the health impact of long-term mstn deficiency, we studied mstn-/- mice from age of 8 days to 24 months. We found beginning at 9-12 months, mstn-/- mice gradually lost their ankle mobility and displayed ectopic calcification of tendon and disorganized bone structure. Compared to wild-type animals, mstn-/- mice had higher plasma concentrations of osteogenic markers. qPCR analysis of Achilles tendon with calcaneus of mstn-/- mice from young to old shows an increased expression of osteogenic genes. These findings suggest an active ECM remodeling process in tendon-to-bone junctions that may contribute to joint dysfunction as the mstn-/- ages. Further investigation into the mechanistic role of mstn in joints associated with aging will lead to the development of novel therapies to treat joint dysfunction.

SESSION 545 (PAPER)

ABUSE OVER THE LIFE COURSE: PREVALENCE, PREDICTORS, AND EFFECTS

EARLY DISABILITY AND DEPRESSION PREDICTS FINANCIAL VICTIMIZATION IN URBAN BLACK ELDERS

P.A. Lichtenberg1, B. Schneider1,2, L. Stickney1, 1. Wayne State University, Detroit, Michigan, 2. West Los Angeles VA Health Center, Los Angeles, California, 3. Illinois Institute of Technology, Chicago, Illinois

Financial losses for older adults from fraud and exploitation have significantly increased (Reminga et al. 2006). African American older adults report higher rates of being fraud victims than do older whites (Beach et al. 2010, Lichtenberg et al. 2010). The current study examines how early transition to disability in older African Americans relates to self reported fraud. Early disability, characterized by a decline in IADLs, is a major transition in the lives of older adults. The relationship of early disability to financial victimization, an aspect of social vulnerability, was examined in a cross sectional study of 78 older African Americans. The sample was comprised of mostly women (89.7%), with a mean age of 72 years. Most had achieved a high school education (education = 12.3 years). MeanMMSE score was 26 (SD=2.4). The sample had a mean GDS-15 score of 2 (SD=2.2) and most participants had minimal functional disability. Seventy eight percent of the sample had no IADL deficits. Overall, 13% of the sample reported being a victim of fraud across the past 5 years and 41% reported not being satisfied with their finances: both figures are twice those of national samples from the 2009 HRS. In a multiple regression analysis, 27% of the financial satisfaction variance was accounted for by measures of verbal fluency and depression. In a logistic regression, total IADL score and GDS score, but not financial satisfaction were related to self-reported fraud. This model correctly predicted 89.7% of the sample.
ELDER MISTREATMENT IN A CHINESE POPULATION: FINDINGS FROM A COMMUNITY-BASED PARTICIPATORY RESEARCH STUDY

Background: This study examines the perception, knowledge, and help-seeking tendency toward elder mistreatment among Chinese older adults. Methods A community-based participatory research approach was implemented to partner with the Chicago’s Chinese community. A total of 39 Chinese older adults (age 60+) participated in focus group interviews. Data analysis is based on grounded theory framework. Results Chinese older adults mostly characterized elder mistreatment in terms of caregiver neglect, and identified psychological mistreatment as the most serious form of mistreatment. Other forms included financial exploitation, physical mistreatment, and abandonment. Chinese older adults have limited knowledge of help-seeking resources other than seeking assistance from local community service centers. Discussion This study has important practical implications for health care professionals, social service agencies, and concerned family members. Our results underscore the need for research and educational initiatives as well as community awareness programs that highlight the pervasive public health issue of elder mistreatment.

TIP OF THE ICEBERG: THE NEW YORK STATE ELDER ABUSE PREVALENCE STUDY

The New York State Elder Abuse Prevalence Study was one of the most ambitious and comprehensive studies to quantify the extent of elder mistreatment in a discrete jurisdiction ever attempted, and certainly the largest in any single American state. The study had three central aims: 1) To estimate the prevalence and incidence of various forms of elder abuse through direct interviews with subjects (n=4,156); 2) To estimate the number of elder abuse cases in all agencies and programs that serve elder abuse victims in the same year; and (3) To compare rates of “known” and “hidden” cases to determine an estimate of the rates of elder abuse under-reporting. The incidence of any form of self-reported mistreatment was 76.6 per 1000 people over the age of 60; the most common form of mistreatment was major financial exploitation, followed by physical abuse and psychological mistreatment. During the same period, 292 agencies serving elder abuse victims responded to our inquiries; they reported 3.2 cases per 1,000 subjects. In comparing rates of “documented” versus self-reported mistreatment, we estimate that for every case coming to the attention of an official agency or responder, 23.5 go undetected. We also noted different under-reporting ratios for different types of mistreatment and in different regions of the state. Elder mistreatment is common and the overwhelming majority of cases are unknown to official agencies charged with protecting victims.

THE LONG-TERM IMPACT OF CHILDHOOD SEXUAL ABUSE ON THE OBJECTIVE MEASURES OF PHYSICAL AND MENTAL HEALTH

Y. Kamiya, V. Timonen, R. Kenny, TCD, Dublin, Ireland

Background: Childhood sexual abuse (CSA) is a worldwide concern. It is known that the consequences of CSA persist into adulthood. However, there is little nationally representative data on CSA and on the long-term consequences of CSA on physical and mental health. The aim of this paper is to examine the long-term effects of CSA on physical and mental health and wellbeing. Objective physical health measures include blood pressure, BMI, pulse wave velocity (a measure of arterial stiffness), timed up-and-go, and grip strength. Mental health includes measures of depression (CES-D), anxiety (HADS), loneliness (UCLA-loneliness) and quality of life (CASP-19). Methods and Findings: Data from The Irish Longitudinal Study on Ageing (TILDA) was used. TILDA is a National representative data of 8,400 individuals over the age 50. Six percent reported CSA with little variation by gender but higher levels of reported abuse amongst better educated and younger respondents. There was no association with the objective measures of health. However, those who reported CSA were more likely to be depressed, anxious, lonely, have poor quality of life, be divorced/separated and use anti-depressive medicines. Conclusion: CSA is associated with adverse mental health outcomes but not physical health. However, depression, anxiety and loneliness are associated with higher risk of mortality and morbidity. In our sample, 74% of those reported CSA were aged 50-64 years-old. Future waves may more precisely determine long term consequences on physical health.

EFFECTS OF EARLY LIFE SEXUAL ABUSE IN LATER LIFE: AN EXPLORATION WITH CATHOLIC NUNS

G.U. Behrman, Social Work, Lindenwood University, St. Charles, Missouri

Responses to crises over a life span are nuanced and varied (Kaplan, 1999). Little research exists regarding the potential impact in old age of sexual abuse in early life (Dube et al., 2005; Graziano, 2003; Hall, 1995). In my research with aging Catholic nuns who suffered early life sexual abuse, I surfaced self reported affects in later life that they associated with their sexual abuse and how this influenced their health span, particularly in old age. In this presentation, I describe the methodology that informed my research and how I empirically approached the rich and nuanced data generated from my face to face interviews. Specific attention was given to the strengths the participants identified when integrating their personal histories of sexual abuse. The theoretical framework of symbolic interaction was utilized when interpreting the strategies, communications, and proscribed roles that helped or hindered them in mitigating unwelcoming effects in old age they associated with early life sexual abuse (Blumer, 1969; Stryker, 1980). Examining religious community life through this theoretical framework enabled me to organize and describe what assisted these women in their strategies of self care in old age. Participants in my study were recruited from an original study conducted by Saint Louis University School of Medicine to determine prevalence rates of sexual abuse among Catholic women religious (Chibnall, Wolf, Duckro, 1998). Participants were active Catholic religious women who were sexually abused before the age of 18 and were over the age of 65, with a mean age of 74.

SESSION 550 (PAPER)

HEALTH BEHAVIORS AMONG OLDER ADULTS: PREDICTORS AND CONSEQUENCES

LIFE DISSATISFACTION AND EATING BEHAVIORS IN OLDER AFRICAN AMERICANS: SOCIAL SUPPORT MODERATION

K.K. Wickrama1, P. Ralston2, J. Ilich-Ernst2,1, C. Harris2,1, C. Coccia2,1, I. Young-Clark2,1, I. Child & Family Development, The University of Georgia, Athens, Georgia, 2. Florida State University, Tallahassee, Florida

Previous research suggests that negative emotions undermine health-promoting behaviors, potentially leading to poor coping responses that include eating comfort food (Ng & Jeffery, 2003). However, no study has investigated whether life dissatisfaction of AA adults has led them to unhealthy eating. This study investigates whether AA older adults’ life dissatisfaction increases their high-fat diet consumption (H1). Furthermore, social relations of AAs provide them with necessary support

64th Annual Scientific Meeting

189
for the consumption of healthy food (Locher et al., 2005). Thus, we investigate whether AA older adults’ social support (a) promotes their fruit-vegetable consumption (H2), and (b) protects them from high-fat diet consumption (H3). METHODS: Participants included 178 adults (median age = 60 years) enrolled in the NIH-funded Health for Hearts United Project in North Florida. The data on the frequency of eating high-fat diets (NCI fat screener), daily consumption of fruits/vegetables (a global item), their life satisfaction (5-item scale), Social support (4items) were collected at baseline. RESULTS: The standardized regression coefficients of SEM modeling support the hypotheses. AAs’ Life dissatisfaction increases high-fat diet consumption (22%) and decreases fruit-vegetable consumption (-16%) (H1). Social support increases fruit-vegetable consumption (25%) (H2), but does not influence High-fat diets (-13, ns). Also, AAs who receive less social support (median-split) are more vulnerable to life dissatisfaction (the influence on High-fat diets = .37*) whereas AAs who receive more social support are not vulnerable to life dissatisfaction (the influence = .02, ns) (H3). Further analysis using longitudinal data (incorporating gender, marital status, education and age) is in progress. Implications for practice will be discussed.

GENDER, DEPRESSION, AND CIGARETTE SMOKING FOLLOWING FIRST STROKE AMONG OLDER ADULTS IN THE U.S.
M. McCarthy1, J. Newsom1, N. Huguet1, M.S. Kaplan1, B. McFarland2, 1. Portland State University, Portland, Oregon, 2. Oregon Health and Science University, Portland, Oregon

Changes in health behaviors including cigarette smoking are critical following stroke in order to mitigate the consequences of the illness and reduce the risk of reoccurrence. While studies have identified sociodemographic factors contributing to smoking cessation following stroke, few studies have investigated the role of psychosocial variables in recently-diagnosed patients’ post-stroke cigarette consumption. Moreover, even fewer studies are prospective, instead controlling for levels of smoking prior to stroke through retrospective reports. This study used lagged regression over a two-year period (derived from 18 years of longitudinal data) from the U.S. Health and Retirement Study to examine the roles of healthcare use, patient functioning, social support, and depression on cigarette consumption in a population of survivors of first stroke (N = 184). After controlling for sociodemographic factors and pre-stroke cigarette consumption, higher depressive symptomatology was predictive of greater cigarette consumption (β = .871, p < .001). Although the main effect of gender was marginally significant in the final model (β = .210, p < .10), there was a significant interaction between patient gender and depressive symptomatology (β = -.161, p < .01), with the relationship between depression and cigarette consumption being substantially more pronounced for men than for women. Social support was also marginally associated with post-stroke cigarette consumption (β = -.18, p < .10), although healthcare use and patient functioning were not significant. These findings increase our understanding about the complex interplay of sociodemographic, social, and psychological factors in patients’ consumption of cigarettes following acute stroke.

IMPACT OF TREADMILL EXERCISE ON EFFICACY EXPECTATIONS, PHYSICAL ACTIVITY, AND STROKE RECOVERY
M. Shaughnessy1, B. Resnick2, K. Michael2, 1. GRECC, Baltimore VAMC, Baltimore, Maryland, 2. University of Maryland School of Nursing, Baltimore, Maryland

Stroke survivors are at high risk for cardiovascular mortality which can be in part mitigated by increasing physical activity. Efficacy beliefs (self-efficacy and outcome expectations) related to exercise are known to play a role in adoption and maintenance of exercise behaviors. This study examines self-reported psychological outcomes in a group of 64 chronic stroke survivors randomized to either a 6-month treadmill training program or an attention-matched stretching program. Hemiparetic stroke survivors reported to an urban rehabilitation gymnasium at an academic medical center and exercised three times per week up to one hour per session for a total of 6 months. Outcome measures considered in this analysis were the Short Self-Efficacy and Outcome Expectations for Exercise, Yale Physical Activity Survey and Stroke Impact Scale. Results indicated that regardless of group, all study participants experienced increased self efficacy (F=2.95, p=.09) and outcome expectations for exercise (F=13.23, p<.001), and improvements in activities of daily living as reported on the Stroke Impact Scale (F=10.97, p<.002). No statistically significant between-group differences were noted, possibly due to the fact that specific interventions designed to enhance efficacy beliefs were not part of this study. Theoretically based interventions should be tested to clarify the role of motivation and potential influence on exercise and physical activity in the post-stroke population.

SOCIAL NETWORK TYPES AND WELL-BEING IN SOUTH KOREAN OLDER ADULTS
S. Park, R. Dunkle, university of michigan, Ann Arbor, Michigan

We examined the role of network type of older adults in their health service use. By investigating how social network type as convenient and parsimonious construct promotes or inhibits health service use, individuals most at risk could be identified and interventions can be designed to meet the needs of those at risk. We used the 2006 data of the RAND release of the Health and Retirement Study, focusing on respondents aged 65 who are non institutionalized. The analytic sample was N=4865. Social network types were derived by Ward hierarchical and K-means cluster analysis based on a range of social network characteristic variables. As a result, we derive four network types: Marriage–Diverse type (n=1703, 39%), Friend–Diverse type (n=1037, 24%), Marriage–Restricted type (n=1267, 29%), and Family type (n=319, 7%), and Non Marriage–Restricted(n=611, 14%). Health utilization was measured on hospital admissions, physician visits, dentist visits, prescription drug use, outpatient surgery, and other medical service use, along with home health care and nursing home stays. Logistic regression analysis, examining the influence of predisposing, needs, and enabling factors based on the health behavior model of Anderson and Newman showed that when compared with the reference category (Non Marriage – Restricted network), showed that older adults in the two restricted networks, both marriage and non-marriage-focused types, used health services the most. Two major findings are 1) a common network typology can be identified. 2) people with more health needs are in a restricted network type and they used health services most.

SOCIAL RELATIONS AND PHYSICAL ACTIVITY ACROSS THE LIFESPAN: INTERACTIONS WITH AGE AND SEX
K. Cotter1, M. Lachman1, 1. Psychology, Sacramento State University, Sacramento, California, 2. Brandeis University, Waltham, Massachusetts

Perceived social support and perceived social strain have both demonstrated a positive relationship to physical activity. However, previous studies have generally lumped specific sources of support and strain together, or have failed to consider the interactive effects of social relations with sex and age. To determine the differential relationships of support and strain with physical activity frequency in a nationally representative sample, we examined cross-sectional data from 3000 adults age 33 to 83 years (Mage = 55.31, SD = 12.08; 50.8% women) who were either married or cohabiting with a romantic partner. In a hierarchical regression analysis controlling for demographic variables, younger age (β = -.24, p < .001), male sex (β = -.10, p < .001), higher educational attainment (β = .10, p < .001), better self-reported physical health (β = .14, p < .001), and greater perceived strain from the family (β = .04, p = .05) and friends (β = .05, p = .01) were associated with more frequent physical activity. The associations of support and strain
from the romantic partner were moderated by age and sex, such that more support and more strain from the partner were associated with more frequent physical activity for younger adults, but less frequent physical activity for older adults. More perceived strain from the partner was also related to more frequent physical activity for women but was unrelated to physical activity for men. These results demonstrate the importance of considering personal characteristics when promoting healthy lifestyles across the lifespan.

SESSION 555 (PAPER)

INTERGENERATIONAL CAREGIVING: NATIONAL AND INTERNATIONAL RESEARCH

DEPRESSIVE SYMPTOMS, FAMILY FUNCTIONING AND SELF-ASSESSMENT OF LIVING SITUATION OF GRANDMOTHER CAREGIVERS OVER TIME
C. Musi1, A. Jeanblanc2, C. Burant1, C. Warner1, J. Zauszniewski1. 1. Case Western Reserve University, Cleveland, Ohio, 2. Jeanelan & Rosser, LLP, Cleveland, Ohio

The important role of grandmother caregiving has been well-documented, especially for grandmothers who are raising grandchildren or living in multigenerational homes. Less is known about grandmothers’ self-assessments of their household living situations or how such assessments are related to their mental health and perceptions of family functioning, either cross-sectionally or over time. Therefore, we analyzed data, obtained from waves four and five of a five-wave longitudinal study of 334 Ohio grandmothers, that addressed these questions. Grandmothers were classified by their caregiving status: primary caregivers (grandmothers raising grandchildren), multigenerational (grandmothers living with adult children and grandchildren) and non-caregiver (grandmothers not living with children). We examined the relationship between grandmothers’ appraisals of their depressive symptoms, family functioning, and current living situation. Wave 4 grandmother caregiver group status (dummy-coded dichotomous variables) was included. We used AMOS (19) to build a two-wave, cross-lagged autoregressive model. Our final model had fit statistics of Chi Square = 7.61, DF = 10, p<.001; CFI = 1.0; TLI = 1.0, and RMSEA = .00. All autoregressive paths were statistically significant. At wave four, primary and multigenerational home grandmothers had less positive assessments of their living situations, and primary grandmothers reported more concerns with family functioning. More depressive symptoms at wave four significantly predicted less favorable self-assessments of living situations and more problems in family functioning at wave five. These results highlight the potentially deleterious effects of continuing grandmother caregiving burden on mental health and family functioning over time. Potential interventions and further research directions will be discussed.

SYSTEMATIC REVIEW OF THE LITERATURE OF CHRONIC ILLNESS IN THE AFRICAN-AMERICAN CAREGIVING GRANDMOTHER
D.L. Carthron, School of Health Sciences, Winston-Salem State University, Winston-Salem, North Carolina

Background & Significance: A substantial body of literature provides evidence that caregiving can have negative effects on the physical health of caregiving grandmother. The aim of this literature review was to investigate the impact of caregiving responsibilities on chronic illness and chronic illness self-management in African-American caregiving grandmothers. Method: The databases MEDLINE, CINHAL, PubMed, and PsychINFO were extensively searched. Inclusion criteria included peer reviewed articles, include African-American caregiving grandmothers in the sample, English language, and report findings related to the aim of the literature review. No date range was placed in the search parameters. The initial search yielded 218 articles. Dupli-
THE VIEWS OF UK SOUTH ASIAN FAMILIES OF THE BEST WAYS TO CARE FOR A MEMBER WITH DEMENTIA
J.R. Oyebode, D. Chadha, School of Psychology, University of Birmingham, Birmingham, United Kingdom

The proportion of the population that is over 65 years of age continues to increase dramatically in the technologically developed world. As an integral part of this the number of people with dementia is also growing, placing continuing demand upon families and society to find ways of providing effective support and care. Western societies are increasingly multi-cultural, yet those from minority cultural groups do not use mainstream services in the numbers that one might expect. Thus it is important to understand cultural attitudes to dementia caregiving in order to enable the provision of appropriate services. This research focuses on one of the major minority ethnic groups in the UK, that of the South Asian communities and is an attempt to understand South Asian carers’ views about care provision for those with dementia, and the factors that influence these views. Semi-structured interviews were conducted with 10 “decision makers” within South Asian families that had a member with dementia. The study employed a qualitative research design using constructivist Grounded Theory. The emergent themes emerging highlight perceptions of those interviewed as being culturally different from indigenous British culture in terms of their attitudes to family care and closeness between family members, alongside a sense of duty and responsibility to keep care within the family. Themes such as “us vs. them”, “the uncaring West” and “the concept of strangeness” uncover underlying reasons for reluctance to consider mainstream care services. Implications for changing attitudes and better service delivery for those from minority populations will be discussed.

SESSION 560 (PAPER)

RACE, ETHNICITY AND HEALTH

UNDERSTANDING THE EFFECT OF LANGUAGE, IMMIGRATION AND RACIAL/EThNIC DISCRIMINATION ON HEALTH AMONG OLDER ADULTS IN NEW YORK CITY

Recent evidence suggests that racial/ethnic discrimination may contribute to health disparities. Given the growing diversity (race, ethnicity, language, immigration) among older adults, understanding and disentangling the various forms of discrimination and its effect on health becomes increasingly important. The objective of this analysis is to examine the association between self-reported discrimination (language, race/ethnicity, and nativity) and health related quality of life among older adults. We used data from the 2008 Health Indicators Project, a representative sample of 1,870 older adults based on a stratified selection of 56 senior centers in New York City. Face-to-face interviews were conducted in five languages using standardized individual and neighborhood-level instruments. Measures of health-related quality of life were based on the Centers for Disease Control and Prevention’s definition for self-rated health, unhealthy days, and activity limitations. Self-reported discrimination for language, nativity, race/ethnicity were each single-item measures. Multivariate analyses controlled for related demographic and socio-economic status variables. Among older adults, nearly 20% reported having experienced racial/ethnic discrimination; five percent indicated perceived discrimination based on immigration status; and 11% reported bias due to language. Language and nativity discrimination were associated with increased number of unhealthy days and greater activity limitations. As our older adult population increases exponentially, it becomes even more important to understand and address the complexity of racial/ethnic disparities in health. Future research attempting to understand racial/ethnic differences should include a wide range of measures of discrimination, including language and immigration status, as potential risk factors.

THE EFFECT OF ‘KOREAN IMMIGRANTS & MAMMOGRAPHY: CULTURE-SPECIFIC HEALTH INTERVENTION’ (KIMCHI) AMONG OLDER KOREAN-AMERICAN WOMEN
E. Lee1, K. Nandy1, H. Park2. 1. UCLA School of Nursing, Los Angeles, California. 2. Univ. of Illinois at Chicago, Chicago, Illinois

The Korean Immigrants & Mammography: Culture-Specific Health Intervention (KIM-CHI) leverages cultural context in a couples’ intervention to increase mammography use among Korean American (KA) women. Breast cancer is the most frequent cancer in KA women, and the incidence rate continues to increase. However, mammography screening rates remain low in KA women. Using an educational culture-specific DVD directed at KA couples, this project sought to increase mammogram use among KA women by changing their beliefs, knowledge, self-efficacy, and perceived support from their husbands. A total of 249 KA women age 50 or older and non-adherent with mammography in the past year were recruited—along with their husbands—for a two-group, longitudinal cluster randomized study (120 couples in the intervention group and 129 couples in the attention control group). The intervention consisted of (1) showing a culture specific DVD to groups of women and their husbands separately; (2) holding a group discussion session immediately after the showing; and (3) requiring each couple to complete a discussion activity together related to the education they received. The mean age of the women was 59.6 years; mean years of education was 13.7 years; and mean years of marriage was 35 years. There was a significant increase in the proportion of women obtaining mammograms in the intervention group compared to the control group at 15 months post-baseline (65.1% vs. 47.3%, P=.017). The findings indicate that the KIM-CHI program is effective in increasing mammography uptake in KA women. The DVD-based education has high potential for community-wide dissemination.

RACE AND ETHNIC DIFFERENCES IN OCCUPATIONAL INJURY, MUSCULAR SKELETAL DISORDERS, CHRONIC PAIN AND EMOTIONAL DISTRESS AMONG CALIFORNIA PAS WORKERS

Background. Personal Assistance Services (PAS) workers provide support for activities of daily living (ADLs) among the aged and dis-
able living in community settings. Study Purpose. To determine: 1) rates of acute occupational injury (OI) and chronic work-related musculoskeletal disorders (MSD), 2) levels of chronic work-related pain, 3) emotional distress, and 4) whether these outcomes differ by ethnicity among California PAS workers. Methods. A telephone survey was conducted among a stratified probability sample (N=855) of California PAS workers. The sample was limited to the primary paid PAS worker providing care for a recipient with > 2 ADL limitations. Results: 20% of the sample was African American, 28% Caucasian, 34% Latino and 15% Asian, with a mean age of 50. 31% reported either OI or MSD. In multivariate models, Being African American or Latino were negatively associated with OI/MSD. Being Latino, having worked longer as a PAS worker and co-morbidity were positively associated with pain severity. Being a relative of the recipient and co-morbidity were positively associated, while being Latino was negatively associated with emotional distress. Conclusions: Comorbidity places PAS workers at increased risk of OI/MSD, severe pain, and emotional distress regardless of ethnicity. The ethnic differences in the prevalence or severity of impairment or pain, and rates of emotional distress suggest a need for targeted interventions to reduce the physical and psychosocial impact of PAS work.

IMMIGRANT GENERATION AND DIABETES RISK IN AN AGING MEXICAN-ORIGIN POPULATION

A. Afable-Munsuz, E.R. Mayeda, M.N. Haan, University of California, San Francisco, San Francisco, California

Background: Studies examining whether diabetes risk increases with longer residence or acculturation among immigrants to the US are equivocal. We examine this question using longitudinal data on aging Mexican-origin adults. Methods: Independent effects of immigrant generation, acculturation, socioeconomic status (SES), lifestyle factors, waist circumference, age and sex on diabetes risk were examined using a 9-year population-based cohort study called the Sacramento Area Latino Study on Aging (SALSA). Diabetes status was determined as a fasting glucose >125 mg/dl, self-report of physician diagnosis of diabetes, use of a diabetic medication, and a diabetes-related death in 1,789 male and female adults >=60 years old. Logistic and Cox regression modeled the odds of prevalent and incident diabetes, respectively. Results: Significant but divergent associations between immigrant generation, acculturation and baseline diabetes risk were observed in age and sex adjusted models. Relative to 1st generation adults, 2nd generation adults had an OR=1.7 (95% CI:1.3, 2.3) and 3rd generation adults had an OR=2.0 (95% CI:1.4, 3.1). Greater acculturation, however, was associated with a slightly decreased risk, but the effect was completely attenuated after adjusting for SES and lifestyle factors. The generation effect remained. There were no significant associations between generation/acculturation and incident diabetes. Conclusion: Our study adds to the evidence on the adverse effects of accumulating exposure to US environment and diabetes risk in immigrants to the US. Viewing immigrant generation as a proxy for US assimilation, our findings suggest the need to examine more closely the causal mechanisms explaining the harmful effects of assimilation on health.

EXAMINING HBA1C AMONG MIDDLE-AGED AND OLDER RURAL AFRICAN AMERICANS WITH TYPE 2 DIABETES MELLITUS

I. Canty Williams, S.W. Utz, K. Reid, R. Jones, I. Hinton, G. Yan, University of Virginia, Charlottesville, Virginia

Type 2 diabetes mellitus (T2DM) disproportionately affects African Americans who have a nation-wide prevalence of 13.3% versus 8.7% among adults. In rural Virginia, rates of T2DM are 15% among African American adults, and 30% for over 60. African Americans have high rates of complications and inadequate glycemic control. Effective self-management is limited by lack of available diabetes self-management education (DSME). The purpose of this intervention study was to test feasibility and efficacy of a culturally-tailored community-based group DSME intervention on physiologic and behavioral outcomes among rural adult African Americans (mean age =60). Based on Social Cognitive Theory and Afro-centric cultural norms, the intervention incorporates storytelling and a problem-solving approach. Outcomes were compared between immediate intervention and wait-list control groups. Thirty-two rural African American adults with T2DM were recruited to participate in the on-going two-year intervention study and were randomly assigned to immediate or delayed intervention groups. Results from analysis of baseline data show the variables that best predict entering HbA1c is reflective of diabetes management. Regression analysis suggest that waist circumference and BMI (p<.0001) was associated with entering HbA1c. Additionally, participants who completed the intervention (n=25) were generally sicker compared to dropouts (n=7). There were no significant differences in baseline variables among the intervention and delayed intervention groups. Results will inform health care providers about factors that help identify those at highest risk for inadequate diabetes self-management among older rural African Americans to enhance the ability of providers to tailor interventions to improve quality of life and prevent complications.

SESSION 565 (SYMPOSIUM)

A PRIMER ON THE WISCONSIN LONGITUDINAL STUDY: OVER 50 YEARS OF SOCIAL DATA AND NEWLY AVAILABLE GENETIC DATA

Chair: P. Herd, University of Wisconsin-Madison, Madison, Wisconsin

The Wisconsin Longitudinal Study is an important data source for researchers interested in examining aging in the context of the life course. The study is a sample of one in three Wisconsin high school graduates, and a selected sibling, from the class of 1957. WLS is unique among major social scientific resources for the length with which it has followed a large population-based cohort sample and that it includes siblings. Recently available DNA data can be merged with fifty years of social data. The addition of genetic data allows new analyses linking genotypic, biomedical, psychosocial, and life course outcomes in novel ways. The data cover nearly every aspect of the participants’ lives from early life socioeconomic background, schooling, family and work to health, social participation, civic engagement, well-being, and cognition. The study also has a wealth of unique data including examples such as administrative IQ scores from high school, information collected from high school yearbooks that include measures of attractiveness, proxy measures for obesity, and complete lists of student activities for all respondents. Examples of administrative data include Medicare records, Social Security records, and resource data on primary and secondary schools attended by participants. This session will introduce the study to researchers who are not familiar with the data by providing an overview of the study as well as practical information on the structure of the data. Attendees who bring a laptop will be provided with a CD containing documentation and the data.

HOW TO ACCESS AND USE DATA FROM THE WISCONSIN LONGITUDINAL STUDY

C. Roan, Sociology, University of Wisconsin, Madison, Wisconsin

With over 15,000 analysis variables covering more than 50 years of data, new users of the WLS data may find themselves overwhelmed when looking for the measures they need to answer their research questions. I will give detailed instructions on how to use the tools and reference materials developed by WLS staff. Attendees will learn how to search for analysis variables, where to find copies of the survey instruments online, and how to download the public data. I will also explain the organizational structure of the data, variable naming conventions, and offer recommendations on how to break the data into smaller pieces if your computing resources are limited. Participants in this symposium
will also learn about the differences between publically available data and data available only by application. Finally I will explain how to apply to use the genetic data and other non-public data.

WHAT’S IN THE WLS? AN OVERVIEW OF SURVEY CONTENT ACROSS TIME
P. Herd, R.M. Hauser, T. Hauser, University of Wisconsin-Madison, Madison, Wisconsin

This presentation will provide an overview of the WLS data. Survey years include 1957, 1964, 1975, 1993, 2004 and a new data collection effort is currently in the field. The content of the WLS has changed to reflect the life course of participants: education inspired the initial data collection, familial and career outcomes focused data collection in midlife, and later rounds have shifted attention to respondent’s health, cognitive status, psychological and other dimensions of well-being, non-work activities, and caregiving and social support. Some examples of non-survey derived measures include: parent earnings from state tax records (1957-60), high school IQ scores; characteristics of high schools and colleges, employers, industries, and communities of residence; archival data on high school and elementary school resources; information on social participation, facial obesity, and attractiveness from yearbooks; matches to the National Death Index and the Wisconsin State Tumor Registry; and Medicare claims data for older siblings.

A PRIMER ON GENETIC DATA AVAILABLE IN THE WISCONSIN LONGITUDINAL STUDY
C.S. Atwood, J.A. Yonker, N.S. Roetker, V. Chang, T. Hauser, R.M. Hauser, 1. Medicine, University of Wisconsin-Madison, Madison, Wisconsin, 2. Veterans Administration Hospital, Madison, Wisconsin

The Wisconsin Longitudinal Study (WLS) is unique among major social scientific resources for the length with which it has followed a large population-based cohort sample and that it includes siblings. WLS is a premier resource for studies of social, economic, psychological, and health outcomes in the United States, and its design and findings have had world-wide influence. The addition of genetic data allows new analyses linking genotypic, biomedical, psychosocial, and life course outcomes in novel ways. WLS will be a unique resource available to all qualified researchers that is well suited for replication of findings from existing studies in a population-based sibling-design sample, investigation of innovative developmental designs, improvements in measurement for detecting within-person change, and statistical advances in dynamic modeling and population inference conditional on mortality and attrition is meeting many of these concerns. Muniz describes a new change-point mixture model, providing a solution to fitting such models to data where some individuals do not exhibit a change-point, and provides results from the OCTO-Twin study. Robitaille evaluates the role of processing speed in accounting for aging-related change in other cognitive functions, contrasting between-person and within-person effects. Rast describes the measurement and modeling of verbal learning effects within occasions, with individual differences in asymptote modeled across three occasions over five years. Piccinin describes the alternative approaches that have provided evidence for terminal cognitive decline, with particular attention to the test of accelerated terminal decline in available longitudinal studies of aging. MacDonald describes results from a measurement burst study, Project MIND, with findings that both increased variability and diminished plasticity are linked to cognitive impairment.

DO ALL INDIVIDUALS EXPERIENCE A CHANGE IN AGE-RELATED COGNITIVE DECLINE?

Change point models often used to identify the onset of change in rate of decline assume and estimate a change point for every individual in the sample. However, such change may not be observed in some individuals during the study. To account for these non-changing trajectories, we propose a mixture model with a linear and a non-linear component that follows a change-point trajectory. Individual change points are estimated only for individuals allocated to the change point component. We compare change point estimates obtained from fitting a change point model that estimates a change point for every individual in a sample with those obtained from the mixture model proposed. We illustrate the methodology using several cognitive measures from a Swedish longitudinal study of ageing: the OCTO-Twin Study. Our results provide evidence of biases incurred when fitting change point models in the presence of linear trajectories.

DOES PROCESSING SPEED ACCOUNT FOR AGING-RELATED CHANGE IN OTHER COGNITIVE FUNCTIONS?
A. Robitaille, G. Muniz Terrera, A. Piccinin, S.M. Hofer, 1. University of Victoria, Victoria, British Columbia, Canada, 2. MRC biostatistics Unit, Cambridge, United Kingdom

Aging-related decline in processing speed has long been considered a key driver of changes in other cognitive functions with age. While the majority of empirical evidence for the processing speed hypothesis has been obtained from cross-sectional analyses of age differences, studies of intravindividual change suggest an attenuated mediation effect of age via processing speed. We further examine the speed-mediation hypothesis, and describe the importance of alternative and complementary tests of within-person age change and variation using multiple longitudinal studies associated with the IALSA network. The effect of age on cognitive functioning via processing speed was greatest for between-person age differences compared to the within-person fixed and random effects. Still, variations in how the models were specified had an impact on the percent mediated effect of age on cognitive functioning via processing speed. These results provide evidence for a moderate degree of interdependency among different types of cognitive functioning.

AGING-RELATED CHANGE IN VERBAL LEARNING ACROSS FIVE YEARS: THE ZULU STUDY
P. Rast, D. Zimpich, 1. Department of Psychology, University of Victoria, Victoria, British Columbia, Canada, 2. University of Erlangen-Nuremberg, Erlangen, Bayern, Germany

In order to capture changes in verbal learning, a second order growth curve model based on first order non-linear mixed effects models was used for data from the Zulu-Study. Given that within five years, and three measurement occasions, test effects may supersede long-term changes, we chose to focus on asymptotic performance. For each individual we estimated an upper asymptote of verbal learning performance, which is less susceptible to retest effects than initial learning. On
average, asymptotic performance did not decrease significantly over five years, but participants showed large, reliable individual slope differences. Some participants maintained their asymptotic performance while others showed decline. While age did not contribute to explanation of slope variance in asymptotic performance, the rate of change in working memory (WM) explained 30% of that variance. Participants with greater decline in WM also declined faster in asymptotic verbal learning performance, reflecting the importance of WM in learning tasks.

PLASTICITY AND VARIABILITY AS INDICATORS OF COGNITIVE STATUS: A MEASUREMENT BURST STUDY
S.W. MacDonald, J.H. Grand, D.F. Hultsch, Psychology, University of Victoria, Victoria, British Columbia, Canada

Recent theorizing differentiates key constraints on cognition, including flexibility (current range of processing efficiency) and plasticity (capacity to expand flexibility). The present study examines the interplay between markers of intraindividual variability (flexibility) and gains across burst sessions (plasticity) in relation to age-related cognitive function. Participants included 304 adults (aged 64 to 92 years; M=74.02, SD=5.95) from Project MIND, a longitudinal burst design study assessing performance across micro and macro intervals (response latency trials, weekly bursts, annual retests). Multilevel modeling was employed to derive year-1 indices of plasticity and variability, which were subsequently examined as predictors of 6-year cognitive change as well as cognitive status at the final measurement occasion. Both increased variability and diminished plasticity were linked to cognitive impairment. Results will be discussed in terms of differential predictivity, the projected time course to elicit plasticity, and the prospects for improving sensitivity of detecting those at risk of cognitive impairment.

ESTIMATING THE EFFECTS OF TERMINAL COGNITIVE DECLINE FROM WITHIN-PERSON PERSPECTIVE
A.M. Piccinin, G. Muniz, F. Matthews, B. Johansson, Psychology, University of Victoria, Victoria, British Columbia, Canada, 2. MRC Biostatistics Unit, Cambridge, United Kingdom, 3. University of Gothenburg, Gothenburg, Sweden

The terminal cognitive decline hypothesis implies a change in rate of decline within an individual. We examine the effect of impending mortality on cognition from a within-person perspective using quadratic growth curve models with a time to death chronological structure based on participants with confirmed death dates. Covariates of initial performance and of linear and quadratic change over time include both age and distance from death at study entry, sex, education, and dementia diagnosis. Initial findings based on the OCTO-Twin study (faster decline in incident cases closer to death at study entry, but within-person evidence of terminal decline not as strong as previously published between-person results) are extended to several additional longitudinal datasets. Strategies for focusing models on longitudinal aspects of available data and the extent to which lack of within-person evidence for terminal decline may stem from common data limitations are discussed.

SESSION 575 (SYMPOSIUM)

AMERICAN INDIAN AGING: CULTURAL, HEALTH, AND POLITICAL CONSIDERATIONS
Chair: R. Goins, Dept of Community Medicine, West Virginia University, Morgantown, West Virginia

American Indians experience substantial health disparities compared to the general U.S. population. Although medical advances have increased life expectancy, morbidity, and mortality statistics suggest that the health of older American Indians lags behind. Older American Indians have lower life expectancies; higher rates of functional disability, diabetes, cardiovascular disease, and arthritis; and lower incomes and educational attainment. Although over 4.2 million American Indians live in the U.S. and the number of American Indians aged 65 years or older is projected to increase 3½ fold between 2010 and 2050 from 410,000 to 1,395,000, we know virtually nothing about the aging process in this vulnerable population. The purpose of this symposium is to share current quantitative and qualitative research studies which focus on health-related issues of this relatively misunderstood population. Several of the papers will underscore the role of culture as a relevant consideration when examining health in Indian Country; values and cultural norms can influence both self-identification as an elder in addition to caregiver networks and health appraisals. The symposium will include papers that will speak to cultural considerations around the designation of “elder”; intergenerational cultural concepts of diabetes etiology, caregiving for elders with dementia, and lower body physical functioning and correlates of poorer lower body functioning. The final paper will offer an in-depth examination of the political status of American Indians and how federal and state policies affect health status and access. This symposium illustrates the importance of improving our understanding of older American Indians.

WHAT MAKES AN ELDER?: THE CONSTITUENT ELEMENTS OF “ELDERHOOD” AMONG OLDER AMERICAN INDIANS
L.L. Jervis, Anthropology, University of Oklahoma, Norman, Oklahoma

It is generally maintained that being an elder in Native communities has more to do with cultural considerations such as being respected and living an honorable life than with chronological age. This paper focuses on the meaning of elderhood among 100 American Indians age 60 years or older. Through open-ended interviews, participants identified chronological age, social role/status factors, health/disability considerations, and comparison of oneself to a specific older person as part of elderhood. Both chronological age and social role/status factors emerged as especially crucial in the determination of elder status. Interestingly, roughly 40% of the sample stated that they themselves were not elders. The most common rationale given was that participants were too active or “able” to be elders. This study hints at the complexity of notions of elderhood and age identity in contemporary Native communities, and calls into question claims that chronological age is minimally relevant to elder status.

CORRELATES OF LOWER BODY FUNCTIONING AMONG OLDER AMERICAN INDIANS: THE NATIVE ELDER CARE STUDY
R. Goins, K.E. Innes, L. Dong, Dept of Community Medicine, West Virginia University, Morgantown, West Virginia

Although over 4.2 million American Indians live in the U.S. and 1,319,000 will be 55+ years by 2020, virtually nothing is known about the aging process in this population. The scant literature on older American Indians suggests they suffer some of the highest functional disability rates of any U.S. racial group, exceeding those of their White counterparts. Survey and lower body performance-based assessment data were collected from 303 reservation-dwelling older American Indians aged 55+ years. Lower body functioning was measured with the Short Physical Performance Battery (SPPB) and the SPPB score ranges from 0 to 12 with higher scores indicative of better performance. The mean SPPB score adjusted for age was 9.8 for men and 8.5 for women. Results from an ordinary least squares multiple variable regression indicated that significant correlates of poorer performance included older age, being female, not being married, increased body mass index, osteoporosis, and medical comorbidity.

EXAMINING THE POLITICAL STATUS OF AMERICAN INDIAN ELDERS AS IT INTERSECTS WITH ELDER AND HEALTH CARE
M. Mass, School of Nursing, Yale University, New Haven, Connecticut

To be American Indian (AI) in the US denotes a political status. Researchers and health providers are largely unaware of this status and
relegate AI to a racial minority status only. Tribes as partial sovereign nations are domestic dependant nations who have a distinct relationship with the US through a federal trust responsibility. These concepts stem from the Marshall Trilogy, a group of decisions from Chief Justice John Marshall’s court in the 1800s. There are consequences playing out today especially for the elders as a result of this intricate interplay of legal concepts. Many of today’s oldest old (85+) were not even conferred US citizenship at birth. Yet today most AI are dual citizens. These are the US’ most regulated people in one of the US’ most regulated systems. This paper will be a review of how federal policies and state and federal laws have affected AI elder and healthcare.

AMERICAN INDIAN DEMENTIA CAREDICING: INDIGENOUS AFFECTS ON KIN NETWORK CAREGIVING TASK DISPERSION

N. Henderson, L. Henderson, health promotion sciences, university of oklahoma health sciences center, Oklahoma City, Oklahoma

In this case study, a Plains Indian family mobilized 12 members of their kindred as “Core Caregivers” for caregiving to their elder matrilineal with dementia. Unlike the majority population, this kin unit operates under the stimuli of key indigenous ethnohistorical particulars: 1) a family residential pattern derived from the Allotment Act of 1887 of four adjacent homes, 2) a resolute cultural ethic of reciprocal obligation enacted as elder caregiving, 3) contemporary adaptation to cash economies, fixed work hours, and shift work to perpetually keep a caregiver available and on-site, 4) healthcare costs diffused due to Indian Health Service clinics and hospitals, and 5) rural living location that requires reckoning of long drive-times between work and home to insure no lapse in on-site caregiver coverage. Gerontology’s penchant for focusing many caregiving studies on a “primary-secondary” caregiver dyad may be a middle-American culture bound artifact that requires reconsideration across other sub-cultures.

INTERGENERATIONAL DIABETES EXPLANATORY MODELS IN AMERICAN INDIAN YOUNG WOMEN AND ELDERS

N. Henderson, L. Henderson, K.L. Kleszynski, K. Waggoner, health promotion sciences, university of oklahoma health sciences center, Oklahoma City, Oklahoma

This paper juxtaposes intergenerational Explanatory Models (EMs) of diabetes causation in two American Indian (AI) tribes. Semi-structured interviews were conducted with an intensity sample of 1) 30 elders with diabetes and 2) 100 pregnant women to elicit diabetes EMs. In the elder cohort, author LCH found that in one model, diabetes was thought to be precipitated by life stressors. Another model suggested that diabetes was brought to AI people by the “White man.” Analysis of the younger cohort data indicated that causation was mainly tied to genetic susceptibility with the corollary that lack of familial diabetes was thought to confer protection. Explanatory Models (EM) for health and disease are quite malleable and vary along many dimensions including time, chronicity, and intergenerational position. The disparate nature of these findings indicates a need for diabetes education initiatives that address diverse EMs across generational cohorts.

SESSION 580 (SYMPOSIUM)

FAMILY RELATIONSHIP STYLES Ç LIFESPAN EFFECTS

Chair: R. Blieszner, Virginia Tech, Blacksburg, Virginia
Co-Chair: V.H. Bedford, University of Indianapolis, Indianapolis, Indiana

Discussant: V.H. Bedford, University of Indianapolis, Indianapolis, Indiana

Close relationships play a key role in health and well being over the lifespan, as shown by burgeoning research dating back as far as the 1970s. Studies reveal that relationships are complex and multidimen- sional, yet research often focuses either on superficial aspects (e.g., comparisons based only on marital or parental status) or on such a complex array of variables that the role of relationships is hidden. In keeping with the lifestyle—lifespan conference theme, this symposium highlights the long-term and short-term impacts of important dimensions of five key family relationships (spouse/partner, parent-child, grandparent-grandchild, step-relations, and sibling) on health and well being in middle and old age. Bookwala focuses on influences of marital quality; Sechrist et al. address parent-adult child ambivalence and within-family differences; Hayflick and Page present positive adaptations and generativity on the part of grandparents; Bedford and Avioli’s work in siblings includes social network functions and family structure; and Ganong and Coleman analyze length of stepfamily relationships and acceptance of stepfamily relations by other family members. Collectively, the presenters demonstrate the value of examining specific family relationships in depth. Discussant Bedford concludes with a summary that synthesizes findings when looking at within-family dynamics occurring across multiple relationships and points to new directions for family gerontology research in the future.

SPouse/partner relationships and well-being in the middle and late adulthood years

J. Bookwala, Psychology, Lafayette College, Easton, Pennsylvania

A vast body of research indicates that spousal and similar partnered relationships play an integral role in psychological and physical well-being in mid and late life. This presentation will review recent empirical research and theoretical developments on the intersection between spousal/partnered relationships and well-being. Topics include the role of marital/partnered status in health and mortality; the direct role of a good quality relationship in psychological and physical well-being and its potential buffering effects in the face of normative age-related stressors; how couples cope with illness and how illness, in turn, influences the couple relationship and; the role of the spouse/partner in health behavior performance. To conclude, the presentation will provide recommendations for gerontological practitioners based on the reviewed literature and will identify future directions for research on the link between partnered relationships and well-being in mid and late life.

AgInG PARENTs AND ADULT CHILDREN: THE EFFECTS OF RELATIONSHIP QUALITY ACROSS THE LIFE COURSE

Over the past several decades, research in family studies has focused on the effects of both close and conflictual relationships on the well-being of both parents and adult children. Recent developments in theory and method have allowed further exploration into more complex aspects of relationship quality between parents and children as well as placing the parent-adult child relationship within the broader context of other family relationships. This paper addresses the developments in the study of ambivalence and within-family differences in parent-adult child relationships and current research on the consequences of these for the health and well-being of individuals. Avenues for future research on the effects of ambivalence, favoritism and other aspects of parent-child adult relationships on the health and well-being of both generations are also examined.

Grandparent-grandchild relationships: intergenerational perspectives on health and well-being

B. Hayslip, K.S. Page, Psychology, University of North Texas, Denton, Texas

Within the dual contexts of cultural-historical change and a developmental life course perspective, grandparenthood is examined in light
of the mental and physical health benefits for both grandparents and grandchildren. In understanding such benefits, it is key to acknowledge that the cultural-historical and developmental life course frameworks interact, consistent with historical shifts in the demographics of grandparenting and the salience of developmental changes in grandparent-grandchild relationships. In the context of relationships between the meaning of grandparenthood and responses to it, both normative and nonnormative forms of grandparenting will be discussed to understand both the short-term and long-term impact of grandparent-grandchild relationships on physical and mental health of both generations. In view of the fact that grandparent-grandchild relationships can be defined in a variety of ways, an emphasis will be placed upon the positive adaptive consequences of grandparenthood and the generative roles that many grandparents play in the lives of their grandchildren.

SIBLING RELATIONSHIP CHARACTERISTICS —> LIFESPAN EFFECTS
V.H. Bedford1, P.S. Avioli2, 1. University of Indianapolis, Indianapolis, Indiana, 2. Kean University, Union, New Jersey

This paper is a review of the literature on the influence of sibling relationships on the well-being of middle-aged and older adults. It examines whether the sibling link to well-being exists, whether and how siblings are unique in their contributions to well-being, and what kinds of mechanisms may promote this link. The presentation will focus primarily on three aspects of well-being: loneliness, physical health, and mood. Specifically, the presenters examine how sibling social support, sibling marital and parent status, sibling gender, sibling contact frequency, and sibling family structure relate to well-being. Little is known about the mechanisms involved in linking the sibling relationship to well-being, but the following possibilities will be examined: siblings may serve attachment functions, sibling equity may enhance well-being, siblings function as substitutes for other relationships, and siblings provide unique support. Finally, the presenters will make recommendations for future research.

STEP-RELATIONSHIPS ACROSS THE LIFESPAN
L. Ganong, M. Coleman, HDFS, University of Missouri, Columbia, Missouri

Step-relations are common – nearly 40% of U.S. families have a step-grandparent (Szinovacz, 1998) and 42% of a recent national sample of adults had at least one step-relative (Pew Research Center, 2011). Step-relations are formed across the lifespan, and their influences on individuals depend a great deal on the complex familial contexts within which step-relations are formed. The effects of step-relations on individuals’ well-being are determined by a variety of factors, including length of time since the relationships began, genders and ages of the step-kin, quality of the relationships, and the extent to which other family members provide support or create strains on step-relations. In this presentation we will review what is known about step-relations and their effects on individual well-being across the lifespan. We also will identify gaps in the literature and will propose a research agenda for studying the connections among multigenerational stepfamilies, step-relations, and individual well-being.

SESSION 585 (SYMPOSIUM)

GROWING OLD IN URBAN NEIGHBOURHOODS: CROSS-NATIONAL RESEARCH FROM BELGIUM, THE UK AND THE USA
Chair: C. Phillipson, Keele University, Stoke-on-Trent, United Kingdom
Discussant: G.D. Rowles, University of Kentucky, Lexington, Kentucky

Population ageing and urbanisation are two major trends affecting life in the twenty-first century. The share of older residents in cities is increasing. By 2030, the major urban areas of the developed world will have 25 per cent or more of their populations aged 60 and over. This symposium explores both the constraints and opportunities urban environments present for older people. Urban settings impose limitations on daily life but they have advantages as well, including the strength of bonds formed within urban neighbourhoods and the benefits for migrant groups. Phillipson and Buffel present studies from Belgium and England examining pressures on older people in areas of high deprivation. The paper addresses experiences of community change, the management of urban space and attitudes towards crime and security. Jessica Kelly-Moore presents data from the US on the pivotal role of low income seniors in providing family support such as meals to grandchildren. The paper demonstrates the complex activities necessary to deliver this assistance, notably in respect of shopping in safe and secure areas. Verté et al. focus upon the ‘Belgian Ageing Studies’ project which monitors challenges and opportunities among home-dwelling older people in order to provide tools for evidenced-based ‘age-friendly’ policies at a local level. Finally, Scharf et al. present findings from an action research project which shifts the focus away from ‘problems’ associated with ageing in urban communities towards an assessment of the ways in which community projects can potentially enhance older people’s quality of life.

INVOLVING OLDER PEOPLE IN PLACE-MAKING: THE BELGIAN AGEING STUDIES
D. Verté1, T. Buffel1, N. De Winte2,3, L. De Donder1, S. Dury1, 1. Adult Educational Sciences, Vrije Universiteit Brussel, Brussels, Belgium, 2. University college Ghent, Gent, Belgium

While older people tend to spend a lot of time in their neighbourhood, they are often among the first to be ignored when it comes to decision-making processes and participation in the production of their community. This contribution seeks to reflect on the key challenges and opportunities of involving older people in aspects of research, policy and social change at local level. The focus is the ‘Belgian Ageing Studies’, a research programme which monitors challenges and opportunities, as well as issues of quality of life, among home-dwelling older people in order to provide tools for evidenced-based ‘age-friendly’ policies at local level. Through a participatory method, older people themselves are actively involved as actors in all stages of the project: in the planning and realisation of the research project, as well as in the development of local policy plans on the basis of the findings of the research.

EXPERIENCES OF PLACE AND COMMUNITY AMONG OLDER RESIDENTS LIVING IN INNER-CITY NEIGHBORHOODS: EVIDENCE FROM TWO EUROPEAN COUNTRIES
T. Buffel1, C. Phillipson2, T. Scharf3, 1. Adult Educational Sciences, Vrije Universiteit Brussel, Brussels, Belgium, 2. Keele University, Keele, United Kingdom, 3. Irish Centre for Social Gerontology, Galway, Ireland

The environmental context of ageing has re-surfaced as a major theme within social gerontology. This paper explores a range of issues concerned with the role of place and community for older people living in deprived inner-city neighborhoods. It presents an overview of prominent approaches concerned with environmental perspectives in gerontology, and further argues that these are rather poorly equipped to deal with the macro-sociological developments that characterize inner-city neighborhoods. The aim of the study is to explore the ways in which structural processes of globalization are locally expressed by various groups of older people living in deprived urban areas facing social change. Drawing on two comparable qualitative studies in Belgium and England, the paper addresses four key themes: experiences of community change; the management of urban space; attitudes towards crime and security; and strategies of control. It concludes by discussing both conceptual and policy issues raised by the research.
NOT JUST SURVIVING BUT THRIVING: OLDER ADULTS AS NUTRITIONAL ASSET IN POOR URBAN NEIGHBORHOODS
K. Judge, Psychology, Cleveland State University, Cleveland, Ohio
S. Yarry, VA Palo Alto Health Care System, Palo Alto, California
K. Maslow, Institute of Medicine, Washington D.C., District of Columbia
Previous research presents a grim picture of nutritional intake among low-income seniors, exacerbated by fixed incomes and loneliness. To further this, we conducted semi-structured interviews of Black older adults living in subsidized housing in Cleveland. Contrary to previous findings, we discovered that these older adults consume more fruits and vegetables than younger persons. As part-time and periodically full-time caregivers for their grandchildren, these older adults recognize their important role in the nutritional intake of children. Since they are more financially stable than their children, they are able to plan menus that integrate fresh fruits/vegetables more regularly. The older adults also have an informal food economy with their neighbors, sharing excess and eating together. Groups often coordinate trips to a supermarket and pool money to buy items in bulk. Black older adults play an active and positive role in the nutrition of their families and neighbors, a significant neighborhood resource.

COMMUNITY ACTION BY OLDER PEOPLE IN URBAN ENGLAND: EMPIRICAL FINDINGS FROM FOUR GARDENING SCHEMES
T. Scharf, S. Middling, J. Bailey, S.E. Maslin-Prothero. 1. Irish Centre for Social Gerontology, NUI Galway, Galway, Ireland, 2. Keele University, Keele, United Kingdom
A growing body of research highlights the challenges faced by people who age in disadvantaged urban communities. In presenting findings from CALL-ME – a participatory action research project in disadvantaged communities in Manchester (England) – this paper seeks to shift the focus away from ‘problems’ associated with ageing in urban communities towards an assessment of ways in which community action might enhance older people’s quality of life. The paper explores older adults’ participation in four contrasting community gardening schemes, assessing the contribution of such schemes to participants’ ability to engage in community social life. Analysis of qualitative data (focus groups, in-depth interviews, observational material), highlights 1) a sense of making a contribution to one’s community; and 2) feelings of personal satisfaction arising from participation as key elements underpinning participation in gardening schemes. The ability to overcome challenges associated with developing the schemes was identified as representing a particularly empowering experience for participants.

SESSION 590 (SYMPOSIUM)
IMPLEMENTING INTERVENTIONS FOR INDIVIDUALS WITH DEMENTIA
Chair: K. Judge, Psychology, Cleveland State University, Cleveland, Ohio
Co-Chair: S. Tarry, VA Palo Alto Health Care System, Palo Alto, California
Discussant: K. Maslow, Institute of Medicine, Washington D.C., District of Columbia
A small number of interventions have included individuals with dementia (IWDs) as active participants or addressed IWDs’ psychosocial needs. This symposium presents four innovative interventions developed for IWDs which are being translated into clinical practice. These studies address a variety of dementia-related symptoms and care issues across a range of dementia severity and care settings. Unique aspects of these intervention protocols include methods for facilitating active participation of IWDs and targeting psychosocial issues faced by IWDs, such as relationship strain, anxiety, difficult behaviors, and engagement. The first paper discusses key phases of intervention development necessary for successful and widespread adoption, including efficacy, effectiveness, and dissemination. The second paper addresses a dyadic counseling intervention for IWDs and their family caregivers, Early Diagnoses Dyadic Intervention (EDDI), which allows care partners to discuss their preferences for care. The third paper discusses a cognitive rehabilitation and skills training program for IWDs and their family caregivers, Acquiring New Skills While Enhancing Remaining Strengths (ANSWERS), which trains care partners on a core set of evidence-based skills for managing and coping with symptoms of dementia. Discussion will focus on the merits and challenges of developing and implementing intervention protocols for IWDs including: strategies for including IWDs; the role of formal and informal caregivers in implementing interventions; and examining viability of intervention protocols based on IWDs’ impairment and environmental setting.

DEVELOPING EFFECTIVE INTERVENTIONS FOR DEMENTIA: ISSUES IN TRANSLATING RESEARCH INTO PRACTICE
C. Camp, Hearthstone Alzheimer Care, Woburn, Massachusetts
For dementia interventions to be both useful and used, they must undergo three distinct evolutionary phases of development. First, the intervention must demonstrate efficacy, generally associated with a high degree of internal validity. Second, the interventions must demonstrate effectiveness, meaning that they can produce desired effects in a variety of real-world contexts, generally associated with external validity. Finally, the interventions must be disseminated, such that interventions are actually utilized in an effective way by non-researchers in the course of providing care and/or doing one’s job. This requires creation of an infrastructure that will support provision of effective interventions, which requires linking the delivery of interventions with the motivators of care-delivery systems. Two dementia interventions – spaced retrieval and Montessori-Based Activities Programming® – which are now being utilized internationally, will be presented as case studies to illustrate these phases of development.

A DYADIC INTERVENTION FOR INDIVIDUALS WITH EARLY-STAGE DEMENTIA AND THEIR FAMILY CAREGIVERS
C.J. Whitlatch, Benjamin Rose Institute on Aging, Cleveland, Ohio
Individuals with early-stage dementia (IWDs) and their family caregivers (CGs) face numerous challenges as they adapt to the unpredictable changes associated with memory loss. Early-stage IWDs and their CGs often report feelings of depression, anxiety, loss, and fear. Unfortunately, few psychosocial interventions specifically target these symptoms for early-stage dyads, although an increasing number of interventions show promise for alleviating stress and improving well-being. This presentation describes an early-stage intervention that includes both the IWD and family CG in sessions designed to improve communication, increase mutual understanding of each person’s values and preferences for care, enhance well-being, and increase the IWD’s participation in his/her own care. Discussion will focus on the development, implementation, and evaluation of the Early Diagnosis Dyadic Intervention, and subsequent protocol modifications made as a result of the original findings.

ACQUIRING NEW SKILLS WHILE ENHANCING REMAINING STRENGTHS (ANSWERS): A DYADIC COGNITIVE REHABILITATION AND EDUCATIONAL SKILLS TRAINING PROGRAM FOR INDIVIDUALS WITH DEMENTIA
K. Judge, S. Tarry, M. Wilson, S. Powers, N.T. Dawson. 1. Psychology, Cleveland State University, Cleveland, Ohio, 2. VA Palo Alto Health Care System, Palo Alto, California, 3. The University of Akron, Akron, Ohio
The following paper will present research findings regarding the development, implementation, and evaluation of the intervention protocol, Acquiring New Skills While Enhancing Remaining Strengths.
SESSION 595 (SYMPOSIUM)

NARRATIVE GERONTOLOGY: HISTORY, THEORY AND METHODS IN EXPLORING THE STORIED LIVES OF ELDERS

Chair: R.B. Meraz Lewis, Leadership and Counseling, Eastern Michigan University, Ann Arbor, Michigan
Co-Chair: E. Covan, University of North Carolina Wilmington, Wilmington, North Carolina

This session will clarify the purpose and process of narrative inquiry in gerontology and help participants see where narrative research has been historically and understand where it is going now. The “narrative turn” which includes entering the perspective of our research subjects by listening to and analyzing their stories has a rich history in the field and is becoming an increasingly vibrant part of the field. A narrative approach allows for discovery of human agency, as well as how larger social institutions frame how and why a particular event is storied and what a narrator accomplishes by developing the story in a particular way. The first paper offers historical and theoretical insights on the field of narrative research, and the papers that follow stand as examples of current research of interest to those who have an appreciation for what the humanities and social science can offer gerontologists. The papers in this session present a diverse array of data collection methods and topics but the focus is the “storied lives” individuals and each emphasize the importance of social networks in helping older adults negotiate life transitions and challenges. The papers include: 1) the historical and theoretical underpinnings of narrative gerontology; 2) a grounded theory study on value of technology with regard to healing inter-generational relationships for Vietnam veterans; 3) stories of transition and ideological disconnect for residents of university-linked retirement communities; 4) experiences of Latino family caregivers; 5) a narrative life history model to study the impact of spinal cord injury on aging.

NARRATIVE RESEARCH: WHERE HAVE WE BEEN, WHERE ARE WE GOING?
K. de Medeiros, Miami University, Oxford, Ohio

Interest in narrative methods in gerontology, the social sciences, medicine and others has increased dramatically over the past several years. Yet, many remain unclear on exactly what “narrative” entails including narrative as a mode of inquiry and/or research method and strategies for narrative analysis. This paper presents research on the historical use and theoretical development of narrative approaches, including interviews, secondary text analysis, life story writing, and other narrative forms. Overall, this research brings together a wealth of perspectives on narratives that will benefit researchers interested in considering incorporating narratives in their work.

NARRATIVES OF CARING FOR A LATINO FAMILY MEMBER WITH ALZHEIMER’S DISEASE
C. Gelman, Hunter College School of Social Work, New York, New York

Caregivers of patients with Alzheimer’s disease (AD) experience increased depression and stress, poorer self-rated health, and even increased mortality. Latino caregivers face special challenges, yet relatively few studies explore their experiences qualitatively, which can provide important insights. We discuss a narrative analysis of extensive contacts with 24 Latinos caring for relatives with AD, and focus on an emerging theme less commonly noted in the literature: despite the cultural value of familismo, defined as an identification and attachment of individuals with their families and typically ascribed to Latinos, these caregivers report experiencing insufficient support from their extended families. Reasons for this gap between cultural ideal and reality, the impact on Latino caregivers, and the implications for provision of supportive services for AD caregivers and their families, are discussed.

DIGITAL HEALING: THE VALUE OF TECHNOLOGY THROUGH SOCIAL NETWORKING FOR INTERGENERATIONAL RELATIONSHIPS OF VIETNAM VETERANS
E. Covan, R. Smith, Gerontology, UNC Wilmington, Wilmington, North Carolina

Authors used grounded theory and the life course perspective to analyze narrative and visual posts on social networking sites created by and for Vietnam veterans, their friends, and family. For ethical reasons personal identities were removed when the authors created separate narrative word processing files for each population. Networking sites included Facebook, MySpace, and Twitter. Additional data include life history narrative interviews with a separate sample of Vietnam veterans and their significant others. Comparing and contrasting the two sources of data for each of the three populations, we performed a qualitative content analysis of topics of communication, coding basic themes. Although digital narratives vary by population, themes common to all include: 1) Memorials to lost comrades; 2) Intergenerational tributes to Vietnam Veterans from family and friends; 3) Requesting information; 4) Fitting In; and 5) Networking to facilitate social connections.

NARRATIVES OF DISCONTENT: EXPLORING THE IMPACT OF PERSONAL IDEOLOGY ON EXPERIENCES OF RESIDENTS IN UNIVERSITY-LINKED RETIREMENT COMMUNITIES
R.B. Meraz Lewis, Eastern Michigan University, Ypsilanti, Michigan

This study utilizes life course theory as a framework for exploring the lived worlds and life experiences of residents of University-Linked Retirement Communities (ULRC). The narrative examples explored in this paper illuminate how an individual’s personal biography and social history influence personal ideology and in turn impacts adjustment to and experiences in their communities. The analysis uses narrative—the stories community dwellers tell about themselves—to explore individual’s ideological disconnect and feelings of discontent within their communities. Findings for this paper are from a qualitative study utilizing an interpretative ethnographic approach with site visit observations conducted at three ULRCs located in the Midwest, Northeast, and Southern regions of the United States. Narrative examples are presented from thematic coding of 55 in-depth individual and partner interviews of residents ranging from 56-92 years old.

THE ROAD NOT TAKEN: ROLLING WITH A SPINAL CORD INJURY ON THE PATH TO OLD AGE
R. Gwyer, E. Covan, C. Ashton, Gerontology, UNC Wilmington, Wilmington, North Carolina

The life narratives of males with paraplegia and quadriplegia were analyzed, illuminating themes among perspectives of how spinal cord injury (SCI) affects aging, with quality-of-life (QOL) patterns varying...
by level of injury. Compared to higher (cervical) SCIs, those with lower (thoracic or lumbar) injuries appear less concerned about declines typically occurring with age. Factors influencing QOL include: (a) personality; (b) healthcare access; (c) functional ability; (d) social networks; (e) individual resources; (f) disability benefits bureaucracy; (g) marketable job skills; (h) rigid policies discouraging employment; and (i) how people in society treat them. The men attempt to “fit-in” and live typical lifestyles despite their disabilities, compensating by adapting and altering their routines, while interacting in a world designed by, and for, able-bodied people; sometimes this is impossible. Implications for their reduced life-expectancy, both subjective and actuarial, are discussed.

SESSION 600 (SYMPOSIUM)

THE TRAINING AND SERVICES PROVIDED BY DIRECT CARE WORKERS: FINDINGS FROM FEDERAL AND STATE INITIATIVES
Chair: F. Ejaz, Benjamin Rose Institute, Cleveland, Ohio
Discussant: R. Stone, LeadingAge, Washington, District of Columbia

This symposium highlights findings from federal and state initiatives that examine the training of direct care workers (DCWs); and provides insights in how state’s vary in the types of services and supports provided by such workers. Three research teams will present findings using data from national sources and state demonstrations. Dr. Sengupta and colleagues use data from nationally representative samples of 2,897 certified nurse aides and 3,377 home health aides to examine the similarities and differences in the training received by home health and nurse aides. Dr. Seavey describes federal and state initiatives aimed at reshaping and guiding the training received by personal care aides (PCA). Findings are based on a national survey of existing PCA requirements highlighting how states differ in such requirements. Findings will also be supplemented by a six-state demonstration to develop core competencies and certifications to address the changing needs of consumers of home- and community-based services. Dr. Reinhard will highlight differences in the types of services and supports provided by DCWs in various states using data from a national survey of State Boards of Nursing conducted in 2011. These data point to variations among states in terms of the types of services and supports provided by DCWs. She will also highlight findings from a demonstration in New Jersey to change practices and policies to help consumers receive enhanced services from DCWs. Dr. Stone will moderate the session and will lead the discussion on the implications of the findings for changing practice and policy in the U.S.

VARIATIONS IN HOW STATES DIFFER IN THE SERVICES PROVIDED BY DIRECT CARE WORKERS
F. Ejaz, S. Reinhard, S. O’Kane, F. Ejaz, L. Harris-Kojetin, F. Ejaz, CDC/NCHS, Hyattsville, Maryland

Training for personal care aides (PCAs) in the U.S. is at a rudimentary stage of development. No federal training standards exist for PCAs, and most states have instituted a patchwork of limited requirements. Furthermore, the quality of PCA training curricula and credentialing is often weak. However, notable federal and state initiatives are underway with potential to fundamentally reshape and guide this important training domain. This presentation will provide symposium attendees with: a) preliminary findings from a 50-state survey of existing PCA training requirements; and b) highlights of leading state-based initiatives including those stemming from the Personal and Home Care Aide State Training Program (PHCAST) — a three-year, $15 million federal demonstration program for six states to develop core competencies and curricula, training, and certification programs for PCAs. Attendees will also receive insights into the practice and policy implications of these initiatives for improving training standards and opportunities for PCAs.

TRAINING OF HOME HEALTH AIDES AND NURSE AIDES
M. Sengupta, L. Harris-Kojetin, F. Ejaz, CDC/NCHS, Hyattsville, Maryland

Training and satisfaction with training were examined using data from nationally representative samples of 2,897 certified nursing assistants (CNAs) from the National Nursing Assistant Survey and 3,377 home health aides (HHAs) from the National Home Health Aide Survey. Most HHAs (83.9%) and all CNAs received some initial training. Of these, significantly more HHAs (82%) compared to CNAs (66%) felt that training had prepared them ‘very well’ for their jobs (p <.01). About 91% of HHAs and 88% of CNAs received continuing education training. Of these, similar percentages of HHAs (79%) and CNAs (75%) assessed continuing education training as being very useful (p >.10). Groups differed in their assessments of content of initial training: 67% of CNAs and 54% of HHAs believed that their training was ‘excellent’ in helping them address patients’ limitations in activities of daily living (p <.01). Findings identify commonalities and differences in training among HHAs and CNAs.

SESSION 605 (PAPER)

EDUCATING GERIATRIC SPECIALISTS

COMMUNITY BASED GERIATRIC MEDICINE FELLOWSHIPS: SPREADING GERIATRICS INTO COMMUNITIES
K.T. Foley, M.M. Noel, M. Neuberger, W.C. Wadland, Family Medicine, Michigan State University, East Lansing, Michigan

The Institute of Medicine has projected critical shortfalls in the national workforce of certified geriatricians, particularly in non-urban areas. In Michigan, certified geriatrician practices are concentrated in close proximity to academic medical centers in Detroit and Ann Arbor, locations that are inaccessible to the majority of older Michiganders who live outside of the southeast region. To improve access to geriatricians throughout the state, the Department of Family Medicine in the College of Human Medicine at Michigan State University (MSU) has initiated a plan to establish geriatric medicine fellowship programs aligned with MSU’s family medicine residency programs located at seven training sites. Supported by a Health Resources and Services Administration grant, the network of geriatric medicine fellowships has increased to four programs, doubling the number of fellows trained per year who will likely remain in Michigan to practice geriatrics. The network model of collaboration has facilitated the completion of program accreditation applications, improved recruitment of new fellows, and produced a network training curriculum consistent with Accreditation Council for Graduate Medical Education program requirements. Opportunities are pro-

Downloaded from https://academic.oup.com/gerontologist/article-abstract/51/suppl_2/1/646194 by guest on 30 April 2018
vided for fellows to travel and train at resource-intensive sites and also to meet together as a group with their program directors three times annually to participate in half-day assessments of their clinical skills and core competencies. Geriatric medicine fellowship programs offer a promising means to increase the supply of geriatricians in community settings.

DEVELOPING AN ADAPTABLE, COMPETENCY-BASED CURRICULUM FOR A NETWORK OF COMMUNITY-BASED GERIATRIC MEDICINE FELLOWSHIPS

D.A. Sleight1, M. Neuberger2, K.T. Foley3, 1. Office of Medical Education Research and Development, Michigan State University, East Lansing, Michigan, 2. Michigan State University CHM Department of Family Medicine, East Lansing, Michigan

A network of seven geriatric medicine fellowship programs needed a curriculum that was instructionally sound, met ACGME core competencies and was adaptable to the various communities of the network. To spread the curriculum development load and to promote buy-in among the seven program directors, a series of meetings was held. Directors were taught the basics of curriculum development, and a rough draft of a curriculum was hammered out. This became Phase 1 of a four-phase development model. In Phase 2 a smaller development team comprising educational psychologists, content experts and the network director revised the draft curriculum according to instructional design principles and the ACGME core competencies. In Phase 3 the development team reviewed the curriculum for content validity, and visited rotation sites to present the curriculum to site directors for a feasibility check. Phase 4, in which the curriculum was piloted, again included program directors. This development model provided faculty development, built a team of community-based faculty, distilled consensus, and culminated in a curriculum that could be used in different training sites. The curriculum provided opportunities for fellows to travel to and train at resource-intensive sites and to meet as a group three times during the fellowship and more often via videoconferencing.

CHAMPIONING ADVANCED PRACTICE GERONTOLOGICAL NURSING: VALUED ROLE FOR THE GERONTOLOGICAL NURSE SCIENTIST

L. Kennedy-Malone1, C. Auerhahn1, 1. UNCG, Greensboro, North Carolina, 2. NYU, New York, New York

The APRN Consensus model requires the inclusion of gerontological content for all advanced practice nurses managing the care of older adults. With the shortage of qualified gerontological advanced practice nursing faculty, Schools of Nursing are often challenged to find expertise in geriatrics and gerontological nursing. Identifying a champion in gerontological nursing is one of the keys to successful integration and embedding of gerontological content. Nurse scientists as part of the faculty role are often charged with teaching core curriculum courses to graduate level nurse students. Faculty with expertise in gerontological research are valued partners in this new mandate requiring aging specific content across the graduate nursing curriculum. In this presentation, strategies to enhance gerontological experiential learning activities focused on addressing the AACN/John A. Hartford Adult and Gerontology Nurse Practitioner Competencies and AACN/John A. Hartford Adult and Gerontology Clinical Nurse Specialist will be presented. Recommendations for gerontological nurse scientists with clinical expertise to assist with the gerontologizing of clinical management course will be discussed.

GERONTOLOGICAL CONTENT IN AN INTEGRATED UNDERGRADUATE NURSING PROGRAM

S. Hirst, A.M. Lane, C. Le Naveen, Faculty of Nursing, Calgary, Alberta, Canada

The need for fresh approaches to the lingering question of how to stimulate students to enter gerontological nursing practice is a priority for nurse educators. Purpose: Described in this paper is a process model to increase the exposure of undergraduate degree nursing students to attitudes, content, and skills on aging and related nursing care of older adults so they better understand the implications of an aging population, stereotypes of older adults, and thus provide quality care. Design and Method: The Brenda Strafford Centre for Excellence in Gerontological Nursing in collaboration with faculty members (Faculty of Nursing, University of Calgary) have developed a new integrated undergraduate program to identify appropriate content and learning experiences, and incorporate information on aging into new courses as they are developed in a six semester nursing specific program. The Centre staff provided expertise on gerontology and assisted in identifying and teaching appropriate content. Results: Faculty members developed about a dozen lessons covering from one class to two weeks in subjects such as changing demographics, aging families, health care requirements, and normal aging changes. This experience suggests a number of issues that should be addressed when developing a gerontology infusion initiative in a new program. Implications: Information on the nursing care needs of older adults is successfully incorporated into existing academic curricula within the constraints of mandated learning objectives and professional competencies.

FEASIBILITY AND OUTCOMES OF IMPLEMENTING AN ONLINE EVIDENCE-BASED GERIATRIC COMPETENCY TRAINING PROGRAM FOR HOME HEALTHCARE NURSES

A. Brody1, L. Rolita1, 1. NYU College of Nursing, New York, New York, 2. NYU School of Medicine, New York, New York

Introduction: Ample evidence has found that hospitals are discharging older patients home with significantly greater debility. While much effort has been placed on ensuring an appropriate transition from hospital to home, little focus has been placed on whether home healthcare nurses are able to provide appropriate, geriatric competent care. Geriatric competency training programs have been developed and tested in both the acute and long-term care settings, however the same cannot be said in home healthcare. This study therefore examined the feasibility of implementing an online evidence-based practice geriatric competency program using pain and depression as exemplars. Methods: Five nurses at a home healthcare agency took the online training modules, while an additional five were used as control subjects. Nurses in the intervention and control groups assessed pain using the numerical rating scale or the PAINAD scale for cognitively intact or impaired patients respectively at each visit. Depression was assessed using the Zung Depression Scale at 0 and 3 months. Interventions for pain and depression, utilization, cost and readmission data was obtained from the electronic medical record and OASIS records. Patient outcomes were followed for three months. Statistical analysis was performed using t-tests, chi-square analysis, and multivariate regression modeling. Results: Preliminary results have found reductions in pain and depression levels, increased interventions both pharmacologic and non-pharmacologic, and reduced rehospitalization. Implications: The positive findings from this feasibility study suggest that expanding it to more geriatric conditions and studying for a longer period time would be beneficial.

SESSION 610 (SYMPOSIUM)

A LIFE COURSE APPROACH TO BODY WEIGHT, BODY COMPOSITION AND MUSCLE STRENGTH

Chair: D. Alley, University of Maryland, Baltimore, Maryland
Discussant: A.B. Newman, University of Pittsburgh, Pittsburgh, Pennsylvania

It is well-documented that the average age-related weight trajectory involves weight gain in early adulthood, followed by weight stabilization in midlife and eventually weight loss. However, few studies have...
the long-term data needed to examine variability around these trajectories or the implications of changing body weight for body composition and strength. The presentations in this symposium draw on unique cohorts from diverse settings (the community-dwelling U.S. population, the Old Order Amish, Finland, the Netherlands) not only to describe longitudinal trajectories in weight, body composition, and strength, but also to demonstrate the importance of these trajectories as determinants of late life health status. Zajacova and Huzurbazar use functional data analysis to examine the association between weight variability, health status, and mortality. Alley and colleagues compare age-related trajectories of body composition in two populations with different socio-cultural environments to demonstrate that aging trajectories vary across environments and historical time. Stenholm and colleagues examine changes in grip strength over 22 years in a sample of men and women from Finland. Visser and colleagues utilize retrospective data from a cohort in the Netherlands to demonstrate that body mass index and physical activity at age 40 are associated with muscle mass and function in old age. Finally, Alley and colleagues show that weight, body composition, and physical activity before age 40 are associated with muscle quality at older ages. Taken together, these studies demonstrate the importance of a life course approach to considering the health effects of weight and body composition at older ages.

AGE-RELATED CHANGES IN BODY COMPOSITION: COMPARING AMISH AND NON-AMISH POPULATIONS

D. Alley1, L. Yerges-Armstrong1, M. Shardell1, E. Metter2, E.M. Simonsick2, S. Snitker1, B. Mitchell1, L. Ferrucci1, 1. University of Maryland, Baltimore, Maryland, 2. National Institute on Aging, Baltimore, Maryland

Age differences in body composition may depend heavily on the environment. This study compared longitudinal changes in body composition in adulthood (ages 20+) in two socio-culturally distinct populations: the Old Order Amish (OOA, N=159 males, 226 females) and the Baltimore Longitudinal Study of Aging (BLSA, N=419 males, 413 females). Mixed effects models predicted weight and body composition (obtained from DXA scans conducted from 1991-2010) based on age, birth cohort, and their interaction. OOA men had greater lean mass at younger ages relative to BLSA men, but they experienced a faster rate of lean mass loss. In contrast, body composition trajectories were similar in OOA and BLSA women, although OOA women had greater percent lean mass at all ages. Differences in trajectories of body composition across environments and historical time provide a unique opportunity to study the effects of body composition changes on health and disease.

PREDICTORS OF DISCORDANCE BETWEEN MASS AND STRENGTH: THE BALTIMORE LONGITUDINAL STUDY OF AGING

D. Alley1, E. Metter1, R. Conwit2, L. Ferrucci1, 1. University of Maryland, Baltimore, Maryland, 2. National Institute of Neurological Disorders and Stroke, Baltimore, Maryland, 3. National Institute on Aging, Baltimore, Maryland

It is unclear why some older adults maintain muscle strength despite relatively low lean mass, while others exhibit weakness despite high lean mass. In order to identify young adulthood predictors of muscle quality at older ages, we classified participants aged 55-70 from the Baltimore Longitudinal Study of Aging (N=280) into tertiles of the association between knee extension strength (measured by KinCom dynamometer) and thigh muscle area (measured by CT) and compared weight, body composition, and physical activity before age 40 across tertiles. Relative to the highest tertile (high strength relative to muscle area), men in the lowest tertile had significantly lower weights and a higher rate of weight gain before age 40. Women in the lowest tertile weighed significantly more at all ages. Differences in body fat and physical activity were also observed. Results suggest that weight and health behaviors in young adulthood have implications for later life muscle quality.

BODY WEIGHT AND PHYSICAL ACTIVITY HISTORY IN RELATIONSHIP TO BODY COMPOSITION IN OLD AGE

M. Visser1,2, L. Schaap3, D.J. Deeg2, 1. Health Sciences, VU University Amsterdam, Amsterdam, Netherlands, 2. VU Medical Center, Amsterdam, Netherlands

The aim was to examine whether early life body weight and physical activity influence body composition in old age. We included 452 participants of the Longitudinal Aging Study Amsterdam aged 65-87 years with information on appendicular skeletal muscle mass (ASMM) and fat mass from DXA. Weight at age 40 and physical activity from age 15 to 50 were obtained by recall. Per unit higher BMI at age 40, ASMM was 177g (SE 33) and 294g (47) higher in women and men, irrespective of age, height, and current fat. Adjustment for current lifestyle did not change this association (177g,287g). Higher physical activity in early life was associated with higher ASMM in men and women in the fully adjusted models, including BMI age 40. In men, higher BMI at age 40 and higher physical activity was related to higher grip strength. Early life lifestyle may influence muscle mass and function in old age.

AGE-ASSOCIATED LOSS IN HANDGRIP STRENGTH IN MEN AND WOMEN – A 22 YEAR LONGITUDINAL STUDY

S. Stenholm, T. Härkänen, P. Sainio, M. Heliläväara, S. Koskinen, National Institute for Health and Welfare, Turku / Helsinki, Finland

This study examines age-related changes in handgrip strength through 22-year follow-up. Data are from 1891 men and women aged 30 years or more at baseline participating in the population-based Mini-Finland Health Examination Survey (1978–80) and living in the 9 municipalities in which the handgrip strength measurement was repeated in 2000–01. Because handgrip strength is associated with mortality, the effect of right-censoring due to deaths was accounted for in our analyses. In men aged 30 to 40 years, the annual decrease in handgrip strength was approximately 3.5 Newtons (N). After that the decrease accelerated and stabilized around the age of 75 years being approximately 7.3 N per year. In women, respectively, prior to 45 years the annual decrease was approximately 2 N and after age 80 approximately 4 N per year. Findings confirm earlier smaller-scale studies that deterioration of muscle strength differs between gender and age groups.

VARIABILITY IN BODY WEIGHT TRAJECTORIES AND HEALTH OUTCOMES AMONG OLDER ADULTS

A. Zajacova, S. Huzurbazar, University of Wyoming, Laramie, Wyoming

An increasing proportion of older adults are overweight or obese; the variability of their weight trajectories necessitates new approaches to understanding the links between body weight and health. We examine how changes and fluctuations in body mass index (BMI) over 17 years relate to health and survival. Data are from the Health and Retirement Survey, a nationally-representative cohort of older adults interviewed every 2 years from 1992 to 2008 (N=9,814). We employ functional data analysis (FDA), a state-of-the-art approach in which each individual’s BMI trajectory is represented by a mathematical function describing the smoothed curves. The curves are then used in regression models of general health and hazard models of all-cause mortality, to determine how variability in the weight trajectories impacts health. Results describe curves associated with poor health outcomes and demonstrate the importance of examining both general trends and variability in weight trajectories.
SESSION 615 (SYMPOSIUM)

AGE-RELATED HEARING LOSS: AN INEVITABLE CAUSE OF PSYCHOSOCIAL PROBLEMS OR PRONE TO CopING?
Chair: D.J. Deeg, VU University Medical Center, LASA, EMGO Institute for Health and Care Research, Amsterdam, Netherlands
Co-Chair: M. Pronk, VU University Medical Center, Dept. of ENT/Audiology, EMGO Institute for Health and Care Research, Amsterdam, Netherlands

Age-related hearing loss is one of the most prevalent chronic conditions in older adults. There is ample evidence showing that hearing-impaired persons can suffer considerably from hearing loss, both socially and emotionally. However, evidence is still inconclusive regarding the relationship with loneliness and depression. The first two presentations will showcase current insights into these relationships, using an epidemiological and qualitative approach, respectively. In addition, the first study will provide evidence for the hypothesis that these consequences only apply to specific vulnerable sub-groups. It is sometimes forgotten that significant others (e.g. spouse) can also experience significant distress, even when the hearing-impaired person him/herself may suffer only minimally. The third presenter will discuss recent qualitative findings covering this. The use of emotional and behavioral coping strategies may determine whether adverse effects are combated/prevented. Existing rehabilitation strategies can provide these, however, under-use of services (e.g. hearing aids) is still a major problem. Screening combined with appropriate intervention may be a useful approach. The second presentation will report findings on a recently developed screening tool. Further, it is essential that the underlying reasons for low uptake are known. The fourth presenter will discuss a recent study that investigated which factors predict rehabilitation uptake. An important reason for the limited attention for hearing loss (rehabilitation) is the generally restricted knowledge about hearing loss and its consequences, also in health care professionals. The fifth presenter will conclude the symposium by giving a scientific overview of various (gerontological) perspectives on consequences of hearing loss and its treatment.

EFFECTS OF HEARING STATUS ON LONELINESS AND DEPRESSION IN OLDER PERSONS – SUBGROUPS IDENTIFIED
M. Pronk1,2, D.J. Deeg2, C. Smits1, T.G. van Tilburg1, D.J. Kuik1, J.M. Festen1, S.E. Kramer1, 1. VU University medical center, dept. of ENT/Audiology, EMGO Institute for Health and Care Research, Amsterdam, Netherlands, 2. VU University medical center, dept. of Epidemiology and Biostatistics, EMGO Institute for Health and Care Research, Amsterdam, Netherlands, 3. VU University Amsterdam, Dept. of Sociology, Faculty of Social Sciences, Amsterdam, Netherlands

The aim of this study was to investigate the prospective associations between hearing status and depression and loneliness in the older population using a longitudinal design, adjusting for relevant confounders, and using two hearing status measures. Data of about 900 participants (aged 63-93) of the Longitudinal Aging Study Amsterdam were used. Multiple linear regression analyses were used, assessing the associations between baseline hearing and 4 year follow-up depression, social and emotional loneliness while correcting for relevant confounders. Subgroup effects were explored using interaction terms. Both hearing measures showed significant adverse associations with both loneliness measures (p<0.05). However, stratified analyses showed that these effects were restricted to specific subgroups such as non-hearing aid users (SR - social loneliness model) and men (SR and SNT - emotional loneliness model). No significant effects appeared for depression. Future research should confirm the subgroup effects and may contribute to the development of tailored intervention programs.

OLDER ADULTS AND HEARING IMPAIRMENT: WHO, WHEN AND WHY REFER?
B.E. Weinstein, Graduate Center, CUNY, New York, New York

Hearing loss co-exists with many chronic conditions, potentially jeopardizing diagnostic validity. Isolating hearing loss is important as it is among the leading causes of years living with disability (YLD) globally. We assessed the test retest reliability of the SOFI (Screening for Otologic Functional Impairments) an abbreviated questionnaire for identifying older adults at risk for hearing impairment. Administered to twenty older adults on two occasions, reliability was high (91) as was criterion validity (.82). The majority of individuals referred for hearing related intervention had significantly higher scores on the SOFI than did those not referred. Identification of older adults at risk for hearing loss is important for all stakeholders including family members, health care and home care providers. The value of screening activities in terms of heightening awareness and educating about community resources will be discussed along with the importance of tailoring interventions to individual needs.

ADAPTATION TO HEARING LOSS: STRATEGIES AND CONSEQUENCES
M.I. Wallhagen1, K. Lane2, W. Strawbridge1, J. Physical Nursing, University of California, San Francisco, San Francisco, California, 2. University of Iowa, Iowa City, Iowa

Hearing loss (HL) is common in older adults, yet the average time from onset to service use is often ≥5 years. This partly relates to the slow onset of age related HL which allows individuals to adapt and be unaware of the amount of information missed. Because words are distorted, many blame the HL on others. Thus, although HL is associated with many negative outcomes, some individuals appear not to be bothered even while the HL disrupts family relations. This presentation presents data from a longitudinal qualitative study of 91 older adults (≥65) and their communication partners to highlight how individuals with HL deal with this experience in ways that minimize its impact while also demonstrating the on-going impact that the HL has on the partner. An adaptation model and possible targets for intervention to enhance hearing health service use and promote continued engagement and quality interpersonal relationships are discussed.

FACTORS INFLUENCING HELP-SEEKING FOR HEARING IMPAIRMENT BY OLDER ADULTS
L. Hickson1,2, C. Meyer1,2. 1. School of Health and Rehabilitation Sciences, University of Queensland, Brisbane, Queensland, Australia, 2. HEARING CRC, Melbourne, Victoria, Australia

Research investigating factors associated with help-seeking for hearing impairment was conducted with 309 people aged 60 or older. Participants were assigned to a non-consulter group (n = 55), a non-hearing aid owner group (n = 92), an unsuccessful hearing aid owner group (n = 74), or a successful hearing aid owner group (n = 88). A test battery, including a variety of audiological (e.g., pure tone audiometry) and non-audiological measures (e.g., pension status, attitude towards hearing aids) was administered. Two multivariate, multinomial logistic regression models were fitted to the data to determine which factors were associated with consultation for hearing impairment and hearing aid uptake. Findings are that consultation and uptake are influenced by pension status, attitude to hearing aids, significant others and self-efficacy for ability to handle the basic functions of a hearing aid. The implications of these findings for promoting rehabilitation in this population will be discussed.

OLDER ADULTS WITH HEARING LOSS: IT’S MORE THAN JUST THE EARS

A number of factors affect the quality of life of older adults. A prevalent condition that negatively influences quality of life in this population is hearing loss. Studies have revealed the substantial effects that
The Gerontological Society of America

SESSION 620 (SYMPOSIUM)

EDUCATING PRIMARY CARE PROVIDERS IN GERIATRICS AND GERONTOLOGY: INFILTRATION AND INTEGRATION MODELS

Chair: J.L. Howe, Brookdale Department of Geriatrics and Palliative Medicine, Mount Sinai School of Medicine, New York, New York, Bronx VAMC GRECC, New York, New York

Discussant: T. Fulmer, New York University, New York, New York

Many older adults have multiple health conditions requiring a diverse array of skills to address physical, mental, and social health needs. While specialists in geriatric s and gerontology are educated to recognize these issues and to address them within an interdisciplinary team context, older people receive primary and specialty care from social workers, physicians, nurses and other health care providers who have little or no training in aging. The situation is becoming increasingly critical given the current shortfall of aging specialists in all fields of practice and the rapidly increasing aging population. For instance, there are currently about 7,000 geriatricians in the US, and the number is falling. Similarly, just 5% of social workers specialize in gerontology, and less than 1% of nurses are certified in geriatrics. One solution is the development, implementation, and evaluation of education programs that train generalists in geriatrics and gerontology so that they may have enhanced skills in managing the needs of older patients and clients. In this symposium we present four successful education and training models in a range of health care settings that bring geriatrics and gerontological knowledge and skills to primary care providers in the fields of medicine, nursing, and social work. These programs demonstrate that primary care providers can learn and implement key concepts in their practice settings to effectively care for older patients. Presenters will discuss educational opportunities, strategies for overcoming organizational and disciplinary barriers, methods for measuring program effectiveness, and educational resources.

THE VA GERIATRIC SCHOLARS PROGRAM: ENHANCING SKILLS IN RURAL PRIMARY CARE SETTINGS

Forty per cent of Veterans live in rural areas but rural VA Community Based Outpatient Clinics (CBOCs) experience a severe shortage of physicians, mid-level practitioners or affiliated team members who have had training in geriatrics. The Geriatric Scholars Program (GSP) was developed to fill this gap by providing highly focused and on-going education. GSP, a collaboration of eight VA Geriatric Research Education and Clinical Centers, offers in-service education using multiple educational modalities for individualized, tailored education designed for the adult learner; evaluation is based on the Kirkpatrick chain of impact. Currently, 77% of learners (n=140) have successfully applied their knowledge through quality improvement projects in their respective CBOCs. On-going support and education is part of the program and is delivered by coaches, mentors, clinical practice and a web-based learning community. In the most recent class, 52% have accessed the learning community and 38% use the site on a monthly basis.

VALIDATING THE GERIATRIC EXPERTISE OF NURSES

Validating nurse expertise is an important component of guaranteeing high quality care to all patients. National certification is a key tool for nursing validation. It is assumed that nurses caring for children will have national certification, but that is not the case yet for nurses taking care of older adults. There is an American Nursing Credentialing Center national examination to certify nurses in geriatrics, yet less than 1% of nurses are certified in geriatrics. The NYU Hartford Institute for Geriatric Nursing and the Consortium of New York Geriatric Education Centers are fostering opportunities for nurses no matter what setting – including nurses providing outpatient care – to gain expertise in geriatrics and to become nationally certified. This symposium focuses on the components of such training including online resources and examples of training in clinical settings as well as examples of outcomes from this initiative.

COMPETENCY-BASED SOCIAL WORK TRAINING PROGRAM FOR SOCIAL WORKERS IN RURAL SETTINGS

J. Frank1, J. Danzon-Rodriguez2, J. Fasbindner1, 1. UCLA, Los Angeles, California, 2. California Council on Gerontology and Geriatrics, Los Angeles, California

The need to further develop geriatric expertise in the social work labor force is well documented and is being addressed by the Hartford Geriatric Social Work Initiative (GSWI) through the preparation of new graduates. Practicing social workers are working with older persons as are professionals in rural areas serving intergenerational populations. The consensus-based GSWI Gero Social Work Competencies delineate

Downloaded from https://academic.oup.com/gerontologist/article-abstract/51/suppl_2/1/646194 by guest on 30 April 2018
the skills both generalist and specialist social workers require. VHA, the largest employer of social workers in the nation, have increased access to care in rural areas by employing social workers in Community-based Outpatient Clinics. The Geriatric Scholars Program created a social work track grounded in the GSWI Competencies as part of an intensive 5-day course. Outcomes as measured by a validated competency scale showed significant and sustained improvement of skill levels, and differentiated areas of most and least improvement, pointing the way to further in-service needs for rural social workers.

SESSION 625 (SYMPOSIUM)

PERSON-ENVIRONMENT-ACTIVITY TRANSACTIONS IN OLD AGE FRAMED IN AN OCCUPATIONAL THERAPY PERSPECTIVE
Chair: S. Iwarsson, Health Sciences, Lund University, Lund, Sweden Co-Chair: L. Borell, Karolinska Institute, Stockholm, Sweden

Activity and participation are important components of health in old age, and environmental factors act as barriers or facilitators in the everyday life of older adults. The set of presentations building up this symposium share the theoretical base expressed in terms of person-environment fit with other strands of research within environmental gerontology. Adding to that, they are underpinned by the notions of person-environment-activity transaction as described in occupational therapy. The presentations of this symposium serve to exemplify current theoretical, methodological and empirical developments in occupational therapy, in Scandinavia and in the U.S. Starting out with a problematisation of how to implement research-based methodology in occupational therapy and housing provision practices in different national contexts, the second will focus on new possibilities to enable persons with cognitive limitations stay in the homemaker role. The third presentation is about indoors and out-of-home activities in very old age and changes over time. Finally, we give an example of ongoing research in the context of North American occupational therapy, presenting empirical results on the environment on home, community and work participation with older adults with cognitive disabilities. Methodology and empirical studies designed based on the person-environment-activity approach offer in-depth insights to the complex dynamics of human development in later life, with potential to nurture the development of interventions targeting activity, participation and health in old age.

IMPLEMENTATION OF RESEARCH-BASED STRATEGIES TO FOSTER HOUSING ENVIRONMENTS SUPPORTING ACTIVITY AND PARTICIPATION – CHALLENGES AND EXPERIENCES DURING 20 YEARS
S. Iwarsson, Health Sciences, Lund University, Lund, Sweden

Since long at Lund University, an inter-disciplinary research team influenced by occupational therapy has been engaged in the development of methodology for assessment of housing accessibility and usability problems, and how such dynamics interact with aspects of health. Our research represents methodology development, problem-oriented studies among older people and persons with disabilities, and solution-oriented projects in interaction with practitioners, aimed to implement research-based solutions and evaluate their effects. This presentation will provide an overview of strategies used, challenges met, and experiences gathered during a process of efforts aiming for implementation of research-based strategies to foster housing supporting activity and participation.

COGNITIVE SUPPORT IN EVERYDAY LIVING
L. Borell, Karolinska Institute, Stockholm, Sweden

Modifications of the physical environment with the purpose to make it accessible to persons with cognitive limitations, as in the case of impairments after a stroke, or in the case of dementia will be more and more common through the developments of technology. There will soon be smart home technology and robots on the market to increase home safety, and increase to social contacts. For example, Assistive Technology (AT) with focus on cognitive support can bring changes into the everyday life for the older users and their families. Recent studies have shown how new and good daily routines developed with the help of AT supported older persons with cognitive limitations in increasing own control of an activity, in regaining social roles and in overall creating a daily structure. The specific AT also reduced the spouses’ perceived burden of responsibilities and served as a “third party” through the provision of reminders for eating, exercises, and environmental control. This type of support was experienced as something that made daily living easier for both the person who had cognitive limitations as well as the spouse. In an additional study with the aim to generate new knowledge as basis for the design of kitchens and kitchen products that provide support ageing persons with cognitive impairments in kitchen activities within the cultural context of Swedish middle class society. The analysis of the “state of the art knowledge” identified four principles for design of a “cognitive kitchen” - a) Safety; b) Support for order and structure, c) Simplicity: easy to understand, easy to use and d) Guidance through recognition and intuition. The findings in these studies will be discussed in relation to societies need to create the best possible conditions for older peoples wish to be ageing in place even with cognitive limitations.

ON INDOOR AND OUT-OF-HOME ACTIVITY IN VERY OLD AGE
G. Carlsson, M. Haak, C. Löfqvist, S. Iwarsson, Department of Health Sciences, Lund, Sweden

The process of ageing might change what people do in their everyday life. To deepen our understanding of person-environment-activity transactions in very old people’s everyday life, the aim of this study was to investigate indoors and out-of-home activities. The aim was also to explore how the number of reported activities changed over a five-year period in relation to personal and environmental characteristics. In the ENABLE-AGE project, the Swedish sample consisted of 397 very old persons (80-89 years) living alone in regular housing, most of them in multi-dwelling houses. Extensive data on personal capacity, environmental barriers, and activities were collected at home-visits by means of interview and observation. In all, 1,500 activities were reported at baseline in areas such as paid/voluntary work, crafts, sports, cultural activities, etc. Based on this empirical data, theoretical reflections on person-environment-activity transactions will be developed.

PRESENTATION: EVALUATING THE IMPACT OF THE ENVIRONMENT ON HOME, COMMUNITY & WORK PARTICIPATION WITH OLDER ADULTS WITH COGNITIVE DISABILITIES
J. Haamm, OT/Disability Studies, University of Illinois at Chicago, Chicago, Illinois

People aging with long term disabilities have long acknowledged that their participation in society is influenced by social, physical, cultural, and economic barriers and supports in their everyday environments. Evaluation of this participation in a way that is accessible to and inclusive of older adults with cognitive disabilities is needed if we are to identify barriers and enact actions to address these barriers and support full participation. This presentation describes a participatory action research project involving 400 consumer-directed assessments of environmental barriers and supports to home and community participation by people aging with stroke and intellectual disabilities. Trend analyses and radar plots of environmental barriers, and odds ratio analyses of ability to action plan these barriers and create environmental supports are highlighted between groups and contexts, as are participatory strategies for making this participation audit accessible to people aging with long term disabilities and for translating this knowledge to policy makers, funders and community businesses.

64th Annual Scientific Meeting

Downloaded from https://academic.oup.com/gerontologist/article-abstract/51/suppl_2/1/646194 on 30 April 2018
SESSION 630 (SYMPOSIUM)

SUCCESSFULLY MAINTAINING HEALTHY BEHAVIORS THROUGHOUT THE ADULT LIFESPAN
Chair: B. Resnick, University of Maryland, Baltimore, Maryland

Nearly half of all Medicare beneficiaries aged 65 years or older currently live with at least 3 chronic medical conditions; one in five live with 5 or more. Many of these chronic illnesses are optimally managed by combined pharmacological and non-pharmacological treatments such as changes in personal behaviors. Motivating older adults to change and adhere to health behaviors throughout their adult lifespan is critical to decreasing health care costs and improving quality of life of these individuals. Numerous theoretic approaches have been described to be helpful in guiding behavior change interventions including such theories as social cognitive theory, the Health Belief Model and the Transtheoretical Model. This session will provide an overview of some new and innovative theoretic approaches to behavior change being used for older adults including ecological theories of Choice Architecture, Nudge Theory and Personal Process Improvement among others. In addition, we will provide examples of how theoretically based behavior change interventions have successfully been implemented to improve health behaviors and outcomes among older adults. Examples will include a lifestyle modification for healthy eating and activity among rural mid-life and older women to improve blood pressure management and the use of a SystemCHANGE to integrate exercise in routine daily activity. Despite the use of theoretically based interventions to optimize health behaviors among older adults, there are numerous challenges that must be overcome. These common challenges will be identified and ways in which to successfully overcome those challenges articulated.

THEORETICAL APPROACHES THAT GUIDE INTERVENTIONS AND OPTIMIZE OUTCOMES
S.M. Moore1, M.A. Dolansky2, C. Brown2, 1. Case Western Reserve University, Cleveland, Ohio, 2. Virginia Commonwealth University, Richmond, Virginia

Theory based health behavior change interventions are recommended to enable the study of complex networks of variables, establish hypotheses, interpret and explain mechanisms of behavior change, and increased effectiveness of interventions. There are some theories that are more useful to drive behavior change among older adults than others. Specifically, theories with a general approach (e.g., Social Cognitive theory) and theories based on disease protection (e.g., Protection Motivation Theory) have been noted to be especially useful and appropriate when used to change behavior among older adults. We will provide an example of successful use of the transtheoretical model among older African American Women. In addition, this session will provide a discussion of emerging new health behavior change theories, including the ecological theories of Choice Architecture, Nudge Theory, and Personal Process Improvement; Positive Emotions theories of Appreciative Inquiry and Intentional Change; and Quantum Change.

MAKING BEHAVIOR CHANGE HAPPEN IN REAL WORLD SETTINGS
S.M. Moore1, M.A. Dolansky2, P.A. Hageman2, 1. Case Western Reserve University, Cleveland, Ohio, 2. Florida Atlantic University, Boca Raton, Florida

Lifestyle modification is commonly recommended to older adults for prevention and management of chronic illness. Unfortunately, finding effective interventions that are realistic to implement to specific groups of older adults is challenging. We will describe an effective intervention used with older women living in rural settings comparing use of the Internet or printed materials. This randomized clinical trial compared the effectiveness of two tailored interventions based on constructs of the Health Promotion Model using a three group approach with randomization to Internet based materials (n=116), print-mailed materials (n=115) or standard advice only (n=58). A second example of an effective intervention will include the use of SystemCHANGE to build habitual exercise behavior among older adults post cardiac event. Also using a three group approach, participants were randomized to SystemCHANGE, a CHANGE intervention using social cognitive theory and standard care. In both cases findings support use of the theoretically based approaches delineated.

OVERCOMING SPECIAL CHALLENGES TO ADHERING TO HEALTHY BEHAVIORS AMONG OLDER ADULTS
D.J. Hain1, K. Wright1, L. Crampton2, 1. University of Utah, Salt Lake City, Utah, 2. Arkansas State University, Little Rock, Arkansas

Across a variety of clinical conditions, settings and cultures changing behavior among older adults results in special challenges. Commonly, shortness of breath, pain and fear of falling or exacerbating underlying conditions present major challenges to behavior change. These are often made more difficult due to living environments and lifelong cultural beliefs and practices. This session will provide an overview of three ways in which to overcome challenges to behavior change. Specifically we will describe the use of guided mastery with older African American woman to increase physical activity; the use of the Kirby Delay-discounting Monetary Choice Questionnaire and use of delayed discounting will be proposed as an option to improve exercise work with community dwelling older adults; and lastly the use of Story Theory will be described as a way in which to increase exercise behavior among older adults with kidney disease.

LIFESTYLE MODIFICATION FOR HEALTHY EATING AND ACTIVITY IN OLDER RURAL WOMEN WITH PREHYPERTENSION
P.A. Hageman, University of Nebraska Medical Center, Omaha, Nebraska

Lifestyle modification is recommended for managing prehypertension, yet finding effective interventions to reach rural women is a public health challenge. A randomized clinical trial [ClinicalTrials.gov ID: NCT00580528] compared the effectiveness of two tailored interventions based on constructs of the Health Promotion Model that used Internet (n=116) or print-mailed (n=115) delivery methods as compared to standard care. In both cases findings support use of the theoretically driven interventions, yet finding effective interventions to reach rural women is a public health challenge. A randomized clinical trial [ClinicalTrials.gov ID: NCT00580528] compared the effectiveness of two tailored interventions based on constructs of the Health Promotion Model that used Internet (n=116) or print-mailed (n=115) delivery methods as compared to standard advice only (n=58), in order to promote the adoption (0-12 months) and maintenance (13-24 months) of healthy eating and activity to reduce blood pressure among 289 rural women ages 40-69 with prehypertension. Using intention-to-treat principles and linear mixed model analysis methods, rural women with prehypertension were found to lower blood pressure using lifestyle modification, with greater reductions in systolic BP, daily Kcal intake and daily % calories from fat observed over 24 months in the Internet intervention group compared to advice only group. Supported by NIH Grant RO1 NR04861.

SESSION 635 (PAPER)

NURSING HOME ADAPTATIONS TO MARKET DEMAND

WHY IS NURSING HOME USE DECLINING?

An important component of balancing the long-term care system is controlling nursing home use. Nursing home use has fallen substantially in recent years, but little research has been done to analyze the reasons
NURSING HOME OWNERSHIP: DIFFERENCES IN COSTS AND RESPONSE TO MARKET CHARACTERISTICS

W.D. Spector1, R. Limcango1, D.B. Mukamel2, 1. CDOM, AHRQ, Rockville, Maryland, 2. University of California Irvine, Irvine, California. 3. Social and Scientific Systems, Silver Spring, Maryland

Introduction: For-profit and nonprofit nursing homes (NHs) behave differently due to different missions. If NH consumers are not able to view/monitor outputs easily, for-profits are more likely to cut corners and less likely to provide expensive care. Some argue that for-profits are more likely to provide care efficiently. Others argue that ownership mix in the market can influence NH behavior. Markets with higher non-profit proportion may result in for-profits providing more quality, and higher proportion of for-profits may encourage nonprofits to be more efficient. Data and Sample: National sample of private nonprofit and for-profit free standing Medicare certified NHs in 2005. Data are from the Healthcare Cost Report Information System, the MDS, and the Economic Census. Design: We estimate a hybrid cost function, which includes resident days, case mix (CM), wages, price of capital, for-profit market share, and competition, all interacted with ownership to assess whether for-profits and nonprofit marginal costs differ. 2SLS was used to deal with potential endogeneity of CM and CM interaction with for-profit. The eigenvalue was 52 rejecting the weak instruments hypothesis. Results: Marginal costs for for-profits were lower for CM and input prices. Costs were higher for both for-profit and nonprofit in more competitive markets. For-profits had lower costs for all NH sizes except for the very largest. The model predicts that annual costs for for-profit NHs is ~$1 million less than nonprofit NHs facing median CM, size, and market characteristics. Conclusion: For-profit costs respond more to market characteristics but less to higher CM.

FACILITY AND RESIDENT CHARACTERISTICS CORRELATED TO LENGTH OF STAY IN ASSISTED LIVING DEMENTIA UNITS

J. Hyde1, R. Perez2, B. Forester1, T. Whitfield1, P.J. Doyle1, J. Hennen1, 1. Gerontology Institute, University of Massachusetts Boston, Boston, Massachusetts, 2. University of Maryland, UMBC, Baltimore, Maryland, 3. McLean Hospital, Harvard University, Belmont, Massachusetts, 4. BioStatisticsSolutions, Boston, Massachusetts

Health care professionals, providers, policymakers, and consumers wish to understand how various processes and structures affect how long residents with dementia are likely to remain in the assisted living setting and their reasons for leaving. This study, based on a retrospective chart review of 312 residents in five dementia specialized facilities, reports on correlations between length of stay and both resident and facility characteristics. The facilities, which offer well-developed end-stage programs offer full medication administration, up to 16 hours per day of RN/LPN staffing, and seven hours per resident day of direct care staff. Findings include relationship of age, gender, co-morbidities, and cognitive and functional status to length of stay, along with destinations of those residents who left. Age and gender were strongly correlated to length of stay, with male gender and age over 90 at the time of move-in being related to shorter stays. Need for more care was the most common (37.6%) reason that people left. The 11.5% of residents who moved out for financial reasons were also the longest stayers. Behavioral issues accounted for 8.5% of the population who left, with most moving to a nursing home. Nearly a quarter of the residents were able to stay until their death, many with the use of hospice services. Length of stay was, as hypothesized, positively correlated to the size and duration of the end stage programs. These findings have implications for many stakeholders on factors influencing aging in place, including physician understanding of hospice for residents with dementia.

END-OF-LIFE IN NURSING HOMES: EXAMINING THE RELATIONSHIP OF STRUCTURE, PROCESS, AND OUTCOMES

Chair: S. Thompson, College of Nursing, University of Nebraska Medical Center, Omaha, Nebraska
Co-Chair: S. Miller, Brown University, Providence, Rhode Island

As the American population ages, nursing homes are rapidly becoming a dominant site for death. By 2020, 40% of those over 65 will die in nursing homes. There have been long standing concerns about the quality of care at the end of life. Efforts to improve care will benefit from an understanding of whether nursing home structure and process factors, such as staffing and education levels, tenure, palliative care knowledge and processes influence outcomes at the end of life such as pain and symptoms, caregiver strain, and family satisfaction with care. Papers are presented from two independent, but inter-related studies. Three papers report findings from a prospective, correlational, longitudinal study of end-of-life care in Midwestern nursing homes.

NURSING HOME COMPARE: DOES PERFORMANCE CHANGE VARY BY THE RACIAL COMPOSITION OF A FACILITY?

J. Gaudet1, C.E. Bishop1, J. Perlotti1, M. Fennell2, L.A. Nsiah-Jefferson1, J. Brandeis University, Waltham, Massachusetts, 2. Brown University, Providence, Rhode Island

The public release of performance data through Nursing Home Compare (NHC) was initiated in effort to improve the quality of US nursing homes (NHs). Although existing studies show that many of the measures improved in the years since the policy’s implementation, these studies also suggest improvement has been inconsistent across facilities, and variation may be systematic. Concerns have been raised about whether these types of market-based approaches will have unintended consequences for vulnerable populations, given that black elders tend to reside in facilities that are heavily reliant on Medicaid, understaffed, and located in poor communities, which may impact capacity to improve quality. Using an Interrupted Time Series study design spanning 1999 through 2007, this research shows that NHs characterized by three differing proportions of black residents show different patterns of quality performance at the point of intervention and in the post-period. However, these differences don’t always follow the expected patterns suggested by the literature. For instance, although all groups of facilities show a reduction in the use of restraints, only the facilities with a high proportion of black residents had a significant estimate for the point of intervention. Similarly, high proportion black NHs were the best performing facilities with regards to ADL decline, although the post-period slope for these NHs was smaller in magnitude as compared to the other NHs. The results of this study can inform policy makers and researchers with regards to the effectiveness and consequences of NHC and similar types of quality improvement initiatives.

SESSION 640 (SYMPOSIUM)
(N=85). Data were collected from nursing home staff and bereaved family members and analyzed using linear mixed models and two-level structural equation modeling. The fourth paper presents data from a national study that uses an adapted version of the palliative care practice and knowledge scales used in the regional study. Although both studies used different measures of structure variables (e.g., tenure of staff versus staffing levels), similar findings regarding the relationship of nursing home structure and process, were found. The regional study extends the relationship of structure and process to end-of-life outcomes. Implications from each study as they relate to resident care and health policy will be discussed. Concluding the symposium is a discussion regarding the sampling challenges inherent in nursing home research.

SAMPLING CHALLENGES IN NURSING HOME RESEARCH
S. Thompson\textsuperscript{1}, M.J. Bott\textsuperscript{2}, B. Gajewski\textsuperscript{1}, C.M. Buescher\textsuperscript{1}, V. Tilden\textsuperscript{1}, I. College of Nursing, University of Nebraska Medical Center, Omaha, Nebraska, 2. University of Kansas School of Nursing, Kansas City, Kansas, 3. University of Kansas School of Medicine, Kansas City, Kansas

As part of a larger study, we described the methodological challenges encountered while recruiting and retaining nursing homes, and identified characteristics of homes most likely to complete a longitudinal study of end-of-life care. Administrators, staff, and family members participated in the prospective, correlational, longitudinal study of nursing homes (N = 110) from two Midwestern states. Measures included characteristics and tracking data to monitor sampling such as urban/rural location, number of deficiencies, bed size, profit/not-for-profit status, turnover of administrators and site coordinators, and the number of attempts to contact study personnel. The number of deficiencies and turnover of site coordinators and administrators predict the likelihood of a nursing home completing the study. Homes with higher deficiencies and turnover will require intensive resources (i.e., staff training, time, and perseverance) for retention in the study. To enhance generalizability, researchers will benefit from considering the resources needed to maintain participation in longitudinal studies.

A MODEL TO EXAMINE END-OF-LIFE CARE IN NURSING HOMES
S. Thompson\textsuperscript{1}, C.M. Buescher\textsuperscript{1}, M.J. Bott\textsuperscript{2}, B. Gajewski\textsuperscript{1}, V. Tilden\textsuperscript{1}, I. College of Nursing, University of Nebraska Medical Center, Omaha, Nebraska, 2. University of Kansas School of Nursing, Kansas City, Kansas, 3. University of Kansas School of Medicine, Kansas City, Kansas

The purpose of this presentation is to describe the theoretical framework, sampling, and methods for the end-of-life study. Using Unruh and Wan’s expanded structure, process, and outcomes model, we examine key organizational structures (e.g., staffing, tenure, deficiencies) and processes (communication, palliative care knowledge, and palliative care practice) and their impact on the quality of end-of-life care for dying nursing home residents and their family members. Quality of end-of-life care is reflected by facility level indicators: use of feeding tubes, hospitalizations, and advance directives; and resident/family outcomes: resident/family centered care, family satisfaction with care, family caregiver strain, resident symptom distress, and resident preferences honored. Data were collected from randomly selected Midwestern nursing homes (N=85), family members (N = 1,282) of deceased residents regarding end-of-life outcomes, and nursing home staff (N = 6,383) regarding communication, palliative care knowledge, and palliative care practices. Descriptive data used in the structural equation model is discussed.

PREVALENCE AND CORRELATES OF PALLIATIVE CARE KNOWLEDGE AND PRACTICES IN U.S. NURSING HOMES
S.C. Miller\textsuperscript{1}, J. Looze\textsuperscript{1}, M. Clark\textsuperscript{1}, M. Clark\textsuperscript{1}, J. Thompson\textsuperscript{2}, V. Mor\textsuperscript{2}, B. Gajewski\textsuperscript{1}, M. Clark\textsuperscript{1}, V. Tilden\textsuperscript{1}, C.M. Buescher\textsuperscript{1}, S. Thompson\textsuperscript{1}, I. College of Nursing, University of Nebraska Medical Center, Omaha, Nebraska, 2. University of Kansas School of Medicine, Kansas City, Kansas

As part of a larger study, we surveyed directors of nursing (DoNs) using selected knowledge and practice questions from the nursing home (NH) “Palliative Care (PC) Survey.” The survey was administered in 2009/10 to a stratified proportionate random sample of 3,697 DoNs nationwide; 2,129 (57.6%) responded. Responses were summed to create PC knowledge and intensity (i.e., practice) scores, and compared with hospice use (from OSCAR) and staffing data (from OSCAR and administrator survey) using Chi-square statistics and ANOVAs. Higher aide and nurse tenure was significantly associated with both higher knowledge and intensity scores. However, higher hospice use, higher RN to nurse staffing ratios and higher aide hours per resident day were significantly associated with higher knowledge only. Further, only higher intensity scores were associated with lower administrator and DoN turnover. It appears NH resources are integral to higher PC knowledge while leadership stability may be integral to higher PC practice.

THE IMPACT OF QUALITY OF END-OF-LIFE CARE IN NURSING HOME: A STRUCTURAL EQUATION MODEL
B. Gajewski\textsuperscript{1}, M.J. Bott\textsuperscript{2}, V. Tilden\textsuperscript{1}, C.M. Buescher\textsuperscript{1}, S. Thompson\textsuperscript{1}, I. College of Nursing, University of Nebraska Medical Center, Omaha, Nebraska, 2. University of Kansas School of Medicine, Kansas City, Kansas, 3. University of Kansas School of Nursing, Kansas City, Kansas

We examine key organizational structures (staffing) and processes (communication, palliative care knowledge, and palliative care practice) and their impact on the quality of end-of-life care for dying residents and their family members. Via facility level structural equation modeling we estimate the: 1) influence on palliative care practice (PCP) of communication and palliative care knowledge (PCK); and 2) associations among structure (staffing), communication, PCK and PCP processes and quality of end-of-life care. Revising the original model using theoretical and empirical evidence results in a model with acceptable fit (CFI = 0.92; RMSEA = 0.05; 90% CI = 0.00-0.08). Relationships between the structural and process variables and quality of end-of-life care are demonstrated. Based on the findings, potential strategies impacting the characteristics of PCP and PCK can be developed for improving resident quality of end-of-life care and tested in future studies.

SESSION 645 (SYMPOSIUM)

OLDER WORKERS IN AN AGING WORKFORCE: A GLOBAL PERSPECTIVE
Chair: A.E. Morgan, Sloan Center on Aging and Work at Boston College, Chestnut Hill, Massachusetts

Many countries today are in the midst of a demographic shift that is pushing up the average age of the workforce. In most of these countries the economic conditions have substantially increased unemployment among older workers (55+). Although many individuals express a desire to remain in or return to paid employment, jobs for older workers have been scarce. In Japan, issues have been raised about the nature of work for older workers and the meaning of retirement. In Australia, concerns have been expressed about adequacy of the labor supply and employers’ response to hiring or retaining older workers. In the United Kingdom, relatively low unemployment has led to labor shortages in some sectors, although many workers are in part-time employment. In the United States older workers who became unemployed during the recent recession have frequently been unable to find new work or took a long time to obtain it and then often at lower pay or in part-time or temporary positions. Panelists will discuss the questions: As the global economy recovers and the workforce ages, will employers increase...
demand for older workers? Have public policy measures affected employer demand for older workers? What factors encourage older workers to remain in or return to the workforce? Is intergenerational conflict a concern if older workers remain in or return to the workforce?

AUSTRALIAN INDUSTRY RESPONSES TO OLDER WORKERS IN A PERIOD OF TIGHTENING LABOR SUPPLY
P. Taylor, Office of the Pro Vice-Chancellor and President, Monash University, Churchill, Victoria, Australia

Continued workforce participation among older workers is viewed as critical to tackling anticipated effects of population aging on economies. Australia avoided the recent global economic downturn, with strong growth and labor shortages forecast. It may therefore be viewed as a case study of attitudes to older workers in a period of tightening labor supply. An Australian Research Council funded survey of 600 public and private sector employers of more than 50 employees carried out in 2010 considered the status of workforce aging in organizational policymaking. Contrasting with earlier studies, Australian employers face labor shortages in specific occupational areas, with older workers viewed as key to their response. Analysis of the factors associated with an orientation (or otherwise) to this potential labor source is reported. While employers had taken steps to address issues of workforce aging, they appeared unwilling to invest in aging human capital in the long-term. Implications for older workers are discussed.

TALENT MANAGEMENT RESPONSES TO THE AGING WORKFORCE: THE CASE OF AMERICAN EMPLOYERS
S. Sweet1, E. Besen2, M. Pitt-Catsouphes2, 1. Sociology, Ithaca College, Ithaca, New York, 2. Boston College, Boston, Massachusetts

We will present findings from the 2009 Talent Management Study, a survey of the employment practices of 696 American employers who operate in the 10 leading sectors of the economy. Nearly one in two of these employers believed that age related concerns will have a negative or very negative impact on their operations. While some indicate serious response to this issue, others appear to be more flat-footed. For example, only one in three employers analyzed the demographic makeup of their organization to a moderate or great extent, and only one in four have a firm grasp on how forthcoming retirements might impact talent needs/availability. We consider why responsiveness to the issue of aging workers varies, as well as how responsive practices vary by industry sector and organization size. We suggest that responses can be directed specifically toward older workers, as well as through the expansion of flexible work arrangements.

AGING WORKFORCE AND BABY-BUMMER RETIREMENT IN JAPAN: INSIGHTS FROM THE WORLD’S MOST AGED SOCIETY
F. Kohlbacher, German Institute for Japanese Studies (DIJ) Tokyo, Tokyo, Japan

Japan is being severely affected by demographic change with a rapidly aging and shrinking population. Companies face the specter of a looming workforce crisis in the form of a potential labor shortage and knowledge loss as experienced employees in the large baby boom cohort retire. Yet older workers often find themselves confronted with a 5-year gap between mandatory retirement age and pension eligibility age. These factors contribute to one of the highest labor force participation rates of older people worldwide. More than 20% of those aged 65 and older are still working. However, a mismatch appears between older workers’ preferences and employment options offered by employers. Public policy measures seem insufficient in redressing the imbalance. This presentation gives an overview of the current situation in Japan, analyzes the reasons and implications of the employer-employee mismatch, and offers conclusions from an international perspective.

SESSION 650 (SYMPOSIUM)

POLICY SERIES: MEDICARE AND THE DEFICIT—A DEBATE ABOUT SOLUTIONS
Co-Chair: J. Rother, AARP, Washington, District of Columbia

This policy session, sponsored by AARP and the GSA Public Policy Committee, will present differing perspectives on how best to control the growing cost of the Medicare program in light of the looming federal deficit. John Rother, Executive Vice President of Policy, Strategy, and International Affairs for AARP, will moderate the session. Presenters will include key policy analysts debating the best solution for addressing the Medicare challenge. Growing concerns about the federal deficit are resulting in a proliferation of plans to help curb Medicare spending. The Medicare program, which covers 47 million people, is expected to spend $519 billion this year and grow to $929 billion in 2020. The proposals to cut Medicare spending, put forth by members of bipartisan deficit-reduction panels as well as Republican lawmakers, aim to help reduce the $1.3 trillion federal budget deficit as well as the mounting national debt. The plans vary greatly in approach and outcome, causing some to fear decreasing coverage and rising costs. Ideas for improvement range from reducing benefits to privatizing the system and giving seniors greater choice. Patricia Neuman, Kaiser Family Foundation, will present the issue and frame options. William Hall, University of Rochester Medical Center and member of the Medicare Payment Advisory Commission (MedPAC), will look at Medicare from a geriatrician’s perspective as well as MedPAC options. Robert Blendon, Harvard School of Public Health, will weigh in on public opinion. John Rother will offer a vision for Medicare’s future.

SESSION 655 (SYMPOSIUM)

RECENT EFFORTS SUPPORTING ASSISTIVE TECHNOLOGIES AND HOME MODIFICATIONS TO REDUCE FAMILY CAREGIVERS’ STRAIN
Chair: C. Gruman, The Lewin Group, Falls Church, Virginia
Co-Chair: P. Doty, Assistant Secretary for Planning and Evaluation, Washington, District of Columbia

Discussant: M. Alwan, LeadingAge CAST, Washington, District of Columbia

Recent studies indicate that physical strain (overexertion, injuries) is an important, overlooked problem for family caregivers of older adults with chronic illness/disability living in the community. Caregivers with physical strain are more likely to report being highly stressed, which increases the risk of nursing home placement. Although a number of programs provide some assistance with assistive technology and home modifications, these efforts are typically uncoordinated and their use among family caregivers has been limited. Learning about, assessing, and paying for devices and home modifications that may assist them remains a challenge for many family caregivers. In this symposium, participants will learn about new research findings and implications for policy from five innovative efforts to bring assistive technology, home modifications, and related training to more family caregivers: An ASPE project that is developing recommendations and a dissemination plan for supporting assistive technologies/home modifications through the National Family Caregiver Support Program (NFCSP) and state Assistive Technology Act Programs, through a literature review, consultation with technical experts and family caregivers, and visits to NFCSP sites; A National Institute on Aging funded intervention providing assistive devices for family caregivers of individuals with dementia, including the assistive devices that families found helpful; A highly successful caregiver intervention demonstration program of the Howard
Effective Strategies for Disseminating Assistive Technology and Home Modification to Help Family Caregivers

This ASPE project, funded by the American Recovery and Reinvestment Act of 2009, reviewed the literature on the use of assistive equipment and home modifications and consulted with technical experts, family caregivers, and National Family Caregiver Support Program (NFCSSP) sites. Interventions found to be important for reducing caregiver stress and increasing independence of older adults included assistive devices, modifications to the home environment, vehicle modifications, and assessment/training. Assistive equipment has been found to yield savings from reduced caregiver injuries and reduced need for assistance. Findings highlight the importance of explaining the benefits of technology to caregivers, making training on assistive technology available to family and paid caregivers and program staff, and selecting devices that fit well in the home and are easy and comfortable to use. While many initiatives have relied on temporary grant/demonstration funds, potential sources for ongoing funds include the NFCSSP, Assistive Technology Act programs, and Medicare.

Helping Families Live with Dementia at Home: The Role of Assistive Devices

L.N. Gitlin, School of Nursing, Johns Hopkins University, Baltimore, Maryland

Assistive devices (AD) are not part of standard care for individuals with dementia living at home or for their family caregivers. However, AD have the potential to ease the physical burdens of caregiving and enhance home safety for patient and caregiver. In a nonpharmacologic intervention trial designed to reduce neuropsychiatric behaviors, 136 of 272 caregiver-patient dyads were randomized to intervention, of whom 63 were determined to need and subsequently receive AD. A total of 197 devices (3 per dyad) were issued of which 87.6% were in use at 4 months. Caregivers reported that overall, devices were “somewhat” to “very helpful.” Devices ranged in cost from $4.80 to $282.93; average device cost was $45.00 representing $152.52 (SD=$102.7) per dyad. Caregivers reported a high rate of device use and overall perceived helpfulness suggesting that simple, low-cost, common assistive devices can be an important component of managing dementia at home.

Better Living at Home Program: A Randomized Trial to Improve Independence and Safety of Older Adults

M. Becker, B. Wright, J. Howard County Office on Aging, Columbia, Maryland; 2. The Lewin Group, Falls Church, Virginia

Public agencies serving older adults are increasingly confronted with the twin challenges of increased demand for services to assist older adults to “age in place” and strained family caregivers and public budgets. Better Living at Home is an innovative approach providing assistive technologies and environmental modifications to older adults in Howard and Montgomery Counties, Maryland. Occupational therapists collaborate with social work case managers and community health nurses to assess participants’ person-environmental fit and recommend ways to improve “fit” to increase independence. The occupational therapist typically conducts two to four follow-up visits and makes modifications as needed to meet the individual’s needs. Using a delay randomized control experimental design, the evaluation found that the program generated an average savings of over $7,000 for each $1,000 spent, reduced the need for personal care services by 48%, and significantly improved functional independence and safety. Training materials are available to support replication at other agencies.

Family Caregivers: Finding and Using Technologies in the Home

K. Kelly, Family Caregiver Alliance, San Francisco, California

Family caregivers often provide direct care of their relative, assist in coordination of services and with finding information to aid in making health care decisions. Often this includes using assistive technologies and home modifications that help with care of the older adult. This presentation will review the common caregiver challenges with finding and using technologies in the home. It will also present the findings and trends from an online survey of caregivers that looks at what types of technologies are being used; where caregivers seek information about technologies used in the home; what factors should be in place for more caregivers to adopt technologies; and suggestions for future developments in this area. Participants will gain an understanding of the current profile of caregivers using technologies; who they look to for information; and what might make using technologies in the home easier in the future.

Session 660 (Symposium)

The Art of Interviewing: Exploring the Qualitative Researcher’s Options

Chair: J. Weil, University of Northern Colorado, Greeley, Colorado
Co-Chair: C.M. Gallooly, St. Joseph’s College, Patchogue, New York
Discussant: L.K. Donorfio, University of Connecticut, Storrs, Connecticut

Qualitative interviewing with elders is a dynamic, interactive process. It involves a complex and adaptive relationship between the interviewer and the respondent. The interview process is also strongly influenced by the interviewer’s perceived role, the setting, and potential changes in the field. The richness of the qualitative approach is that it provides a wide range of techniques that take into account the evolving nature of the interviewing process in the quest for the authentic voice of the respondent. The careful balance of structure, adaptability, and self-reflection built into all qualitative methods adds to the art of the interview. Presenters in this symposium will discuss the application of innovative interviewing styles, changes to the interviewing process based on the interviewer’s role, and how interviewing can artfully adapt to changes in a shifting field setting, such as presented by the environment of dementia. Topics include how “laddering” and means–end theory (once used in marketing) can be applied to understanding leisure-activity choices, issues raised when negotiating the boundaries between the roles of clinician and interviewer, and the use of an adaptive interviewing process during the “shuttering” of a senior center. After attending this symposium, participants will be able to evaluate alternative qualitative interviewing techniques for inclusion in their own research designs, as well as assess the role that the field setting will play in the interview process.

Challenges in the Art of Interviewing: Transitioning from Clinician to Researcher

S. Berger, Occupational Therapy, Boston University, Boston, Massachusetts

Interviewing during qualitative research requires careful observation, focused listening, and guided questioning. This skill set, however, is not unique to qualitative researchers. Clinicians, including nurses, physicians, social workers, and rehabilitation therapists also use interviewing to learn about an individual’s abilities, challenges, and needs. After years as a clinician interviewing clients and listening to their stories with the goal of providing support, guidance, or suggestions to improve health, participation, and quality of life, listening with the
sole objective of learning about the participant’s story requires a change in perspective. This presentation will discuss challenges of and strategies for transitioning from clinician to researcher during qualitative interviewing, sharing examples from the authors own research with older adults with vision loss.

**SESSION 665 (SYMPOSIUM)**

**THE CHANGING POLITICS OF POLICIES ON AGING**

Chair: R. Binstock, Case Western Reserve University, Cleveland, Ohio
Discussant: J. Quinn, Boston College, Chestnut Hill, Massachusetts

Robert Binstock provides perspectives on both the changing political contexts of old-age policies and the “third rail” postulate regarding the voting behavior of older persons. His analysis of detailed exit poll data from the 2010 election suggests that the third rail may have been activated for the first time in modern elections, and he speculates regarding the implications of this development for policy reforms. Andrea Louise Campbell uses a variety of survey data and polls to examine attitudes among senior citizens toward government spending, taxes, the federal budget deficit, cuts in Social Security and Medicare. In addition, she explores variation in attitudes and vote choice among senior subgroups (ideological, partisan, income, gender, etc.) as well as self-interest, affluence, and misperceptions as sources of such variation. John Rother highlights the role that Republican rhetoric about Medicare cutbacks in the Affordable Care Act played in the election of 2010. In this context, he addresses the following questions. Are Medicare cuts still on the policy agenda? Why has the Medicare debate become so politically polarized? Is there a way forward that protects beneficiaries? What Medicare reforms are desirable? Robert Hudson traces how the CLASS Act component of the Affordable Care Act has elevated long-term care Medicare reforms are desirable? Robert Hudson traces how the CLASS Act component of the Affordable Care Act has elevated long-term care

**ETHNOGRAPHY WHILE “SHUTTERING”: INTERVIEWING CENTER-GOERS AS THEIR SENIOR CENTER UNEXPECTEDLY CLOSES**

J. Weil, University of Northern Colorado, Greeley, Colorado

Qualitative methods are responsive to the changing environment of community-dwelling elders interviewed over time in a field setting. The experiences from in-depth interviews as part of a two-year ethnographic study of a Senior Center in New York City are used to demonstrate the way an open-ended interview schedule can be adapted to meet the needs of a group undergoing an unforeseen change. In the case of this study, the change was closing of the field site, the senior center, itself. In-depth interviewing can provide ways to address: participants’ changing perceptions of the interviewer’s role in the shifting setting, different themes arising in interview text due to external changes in the field, the influence of occasional other interviewers, such as journalists or aides to politicians, entering the field, and the effect changes in the center’s management structure has upon the actual interviewing process.

**AFTER HEALTH CARE REFORM, THE TEA PARTY, AND MIDTERMS: WHAT DO SENIORS REALLY WANT?**

A. L. Campbell, Political Science, Massachusetts Institute of Technology, Cambridge, Massachusetts

This presentation uses a variety of survey data to examine attitudes among senior citizens toward government spending, taxes, the federal budget deficit, and entitlement reform. On the one hand, older Americans were highly visible participants in Tea Party rallies across the nation in 2009 and 2010 and heavy voters in the 2010 election which diminished Democratic power in the Senate and gave Republicans control of the House. On the other hand, polls show majorities of senior citizens (and younger respondents) wary about cuts to Social Security and Medicare. This paper explores variation in attitudes and vote choice among senior subgroups (ideological, partisan, income, gender, etc.) and explores self-interest, affluence, and misperceptions as sources of such variation.
MEDICARE: WHAT NEEDS TO HAPPEN; WHY IT’S SO DIFFICULT
J. Rother, AARP, Washington, District of Columbia

Medicare was a political football in the 2010 election cycle, and played a major role in the election of a new Republican majority in the House. Candidates repeatedly cited their opposition to the “$500b in Medicare cuts” contained in the Affordable Care Act. Now that they have been successful, are Medicare cuts still on the table? Why has the Medicare debate become so politically polarized? Is there a way forward that protects beneficiaries? What Medicare reforms are desirable?

BRINGING CLASS TO LONG-TERM CARE
R. Hudson, Social Work, Boston University, Boston, Massachusetts

ABSTRACT: The CLASS Act remains an under-appreciated component of the Affordable Care Act. Politically, its passage was unexpected. Programmatically, it gives unprecedented prominence to long-term care concerns within the world of health and social policy. Conceptually, the CLASS Act, being predicated on the principles of social insurance, has added a third leg of protection, however shaky it may be, to those supporting income and acute care needs. This presentation addresses the conceptual element, tracing and analyzing how the CLASS Act elevates long-term care from a residual to an institutional standing. The Act transforms understandings of the populations served, the definition of the problem being addressed, and the underlying purpose of the program itself along several critical dimensions. Regardless of the legislation’s ultimate fate in these politically charged times, these conceptual advances should be cataloged and celebrated.

SESSION 670 (SYMPOSIUM)

INSIGHTS INTO GENETICS AND NUTRITION IN THE LONG-LIVED
Chair: B. Willcox, University of Hawaii, Honolulu, Hawaii
Co-Chair: C. Bell, University of Hawaii, Honolulu, Hawaii

How does ones’ genetics contribute to life span? If I eat the right foods or less food, will I live longer? This session addresses our longest-lived populations and the studies that bring this information to light. The potential genetic and nutritional factors that may be responsible for or are linked to the observed longevity in these populations will be presented. Details of the projects involving centenarian populations in Georgia and Okinawa, Japan will be highlighted as well as the factors related to diet and genetics in a relatively homogeneous population of long-lived people will be covered.

RELATIONSHIP BETWEEN LONGEVITY GENES AND LIFESTYLE FACTORS AMONG PEOPLE WITH EXCEPTIONAL LONGEVITY
N. Barzilai, J. Crandall, Medicine and Genetics, Albert Einstein College of Medicine, Bronx, New York

Despite evidence for a substantial genetic component, the inherited biological factors that promote extended life span (longevity) in humans remain unknown. We have comprehensively characterized over 500 Ashkenazi Jewish subjects with exceptional longevity and have identified several biological markers that may be causative in their longevity. We assessed the role of lifestyle factors in these subjects at retirement age and found that rates of overweight (43% & 34%), smoking (60% & 30%), physical activity (43% & 44%) in men and women (respectively) where generally worse over that reported in their cohort (Nfanes1), overweight (43% & 25%), smoking (78% & 26%) physical activity (57% & 44%) in men and women (respectively), and only 2.3% were vegetarians. Thus, subjects with exceptional longevity are not distinct in terms of lifestyle factors compared to general population. These data suggest a possibility that genetic factors associated with longevity may protect individuals from the detrimental effects of the environment.

NUTRITION AND HEALTHY AGING IN OKINAWA:
ENERGY BALANCE, DIETARY FACTORS, AND EXCEPTIONAL LONGEVITY
B. Willcox1,2, D.C. Curb1,2, Q. He1, M. Suzuki1, D. Curb1,2, R. Chen1,
1. Department of Research, Kuakini Medical Center, Honolulu, Hawaii, 2. Department of Geriatric Medicine, University of Hawaii, Honolulu, Hawaii, 3. Okinawa Research Center for Longevity Science, Urasoe, Okinawa, Japan, 4. Okinawa International University, Ginowan City, Okinawa, Japan

“Dietary or caloric restriction” (CR) is the most robust intervention for extending lifespan and healthspan in model organisms but few data exist in human populations. Therefore, we assessed more than six decades of epidemiologic and clinical data from the Okinawa Centenarian Study database for evidence of CR, and other candidate nutrition-related-factors, implicated in longevity. Principal analyses included diet variables, anthropometry, bloodwork, trends in population energy balance, mean and maximum lifespan. The Okinawan diet was high in vegetables, legumes and most antioxidant micronutrients and lower in calories compared to the Japanese diet. Evidence for CR was found until the 1970s; thereafter energy balance became positive with concomitant increases in height, body weight and BMI. Biodemographic analysis revealed marked reductions in age-related diseases and extension of both mean and maximum lifespan. This work is consistent with an effect of nutrition on lifespan and healthspan in humans.

NUTRITION AND LONGEVITY IN THE KUAKINI HAWAII LIFESPAN STUDY: DIET, GENES AND ENERGY-SENSING PATHWAYS
C. Bell1,2, K. Masaki2, Q. He1, T. Donlon1, D.C. Willcox1,2,3
1, 2. Department of Research, Kuakini Medical Center, Honolulu, Hawaii, 2. Department of Geriatric Medicine, University of Hawaii, Honolulu, Hawaii, 3. Okinawa Research Center for Longevity Science, Okinawa, Japan, 4. Okinawa International University, Okinawa, Japan

“Dietary restriction” is the best known nutritional intervention affecting healthspan and lifespan in model organisms. However, nutrition-related factors that might affect human aging are poorly understood. Candidate nutrition-related factors from model organisms and prior human studies (e.g. Okinawa Centenarian Study) were assessed in the Kuakini Hawaii Lifespan Study dataset. Promising factors were studied for prospective effects on survival and healthy survival using regression models in up to 8,006 men. Participants were aged 45-68 years at the baseline (1965) exam and were followed for up to four decades. Significant correlates of survival and healthy survival were found including markers of energy balance, several micronutrients, fasting glucose, insulin sensitivity, and alleles from the FOXO3A energy-sensing gene. This work provides support for nutrition-related effects on lifespan and healthspan in humans and suggests a possible role for energy-sensing pathways. More study is needed of nutrition-related factors and biological pathways in healthy human aging.

A SYSTEMS APPROACH IN THE UNDERSTANDING OF MECHANISMS OF LONGEVITY
L. Poon1, M. Johnson1, J. Arnold2, P. Martin2, S. Jazwinski2,
1. Institute of Gerontology, University of Georgia, Athens, Georgia, 2. Iowa State University, Des Moines, Iowa, 3. Tulane University, New Orleans, Louisiana

It is well known among centenarian researchers that longevity is a function of many and interactive effects among a host of bio-physiopsychosocial contributors and no one or two factors could adequately explain the variance accounted for in longevity. This presentation will outline the interdisciplinary approach employed by the Georgia Centenarian Study and describe the direct and indirect effects of health, chronic diseases, functional capacities, genetics, cognition, personality, social and
environmental support systems, as well as distal and proximal life events on longevity.

SESSION 675 (PAPER)

AGEISM, AGE IDENTITY, AND SELF-IDENTITY

THE WEAKTEST AGE
H. Suth. Centre for the Study of Group Processes, University of Kent, Canterbury, United Kingdom

Although negative stereotypes of old age are quite pervasive, people are often reluctant to express prejudice overtly. Previous research established that older people are stereotyped as being less capable than younger people, but there is no previous observational evidence of how these stereotypes might actually affect discriminatory behaviour. Here we investigate whether ageism is expressed powerfully but implicitly through one of the most powerful and painful forms of discrimination, namely exclusion from a social group. Based on psychological theories of stereotyping and prejudice we investigate whether ageism is manifested behaviourally even in the presence of objective evidence that older people are performing well. Using as our database the voting decisions of 900 players in 100 consecutive episodes (and over 4000 votes) in the television quiz show ‘The Weakest Link’, we examine how contestants’ age affects which others they vote out of the game and whether they are voted out themselves. Here we show that people aged 55 and over are more likely to be voted out of the game than are those aged under 55. Contestants aged under, but not over, 55 also vote for people older than the average age of all contestants. These results are found after controlling for contestants’ performance and hesitancy as well as gender, ethnicity, and perceived attractiveness. The evidence shows that ageism is a powerful force that can result in the unjustified exclusion of, and discrimination against older people.

LIFE COURSE TRANSITIONS AND THE FUTURE OF FANDOM
C. Harrington, D. Bielby, A. Bardo, J. Sociology and Gerontology, Miami University, Cincinnati, Ohio, 2. University of California Santa Barbara, Santa Barbara, California

This paper extends an ongoing project on aging and fandom, where we argue that fans’ identities, practices, and interpretive capacities have more age-related structure than has previously been addressed in fan studies (Harrington & Bielby, 2010). In this paper we link the disparate fields of gerontology and media studies by examining population aging and restructuring of the life course, on the one hand, and the changing role of media and media fandom in people’s lives, on the other, as dual processes that inform and shape one another. We accomplish this by first summarizing our prior research findings, then by arguing that the marketing industry’s construction of adulthood and late(r) life is directly relevant to older adults’ negotiation of aging in the 21st century. We find that age-based marketing strategies and the role of fandom in navigating our current climate of multiple and evolving life course formations has a major impact on life course and media scholarship. For example, the disconnect between chronological age and subjective age has been noted by media and life course scholars for some time, but developmental considerations in media content directed at older adults have not. Because individuals increasingly draw on media content and fan objects to help make sense of their own aging process through the fashioning of self-narratives, we aim to inform gerontological scholars of the important relationship between media and aging through a multidisciplinary approach that utilizes a life course perspective to better understand how fictional texts, characters, and textual fragments serve as anchors to fans’ lives as they age.

POSSIBLE SELVES IN ACTION: PROMOTING SOCIAL GOAL PROGRESS FOR OLDER ADULTS
H. Ko, S. Mejia, S. Choun, T. Pham, R. Metoyer, K. Hooker, Oregon State University, Corvallis, Oregon

Hoped-for and feared possible selves are cognitive representations and are theoretically tied to motivation to pursue goals. Past research has shown that the social domain is one that is particularly important for goal pursuits in late life. We hypothesized that having social possible selves would predict goal progress in achieving a social goal. Being balanced (having both hoped-for and feared possible selves in the same domain) was predicted to provide the strongest motivation for goal progress. Since goal progress was self-reported, we measured optimistic tendencies with the LOT-R and all analyses controlled for optimism. Data were collected as part of the Personal Understanding of Life and Social Experiences (PULSE) project (n=105, mean age= 63.13, SD= 7.8), a 100-day study that followed participants via web-based surveys. At baseline, participants reported two of their most important hoped-for and feared possible selves and provided a social goal which they planned to work on during the study time period. Participants completed brief on-line surveys and rated their progress towards social goals. Those with balanced social possible selves had significantly higher averaged daily social goal progress than those with no social possible self or only a hoped or feared self in the social domain (p< .001). Possible selves in the social domain may guide daily actions to meet social goals most effectively if there is both an achievement focus (hoped-for self) as well as a focus on regulation of loss (avoid a feared self). These results are discussed in light of life-span theories of motivation.

IS SELF-PERCEIVED AGE CULTURE-FREE? A CROSS-NATIONAL STUDY OF AGE IDENTITY AND COGNITIVE AGE
F. Kohlbacher, L. Sudbury, A. Hofmeister, J. German Institute for Japanese Studies (DIJ) Tokyo, Tokyo, Japan, 2. Liverpool John Moores University, Liverpool, United Kingdom, 3. Corvinus University of Budapest, Budapest, Hungary

Self-perceived age has emerged as a key variable in studying older people around the globe. The sparse number of studies that have investigated this type of self-concept in cross-national settings have concluded that it is culture-free. Using data from an empirical study in four different countries (Japan, Germany, UK, Hungary), we challenge this view and thus aim to make a contribution to knowledge on self-concept of older adults on an international scale. Using random samples from the four culturally disparate nations, 1368 usable questionnaires were received measuring self-perceived age with two instruments: age identity (Cavan et al. 1949) and cognitive age (Barak & Schiffman 1981). We found the “young at heart” philosophy to be true for older adults in all four nations under study, with the vast majority of seniors feeling middle-aged, not yet ready to admit they feel old. Moreover, many of the patterns to emerge have similarities to research in the US in that there is little agreement between cognitive and chronological age, with a strong youth bias. Likewise, the expectation that the look age dimension would be closest to actual age than any of the other self-perceived age dimensions emerged in all the samples with the exception of Hungary. However, significant differences found between the nations were also found, thus challenging the culture-free view. The youth bias ranged from 4–10 years and Japanese and Hungarian seniors are more likely to admit to being old than are their British and German counterparts.
SESSION 680 (PAPER)

CAREGIVERS AND CARE RECEIVERS: INTERACTIONS AND IMPACTS

RESEARCH AND PRACTICE: ENABLING KNOWLEDGE TRANSFER TO RESIDENTIAL CARE HOMES
I.A. Eyers1, S. Arber2, 1. Zentrum Altern und Gesellschaft, University of Vechta, Germany, Vechta, Germany, 2. University of Surrey, Guildford, United Kingdom

Based on the experiences of a study of sleep in residential care facilities for older people, this paper presents the development of knowledge and the resulting transfer to practice amongst care staff. The study aimed to identify the determinants of poor sleep experienced by old people living in residential care. Using mixed methods, research was undertaken in 10 English care facilities. Data were collected from 183 male and female residents aged 65–100 (mean age 85–90). For two weeks participating residents wore actiwatches and diaries denoting their daily activities were maintained. In addition, 240 hours of dawn, dusk and night time observations, and interviews with 50 care staff were conducted. The analysis of the quantitative actiwatch and diary data identified that the participants were experiencing fragmented sleep and spending up to 13 hours in bed. The qualitative data analysis indicated that these factors were related to care giving routines and processes. In two workshops with almost 200 participants from the residential care sector, the findings were presented and discussed. Contact has been maintained with participating organisations and senior care service managers. There is evidence that a greater awareness of the importance of sleep has taken place and the knowledge transfer has resulted in care staff who attended the workshop passing for thought and restructuring service delivery. This research is supported by the New Dynamics of Ageing initiative, a multidisciplinary research programme funded by AHRC, BBSRC, EPSRC, ESRC and MRC (RES-339-25-0009)

SOCIAL CONNECTION FOR RESIDENTS IN LONG TERM CARE: THE IMPACT OF CAREGIVER INTERACTION
E. Roberts, Human Environmental Sciences, University of Missouri-Columbia, Columbia, Missouri

Often in long term care, individuals who are socially isolated are not approached much by caregivers to participate in activities with other residents. In a sense, the caregivers take the attitude that, “She never wants to go out, so I’m not going to bother her.” Past studies have shown that staff attitudes and actions can enhance or diminish a sense of social connection for residents, thus defining that the care of older people should be shaped around maintaining social connectedness and promoting integration of residents. The goal of this study was to better understand the role of caregiver interaction with residents living in long term care, specifically, how these interactions helped create social opportunities for residents. The study took place at a 70-bed skilled nursing facility in the southeastern region of the United States, with observations and staff interviews conducted over a three month period. The data was analyzed and coded and several constructs relating to the impact of caregiver interaction emerged including: (1) caregiver empathy, (2) resident trust of caregivers, (3) resident sense of personal control, and (4) functional operations of the facility. While no interaction will ever be the same as another, there are essential links in caregiver interactions that can be pulled from this research and used in further studies about caregiver participation in the long term care resident’s world.

UNDERSTANDING MEANINGS OF CARE FROM ELDER CARE RECIPIENTS (ECRS) LIVING IN LONG-TERM CARE: A GENDERED PERSPECTIVE
R.A. Siden, Sociology, Case Western Reserve University, Chardon, Ohio

Throughout the care literature, the meanings of care produce a partial and fragmented picture of what care is simply because the perspectives of care recipients have been neglected in defining and understanding the concept of care. Although theoretical frameworks of care speak to the problems or benefits of that framework (see Hochschild 1993, Tronto 1993, Ungerson 1997, England 2005), addressing important questions; however, the questions encompass concerns for or about the care worker(s) or care provider(s). Thus, care is typically understood and defined from the perspective of care professionals or experts, leaving the nature of care itself and the experience of being cared-for unexamined. For this paper, I present meanings of care that include and capture the experiences of being cared-for (or the lack thereof) by elder care recipients. Specifically, since males and females experience care differently throughout the life course, it is not surprising to see gender differences in meanings of care and how it is experienced among male and female residents living in LTC. The data for this paper were collected from 39 (20 females, 19 males) intense semi-structured interviews, conducted between May 2010 and January 2011.

HOW SOCIAL FACTORS AND CAREGIVING INFLUENCE SLEEP QUALITY IN LATER LIFE
S. Arber, R. Meadows, Sociology, University of Surrey, Guildford, United Kingdom

Background: The impact of providing care for older or disabled relatives has been widely studied, but limited attention has been paid to how caregiving influences the sleep quality of carers. Objectives: This paper analyses (i) the socio-economic pattern of self-reported sleep quality in later life (age >65), and (ii) how caregiving impacts on sleep quality and duration in later life. Methods: We analyse the sleep patterns of older people (n=3131, aged >65) in the British Understanding Society survey for 2009.1. Self-reported sleep duration (hours and minutes), sleep latency (unable to get to sleep within 30 minutes), problems of sleep maintenance (waking at night or early in the morning) and sleep quality are analysed using nested logistic regression models, which included gender, age, marital status, hours of caregiving, education, income, housing tenure, self-reported health and health limitations. Results: Strong associations are found between living in disadvantaged circumstances and short sleep duration, poor sleep quality and reported sleep problems. Older people with less education, lower income and living in public housing are more likely to report poor sleep. There is a linear association of hours spent providing co-resident caregiving with poorer sleep quality, which is not moderated following adjustment for co-variants. Non-resident caregiving had no effect on sleep quality. Conclusions: Practitioners need to recognise the adverse effects of co-resident caregiving on the sleep of caregivers. 1. The SomnIA project is funded by the New Dynamics of Ageing initiative, supported by AHRC, BBSRC, EPSRC, ESRC and MRC (RES-339-25-0009).

PREDICTING COVARYING DEPRESSIVE SYMPTOMS IN LUNG CANCER DYADS OVER TIME
K.S. Lyons1,2, S. Hiatt1, J. Bennett1,3, S. Hickman4, L. Nail1,3, E.K. Fromme1,2, L.M. Miller1,3, 1. Oregon Health & Science University, Portland, Oregon, 2. Indiana University, Indianapolis, Indiana, 3. School of Nursing, Portland, Oregon, 4. School of Medicine, Portland, Oregon

Lung cancer will contribute 15% of all new cancer cases and 29% of all cancer deaths in the United States. Approximately 58% of lung cancer patients die within 1 year of diagnosis with a 5-year survival rate of 16%. This rapid trajectory, and the difficult decisions families are often faced with, heighten the need for early intervention in this end-of-life population. The goal of the study was to examine covarying trajectories of depressive symptoms within lung cancer dyads over time, and identify early-warning risk factors. Lung cancer dyads were recruited through a cancer registry using rapid case ascertainment 1-6 months post-diagnosis (M=4.15; SD=2.8). Baseline data indicated a moderate level of depressive symptoms for patients and family members, with 25% and 28% above clinical cut-offs respectively. Longitudinal data
from 114 dyads were analyzed using multilevel modeling. Results revealed that, on average, patient and family member depressive symptoms remained relatively stable over the first six months, although there was significant variability around the average (p < .001). Controlling for stage of disease, patient age, and family member role, level 2 models found patient concealment, family member role overload, communication problems, and a negative family decision making process played significant roles in predicting baseline depressive symptoms and change over time. As expected, depressive symptoms within dyads was moderately correlated. Findings will be discussed in regard to identifying those families and patients most at risk, the role of patient symptoms over time, and need for communication-based interventions for such vulnerable end-of-life populations.

SESSION 685 (PAPER)

COGNITION: LIFESTYLE AND OTHER INTERVENTIONS

MEMORYWORKS: AN EVALUATION OF A BRAIN FITNESS PROGRAM FOR PEOPLE WITH DEMENTIA
T. Abramson, Center for Gerontology and Geriatrics, NYIT, Old Westbury, New York

Brain health and brain fitness programs emphasize a proactive approach to maintaining or maximizing one’s cognitive functioning. Program efficacy evaluations are lacking. “Memory Works,” developed by the NYC Chapter of the Alzheimer’s Association, includes people in the early stages of dementia. The program provides cognitive stimulation, socialization, and a safe environment for participants. To assess program efficacy, both standardized instruments and subjective reports were obtained for the 26 participants across three groups. The results revealed no significant differences on the MMSE, with only 8% reporting some minimal depression. All three groups rated their satisfaction with their quality of life as “good” with one group slightly higher in their scores on the Dementia Quality of Life Scale. Subjective reports indicate that participation in the program is a positive experience and beneficial for both the diagnosed person and their caregiver. Those diagnosed report feeling that their “brains are stimulated,” the group gives them something they don’t get elsewhere, and they feel useful, less depressed, and more confident when participating in Memory Works.

LIFESTYLE AND LIFESPAN: CONTINUING MEANINGFUL ENGAGEMENT AND INTERACTIONS AFTER THE DIAGNOSIS OF DEMENTIA
S. Bolin1, H. Menne1, C.J. Whittach2, 1. Alzheimer’s Association, Northwest Ohio Chapter, Toledo, Ohio, 2. Benjamin Rose Institute, Cleveland, Ohio

As more individuals are diagnosed with early stage dementia, programs that have been thoroughly evaluated must be offered. These programs provide meaningful impact for individuals so they can continue to maintain their lifestyle while living with a progressive, degenerative disease. Early stage dementia programs need to be developed and evaluated through a framework which not only measures the effectiveness of the program but also assesses recruitment, agency integration, impact, program maintenance and sustainability. This presentation outlines the utilization of the RE-AIM framework in the development and evaluation of early stage programs that provide social engagement, mental activity, coping skills and education. Twenty-four families evaluated up to five different early stage programs. Preliminary analysis shows that after a program the individuals with dementia had improved mood as demonstrated in a smiley face assessment and the Geriatric Depression Scale, while caregivers also had improved mood based on the smiley face assessment. In response to a program, 92% of caregivers were considering engaging the individual with dementia in other activities (e.g., crafts, outings with friends, local baseball games.) Caregiver responses to sustainability questions indicated that families would prefer a program fee versus an annual fee, and programs held at the Alzheimer’s Association offices are preferred over other locations. Discussion will include important strategies for program development, meaningful impact, and sustainability. With the incidence of dementia increasing each year, diverse programs must be readily available to meet the needs and support individuals as they maintain quality of life for the remainder of their lifespan.

SOCIAL INTERACTION AS AN EFFECTIVE TOOL FOR DEMENTIA PREVENTION: SIX-YEAR FOLLOW-UP STUDY
T. Anne, Y. Kawashima, University of Tsukuba, Tokyo, Japan

Objectives One of the biggest issues for the LTC insurance in the middle to long run is the budget shortage for LTC services. For the moment, emphasis is being placed on prevention-oriented services which help prevent seniors from becoming dependent by intervening while their need levels are still low. This six-year follow-up study was designed to analyze the relationship between social interaction and the prevention of dementia. Method All participants (aged 65 years and above) lived in farming communities near major urban centers in Japan (n = 558). The contents of the questionnaire covered social interaction (using an index of social interaction constituting 18 items), health status, physical function, family structure, life events, age, and gender. Results After the baseline survey, 108 subjects were analyzed within the six-year period: (1) baseline age and physical function were related to dementia; (2) greater social interaction was positively related to reduced dementia; (3) the multiple logistic regression analysis adjusted for baseline age, gender, and physical function indicated that low frequency of newspaper reading was related to increased dementia. Discussion These findings highlight the importance of social interaction in dementia prevention. The introduction of new services such as “strengthening of social ties” and “nutritional support” represent initial steps in establishing systems that enable elderly persons to live independently with dignity. An ongoing longitudinal study of elders in one community demonstrate that prevention-oriented services are essential to improving the healthy longevity of citizens, and that seniors will accept such services.

MODIFIABLE BEHAVIORAL RISK FACTORS ASSOCIATED WITH COGNITIVE PERFORMANCE OVER TIME
A. Eisenstein1,2, T. Prohaska¹, S.E. Furner¹, J. Beaumont1,3, 1. University of Illinois at Chicago, Chicago, Illinois, 2. Rush University Medical Center, Chicago, Illinois, 3. Northwestern University School of Medicine, Chicago, Illinois

Decreasing the prevalence of dementia is a public health priority. As a result, public health professionals are turning to modifiable lifestyle behaviors including physical, social, and cognitive activities, smoking, and alcohol use, to examine their potential in postponing or preventing the onset of cognitive decline and Alzheimer’s disease. Research findings on the relationship between cognition and lifestyle behaviors remain inconsistent and controversial. Through the use of data from the Health and Retirement Study, a nationally representative sample of older adults, this study explores the unique and combined contribution of these five behavioral risk factors at one time-point on cognitive performance and diagnosis of a memory-related disease 7 years later. Participants include 2037 adults aged 60+ at baseline. At the bivariate level, cognitive activity, alcohol consumption, and a cumulative lifestyle behavior index were significantly associated with cognitive score (P<.0001), while none of the behaviors were associated with diagnosis of a memory-related disease. After adjusting for demographic characteristics and health-related factors, engaging in cognitive activity remained associated with higher cognitive performance (P<.0001). At the multivariate level, the lifestyle behavior index was no longer significant for either outcome, however, there was a significant interaction between age and lifestyle behavior.
on diagnosis of a memory-related disease. That is, behavioral risk factors were found to have a greater influence on the diagnosis of a memory-related disease among older study participants compared to younger participants. These findings suggest that cognition is influenced by modifiable risk factors and suggests target populations for behavior and cognitive interventions.

CARDIORESPIRATORY FITNESS PREDICTS COGNITIVE ABILITIES IN LATE ADULTHOOD

Successful cognitive aging along certain dimensions has been related to early and mid life-span experiences, such as education and physical activity. In the present study, we focus on the role of cardiorespiratory fitness as a lifestyle factor that could explain successful aging. Participants were 181 older adults who were tested on a series of cognitive abilities (memory, executive control functions and vocabulary) as well as fitness measures (physical activity, body mass index and cardiorespiratory function). First, we examined whether casual relationships exist between fitness and various cognitive abilities that decline with age, i.e., short-term/working memory and two types of executive control functions, viz., inhibition and switching, as well as the cognitive abilities that stay relatively stable across lifespan (verbal abilities or vocabulary). Second, we explored the differential mediating effects of various types of fitness and physical activity measures. Using structural equation modeling approach, we find age-related declines in memory and executive control functions, but not verbal abilities or vocabulary, and these age-related declines cannot be attributed to an inactive lifestyle as assessed by a physical activity questionnaire, but to poorer cardiorespiratory function, which is a better and more objective measure of physical fitness.

SESSION 690 (PAPER)

SELF-MANAGEMENT OF CHRONIC ILLNESS IN LATE LIFE

FACTORS WHICH INFLUENCE DIABETES SELF-MANAGEMENT IN OLDER ADULTS UNDERGOING TREATMENT FOR CANCER

D.S. Hershey1, B.A. Given2, C.W. Given3, W. Corser2, A. von Eye1, 1. College of Human Medicine, Dept of Family Practice, Michigan State University, East Lansing, Michigan, 2. College of Nursing, Michigan State University, East Lansing, Michigan, 3. Department of Psychology, Michigan State University, East Lansing, Michigan

The purpose of this study was to identify factors which influence the performance of diabetes self-management behaviors in older adults with a solid tumor cancer who are undergoing chemotherapy. This pilot study utilized a written baseline survey and a follow up telephone survey to assess the relationship between individual (sociodemographic), clinical (diabetes and cancer specific) and behavioral (self-efficacy, outcome expectancies, depression/anxiety) characteristics and the performance of diabetes self-management behaviors. A total of 41 individuals with a solid tumor cancer or lymphoma were enrolled from eight different community cancer centers in Michigan and Ohio. Linear regression was utilized to identify potential predictors associated with performance of diabetes self-management behaviors. The individual’s age and level of self-efficacy were found to be significant (p < .05) predictors related to the performance of self-management behaviors at baseline. Older adults and those with higher levels of self-efficacy were more likely to perform self-management at baseline. At 8 weeks years with diabetes, baseline self-management and number of comorbidities were all significantly (p < .05) predictive of the performance of self-management behaviors. Significant (p<.05) differences between baseline and 8 week performance levels of specific self-management behaviors were found, with individuals being less likely to perform certain behaviors at 8 weeks. As healthcare providers we need to better assist our patients with being able to co-manage two different chronic conditions, in which the management of one may impact how an individual manages the other, in order to prevent possible complications and improve overall quality of life.

THE INFLUENCE OF COMORBIDITIES ON USE OF SYMPTOM MANAGEMENT STRATEGIES

S. Spoelstra1, C.W. Given2, M. You1, 1. College of Nursing, Michigan State University, East Lansing, Michigan, 2. Michigan State University, College of Human Medicine, East Lansing, Michigan

This research examines 552 solid tumor cancer patients undergoing chemotherapy, the impact of comorbidities on patient’s use of management strategies for 15 common symptoms during treatment. After adjusting for age and intervention mode, number of comorbidities was significantly related to number of symptoms threshold; ranging from 5.5-7.5 (no comorbidity to 3+). However, numbers of comorbidities had no impact on patients trying proposed strategies. To determine if age adjusted numbers of comorbidities influenced proportion of symptoms, severe, moderate, mild cut-points were applied and responses were defined as moving from severe to moderate/mild, or moderate to mild. Mean response rates among patients with 3+ comorbidities were 0.68, with 2 were 0.76, 1 was 0.77, and no comorbidities 0.77. To understand this further we examined fatigue weakness, pain, and insomnia symptom response among patients with varying levels of comorbidity. Patients who had 3+ comorbidities had the greatest proportion (8% more) of symptoms that were severe at onset. Finally, at the last intervention contact, those with 3+ comorbidities had the highest percent of severe symptoms that were lowered to a moderate level of severity; and the smallest percent that moved from severe to mild. In sum, comorbid conditions place extra symptom burden on cancer patients and are associated with lower rates of symptom response. Future trials on symptom management and survivorship need to take into careful account the comorbid conditions patients bring to their treatment and interventions.

PATIENT DECISIONS TO ELECT KNEE REPLACEMENT SURGERY TO TREAT KNEE ARTHRITIS: RESULTS OF A STATED-CHOICE EXPERIMENT

We conducted a stated-choice experiment to examine how patients make decisions concerning full knee replacement as a treatment for osteoarthritis. Our study illustrates an innovative, widely-applicable method to conduct stated-choice experiments to study complex decision-making processes. Because we use the internet to administer vignette experiments, we are able to deliver both general information and manipulate experimental variables through video clips. The approach helps in engaging study participants and delivering emotional content. We can also provide participants with interactive opportunities to extend the information they consider in making choices. Employing a fractional factorial experimental design, we examined how pain experienced by patients, opportunity costs associated with rehabilitation, recommendations of surgeons, second opinions, and patient testimonials affect decisions. The experiment was administered to 500 middle-aged and older members of the American Life Panel, a representative national sample. In the study, research participants were asked to make recommendations regarding surgery for vignette persons with knee osteoarthritis who appeared in video clips. Research participants also received background information about treatment options. They heard recommendations of physicians and testimonials of patients who had experi-
enanced surgery. Our major findings were that the extent of pain experienced by patients, anticipated opportunity costs associated with surgery, physician recommendations, and second opinions all affected recommendations made by research participants. However, research participants were not influenced by patient testimonials. The results have implications for methods used in educating patients who are considering knee replacement and other major discretionary surgery.

INTERNET USE AND ISSUES OF SELF-CARE AMONG MIDDLE-AGED AND OLDER ADULTS WITH CHRONIC CONDITIONS

Background: Alongside increasing rates of chronic conditions in the United States, the emergence of internet-based resources offers additional sources to share experiences, gather information, and overcome traditional barriers to self-care. Methods: Data were analyzed from 1,000 middle-aged (age 44-64; 64.5%) and older adults (age 65+; 35.5%) with one or more chronic conditions who completed the National Council on Aging/California HealthCare Foundation Chronic Care Survey. Multinomial logistic regression and binary logistic regression were used to identify associations between sociodemographics, self-care barriers, healthcare-related frustrations, and internet utilization. Results: Approximately 64% of participants reported using the internet and 42.7% reported relying on the internet for ongoing help and support to improve their health and manage health problems. Compared to older adults, a significantly larger proportion of middle-aged adults used the internet (43.5% versus 76.2%, respectively). Compared to internet non-users, frequent internet users were significantly less likely to be older adults (OR=0.22), racial/ethnic minorities (OR=0.36), and rural residents (OR=0.44). Frequent internet users reported fewer chronic conditions (OR=0.75) and barriers to self-care (OR=0.80). Among internet users, frequent users reported significantly fewer self-care barriers (OR=0.81) and frustrations with healthcare provider interactions (OR=0.89). Frequent users reported more interest in gathering health information from health organization websites (OR=1.64) and engaging in online chats/di

COMPARING AN ADAPTED (VS. ORIGINAL) SELF-MANAGEMENT PAIN PROGRAM: IS ADAPTATION ALWAYS NECESSARY?

A growing body of research suggests that adapting evidence-based programs for use by specific groups can improve their reach and effectiveness. To date, little research has determined whether adapted programs produce superior results when compared with the original (unadapted) program. We used community-based participatory research (CBPR) methods to adapt an evidence-based, self-management program, i.e., The Arthritis Self Help Program (ASHP), for use by three groups of older persons: African American, Hispanic and non-Hispanic white adults. This study compares the effects of the adapted (vs. original) ASHP among older persons (age 60 and above) with pain. Participants (N=201) reported the presence of a non-cancer pain disorder and were recruited from 7 New York City senior centers; each center served one predominant race/ethnicity group. Process outcomes included class attendance and drop-out rates. Efficacy outcomes included measures of pain, mood, function, self-efficacy and number of days participants spent practicing the stretching, endurance and relaxation exercises learned in class. Statistically significant differences in favor of the adapted program were noted with respect to attendance and drop-out rate (p<0.05). In addition, the adapted (vs. original) program produced superior outcomes in mood score (p <0.05). However, both programs produced statistically and clinically meaningful change scores (pre- vs. post-course) with respect to other outcomes, including pain intensity, mood, self-efficacy, pain-related disability, and days spent practicing the exercises. No consistent race/ethnicity effects were observed. These results suggest that the cost and effort to adapt evidence-based programs may not always result in justifiable gains in outcome.

SESSION 695 (SYMPOSIUM)

ADVANCES IN THE CONCEPTUALIZATION OF SOCIAL CAPITAL AND UNDERSTANDING ITS RELATIONSHIP TO HEALTH OUTCOMES AMONG OLDER ADULTS
Chair: J. Norstrand, Social Work, Boston College, Newton, Massachusetts
Discussant: C. Phillipson, Keele University, Keele, Staffordshire, United Kingdom

Research has demonstrated links between social capital (SC) with health; yet, the exact nature of this relationship is still debated. This is partly due to under-conceptualization of SC. Thus, it is imperative that attention be paid to how SC is conceptualized and how this may impact its relationship to health. As SC is often emphasized in terms of social relationships between groups of people it may be considered tied to social organization and sets of norms and values; and these differ from nation to nation. Cross-national perspective may be the best way to identify commonalities that would enhance ability of future studies to do reliable cross-national comparisons. Goal of this session will be to further the discussion on best ways of conceptualizing SC for older adults across multiple countries. Koutsogeorgou and colleagues’ study compares relationship between structural and cognitive SC and self-reported health across Finland, Poland and Spain, taking into account for sociodemographic factors. Another study by Poulsou and colleagues from Denmark, conceptualizes SC in terms of bonding, bridging and linking; and here relationship to functional health is examined. Sirven and colleagues’ study provides detailed analysis of reciprocal causal influence of health on SC and SC on health of older Europeans. SC is conceptualized using multiple indicators (i.e. voluntary associations, church, social clubs, etc) and health using seven binary variables. Finally, Kaspar and colleagues’ study looks at multiple indicators of SC and well-being in Germany. Discussion on ongoing challenges of theory, methods and policy relating to SC will ensue.

SOCIAL CAPITAL AND HEALTH OF OLDER EUROPEANS: INDIVIDUAL PATHWAYS TO HEALTH INEQUALITIES
N. Sirven, T. Debrand, IRDES, Paris, France

Aim: To investigate the reciprocal causal influence of health on social capital and social capital on health of older Europeans. Method: A bivariate recursive Probit model is used to simultaneously investigate (i) the influence of baseline social capital on current health – controlling for baseline health and other current covariates, and (ii) vice versa. Using longitudinal and life-history data from SHARE waves 1, 2 and 3, we dummy variable for involvement in social activities is used as a proxy for social capital; and seven different binary health variables are retained. Results: People taking part in social activities in 2004, appear to be in better health in 2006, and those in bad/poor baseline health have a lower propensity to take part in associations. the effect of health on social capital is larger. Discussion: Although social capital may have individual beneficial health outcomes, it may also be a potential vector of health inequalities.
WHY AGING IN PLACE CAN MAKE A DIFFERENCE - ON THE RELATIONSHIP BETWEEN FACETS OF NEIGHBORHOOD PERCEPTION AND HEALTHY AGING

R. Kaspar, F. Oswald, U. Frenzel-Erkert, Interdisciplinary Ageing Research, Faculty of Educational Sciences, Goethe University Frankfurt, Frankfurt am Main, Germany

The aims of this presentation are (1) to identify indicators of neighborhood participation (e.g., volunteering) and perception (e.g., collective efficacy, neighborhood identity) as facets of social capital, and (2) to explore their relationship to outcomes of healthy aging (e.g., independence, well-being). Data were drawn from an ongoing survey with targeted 600 community-dwelling individuals from three typical districts in Frankfurt, Germany, stratified by age (70-79 vs. 80-89) and household composition (living alone vs. with partner). Preliminary analyses based on 175 participants revealed neighborhood differences with regard to duration of living, perceived collective efficacy and neighborhood attachment. Substantial links occur between neighborhood evaluation and more subtle forms of participation (e.g., being out and about, staying tuned) but not for classical forms of social engagement (e.g., political and welfare activity). The discussion emphasizes on the experiential component of social capital in urban neighborhoods and its consequences for healthy aging in very old age.

ASPECTS OF SOCIAL CAPITAL IN RELATION TO MOBILITY DISABILITY IN OLDER ADULTS

T. Poulsen, R. Lund, U. Christensen, K. Avlund, Institute of Public Health, Section of Social Medicine, University of Copenhagen, Copenhagen K, Denmark

The aim of the study is to analyse measurements of social capital and how social capital might influence mobility disability in older adults. Data are from a Danish prospective cohort study among 4,034 old people (age 75 and 80) in 34 municipalities in Denmark. The measurements on social capital were based on theory of bonding, bridging, and linking social capital. Mobility disability was measured by the Mob-H Scale on need of help to 6 mobility activities. Preliminary analyses based on baseline data showed that 80-year-old men in municipalities with low bridging (p = 0.0016) and low linking (p = 0.0143) had more mobility disability compared to men in municipalities with high levels of linking and bridging social capital. Likewise 80-year-old women living in municipalities with low bonding social capital (p = 0.0076) had more mobility disability compared to women in municipalities with high levels of bonding social capital.

SOCIAL CAPITAL, AGEING AND HEALTH IN EUROPE: COMPARATIVE ANALYSES BETWEEN THREE EUROPEAN COUNTRIES

This study evaluates the association between social capital and selfreported health in Finland, Poland and Spain, using data extracted from the European Social Survey (ESS) in Round 4 (2008/2009) for respondents over the age of 50. In this study we include structural aspects of social capital such as social contacts and religious participation as well as cognitive aspects including social and political trust. The research question is evaluated by using descriptive statistics as well as multivariate regression analyses. The results indicate that the prevalence of good health is increased by frequent social contacts and high political trust in Finland, Poland and Spain. Furthermore, high social trust is associated with good health in Finland and Spain. After adjusting for sociodemographic variables there is still evidence of an association between social contacts and health in all three countries.

SESSION 700 (SYMPOSIUM)

AGING AND TRAUMA ACROSS THE LIFE COURSE: DOES CULTURE MATTER?

Chair: M.E. Davis, Social Work, George Mason University, Fairfax, Virginia
Co-Chair: M. Aydin, UCLA Center for Health Policy and Research, Los Angeles, California
Discussant: A. Glicksman, Philadelphia Corporation for Aging, Philadelphia, Pennsylvania

The experience of cumulative trauma across the life course impacts lifestyle, health outcomes and the potential for successful aging. Even as trauma makes an imprint on the life of an individual, so does culture. Culture has always played a role in shaping beliefs, lifestyle practices and the manner in which people adapt to the social environment. What are the mechanisms of culture that contribute to shaping the response to trauma in old age? This symposium is designed to focus attention on the international and transcultural nature of trauma in older adults. Firstly, Aydin’s overview, Cultural Understanding of Trauma, Response and Coping across the Life Course, presents a meta-analysis of the trauma literature and explores competing perspectives on how culture interacts with trauma exposure to determine outcomes in unique ways. Vakalahi’s paper, Pacific American Elders: Cultural Lifeways As Risk and Protective Factors, provides a qualitative analysis of cultural lifeways and practices, seeking to identify them as risk or protective factors and to understand their life course impact in a study of Samoan and Tongan Elders. Shrira’s paper, the Cumulative Adversity and Mental Health: Accounting for Adversity Type and Time of Occurrence highlights the link between early and late life adversity/trauma and mental health in an Israeli sample. Finally, Mamber’s paper, The Impact of Culture on Trauma in Old Age: Unexpected Consequences, targets older Jewish, and European refugee, Holocaust survivors and the impact of their trauma, and cultural experiences on providers of care.

CUMULATIVE ADVERSITY AND MENTAL HEALTH: ACCOUNTING FOR ADVERSITY TYPE AND TIME OF OCCURRENCE

A. Shrira1, D. Shmotkin2, H. Litwin1, 1. The Hebrew University of Jerusalem, Jerusalem, Israel. 2. Tel Aviv University, Tel Aviv, Israel

The study addressed the association between adversity cumulated at different points in the life span and present mental health. Data of 1,130 participants aged 50+ were drawn from the Israeli component of the Survey of Health, Ageing and Retirement in Europe (SHARE). We found that adversity reported to have occurred early in life was positively related to mental health, while adversity reported to occur in late life was negatively related. Additional analyses showed that the positive association between early-life adversity and mental health was mainly restricted to adversity in which the primary harm was to another person (other-oriented adversity). In contrast, the negative association between late-life adversity and mental health was mainly restricted to adversity in which the primary harm was to the self (self-oriented adversity). This study suggests that the differential effects of cumulative adversity are best captured when accounting for both time of occurrence and adversity type.

THE IMPACT OF CULTURE ON TRAUMA IN OLD AGE: UNEXPECTED CONSEQUENCES

M.H. Mamberg, A. Glicksman1, 1. Planning, Philadelphia Corporation for Aging, Philadelphia, Pennsylvania. 2. Bridgewater State University, Bridgewater, Massachusetts

If a survivor of a traumatic event relocates to a different culture then the disconnect between the survivor’s culture of origin and the new cultural milieu can have an effect on the experience of receiving formal services. Data from two studies of older Jewish refugees who were in Europe during World War Two offer the opportunity to examine the
impact of cultural differences between the providers and the trauma survivors. For example, staff working with Holocaust survivors reported that they often divided in their minds between West European survivors (who were seen as “being like us”) and the East European survivors whose affective style was not only often overwhelming but made it difficult for the staff to differentiate between real distress and standard ways of expression emotions. Our presentation will examine the ways in which cultural differences affected the provision of care and suggest strategies for overcoming such challenges.

PACIFIC AMERICAN ELDERS
H. Vakalahi, George Mason University; Fairfax, Virginia

Samoa and Tongan American elders [Pacific Americans] were the focus of a recent study relating to the cultural context of health and well-being. Framed by a holistic and collective view of health and well-being, 20 Samoa and Tongan American elderly immigrants living on the islands of Hawaii were interviewed. Findings indicate that commitment to cultural practices in the family such as respect for the elders, community and church leaders; reciprocity; spirituality; native language; use of traditional medicine, food, and music; and cultural expectations have protective influences on an elder’s health and well-being. These cultural practices provided psychological encouragement and strength, social support systems, opportunities for reciprocity and strengthened relationships with God and others. On the other hand, over-giving and over-doing these cultural practices led to negative impacts on an elder’s health and well-being. Cultural duality was identified as a source of both risk and protection for health and well-being.

CULTURAL UNDERSTANDING OF TRAUMA, RESPONSE AND COPING ACROSS THE LIFE COURSE
M. Aydin, UCLA Center for Health Policy Research, Los Angeles, California

The significance of early life trauma is gaining recognition among scholars interested in the development and well-being of aging individuals. The life course perspective enables researchers to examine these issues by linking current problems and needs of older adults with earlier non-normative life experiences. Lacking in the current theoretical framework, however, is attention to how culture interacts with trauma exposure to influence outcomes in specific and unique ways. This paper provides a meta-analysis of the trauma reasearch, with a special emphasis on how cultural norms serve as explanatory factors in the life course literature. Depending on the population under study, historical context, the role of family and normative expectations illuminate the empirical findings that explain the extent to which the experienced trauma impacts the individual. More work is needed to incorporate culture into the appropriate measurement tools and theoretical discussions of trauma and response across the life course.

SESSION 705 (SYMPOSIUM)

BRIDGING DIGITAL DIVIDES THROUGH COMMUNITY BASED RESEARCH PROJECTS
Chair: S.R. Cotten, University of Alabama, Birmingham, Birmingham, Alabama
Discussant: S. Czaja, University of Miami, Miami, Florida

There are multiple aspects of digital divides. The most basic type concerns whether individuals have access to technologies. More important, however, is whether individuals have the skills and abilities to be able to effectively utilize technologies in their social lives. Older adults are the most likely group in U.S. society to be on the wrong side of these digital divides. This symposium presents details on four community based research projects that seek to eliminate various aspects of digital divides in the U.S. Nahm presents research related to developing and utilizing web platforms to conduct randomized control trials for older adults. Cotten illustrates specific elements of digital divides that are overcome in a large randomized trial based in assisted and independent living communities. Harootyan and Slobig examine how a large scale community based digital inclusion project enhances knowledge, morale, and outlook for the future (areas typically overlooked in studying impacts of digital divides). Xie discusses results of an experimental study exploring optimal learning methods for older adults using the Internet to access high quality health information. Czaja ends the symposium by discussing the implications of the projects for bridging elements of digital divides among older adults in different types of community settings.

WEB PLATFORMS TO CONDUCT THEORY-BASED RANDOMIZED CONTROLLED TRIALS FOR OLDER ADULTS
E. Nahm1, B. Resnick1, J. Magaziner1, P. Brennan2, M. Bellantoni2, M. Rietzschel3, B. Covington3, J. Brown3, 1. University of Maryland School of Nursing, Baltimore, Maryland, 2. University of Maryland School of Medicine, Baltimore, Maryland, 3. University of Wisconsin-Madison, Baltimore, Maryland, 4. Johns Hopkins University, Baltimore, Maryland, 5. Texas State University, San Marcos, Texas

Over the past seven years, we have conducted three NIH-supported online health intervention studies for community-dwelling older adults. In this session, we will compare two different web platforms used in two online randomized controlled trials (RCT). Both interventions were developed using the social cognitive theory and implemented employing a group approach (10–20 participants per group). In the first two-arm RCT (N = 245) with a 2-week intervention, we used a password-protected interactive website. In the most recent three-arm RCT (projected N = 768) with two longer-term (8 week and 12-month) interventions, the addition of a robust eLearning program to the web-based intervention was necessary to manage the intervention flow in many concurrent groups. The latter showed a lower mean web usability score (64.2, range: 12–84) than the first (79.3) and was revised subsequently. Findings to date demonstrate excellent potential for using eLearning management programs in online RCTs.

DIGITAL INCLUSION: SENIORS HELPING SENIORS TO ENHANCE KNOWLEDGE, MORALE, AND OUTLOOK ON THE FUTURE
B. Harootyan, F. Slobig, Senior Service America, Inc., Silver Spring, Maryland

Seniors who learn the internet not only gain instrumental skills, but also improve their outlook on life. This paper presents survey responses from >14,000 senior learners in the Digital Inclusion Initiative. Senior Community Service Employment Program participants serve as peer coaches assisting other seniors using the Generations on Line (GoL) computer tutorial program. The learners answered questions at their first and subsequent sessions regarding computer skills, internet searches, and attitudes about the fate of older Americans and themselves. Their median age is 68, two-thirds are female, one-fourth have some college education, two-thirds have annual incomes <$30,000, and nearly two-thirds are white. Compared to all learners, GoL tutorial graduates are twice as likely (43% vs. 21%) to feel that the fate of older persons is getting better and significantly more likely (73% vs. 54%) to be satisfied with their lives. Additional differences in morale and other results are also reviewed.

A PUBLIC LIBRARY-BASED APPROACH TO IMPROVING OLDER ADULTS’ E-HEALTH LITERACY
B. Xie, College of Information Studies, University of Maryland, College Park, Maryland

An experimental study was conducted to explore potential effects and interaction of learning methods and information presentation channels on older adults’ e-health literacy. The study is part of a larger research project, electronic health information for life-long learners.
OVERCOMING DIGITAL DIVIDES IN ASSISTED AND INDEPENDENT LIVING COMMUNITIES: RESULTS FROM A RANDOMIZED TRIAL

P.A. Dykstra, Sociology, Erasmus University Rotterdam, Rotterdam, Netherlands

Providing access to information and communication technologies (ICTs) among older adults is critical for eliminating the first level digital divide. However, little research has examined the extent of training needed to help older adults in assisted and independent living communities overcome other levels of the digital divide, especially those related to technology self-efficacy, skill, and continued use. Results from a large randomized trial designed to train older adults in assisted and independent living to use ICTs, especially computers and the Internet, are presented. The processes involved in bridging multiple levels of digital divides are presented, as well as the levels of the divides which seem to be the most amenable to elimination among older adults. Implications for designing other interventions related to bridging digital divides among older adults in these communities are also discussed.

SESSION 710 (SYMPOSIUM)

GENERATIONAL INTERDEPENDENCIES: KEY FINDINGS FROM THE MULTILINKS RESEARCH PROGRAM

Chair: P.A. Dykstra, Sociology, Erasmus University Rotterdam, Rotterdam, Netherlands
Co-Chair: G.O. Hagestad, Norwegian Social Research, Oslo, Norway
Discussant: M. Kohli, European University Institute, San Domenico di Fiesole, Italy

Overview. The symposium presents the accomplishments of the research project MULTILINKS, which was funded through the European Commission Seventh Framework Program. The full title of the research project is: “How demographic changes shape intergenerational solidarity, well-being, and social integration: A multilinks framework.” MULTILINKS started from three key premises. The first is that population ageing is not only about older persons: it affects people of all ages. The second key premise is that there are critical interdependencies between family generations and between men and women in families, and interdependence is built and reinforced by social policies. The third key premise is that to understand generational interdependencies, a spectrum of levels must be distinguished: country/state, historical generation, family, and the person. Papers. The session includes four papers. Chiara Saraceno will present the theoretical and methodological framework of the MULTILINKS database of intergenerational policy indicators, which has comparative indicators for all EU-27 countries plus Norway, Georgia, and Russia. The indicators pertain to the allocation of responsibilities among state and families for caring for children, financially supporting children, caring for frail older persons, and financially supporting older persons. The remaining three papers are devoted to cross-national comparisons involving the indicators database. Jan van Bavel’s paper is on linkages between age at grandparenthood and retirement age, using data from the European Social Survey (ESS). Valeria Bordone’s contribution is on grandparental care and is based on the Survey of Health and Retirement in Europe, whereas Pearl Dykstra considers cross-age social interactions and ageism using ESS-data.

THE MULTILINKS DATA BASE ON THE INSTITUTIONAL FRAMEWORK OF INTERGENERATIONAL OBLIGATIONS

C. Saraceno, Wissenschaftszentrum Berlin Fuer Sozialforschung, Berlin, Germany

In order to understand the division of intergenerational responsibilities between the state and the family and their gender specificity three distinct policy approaches have been identified along the familialism/de-familialisation continuum: (1) Familialism by default, when there are no publicly provided alternatives to family provision. This dimension can be implicit, but also explicit, as in the case of financial obligations within the generational chain prescribed by law. (2) Supported familialism, when policies, usually through financial transfers support) family members in keeping up their financial and care responsibilities. (3) De-familialisation, when individualisation of social rights reduces family responsibilities and dependencies. On the basis of this conceptual framework, 72 indicators have been collected and documented for all EU countries plus Norway, Georgia and Russia. They allow identifying policy approaches with regard to upward and downward intergenerational financial and caring obligations.

BECOMING A GRANDPARENT AND EARLY RETIREMENT IN EUROPE

J. Van Bavel, T. De Winter, Interface Demography, Vrije Universiteit Brussel, Brussels, Belgium

Between Now and 2030, the Post-War Baby Boom Generations Will be Entering the Retirement Ages and this Will Speed up the Secular Trend of Population Ageing. In Many Countries, a Large Number of Baby Boomers Have Already Retired Before the Standard Age. Given that the Funding of Pensions is at Issue, Governments Across Europe Now Try to Discourage Early and Encourage Later Retirement. Yet, International Research About the Determinants of Early Retirement Based on Appropriate Micro-data is Scarce. In Addition, Studies Have Tended to Look at the Retiring Generation in an Isolated Way, Ignoring the Intergenerational Ties That May Play a Role in Their Retirement Decision. This Paper Uses a High Quality International Database With Relevant Micro-data, Covering 22 Countries From All Regions Of Europe, to Try to Start Correcting Such a View. More Particularly, it Investigates to What Extent Becoming a Grandparent Affects Early Retirement in European Countries. We Apply Multilevel Event History Modeling to Data From The Third Round of the European Social Survey and From the Multilinks Database on Intergenerational Policy Indicators.

The Gerontological Society of America
GRANDPARENTING AND SOCIAL POLICIES
B. Arpino, A. Aassve, V. Bordone, G.O. Hagestad, K. Herlofson, I. Università Bocconi, Milan, Italy, 2. Norwegian Social Research, Oslo, Norway

The paper focuses on the association between grandparenting and policies in European societies. Our analysis is primarily based on data from the Survey of Health, Ageing and Retirement in Europe (SHARE) for 12 European countries. Additionally, we make use of the MULTILINKS database on intergenerational policy indicators in order to understand how social policies influence the amount of grandparental care provided within each country. In this perspective, this work is part of a larger project whose results are presented in the Symposium “Generational Interdependencies: Key Findings from the MULTILINKS Research Program”, chaired by Pearl A. Dykstra. Objectives. By presenting this work, we inform participants about the use of MULTILINKS database indicators and we expect to generate a discussion on the importance of considering both micro (individual characteristics) and macro (social policies) factors to study intergenerational relationships.

SESSION 715 (SYMPOSIUM)
INSIGHTS FROM THE PITTSBURGH CENTER ON AGING AND POPULATION HEALTH PREVENTION RESEARCH CENTER
Chair: S. Albert, Center for Aging and Population Health, University of Pittsburgh, Pittsburgh, Pennsylvania
Co-Chair: N.H. Fultz, Center for Aging and Population Health, University of Pittsburgh, Pittsburgh, Pennsylvania
Discussant: J. Donohue, Center for Aging and Population Health, University of Pittsburgh, Pittsburgh, Pennsylvania

With the American older population growing, and medical care costs still a major concern, there has been an increased emphasis on implementing programs that support healthy aging. Although taking preventive actions such as smoking cessation or diet and activity modification are believed to improve well-being, facilitating the learning and practice of these behaviors has been challenging. The University of Pittsburgh’s Center on Aging and Population Health (CAPH) houses one of the thirty-two Comprehensive Prevention Research Centers (PRC) funded by the Centers for Disease Control and Prevention. The focus of the Pittsburgh CAPH PRC is to promote healthy, active lives for older adults in Pennsylvania. CAPH PRC projects share the aim of disseminating the “10 Keys”TM to Healthy Aging. The “10 Keys”TM is an evidence-based whole-person prevention curriculum, updated in 2011, with website certification for teachers, an instructor’s guide, and handouts and exercises that allow older people to understand prevention and effectively discuss it with health care providers. Work toward this goal has involved several completed, ongoing, and planned projects—including the Community Health Ambassador Program, collaboration with the Arthritis Foundation to expand the scope of a community physical activity program, and the Statewide Dissemination of the “10 Keys”TM to Healthy Aging project—insights from which form the basis for this symposium. In addition to specific findings from completed studies, the investigators will describe the conceptual, logistical, and analytic considerations involved in conducting this work. Discussion will center on the policy implications of community-based prevention programs such as these.

THE “10 KEYS”TM TO HEALTHY AGING, ENGAGING COMMUNITIES USING INNOVATIVE APPROACHES
C.M. Bayles, J.C. Zgibor, K. Williams, S.E. Woody, L.H. Kuller, S. Albert, A.B. Newman, University of Pittsburgh, Pittsburgh, Pennsylvania

The “10 Keys”TM to Healthy Aging program, created in 2001, aims to reduce preventable risk factors in the aging population and improve quality life expectancy with a focus on preventable diseases and disability. The program was initiated in an underserved community and within 8 years, expanded across the state, nationally, and internationally. The program was developed based on key areas that improve function and quality of life as people age. Working with governments and organizations, the program promoted healthy aging using outreach (health fairs, talent shows, dances, organized walks), education (public speaking, newsletters, radio shows, newspaper columns, on-line methods). Outreach activities were assessed by the involvement of community partners (over 40 organizations including the State Departments of Health and Aging). Over 1,000 Health Ambassadors throughout communities were certified. Engaging the community contributes to the adoption and success of a best practice program such as the “10 Keys”TM to Healthy Aging.

COMMUNITY HEALTH AMBASSADOR PROGRAM AS A METHOD FOR IMPLEMENTING THE “10 KEYS”TM TO HEALTHY AGING

The Community Health Ambassador Program (CHAP) was designed to empower older adults to adopt and promote ten risk-reduction lifestyle strategies. Success of the CHAP was determined through: 1) characteristics of the individuals and organizations reached, 2) knowledge of the “10 Keys”TM that formed the core educational message, 3) participants’ evaluations of the classes, and 4) changes in health measures indicative of the “10 Keys”TM to Healthy Aging (e.g., blood pressure, activity level, preventive behaviors). In 2006 and 2007, 87 women and 23 men ages 65 – 91 attended CHAP classes at 7 sites in Western Pennsylvania. Comparison of pre- and post-class knowledge questionnaires showed an increase of 24% in the average percentage of correct responses. This finding underscored participants’ positive evaluations of their learning experience. At both the baseline and one-year follow-up assessments, participants met an average of 7 out of the ten criterion health measures.

INTEGRATING A HEALTH PREVENTION PROGRAM INTO A COLLABORATIVE FRAMEWORK IN COMMUNITY-BASED RESEARCH

The “10 Keys”TM to Healthy Aging prevention program was considered a good candidate to enhance the effects of a pre-existing exercise program (the Arthritis Foundation Exercise Program) for people with arthritis or joint pain. The University of Pittsburgh’s Prevention Research Center collaborated with the Arthritis Foundation to implement an integrated program of two evidence-based programs. The steps involved in the collaboration included designing the integrated curriculum, recruiting host sites, instructors, and participants. Obstacles encountered in this community-based participatory research project included regulatory issues within the IRB, study design challenges, and enrolling participants of the exercise class into the research study. Assessments consisted of physical evaluation (SPBB, blood pressure, BMI, cholesterol and glucose levels) and questionnaire (preventive health practices, stages of change, self-efficacy, pain and stiffness of worst joint). Pilot data from two sites and preliminary data from the initial site(s) of the research program will be presented.

STATEWIDE DISSEMINATION OF THE “10 KEYS”TM TO HEALTHY AGING

University of Pittsburgh researchers partnered with Area Agencies on Aging to deliver and evaluate the “10 Keys”TM to Healthy Aging.
program in senior centers across Pennsylvania. The goal of the Statewide Dissemination project is to assess program reach, implementation, adoption, and sustainability. Participants complete a yearly survey to examine the effectiveness of the program in promoting awareness of risk factors, lifestyle change, and outreach to peers. As of March, 33 sites in 10 counties have committed to offer the program, which is expected to enroll approximately 300 older adults. Variation is notable in how county Area Agencies on Aging and pay instructors, advertise, deliver the “10 Keys”TM learning modules, and encourage seniors to participate in the research efforts. An important consideration in the success of this work is the involvement of the PA Department of Aging, with its Prime Time Health Coordinator team serving in a coordinating capacity.

SESSION 720 (SYMPOSIUM)

LIFESTYLE IN SOCIAL CONTEXT
Chair: T. Calasanti, Virginia Tech, Blacksburg, Virginia
Discussant: M. Kohli, European University Institute, Florence, Italy

Health status has improved among elders in the U.S., but not in the same ways for all groups. While lifestyle can influence health, this symposium suggests that there is nothing simple or straightforward about the relationship between lifestyle and lifespan. These presentations complicate correlations of lifestyle to lifespan by placing them within a social and psychological context. Specifically, speakers explore professional interest in lifestyle in this historical moment and the use of it to account for healthy aging or health disparities. Stephen Katz begins the discussion by reviewing the place of ‘lifestyle’ in gerontology and popular culture, linking it to social inequalities. Pam Herd assesses the extent to which lifestyle can explain health disparities in later life, and suggests alternative explanations in terms of the larger social inequalities that also influence lifestyles. Next, Frieder Lang and Margund Rohr call our attention to the importance to health of social relationships and the ways in which people manage their socio-emotional resources. Dale Dannefer brings the discussion full circle, discussing the ways in which emphasizes on lifestyle and lifespan focus on individual choice and naturalized fate rather than on structural mechanisms. Finally, Martin Kohli will respond with further thoughts on the complexity of the lifestyle/lifespan relationship.

THE SOCIAL FABRIC OF POSITIVE AGING: NOT JUST A MATTER OF LIFESTYLE?
F.R. Lang, M.K. Rohr, University of Erlangen-Nuremberg, Erlangen, Bavaria, Germany

Personal relationships and networks of older adults reflect not just outcomes of personal lifestyle but also lifespan developmental changes in social functioning. Individuals actively mold their social worlds in accordance with their aging-related needs and preferences. In this regard, empirical findings point to a notable robustness of social functioning across adulthood. Building on a theoretical model of positive aging, we present illustrations on how adaptive strategies of life management contribute to enhancing health-related socio-emotional resources across adulthood. Empirical findings underscore the idea that individuals actively engage in balanced social exchanges, while selecting close social partners that fit with age-specific needs. Such adaptive mechanisms prove robust across cultures and against effects of living circumstances. It is concluded that positive aging largely depends on how well individuals regulate the self in accordance with the demands and potentials of their social contexts above and beyond lifestyle differences.

SOCIODEMOGRAPHIC AND RACIAL DISPARITIES IN MORBIDITY AND MORTALITY: DOES LIFESTYLE HELP EXPLAIN DISPARITIES?
P. Herd, University of Wisconsin-Madison, Madison, Wisconsin

Socioeconomic and racial inequalities in morbidity and mortality are large, and in some cases, have been growing over time. “Lifestyle”, specifically risky health behaviors such as obesity and smoking, is one common explanation for these differences in mortality and morbidity. I explore this hypothesis in two ways. First, I review the research that tests the extent to which ‘lifestyle’ explains racial and socioeconomic differences in health. Second, I review the research literature that explores the role that chronic stress, due to discrimination and poverty, may play in producing these health inequalities, in part by their impact on ‘lifestyle’, including smoking and obesity.

SESSION 725 (SYMPOSIUM)

LIFESTYLE AND LIFESPAN, CHOICE AND FATE: AVOIDING REALITY WHILE STUDYING AGING
D. Dannefer, Department of Sociology, Case Western Reserve University, Cleveland, Ohio

Lifestyle is often associated with as assumption of choice and agency in the construction of one’s biography; and lifespan is similarly associated with “fate” — with those more fixed and organismically governed elements of the individual’s life from birth to death. While “choice” and “fate” appear at first impression to cover a great deal of important terrain, they both omit the power of social forces and processes that underlie both of them, while obscuring those forces from view. This paper will review 1) the social-structural processes through which both the physical characteristics of individual organisms and the motivational structures that guide decisionmaking are socially constituted, and 2) the ideological processes through which social forces are naturalized as inevitable individual-level processes on one hand, and eclipsed in the celebration of choice and lifestyle diversity on the other.

SMART, FIT AND HEALTHY: LIFESTYLE AS A GERONTOLOGICAL IDEA
S. Katz, Sociology, Trent University, Toronto, Ontario, Canada

Sociologists Max Weber and Georg Simmel conceived the idea of ‘lifestyle’ to identify special cultural features of modern consumerism and individualism. Contemporary thinkers Pierre Bourdieu, Nikolas Rose, and Anthony Giddens have given ‘lifestyle’ critical importance in their work by including questions of agency, reflexivity, and identity in post-traditional society. Within gerontology, ‘smart’, ‘fit’ and ‘healthy’ lifestyles have become associated with successful aging and health promotion programs. This presentation revisits the theoretical story of lifestyle and its development within gerontology with a critical account of lifestyle as a basis for the commercialization of aging and social inequality in later life.

LIFESTYLE INTERVENTIONS FOR OLDER ADULTS WITH CANCER
Chair: K. Belizzi, HDFS, UConn, Storrs, Connecticut
Discussant: C.W. Given, Michigan State University, East Lansing, Michigan

With the unprecedented growth of older adults in America, largely attributable to the baby boomers, coupled with the well-established link between cancer and aging, it is critical to identify the services needed to care for this large and growing cohort of cancer survivors. Though treatment for cancer has resulted in the extension of life for many, these treatments often leave behind a host of physical and psychosocial late health effects. The focus of this symposium is to highlight four distinctive lifestyle interventions aimed at improving physical function and quality of life in older adults with cancer. The first presenter will discuss obstacles and facilitative factors of a yoga intervention designed to meet the psychological and physical needs of older military veteran cancer survivors. The second presentation will explore the role motivation plays in promoting lifestyle changes, including physical activity and dietary changes in African American breast cancer survivors. The third presentation will focus on the unique experience of rowing and dragon boating as exercise activities for older breast cancer survivors.
to improve physical, social and mental health. The fourth presentation will report data on physical function outcomes among participants in the largest lifestyle randomized clinical trial for older cancer survivors to date. Specifically, three trajectory groups of physical activity will be discussed and assessed for functional outcomes. Lastly, our discussant will synthesize these unique presentations and discuss how these studies inform current and future theory, research and practice for older adults with cancer.

**IMPACT OF PHYSICAL ACTIVITY TRAJECTORIES ON FUNCTIONAL OUTCOMES FOR OLDER CANCER SURVIVORS**

M. Morey, VA and Duke Medical Centers, Durham, North Carolina

RENEW (Reach out to Enhance Wellness) is the largest home-based exercise and diet trial targeting physical function (PF) in older, long-term cancer survivors. RENEW (n=641) compared PF of older (aged 65-91), overweight, survivors of breast, prostate and colorectal cancer randomized to intervention or control groups. Primary results, published in JAMA 2009, indicated that at 12-months the control group experienced a significant decline in PF (-4.84 points on SF-36 PF subscale) whereas the intervention group declined less rapidly, (-2.15 points; p=0.03 between groups). Follow-up data culled from surveys collected every three months for two years identified three distinct trajectories of physical activity (PA) (7% of group with minimal change in PA over time; 33% of group with moderate uptake of PA followed by a gradual decline; and 60% of group with moderate uptake of PA sustained throughout intervention period). We will examine functional outcomes within these three classes of trajectories.

**OBSTACLES AND INROADS TO YOGA FOR OLDER VETERAN CANCER SURVIVORS**

Initial studies suggest yoga reduces fatigue and anxiety in women after breast cancer, but will other patient populations adopt the practice? In a longitudinal study of military veterans after treatment for oral-digestive cancer, mostly male (96%) military veterans report minor (18%) or major (14%) depression, 22% report insomnia, 33% fatigue, and 36% pain. When asked specifically about yoga, 85% are “not interested” but after yoga and its potential benefit is explained, 63% express interest, with some noting that a VA setting for a class would make them more comfortable. Concerns include embarrassment (19%) and lack of flexibility (38%). Using survey, qualitative, and focus group data, we will further detail obstacles to yoga participation among older Veteran cancer survivors, and report on the development of a group for this population. Yoga may offer rehabilitation for cancer survivors “lost in transition” to post cancer recovery with adaptations to this unique group.

**THE ASSOCIATION OF MOTIVATION WITH LIFESTYLE CHANGE IN AFRICAN AMERICAN BREAST CANCER SURVIVORS**

R. Young, Wayne State University, Detroit, Michigan

Background: Lifestyle change can reduce recurrence of breast cancer but there is only modest success from lifestyle programs, especially among older women and African Americans. Motivation, an element of theories of behavioral change, is related to improving diet and exercise behavior. Methods: A lifestyle intervention with classroom instruction and dietary counseling was offered to 42 older African American breast cancer survivors. Results: At study entry most participants had several lifestyle risks, but were confident they could change their behavior. After the educational intervention physical activity increased significantly and some weight was lost. Participants previously motivated for weight loss were significantly more confident about lifestyle change than non-motivated participants and had higher quality of life. Conclusions: Although difficult to achieve among older people and African Americans, lifestyle change is possible and was shown among motivated breast cancer survivors.

**ROWING AND DRAGONBOATING AS EXERCISE ACTIVITIES FOR OLDER BREAST CANCER SURVIVORS**

M.H. Parker, IPHT, INC., Oak Park, Virginia

“Pink” rowing and dragonboat teams give older breast cancer survivors a new opportunity to engage in positive physical activity with other breast cancer survivors of all ages. Rowing and dragonboating both require vigorous upper body activity, arms and core. Breast cancer survivors have been discouraged from engaging in this type of activity which was considered possibly causing arm lymphedema. Studies have been done separately for rowing and dragonboat groups, but not comparing these two exercise experiences. Survey data will report responses of women aged 60 and over on the physical, social and emotional benefits gained ‘on the water’ in practices and racing regattas The sample is drawn from participants in the nine WeCanRow programs across the country and from the approximately 40 breast cancer survivor dragonboat teams across the U.S. Attendees at this session will learn the positive and healthful benefits older women gain from rowing and dragonboating.

**SESSION 730 (SYMPOSIUM)**

**MENTAL HEALTH DISPARITIES IN RACIALLY AND ETHNICALLY DIVERSE POPULATIONS**

Chair: G. Kim, Center for Mental Health and Aging/Department of Psychology, The University of Alabama, Tuscaloosa, Alabama

Discussant: K.E. Whitfield, Duke University, Durham, North Carolina

As our nation becomes more racially and ethnically diverse, understanding mental health needs of diverse elderly groups becomes more important. The purpose of this symposium is to (1) address current issues of racial/ethnic disparities in mental health among older adults and (2) discuss ways to reduce existing mental health disparities among minority older adults in the U.S. Racial/ethnic minority elderly groups that will be discussed in this symposium are African Americans, Latinos/Hispanics, Asians (specifically Korean Americans), and American Indians/Alaska Natives. Five experts in the field will discuss the following topics relating to aging and mental health disparities: First, racial and ethnic differences in prevalence and correlates of serious psychological distress (SPD) and impairments caused by SPD will be discussed. Second, the importance of language-related and cultural barriers will be discussed. Specifically, the association of doctor-patient language concordance and patients’ discussion of their mental health needs will be discussed focusing on older Latinos and Asian/Pacific Islanders. Fourth, the importance of environmental context in racial/ethnic minority elders will be discussed. The impact of neighborhood on the physical and mental health of Korean American older adults will be presented. Third, the model of anxiety symptom severity will be discussed with eleven different racial/ethnic groups (i.e., African American, Afro-Caribbean, Vietnamese, Filipino, Chinese, Other Asian, Puerto Rican, Cuban, Mexican, and Other Hispanic). Lastly, focusing on older African American cancer patients, the importance of understanding self-efficacy and discrimination will be discussed.
SERIOUS PSYCHOLOGICAL DISTRESS AMONG OLDER ADULTS: DO RACIAL/ETHNIC DIFFERENCES EXIST?
G. Kim, A.N. Bryant, P. Parmelee, Center for Mental Health and Aging/Department of Psychology, The University of Alabama, Tuscaloosa, Alabama

This study examined racial/ethnic differences in prevalence and correlates of past year serious psychological distress (SPD) and impairments caused by SPD among older adults. Drawn from the 2007 California Health Interview Survey, 14,042 adults aged 65 and older from diverse racial/ethnic backgrounds were selected: Whites (n=11,712), African Americans (n=623), Latinos (n=632), Asians (n=922), and American Indians/Alaska Natives (AIAN; n=155). Prevalence of past year SPD was significantly different across five racial/ethnic groups (p<.001), with AIAN having the highest prevalence (7.9%) and Whites having the lowest prevalence (3.3%). Impairments caused by past year SPD differed across the five racial/ethnic groups. Racial/ethnic-specific predictors of past year SPD were lower educational attainment for Asians and greater number of chronic diseases for African Americans. The findings suggest different disease burden due to SPD may exist across diverse racial/ethnic groups, and highlight the need to develop race/ethnicity-specific intervention strategies for the elderly populations.

THE IMPORTANCE OF DOCTOR-PATIENT LANGUAGE CONCORDANCE FOR PATIENT DISCUSSION OF MENTAL HEALTH NEEDS IN LATER LIFE
D. Sorkin1, K.J. August1, H. Nguyen2, 1. UC Irvine, Irvine, California, 2. UC Los Angeles, Los Angeles, California

The current study sought to examine the association of doctor-patient language concordance and patients’ discussion of their mental health needs among older Latinos and Asian/Pacific Islanders (A/PIs). Respondents included Latino and A/PIs aged 55+ (N=3,003). The findings suggested there were no significant race/age differences in patients’ reports of their own mental health status across language concordance groups (3 groups: English-language concordant, other-language concordant, and language discordant; ps>0.17). There were, however, significant differences in whether patients’ had discussed their mental health needs with their physician by patients’ race/ethnicity and language concordance (OR=0.42, p=0.01). Spanish-language concordant Latinos were more likely to discuss their mental health needs with their physician than English-language concordant Latinos, whereas Asian-language concordant A/PIs were less likely to discuss their mental health needs than English-language concordant A/PIs. These findings underscore the importance of overcoming both language-related and cultural barriers to improve patient-provider discussions of patients’ mental health needs.

DOES PLACE MATTER?: OBJECTIVE AND SUBJECTIVE NEIGHBORHOOD CHARACTERISTICS AND HEALTH IN KOREAN AMERICAN OLDER ADULTS
Y. Jang1, K. Kwag1, S. Roh2, D.A. Chiriboga1, 1. University of South Florida, Tampa, Florida, 2. Elmhurst Hospital Center, New York, New York

Recognizing the importance of environmental context in racial/ethnic minority elders, two studies that examined the impact of neighborhood on the physical and mental health of Korean American older adults will be presented. In the first study, survey data of Korean American older adults in Florida (N=567) was linked by residential address with 2000 U.S. Census block level neighborhood variables (% of people living below the poverty level, % of people aged 65 and older, and % racial/ethnic minorities). Findings from multilevel analyses showed that objectively-defined neighborhood poverty was strongly associated with poor self-rated health, after controlling for the impact of individual-level demographics. The second study focused on subjective perceptions of the neighborhood environment (perceived ethnic density, safety, social cohesion, and satisfaction). Using a sample of older Korean Americans in New York (N=420), we found that perceived neighborhood environment makes a significant contribution to both physical and mental health.

MENTAL HEALTH DISPARITIES IN ETHNIC MINORITY ELDERS: EXAMINING SUBSYNDROMAL ANXIETY
C.B. Worley1,2, R.S. Allen1,2, G. Kim1,2, M.R. Crowther1, 1. Department of Psychology, University of Alabama, Tuscaloosa, Alabama, 2. Center for Mental Health and Aging, Tuscaloosa, Alabama

As the nation becomes more diverse in both age and ethnicity, unique challenges emerge in understanding mental health disparities. Current epidemiological research may underestimate the rates of mental illness in ethnic minority elders due to cultural differences in symptoms. A model of subsyndromal anxiety has been proposed as a mechanism for identifying individuals who may be experiencing distress, but are not being identified for services due to culturally incongruent diagnostic criteria. The proposed model of anxiety symptom severity was assessed for fit using Structural Equation Modeling with data from the Collaborative Psychiatric Epidemiology Surveys (CPES). Respondents were collapsed into 11 racial or ethnic groups including African American, Afro-Caribbean, Vietnamese, Filipino, Chinese, Other Asian, Puerto Rican, Cuban, Mexican, and Other Hispanic. Chi-square difference tests revealed differences in the fit of the model for each ethnic minority group. Implications will be discussed within an ecological framework.

UNDERSTANDING THE INFLUENCE OF SELF-EFFICACY ON THE PAIN EXPERIENCE IN OLDER BLACK AND WHITE CANCER PATIENTS
T. Baker, University of South Florida, Tampa, Florida

There is a substantial body of literature documenting similarities and differences in mental health outcomes (e.g., depression, anxiety) among patients diagnosed with cancer from diverse race populations. However, little is known of the influence self-efficacy has in the experience of cancer pain, and if there are reported differences across the age and race continuums. The objective of this research is to examine the influence self-efficacy may have in the experience of cancer pain in a sample of older Black and White patients receiving outpatient care at a large comprehensive cancer center. In defining this relationship, additional psychosocial factors (e.g., discrimination) are assessed in their influence (independent and collectively) in the pain experience, and to determine if there are differences among a sample of older racially diverse cancer patients.

SESSION 735 (SYMPOSIUM)

REGULATING DAILY AFFECT AND STRESS ACROSS THE LIFE SPAN

Chair: C.A. Berg, Psychology, University of Utah, Salt Lake City, Utah
Discussant: C.M. Aldwin, Oregon State University, Corvallis, Oregon

Regulating affect in response to daily stressful events has largely been described as involving self-regulatory processes emanating from differences within the individual such as individual differences in neuroticism. The current symposium expands models of affect regulation by noting the role of the triggering event itself in producing variability in the regulatory process. In addition, stressful events experienced by other close relationships (e.g., health-related stressful events of one’s child with a chronic illness) may trigger disruption to one’s affect regulation. Regulatory processes are proposed that link the triggering event to individual difference characteristics. Unconstructive repetitive thoughts or repetitive thinking about stressors represents how the triggering event may elicit a self-regulatory process that prolongs negative affect. Further, regulating affect during late adulthood in the context of health stressors may benefit from a coordination of positive and negative affect (or emotional complexity). The symposium explores these processes at different developmental time periods including young, mid-
EMOTIONAL COMPLEXITY MODERATES AGE DIFFERENCES IN REACTIVITY TO DAILY HEALTH STRESSORS
Journal: Psychology, Bangor University, Bangor, United Kingdom

Studies have indicated that higher levels of emotional complexity are related to less stress in older adults. Research has also indicated that older adults are able to maximize positive affect and dampen negative affect. The present study examined the relationship between emotional complexity, health stressors, and negative affect in 215 young-old (60-79 years) and 55 old-old (80-89 years) adults responding to a daily diary study of the VA Normative Aging Study. Emotional complexity was measured for each participant as their mean intraindividual correlation between positive and negative affect over the 8 days. Results indicated an Age x Emotional Complexity x Stressor interaction; old-old adults with higher co-occurrence of positive affect and negative affect were less emotionally reactive to health stressors. This relationship was in the opposite direction for young-old adults. These results suggest that emotional complexity may be especially important for old-old adults in response to health stressors.

VARIATIONS WITHIN THE EYE OF THE BEHOLDER: ASSESSING EVENT VARIABILITY IN STRESSOR APPRAISALS
Journal: Psychology, University Park, Pennsylvania

Cognitive appraisals of stressors (e.g., severity, controllability) are often used to explain individual differences in stressful experiences. However, substantial portions of variability in stressor appraisals may stem from characteristics of the triggering stressor events. This paper assesses intra-event (within-person differences across events) and inter-individual variability in multiple appraisals of daily stressors. Participants (N = 2022, age range = 33-84) were from the second wave of the National Study of Daily Experiences (part of MIDUS) and completed 8 consecutive daily telephone interviews regarding characteristics of stressors and corresponding appraisals. Multilevel modeling techniques with events nested within days, nested within individuals decomposed variability in stressor appraisals into intra-event variability and stable inter-individual differences. Preliminary results show that the majority of the variability in appraisal ratings of stressors is due intra-event variability. Discussion will highlight that cognitive appraisals largely reflect characteristics specific to the stressors reported rather than stable individual differences.

DOES ANTICIPATION OF DAILY STRESSORS REDUCE EMOTIONAL REACTIVITY?
Journal: Psychology, University Park, Pennsylvania

Unconstructive repetitive thought (URT) consists of repeated and attentive thinking about problematic situations or events and encompasses a wide range of related concepts, such as worry, rumination and preservative cognition. We hypothesize that URT operates as a final common pathway that links environmental influences (e.g., daily stressors) and personality characteristics (e.g., neuroticism) to adverse age-related cognitive, physical and mental health conditions. We examined the effects of repetitive thinking about previous stressors and worrying about future stressors on momentary and end of day affect. Results from an experience sampling study suggest that ruminating about previous stressors amplify and prolong negative emotional responses whereas worrying about future stressors increases tonic levels of negative affect, thereby reducing subsequent reactivity. We discuss these findings in light of theories of emotion regulation in aging and clinical theories of worry.
people with early-stage dementia and healthy older people. Method: 50 people with early-stage dementia and 50 age-matched healthy older people completed several measures of identity, focusing on role-identities, self-concept, functions of identity, and identity distress. Results: There were few significant differences between the groups on these measures. The healthy older group appeared to experience more identity-related distress than people with early-stage dementia. Conclusion: People in the early stages of dementia do not appear to differ from healthy older people in their sense of identity. There is no evidence that identity is diminished or lost in the early stages of dementia.

SENSE OF IDENTITY IN EARLY-STAGE DEMENTIA
L. Clare, S. Nellis, A. Mantry, C.J. Whitaker, I.S. Markova, I. Roth, R.T. Woods, R.G. Morris, Psychology, Bangor University, Bangor, United Kingdom, 2. University of Hull, Hull, United Kingdom, 3. Open University, N/A, United Kingdom, 4. Kings College London Institute of Psychiatry, London, United Kingdom

There is a need for empirical evidence on the nature and trajectory of identity in early-stage dementia. Participants were 97 individuals with early-stage dementia; 64 were reassessed after 12 months and 46 were seen again at 20 months. We used the Tennessee Self-Concept Scale to assess identity strength, examine associated factors and explore how identity changes over time. At time 1 identity was associated with anxiety, depression, quality of life, quality of relationship with the carer, everyday memory ability, and awareness. Forty-six percent of the variance in identity was accounted for by a model containing anxiety, quality of life and awareness of social functioning as individually-significant predictors, together with everyday memory ability and awareness of memory functioning. There was no change in identity scores over time. Identity strength is associated with a range of psychosocial and cognitive factors, and appears to remain stable in the early stages of dementia.

ALZHEIMER’S EXPERIENCES: STORIES OF RESILIENCE, SERENITY AND RELIGIOUS IDENTITY

Although much research within the psychological literature explores the role of religious coping in the lives of individuals dealing with various ailments, how sociocultural dimensions of spirituality influence illness identities remain lacking. Based on two larger qualitative studies involving in-depth interviews and focus groups with seniors diagnosed with early stage Alzheimer’s and their family members, a subset analysis of those respondents who spontaneously discussed the role of religion, faith, spirituality, etc. in their illness narratives was performed. Grounded theory methods were used to analyze all data. Data reveal experiences and views of Alzheimer’s that are distinctly less medicalized than previous studies suggest, demonstrate considerable serenity, and reveal narratives of resilience rooted in long-standing religious identities. How these findings contribute to sociological research on illness identities and engage existing social science theories of religious coping will be discussed. The implications of these data for practice and policy will also be examined.

DISCURSIVE PRACTICES OF SOCIALLY CONSTRUCTING A FRIENDLY IDENTITY

Background: People construct their social identities through conversations with others using linguistic and communicative skills to position themselves as social actors. While persons with dementia (PWD) experience difficulties with communicative and linguistic skills as their disease progresses, many of these skills are maintained into late stages. This paper explores the social construction of identity and relationships in the conversations of PWD. Method: Ethnographic observations were conducted. Conversations were among PWD and staff members were recorded and transcribed. Results: Findings show that PWD use language including pronoun reference and alignment to construct identity. Several identity types appear in the data including polite, helpful, and assertive. These identities serve to build relationships. Conclusion: PWD in long-term care settings may suffer from isolation and loneliness due to the nature of the institutional facilities. Understanding how people construct social identities and relationships is important to quality of life.

SESSION 745 (SYMPOSIUM)

STAYING MOBILE WHILE COGNITIVELY IMPAIRED: A MULTIDISCIPLINARY PSYCHO-GEO-EXERCISE VIEW
Chair: H. Wahl, Heidelberg University, Heidelberg, Germany
Co-Chair: M. Isaacson, Hebrew University of Jerusalem, Jerusalem, Israel
Discussant: L.N. Gitlin, Thomas Jefferson University, Philadelphia, Pennsylvania

Loss of out-of-home mobility is one of the behavioral aspects that are affected with cognitive decline. The goals of this symposium are to present both current research on the manner in which cognitive decline limits out-of-home mobility as well as discuss the effect that different interventions can have on controlling and possibly reversing these limitations. Three of the symposium’s contributions will be presenting research that was done as part of the SenTra project. SenTra is an Israeli-German project involving geographical, psychological, psychiatric, and social work expertise that studies the mobility of people with Alzheimer’s disease (AD) and mild cognitive impairment (MCI) compared to controls using GPS and RFID technologies. In the symposium, we will gather from SenTra’s emerging findings two with a psychology (F. Oswald et al.; M. Wettstein et al.) and one with a geography background (M. Isaacson et al.), in which differences between AD and controls but less so between MCI and controls appear in out-of-home mobility patterns, cognitive functioning, as well as affective functioning. Furthermore, the findings of two intervention studies presented in the symposium underscore that physical training is beneficial to underfed individuals (K. Hauer et al.) and that, from a neuropsychological view, different types of dementia may potentially require different physical training approaches to reach the highest outcome efficiency possible (L. Eggermont et al.). A strongly interdisciplinary and intervention oriented scholar highly familiar with the issue of dementia and cognitive decline will discuss the symposium’s findings (L. Gitlin).

PHYSICAL TRAINING OPPORTUNITIES FOR SPECIFIC DEMENTIA SUBTYPES
L. Eggermont, Clinical Neuropsychology, VU University, Amsterdam, Netherlands

Certain brain areas and their connections are particularly vulnerable in aging and dementia, for instance connections of the prefrontal cortex-striatum-hippocampus. These neuronal circuits are known to be involved in both motor functions (e.g. gait) and higher-order cognitive functions; functions that are very important for independent living. Several dementia subtypes show clinical symptoms (both cognitive deficits as well as disturbances in gait) that indicate deterioration of specific neuronal circuits. Physical exercise programs for the different dementia subtypes will be suggested based on whether certain brain areas are relatively preserved or whether they show atrophy in already an early stage of dementia. It can be concluded that different types of dementia require tailor-made physical exercise approaches to reach the highest outcome efficiency possible. Study findings from ongoing studies will be discussed.
AFFECT, DAILY MOOD AND OUT-OF-HOME MOBILITY IN OLDER ADULTS: DOES COGNITIVE IMPAIRMENT MATTER?
F. Oswald¹, H. Wahl², R. Kaspar³, E. Voss⁴, M. Wettstein⁵. 1. Interdisciplinary Ageing Research, Goethe University Frankfurt, Frankfurt, Germany
2. University of Heidelberg, Heidelberg, Germany

The aim of the presentation is to analyze the relationship between emotional well-being (daily mood, affect) and out-of-home mobility for elders with different levels of cognitive functioning. Data were drawn from interviews and mobility diaries over 4 weeks among 20 community-dwelling persons with Alzheimer’s disease (AD), 30 mildly cognitively impaired (MCI) and 100 healthy controls (HC). Descriptive results show worse daily mood and lowered positive affect in AD as compared to MCI and HC. Findings on weekly variability in mood and mobility revealed different degrees of intra-individual stability, based on random-coefficient models linking both processes to one another. Furthermore, the potential of out-of-home mobility to predict daily mood and to explain variation of well-being depending on week periods (week-end versus remaining days) is presented. Our findings help to understand the dynamics between out-of-home mobility and mood and affect at the fine-tuned level of daily recording of behavior and mood.

OUT-OF-HOME BEHAVIOR AND COGNITIVE ABILITIES IN OLDER ADULTS: DOES COGNITIVE HEALTH STATUS MATTER?
M. Wettstein¹, H. Wahl¹, F. Oswald², E. Voss⁴, N. Shoval⁵, G. Auslander⁵. 1. Institute of Psychology, Department of Psychological Ageing Research, Heidelberg University, Heidelberg, Germany
2. Interdisciplinary Ageing Research, Faculty of Educational Sciences, Goethe University Frankfurt, Frankfurt, Germany
3. Department of Geography, The Hebrew University of Jerusalem, Jerusalem, Israel
5. Clinic for special psychiatry, social psychiatry and psychotherapy, center for mental health, clinical center Stuttgart, Stuttgart, Germany

Although a close relationship between out-of-home behavior and cognitive performance can be expected, previous research has rarely analyzed its strength in groups with various cognitive function. In the project “SenTra” (Senior Tracking), high resolution data on out-of-home mobility, assessed with advanced GPS tracking technology, were collected over a 4–week period. Furthermore, the engagement in different out-of-home activities was assessed based on self-reports. Study participants were 157 community-dwelling elders (mean age = 70.7 years) with mild dementia (MD; n = 20), mild cognitive impairment (MCI; n = 37), and cognitively healthy controls (n = 100). Basic mobility indicators, measured with GPS, showed a consistent trend toward lowered out-of-home behavior in case of MD. More pronounced group differences as well as a stronger connection with cognitive abilities, partly moderated by level of cognitive functioning (relationships were strongest in the cognitively healthy group), were observed for self-reported out-of-home activities.

EFFECT OF A STANDARDIZED MOTOR TRAINING ON PHYSICAL ACTIVITY STATUS IN PATIENTS WITH DEMENTIA: RESULTS OF A RCT
K. Hauer, M. Schwenk, T. Zieschang, P. Oster, Bethanien Hospital/ Geriatric Centre at the University of Heidelberg, Heidelberg, Germany

Objective: to determine the effect of a standardized training program on physical activity in patients with dementia. Methods: Physical activity (PAQE) was documented at baseline (T1), after a 3-month- training (T2) and a 3-months-follow-up (T3) in sedentary patients with mild to moderate dementia (n=111). An intensive strength and functional training (intervention) was compared to a low-intensity group training (control). Results: Repeated measure ANOVA show significant effect of time (p<0.001; partial eta square (eta2):0.574) and time*group effects (p<0.001; eta2:0.380) for differences between the intervention: T1:5.36(SD5.07); T2:13.20(SD5.71); T3:6.62(SD5.01) and the control group: (T1:4.08(SD3.76); T2:6.36(SD4.78); T3:6.21(SD5.22). Increase was mainly induced by training activities including leisure walking (Time effects: p<0.0001; eta2:0.655; time*group effects: p<0.0001; eta square:0.421) but partly sustained during follow-up. ADL activities increased in both groups inducing time (p<0.001, eta2:0.133) but no time*group effects (p=0.556, eta2=0.012). Study results document a substantial behavioural change in a patient group at extremely high risk for insufficient physical activity.

LIFE-SPACES OF ELDERLY PEOPLE: A GEOGRAPHIC PERSPECTIVE
M. Isaacson, Geography, The Hebrew University of Jerusalem, Jerusalem, Israel

Mobility—the ability to move through space in general and through outdoor space in particular—is a prerequisite for partaking in social, commercial and cultural activity in our society today. A measurement of mobility, life-spaces express the amount of space that one consumes by movement in day-to-day life. Previous research on life-spaces was based on data collected from activity diaries and interviews, data describing the locations of a person’s various activities. The current study presents the life-spaces of elderly people, participants in the SenTra project, calculated from data obtained using GPS technology over a period of 28 days. The study thus endeavors to reach a deeper understanding of the connection between the size of elderly people’s life-spaces and their quality of life.

SESSION 750 (PAPER)

ACUTE CARE AND CONSEQUENCES OF TRAUMA

OLDER ADULTS SERIOUSLY INJURED IN FALLS AND MOTOR VEHICLE CRASHES: DO COMORBIDITIES DIFFER?
K.D. Lloyd, M. Baumgarten, G.S. Smith, University of Maryland Baltimore, Baltimore, Maryland

Older adults injured in falls are often frail and have a high prevalence of comorbidity. It is unknown if the prevalence of pre-injury comorbidity differs by mechanism of injury. We hypothesized that older adults with a low-energy mechanism of injury (fall on a level surface [FOLS]) have more comorbid conditions than those with a high-energy mechanism (motor vehicle crashes [MVC] or fall from a height [FFHT]).

We examined trauma registry data for patients age ≥65 admitted to a level I trauma center in 2009 (n=628). Average age (±standard deviation) was 78.0±8.4 years; 51.7% were female, 80.7% were Caucasian, and 90.9% had ≥1 comorbidity condition. Patients with FOLS and FFHT were significantly older than those in MVC (mean ages 79.0, 78.7, and 74.5, respectively). The median number of comorbid conditions was significantly higher in patients injured by FOLS and FFHT than those injured by MVC (3, 3, and 2, respectively). Mental illness and gastrointestinal disease were more prevalent, and diagnosis of alcoholism less prevalent, among patients with FOLS than the other groups. These results suggest that patients seriously injured in low- and high-energy falls are more similar to each other with respect to age and number of comorbidities than to patients injured by MVC. However, the strength and direction of the association between injury mechanism and comorbidity differ across comorbid conditions. The association of injury mechanism with comorbidity is important when determining appropriate...
trauma care for older adults as underlying conditions can result in higher risk of complications and poorer long-term recovery.

REHABILITATION INTENSITY AND EARLY FUNCTIONAL RECOVERY IN OLDER ADULTS FOLLOWING MILD AND MODERATE TRAUMATIC BRAIN INJURY
L.L. Hermann, University of Pennsylvania, Philadelphia, Pennsylvania

Previous studies demonstrate that greater intensity of inpatient rehabilitation in TBI patients contribute to improved rates of functional recovery; however, studies are limited by exclusion of limited number of adults over age 65, and inclusion of patients that only received rehabilitation in the inpatient setting. The purpose of this study was to describe the impact of modifiable variables (discharge destination and intensity of rehabilitation) on early functional recovery of adults 65 and older following mild and moderate traumatic brain injury (TBI). The sample consisted of 70 community dwelling adults aged 65 and older hospitalized for a mild or moderate TBI. A descriptive longitudinal cohort design was used to explore discharge destination and trajectory of early functional recovery; intensity of rehabilitative services and their relative contribution to early functional recovery at 2 and 6 weeks post discharge. Correlations, regression, and repeated measures analysis of covariance (ANCOVA) were used. Major findings from this study indicate that intensity of rehabilitation significantly and positively affected the trajectory of recovery of motor function over time; greater improvement in motor and cognitive function was noted in the high intensity group; and, patterns of self-reported difficulties varied by intensity of rehabilitation. Severity of TBI and presence of co-morbidities were significant predictors of discharge destination to home or skilled nursing facility. Additional research is necessary to examine rehabilitation intensity in all settings and its longitudinal effect on the trajectory of motor, cognitive, and psychosocial recovery and are essential if losses are to be integrated meaningfully into a person’s daily life.

A PILOT STUDY TO DETECT CASCADE IATROGENESIS IN HOSPITALIZED OLDER ADULTS
D.K. Thornlow, R.A. Anderson, Duke University, Durham, North Carolina

Background: During hospitalization, older adults are at high risk for cascade iatrogenesis, the serial development of complications. Post-operative pulmonary complications, the example of cascade iatrogenesis used in this study, are common morbidities that increase risk of dying within 90 days in patients undergoing major surgery. Purpose: This pilot study investigated early events in cascade iatrogenesis, using the example of postoperative respiratory failure. We examined factors associated with older adults’ risk for developing this cascading complication, including events that precipitated postoperative respiratory failure and the nursing care variables that may have prevented, mitigated, or exacerbated risk for this event. Methods: We compared 20 cases that developed postoperative respiratory failure to 20 controls, matched by age, type of surgery, and preoperative American Society of Anesthesiologists score. Results: Patients who developed postoperative respiratory failure were less likely to ambulate early and were more likely to develop other pulmonary complications such as pneumonia. These patients experienced more calls to rapid response or code teams, more transfers to higher levels of care, longer lengths of stay, and more deaths than matched controls. No significant differences were noted in use of patient-controlled analgesia or stepdown care. Conclusions: We identified events that may trigger the cascade toward postoperative respiratory failure. Surveillance, a key aspect of nursing care with early intervention for respiratory issues, may result in better postoperative outcomes. Understanding how small events lead to larger untoward outcomes requires additional research to identify and interrupt key points in the cascade with appropriate nursing care.

PALLIATIVE CARE NEEDS OF COGNITIVELY IMPAIRED PATIENTS AT THE START OF AN ACUTE CARE EPISODE

Cognitive impairment (CI; Alzheimer’s disease or other dementias) among older adults living in the community adds to the complexity of care for this population as they transition through an acute care episode. One management strategy for this population includes palliative care, an individualized approach to care designed to meet the needs of people at all stages of progressive, life-limiting illness with the goals to improve quality of life (QoL) and minimize caregiver burden. The purpose of this presentation is to examine the relationships between palliative care needs (i.e., symptoms), QoL, and caregiver burden among community-dwelling older adults with CI and their family caregivers at the beginning of an episode of acute illness (N=407 dyads). The top four bothersome symptoms were aching (63%), pain (54%), shortness of breath (50%), and fatigue (50%). Delirium and depressive symptoms were present in a quarter of the patients. Ten percent of caregivers had depressive symptoms present. Mild to high caregiver burden was present in 71% of caregivers. T-tests reveal that any of the following bothersome symptoms, shortness of breath (p=0.0005), aching (p=0.05), fatigue (p=0.008) or patient depression (p=0.0001), were significantly related to lower QoL ratings. Patient symptoms of delirium and depression, as well as caregiver depression, were significantly associated with higher ratings of caregiver burden (p<0.0001). Understanding the palliative care needs of older adults with CI at various stages along the disease trajectory is critical to understanding how to provide care, improving QoL and decreasing caregiver burden for this population through acute care episodes.

THE UTILITY OF ADVANCE DIRECTIVES IN ADULT ICUS
C.R. Sellers, J.G. Baggs, S.A. Norton, I. School of Nursing, University of Rochester, Rochester, New York, 2. Oregon Health and Science University, Portland, Oregon

Purpose: In this secondary analysis, data from a larger study of end-of-life decision making (EOLDM) in adult ICUs, were examined with a new focus on the use of advance directives (ADs) in the ICU setting. Sample/Setting: The original study was set in 4 different adult ICUs (medical, surgical, burn/truma, cardiovascular) in an academic health care center. ICU patients were predominantly female (62%), White (85%), and mean age of 71 years (SD=14; range=27-91). There were 157 interviews with 130 participants including patients and family members, nurses, physicians, patients, social workers, and other healthcare professionals. Methods: Ethnographic methods were used to create a total of 33 cases of EOLDM (comprised of an ICU patient, transcripts of field observations, in-depth, semi structured individual interviews, and AD documents, as well as family meetings when possible). The cases served as the unit of analysis. Data analysis was both within and across cases. Results: 52% of patients had an AD on admission to the ICU. Fewer than 10% of the patients participated in contemporaneous decision making. The cases were divided into two groups – problematic and non-problematic decision making. Cross-case analysis revealed that both groups contained cases where no ADs were present, where ADs were helpful, and where ADs were not helpful. Exemplar descriptive cases were then created. Conclusions: ADs are often encountered in the adult ICU setting. They may facilitate end-of-life decision making or they may hinder or have no effect on EOLDM. These scenarios are reviewed and implications for future research and practice are suggested.
HEALTH DEMOGRAPHICS, SERVICES, AND POLICY

EFFECT OF GLOBAL PAYMENT ON HEALTH CARE SPENDING IN MASSACHUSETTS: IMPLICATIONS FOR THE DESIGN OF ACCOUNTABLE CARE ORGANIZATIONS IN MASSACHUSETTS

Z. Song1,2, Y. He1, R.P. Ellis2, B. Landon1, D.G. Safran3, R. Mechanic4, M.E. Chernew1, 1. Health Care Policy, Harvard Medical School, Boston, Massachusetts, 2. National Bureau of Economic Research, Cambridge, Massachusetts, 3. Boston University, Boston, Massachusetts, 4. Blue Cross Blue Shield of Massachusetts, Boston, Massachusetts, 5. Brandeis University, Boston, Massachusetts

BACKGROUND: The Patient Protection and Affordable Care Act encourages the development of accountable care organizations (ACOs) in Medicare. In 2009, Blue Cross Blue Shield of Massachusetts (BCBS) implemented a global payment system called the Alternative Quality Contract (AQC) for Massachusetts providers. Similar to ACO models, provider groups shared accountability for total health care spending under the AQC. Provider in the AQC varied from large integrated practices with past experience accepting risk to smaller practices with such experience. METHODS: We used claims data for 380,156 enrollees whose primary care physicians (PCPs) were in the AQC (intervention) and 1,351,427 enrollees whose PCPs were not (control) from 2006 through 2009. We used a difference-in-difference approach adjusting for age, sex, health status, and secular trends, along with propensity score weights to compare spending between AQC and non-AQC groups to isolate its treatment effect on spending. RESULTS: Enrollees whose PCP groups joined the AQC spent, on average, $16.17 (1.9 percent) less per quarter (p=0.007) during the first post-implementation year compared to enrollees of PCPs in non-AQC practices. In subgroup analyses, AQC groups with prior BCBS risk experience did not incur statistically significant savings. AQC groups without such experience had significant average savings of $46.92 (5.2 percent) per enrollee per quarter (p=0.004). Savings were greater among enrollees with lower health status. CONCLUSIONS: Global payment with insurer support for practice redesign can help lower health care spending. Current efforts toward status. CONCLUSIONS: Global payment with insurer support for practice redesign can help lower health care spending. Current efforts toward status.

MEDICAL PLURALISM AFTER AGE FIFTY: AN EXAMINATION OF USE-PATTERNS ACROSS HEALTH CARE SYSTEMS USING THE CANADIAN COMMUNITY HEALTH SURVEY, 2003/2005

K. Voto1,2, M.J. Penning1, 1. Sociology, University of Victoria, Victoria, British Columbia, Canada, 2. Centre on Aging, Victoria, British Columbia, Canada

Health service research tends to be linear with a restricted focus on conventional health care in later life, using variable-centred approaches. Yet since the mid-1990s substantial growth in use of complementary and alternative medicine (chiropractors, acupuncture, naturopath etc.) and in public health care services (flu shots, mammograms, PSA tests), with distinct concentrations of use within baby boom cohorts, suggests the need to widen the existing research lens from examination of discrete service use within conventional health care (medical visits, specialist visits) to include medical pluralism or use across health care systems. Pooling data from two cycles of the Canadian Community Health Survey (2003, 2005), this study analyzed nationally representative patterns of health service use among adults aged 50+ (n=117,854).

Latent class analyses—a pattern-centred approach—reveal that all respondents exhibit medical pluralism to some degree; no one person restricts use to only one health care system. Overall, five distinct service use patterns were observed. When sex-specific public health services were considered, the number of patterns reduced to four for males and increased to seven for females. Results are interpreted as reflecting a medical pluralism paradigm, which explains use-patterns as being stratified by social location and by health condition. Medical pluralism is more common among younger cohorts in better social locations with varying health needs. In this context, health need factors, as traditionally defined, do not appear to be tied to notions of illness but instead signal a refocusing around health consciousness within broader definitions of health and individual responsibility.

SESSION 755 (PAPER)

PATTERNS OF AGING-RELATED DISEASES INCIDENCE AND RECOVERY IN U.S. ELDERLY

Changes in incidence of aging-related diseases and their recovery rates largely contribute to the trends in healthy life expectancy. Age, disability, and comorbidity patterns of acute coronary heart disease (ACHD), stroke, heart failure (HF), ulcer, diabetes mellitus, asthma, Parkinson’s disease, Alzheimer’s disease, skin melanoma, and cancers of breast, prostate, lung and colon were evaluated using the National Long Term Care Survey (NLTC)—Medicare linked data for 1991-2005, and validated using the SEER-Medicare data. Due to its design, the NLTCs provides projected estimates for the whole US population and rates are valid at the national level. Significant 5-year decline was observed for incidence rates of ACHD, stroke, HF, and prostate, lung (male) and colon (female) cancers, while the rates of diabetes and Alzheimer’s disease increased. Males had higher rates of ACHD, HF, Parkinson’s disease, skin melanoma, lung, and colon cancers, while females had higher rates of stroke and asthma. Among individuals with severe disabilities there were higher rates of stroke, HF (males), diabetes, asthma, and Parkinson’s disease, while rates of breast and prostate cancers were higher for nondisabled or moderately disabled individuals. Patients with higher comorbidity had higher rates of ACHD, stroke, HF, Alzheimer disease, and melanoma. Significant declines of recovery rates, more pronounced in females, were detected for ACHD, stroke, and ulcer for the total population and for populations stratified by disability and comorbidity. Sensitivity analysis (including the effects of alternative definitions of disease onset and recovery, latent censoring, study design) confirmed stability of reconstructed patterns.

PROJECTION OF AGEING POPULATION WITH DISABILITY UNDER THE DEMO-SOCIO-ECONOMIC FACTORS IN CHINA, 2006-2050

L. Zhang1,2, X. Zheng1, 1. Institute of Population Research, Peking University, Beijing, Beijing, China, 2. China Research Center for Disability and Development, Peking University, Beijing, China

Background: Population ageing, combined with the fact that disability is most common among the elderly, has focused attention on the future changing of ageing population with disability. While populations throughout the world are ageing rapidly, China already has one of the largest ageing populations who met a big challenge on burden of disability. Objectives: This study creates a new model to predict the changing tendency of ageing population with disability, and determines whether demographic, social, and economic factors could account for the tendency, and finally gives some evidences on prevention and reduction of disability risk. Data & Methods: A cross-sectional data of Second China Sample Survey on Disability (2006) is used in this study, it covered total 31 provinces, Municipalities and Autonomous Regions, with the sample size of 2526145 (161479 were disabled persons), and six types of disability were included. This study combines PDE (Population and Environment) model with the methods of static covariate-direct prediction, static covariate by type prediction and dynamic covariate effect prediction respectively. Results: Base on the results of projection, in 2050, the prevalence rate of people with disability aged
65 and older will reach to 30%, and both male and female percentage of people aged 65 and older among all the people with disability will be more than 60% both in urban and rural areas. Visual, audition, and physical disability will be the commonest three types of disability for the elderly in the following 40 years. And Ageing, education, individual income, gender, profession, local GDP per capita, nationality are significantly affect the prevalence of disability.

**SESSION 760 (PAPER)**

**HEALTH DISPARITIES AND VULNERABLE POPULATIONS**

**RACIAL AND ETHNIC DISPARITIES IN TIME TO A PRESSURE ULCER IN OLDER NURSING HOME RESIDENTS**

Pressure ulcers (PUs) in nursing home (NH) residents are painful, costly, avoidable problems influenced by many factors. Previous studies suggest racial/ethnic disparities in PUs. The purpose of this study was to assess racial/ethnic disparities in the time to development of a PU in individuals aged 65+ after NH admission. We analyzed Minimum Data Set, Online Survey, Certification, and Reporting, and Census data from 2000-2002. Residents (n=90,500) were free of PUs at admission to one of 446 proprietary NIs in 27 states, 66% female, age=82(8) years (meanSD)), 88% White, 8% Black, 2% Hispanic, and 1% Asian. 12% had only urinary incontinence, 6% had only fecal incontinence, and 26% had both. Clinically relevant covariates for time to a PU were first analyzed in a Cox proportional hazards regression for Whites. Using the Peters-Belson method, estimates from the Cox model were applied to Blacks, Asians, and Hispanics resulting in estimates of their expected time to PU, as if they were White, then compared to their actual time to PU. More Blacks developed PUs sooner than expected (p<.001). PUs in Hispanics did not differ from expected (p=.34). Modifiable factors associated with disparities in Blacks and better outcomes in Asians were deficits in activities of daily living, poor nutrition, only fecal incontinence, transferring dependence, and percentage of Hispanics in NHs. Restraints and deficiencies in NH care quality were factors for disparities in Blacks only. Addressing factors associated with health disparities may reduce PUs in NHs.

**THE INFLUENCE OF ORGANIZATIONAL AND COUNTY/MSA CHARACTERISTICS ON NURSING HOME SEGREGATION**

The purpose of this study was to identify facility and county/MSA factors associated with nursing home segregation. This cross-sectional study used the Online Survey Certification Reporting (OSCAR), the Area Resource File, and residential segregation data. Models were developed for two dependent variables: Black-White dissimilarity index and nursing home residents’ racial composition. The dissimilarity index was used to measure segregation among nursing homes in MA’s, and residents’ racial composition was used to measure segregation at the facility level. As such, separate generalized linear models were conducted for this study. Medicare and Medicaid certified nursing homes across the United States located in a MSA during the year of 2005 (N=7,367). Nursing homes that were hospital-based were excluded. Nursing homes in MSAs with a higher Black-White dissimilarity index had a lower proportion of Medicare residents (OR 1.01, p<0.05) and were located in more residentially segregated areas (OR 1.02, p<0.0001). Nursing homes that served a higher proportion of Black residents had higher proportions of Medicaid (OR 1.07, p<0.0001) and Medicare (OR 1.05, p<0.0001) residents. Facilities with a higher proportion of Black residents were located in counties/MSAs characterized by a higher number of empty beds on average (OR 1.03, p<0.0001), lower Black-White dissimilarity index (OR 1.03, p<0.0001), and higher residential segregation (OR 1.05, p<0.001). Nursing homes that serve predominantly Black residents may encounter financial challenges, which can influence their ability to provide high quality care. Initiatives that focus on improving nursing home resources may mitigate racial/ethnic disparities in nursing homes.

**GEOGRAPHIC ISOLATION AND RISK OF INJURY IN A RURAL OLDER ADULT POPULATION**

L.S. Edelman, P.B. McNealy, University of Utah, Salt Lake City, Utah

Older adults living in rural areas experience unique injury risks related to sociodemographic and geographic characteristics which also impact access to emergency department (ED) care. The purpose of this retrospective review is to describe geographic factors impacting access to ED care in Utah counties with the highest rates of injuries occurring to older adults. Method: Probabilistic linkage of Utah ED, hospital discharge and death databases was performed to identify injuries occurring to older adults living in Utah during 2007-2008. Injury rates by county were calculated. Average drive times to the nearest ED was calculated for each county using Geographic Information Systems Mapping. Results: Six of seven counties with injury rates in the >75th percentile were rural and served by small community hospital EDs. The proportion of the total rural county population with longer than a 30 minute drive time to the nearest ED ranged from 2-31%. Three rural counties had 1-5% of the total population living in areas that were greater than 60 minutes drive time to the ED. Conclusions: Older adults living in the rural Utah counties with highest rates of injury may not have timely access to ED care. Delayed access to emergency treatment of injury can increase mortality and negatively impact treatment outcomes.
Injury prevention programs targeted to older adults in rural areas and coordination of rural trauma services are warranted to better serve this vulnerable population.

**DETERMINANTS OF SELF-RATED HEALTH AND IMPLICATIONS FOR HEALTH INEQUALITIES FOR OLDER ADULTS**

I. Todorova, A. Lincoln, S. Arevalo, M. Pescador Jimenez, K.L. Tucker, L. Falcon, Northeastern University, Boston, Massachusetts

Self-rated health (SRH) is an important indicator of overall health, predicting morbidity and mortality. A recent conceptual model proposes that SRH lies “at the cross-roads between biology and culture” and integrates information from multiple sources. In practice it is not completely clear what people integrate into their self-assessments of SRH. This is of interest for the Puerto Rican population, for whom the phenomenon of somatization has been assumed by some investigators. We use data from adults in the Boston Puerto Rican Health Study, living in the greater Boston area (n=1357). Their age ranged from 45 to 75 years, mean 57.2 (SD=7.6). We explored determinants of SRH, including physical health (allostatic load and components, medical conditions, functional status); psychological health (depressive symptoms); health behaviors (smoking, alcohol consumption); and social context (poverty, perceived discrimination, social support and engagement in social activities). We entered these variables in multivariable regression models as separate groups. Poor self-rated health was significantly associated with female gender, fewer years of education, having multiple medical diagnoses, functional problems, high allostatic load, depressive mood, heavy alcohol use, smoking, poverty and low emotional support. When testing the independent effects of these variables by including them in the same model, we found that the strongest predictors of poor self-rated health were medical conditions, functional problems, allostatic load and depressive symptoms. We conclude that these adults do integrate information from multiple sources in their self-assessment of overall health, including psychological mood, as well as objective biological indicators, as operationalized by allostatic load.

**NEW INSIGHTS CONCERNING PREFERRED DEPRESSION TREATMENT APPROACHES AMONG OLDER AFRICAN AMERICANS**

Poor access to and underutilization of mental health treatments persist for older African Americans. Understanding beliefs and preferred treatment approaches may inform future interventions. We examined recognition of and beliefs about depressive symptoms, preferred symptom management strategies, and factors associated with willingness to use mental health treatments in 153 (57-males, 97-females) senior center members. Using a depression vignette, participants indicated if the person was depressed and their endorsement of items reflecting beliefs, stigma, symptom management strategies, and willingness to use treatments (yes/no). PHQ-9 assessed current symptomatology. Overall, 24.2% of participants reported depression (>5); 88.2% correctly identified person in vignette as depressed; and >75% endorsed active symptom management strategies, preference for treatment to occur in doctor and therapist offices, and were willing to take medications, seek therapy, see a doctor for treatment and attend support groups; <33% viewed depression as stigmatizing whereas 48% viewed depression as normal aging. Logistic regressions revealed lower education (p=.05), higher physical function (p=.038) and feeling okay if community knew of depression diagnosis (p=.027) were associated with willingness to see physician; being married (p=.014) and believing anti-depressant medications are beneficial (p=.027) were related to willingness to use medications. Different associations emerged for men and women. Overall, this group held positive attitudes and beliefs and endorsed traditional treatment modalities suggesting that beliefs alone are unlikely barriers to underutilization of depression services. As different factors were associated with willingness to seek physician help and use medications and factors also differed for men and women, interventions should be tailored.

**SESSION 765 (SYMPOSIUM)**

**AGE-RELATED HEARING LOSS: EPIDEMIOLOGY, IMPACT, AND TREATMENT**

Chair: F.R. Lin, Otolaryngology-Head & Neck Surgery, Johns Hopkins, Baltimore, Maryland

Discussant: L. Ferrucci, National Institute on Aging, Baltimore, Maryland

The prevalence of hearing loss doubles every decade of life such that nearly two-thirds of older adults ≥ 70 years are affected by age-related hearing loss (ARHL). The detrimental consequences of ARHL on cognitive, social, and physical functioning are just beginning to be understood, and the role of hearing aids and other rehabilitative strategies in potentially mitigating these effects remains unknown. This symposium will survey the epidemiology, impact, and treatment of ARHL using data from three major ongoing studies: the National Health and Nutrition Examination Survey, the Beaver Dam Epidemiology of Hearing Loss Study, and the Baltimore Longitudinal Study of Aging. We will review current epidemiologic estimates of hearing loss prevalence and incidence, the association of hearing loss with dementia and cognition, and the current state of hearing aid and cochlear implant use as rehabilitative modalities for ARHL.

**15-YR CUMULATIVE INCIDENCE OF HEARING IMPAIRMENT: THE EPIDEMIOLOGY OF HEARING LOSS STUDY**

K.J. Cruickshanks1,2, D.M. Nondahl1, D.S. Dalton1, B.E. Klein1,2, R. Klein1,2, T.S. Tweed1, 1. University of Wisconsin School of Medicine and Public Health Department of Ophthalmology and Visual Sciences, Madison, Wisconsin, 2. University of Wisconsin School of Medicine and Public Health Department of Population Health Sciences, Madison, Wisconsin

The purpose of this study was to determine the 15-yr cumulative incidence of hearing impairment (HI) in a population-based cohort study of 3753 adults ages 48-92 years in Beaver Dam, WI. Hearing thresholds were measured at baseline, 2.5, 5, 10, and 15 year follow-up examinations. HI was defined as a pure-tone average > 25 dB HL at 500, 1000, 2000, and 4000 Hz in either ear. The 15-yr cumulative incidence of HI was 56.8%. Age (5 yr; Hazard Ratio (HR)=1.87, 95% Confidence Interval (CI)= 1.76,1.99), sex (M v W; HR=2.34, CI= 1.95,2.80), and education (<12 vs 16+ yrs; HR=1.65, CI= 1.23,2.22) were associated with the 15-yr incidence of HI. Among the youngest group (48-59 yrs of age), 39% developed a HI. The risk of hearing impairment was high. Because hearing aid use is low and HI has been associated with lower quality of life, HI is an important public health problem.

**HEARING LOSS AND COGNITION IN THE BALTIMORE LONGITUDINAL STUDY OF AGING**

Background: We recently demonstrated that hearing loss is independently associated with incident dementia in the BLSA. The objective of the present investigation was to determine the relationship between hearing loss and cognition as assessed with a standardized neuropsychological battery. Methods: A cross-sectional cohort of 347 participants ≥ 55 years in the BLSA had audiometric and cognitive testing performed in 1990-1994. Hearing loss was defined by the speech-frequency
pure tone average in the better-hearing ear. Regression models were used to examine the association between hearing loss and cognition. Results: Greater hearing loss was significantly associated with lower scores on measures of mental status, verbal memory, and executive function. The reduction in cognitive performance associated with a 25 dB hearing loss was equivalent to the reduction associated with an age difference of 6.8 years. Conclusion: Hearing loss is independently associated with lower scores on tests of memory and executive function.

PREVALENCE AND CORRELATES OF HEARING AID USE IN THE UNITED STATES

W. Chien1, P. Maas2, C. Bell3, R. Thorpe4, F.R. Lin1, 1. Department of Otolaryngology, Johns Hopkins School of Medicine, Baltimore, Maryland, 2. Johns Hopkins Bloomberg School of Public Health, Baltimore, Maryland, 3. Center on Aging and Health, Johns Hopkins Medical Institute, Baltimore, Maryland, 4. Johns Hopkins Center for Health Disparities Solutions, Baltimore, Maryland

Background: Hearing aids are an effective intervention for individuals with hearing loss, but the epidemiology of hearing aid use has not been closely studied. Methods: We analyzed data from the 1999-2008 cycles of the National Health and Nutrition Examination Survey to determine the prevalence and correlates of hearing aid use in the United States. Results: Among those with hearing loss, the prevalence of hearing aid use was 7.69% in 12-19 year-olds, 11.3% in 20-69 year-olds, and 18.3% in ≥ 70 year-olds. Multivariate analyses demonstrated that Hispanics had a significantly lower odds of hearing aid use compared to white participants (OR 0.12, p=.005), and individuals with a college degree had a greater odds of hearing aid use compared to those without a high-school degree (OR 6.06, p=.037). Income was not associated with the odds of hearing aid use in multivariate models. Conclusion: Rates of hearing aid use vary significantly by demographic characteristics.

COCHLEAR IMPLANTATION IN OLDER ADULTS WITH HEARING LOSS: CONSIDERATION OF RESULTS AND IMPACT

H.W. Francis, A.I. Arbaje, Johns Hopkins University, Baltimore, Maryland

Older adults often experience reduced independence and increased isolation due to a variety of physical, cognitive, social and psychological changes. Hearing loss contributes to these changes by affecting an older adult’s quality of social interaction and sense of identity. Individuals with severe to profound sensory hearing loss may not benefit from conventional hearing aids due to damage within the cochlea. The cochlear implant, by comparison, is a surgically-placed device that generates micro-currents within the auditory nerve to deliver encoded speech information to the brain for better access to verbal communication. We provide a synopsis of published evidence for the role of cochlear implantation in the rehabilitation of hearing loss in older adults, and we present the functional outcomes of a cohort of older patients treated at the Johns Hopkins Listening Center. We propose a conceptual model for how real-world experiences of older adults impact rehabilitation outcomes after cochlear implantation.

SESSION 770 (SYMPOSIUM)

BIOLOGICAL AND BEHAVIORAL INTEGRITY AND FUNCTIONAL HEALTH ACROSS THE LIFESPAN: FINDINGS FROM THE BLSA

Chair: E.M. Simonsick, National Institute on Aging, Baltimore, Maryland
Discussant: L. Ferrucci, National Institute on Aging, Baltimore, Maryland

Consistent with the original mission of the Baltimore Longitudinal Study of Aging (BLSA) to improve understanding of the additive effects of aging and chronic conditions, this symposium explores aging-related change in a broad range of biological parameters that reflect the integrity of a variety of physiological systems. The BLSA was established in 1958 as a continuous enrollment cohort of individuals who enter the study as young as age 20 and are followed to the end of life. Examinations occur every 1-4 years depending on participant age and last 2-3 days. Four of the papers have a biological focus encompassing serum pro-inflammatory markers, 24-hour urinary cortisol, circulating nutritional biomarkers and resting metabolic rate (RMR) and each examines age-trajectories in the overall cohort and in three strata of functional health defined in terms of symptom-free performance of exertional activity and reported difficulties: (1) high functioning, (2) mild mobility impaired and (3) mobility limited. While individual nutritional parameters appear stable across the lifespan and do not vary by functional health, RMR and urinary cortisol are lower and a subset of pro-inflammatory markers higher with increasing age. The trajectory of change in these parameters tends to be less steep in high functioning versus mobility impaired and limited individuals. A fifth paper identifies specific personality characteristics associated with exceptional functional health and physical activity as a mediator of this relationship. Findings imply that selected biological parameters may be sensitive markers of subclinical pathology or advanced aging and may provide insight to healthy longevity.

HEALTH STATUS MODIFIES THE ASSOCIATION BETWEEN AGE AND RESTING METABOLIC RATE IN MEN BUT NOT WOMEN

N. Knuth, E.M. Simonsick, L. Ferrucci, NIA, NIH, Baltimore, Maryland

Resting metabolic rate (RMR) has been shown to decline with age, even after adjustment for loss of lean body mass. However, emerging evidence suggests this decline may be altered in relation to health status in older adulthood. Accordingly, we sought to evaluate the association between RMR and age by health status in 550 BLSA participants (45% women) aged 32-96 (mean 68). RMR was measured by indirect calorimetry for 15 minutes upon waking in a fasted, rested state. Participants were classified into three groups according to reported and observed walking endurance: high-functioning, impaired, and limited. Sex-stratified regression of RMR on age adjusted for lean and fat mass identified a significant difference in the relationship between RMR and age between high-functioning and limited men (p = 0.014); no association was found in women. The age associated decline in RMR was lower in high-functioning men than in impaired men.

LOW LEVELS OF PRO-INFLAMMATORY MARKERS CHARACTERIZE OLDER PERSON WITH HIGH PHYSICAL FUNCTION

L. Ferrucci, A. Lhotsky, Y. Milaneschi, N. Knuth, E.M. Simonsick, NIA/NIH, Baltimore, Maryland

Older persons often have a pro-inflammatory state characterized by elevated inflammatory mediators which correlates with poor lower extremity performance and predicts disability. Whether inflammatory profile discriminates highly functional persons from those with mild mobility impairment across the age spectrum is unclear. Using reported difficulties and symptom-free performance of exertional activity, BLSA participants were classified as High Functioning, Mild Mobility Impaired and Mobility Limited. Adjusting for age, sex and potential confounders, IL-6 (but not CRP), number of neutrophils and basophiles and monocyte percentage (but not hemoglobin, ferritin or transferrin) discriminated between the three groups. Findings were confirmed in multivariate analyses including all biomarkers. Pro-inflammatory state is already detectable at an early stage of physical function decline with aging.
ASSOCIATION BETWEEN AGE AND URINARY CORTISOL BY FUNCTIONAL HEALTH STATUS

Y. Milaneschi, E.M. Simonsick, T. Tanaka, N. Knuth, M. Tolea, L. Ferrucci, National Institute on Aging, Baltimore, Maryland

High degrees of variability in cortisol levels have been reported during aging. We examined the cross-sectional relationship between urinary 24-hour cortisol, age, and functional health levels in 821 participants (age:32-95) in the BLSA. Using reported and observed walking endurance, functional health was categorized as limited, impaired, and high. Covariates were sex, race, smoking, BMI and physical activity. After full adjustment, increasing age (β=-0.01; se=0.01; p=0.001), impaired vs. high (β=-0.13; se=0.05; p=0.02) and limited vs. high (β=-0.18; se=0.07; p=0.02) functional status were associated with lower (log)cortisol levels. Although a trend was observed in age-decline of (log)cortisol across functional categories (steeper decline from high to limited functionality), comparison between age slopes revealed no significant differences (F=2.02; p=0.13). We found that higher age and poor functional health were independently associated with lower urinary cortisol levels. No strong evidence was found for different age-trajectories of cortisol by functional health status. Longitudinal studies are necessary.

DO PERSONALITY CHARACTERISTICS DISTINGUISH PERSONS WITH EXCEPTIONAL FUNCTIONAL HEALTH ACROSS THE LIFESPAN?

M. Tolea, E.M. Simonsick, Y. Milaneschi, L. Ferrucci, National Institute on Aging, Baltimore, Maryland

This study sought to examine whether individuals with exceptional functional health exhibit distinct personality features relative to mobility impaired and limited individuals using data on 973 BLSA participants who were administered the NEO Personality Inventory (NEO-PI-R) (mean age=71 ± 13SD; 49% female; 76% white). We found highly functioning individuals to have higher conscientiousness independent of demographic and behavioral factors; an association consistent across the lifespan. Additionally, the high functioning group was more likely to have a combination of high openness to experience and high conscientiousness (OR=0.662, 95% CI: 0.466-0.940) than the mobility limited group. Physical activity partly mediates these associations. Results suggest that higher conscientiousness alone or in concert with high openness to experience may support healthy aging through promoting health protective behaviors. Further research is needed to validate these findings.

NUTRITIONAL AND FUNCTIONAL HEALTH: ASSESSMENT OF CIRCULATING BIOMARKERS

T. Tanaka, Y. Milaneschi, E.M. Simonsick, L. Ferrucci, National Institute on Aging, Baltimore, Maryland

A well balanced diet provides the body with essential nutrients that have been shown to promote healthy aging. Oxidative stress is one proposed mechanism for physical decline with age. As such, there is great interest in the role of dietary antioxidants in maintaining functional health. Using data on serum levels of vitamins C and E and carotenoids in BLSA participants aged 32-97 characterized into three strata of functional health derived from reported and observed walking endurance, this paper examines age-trajectories of nutrient-based antioxidant levels overall and with respect to functional health. Each antioxidant examined was stable over the age spectrum and did not vary by functional health. An analysis restricted to persons aged 65-97 found similar results. Most studies finding an association between nutritional anti-oxidants and physical function have included more frail individuals implying that serum anti-oxidant levels may be better markers of failing than robust health.
COFFEE, CAFFEINE, AND RISK OF DEPRESSION AMONG OLDER WOMEN: A 10-YEAR PROSPECTIVE FOLLOW-UP STUDY
M. Lucas1, F. Mirzai1, A. Pan1, O. Okereke1,2, W.C. Willett1,2, ELLIS J. O’Reilly1, K.C. Koenen1, A. Ascherio1,2, 1. Harvard School of Public Health, Boston, Massachusetts, 2. Channing Laboratory, Brigham and Women’s Hospital, Harvard Medical School, Boston, Massachusetts

Coffee intake from the coffee is the most widely used central nervous system stimulant in the world. However, studies of associations between coffee/caffeine intake and depression risk are scarce. Thus, we conducted a prospective analysis among a cohort of 50,739 US women without severe depressive symptoms at baseline in 1996. Coffee/caffeine intake was obtained from validated questionnaires and computed as cumulatively averaged intake since 1986. Clinical depression was defined as reporting physician-diagnosed depression and/or regular antidepressant use. During follow-up (1996–2006), 6,582 depression cases were identified. Compared to women drinking coffee less frequently (<1 cup/wk), multivariate-adjusted relative risk (RR) of depression was 0.70 (95% CI, 0.61–0.82) for those drinking 1–2 cups/d of coffee. Multivariate-adjusted RR of depression was 0.68 (0.58–0.84) comparing women with highest (≥550 mg/d) vs. lowest (<100 mg/d) coffee intake. Overall, in this large longitudinal study we found that depression risk decreased with increasing coffee/caffeine intake.

BIDIRECTIONAL ASSOCIATION BETWEEN DEPRESSION AND OBESITY IN MIDDLE-AGED AND OLDER WOMEN
A. Pan1, Q. Sun1,2, S. Czernichow1, O. Okereke1,2, M. Lucas1, A. Ascherio1,2, F. Hu1,2, 1. Nutrition, Harvard School of Public Health, Boston, Massachusetts, 2. Harvard Medical School, Boston, Massachusetts, 3. Hôpital Avicenne and University Paris 13, Bobigny, France

Although it has been hypothesized that the depression-obesity relationship is bidirectional, few studies have addressed this hypothesis in a prospective setting. We examined this bidirectional association among 65,955 women aged 54–79 years in the Nurses’ Health Study. Participants were prospectively followed from 1996 to 2006. Depression was defined as self-reported physician-diagnosed depression and/or antidepressant use. Obesity was defined as body mass index ≥ 30.0 kg/m2. Depression at the baseline period (1996–2000) was associated with an increased risk of obesity at the follow-up period (2002-2006) among women not obese at baseline (odds ratio [OR] = 1.51; 95% CI, 1.36–1.67). In the opposite direction, women who were obese at baseline had a moderately increased risk of depression at the follow-up period, compared with normal-weight women (OR = 1.10; 95% CI, 1.02–1.20). Our results suggest a bidirectional association between depression and obesity in middle-aged and elderly women, with a potentially stronger relation of depression to obesity.

PHARMACOTHERAPY OF GERIATRIC DEPRESSION AND NEUROBIOLOGICAL CORRELATES OF TREATMENT RESPONSE
B. Forester, McLean Hospital, Harvard Medical School, Belmont, Massachusetts

Complex clinical and neurobiological variables may offer clinicians guidance in making therapeutic decisions for older adults with depression. This study will review clinical and neurobiological factors associated with depression in later life including medical co-morbidity, cognitive impairment and aging-associated physiological changes. Neurobiological predictors of treatment response such as genetic factors, neuroimaging correlates and cerebrovascular disease will be discussed. An evidenced-based approach to the pharmacological treatment of geriatric depression will be reviewed. Finally, results from a 31Phosphorus magnetic resonance spectroscopy (MRS) study of sertraline for geriatric depression provides evidence of altered energy metabolism, specifically lower levels of total tissue (gray matter plus white matter) beta-nucleoside triphosphate (NTP), associated with depression in older adults. The potential use of MRS as an in vivo investigative tool of bioenergetic metabolism and neurotransmitter function may allow for the identification of regional and tissue specific biomarkers of treatment response in geriatric depression.

SESSION 780 (SYMPOSIUM)

NURSING CARE OF OLDER ADULTS INTEREST GROUP SYMPOSIUM: LIFESTYLE BEHAVIOR CHANGE ACROSS THE LIFESPAN
Chair: K.A. Gretebeck, University of Michigan School of Nursing, Ann Arbor, Michigan Co-Chair: C. Beck, University of Arkansas for Medical Sciences DW Reynolds Center on Aging, Little Rock, Arkansas Discussant: H.M. Young, UC Davis Health System Betty Irene Moore School of Nursing, Sacramento, California

Lifestyle choices made early in life impact the health of individuals across the lifespan. Identifying and modifying lifestyle factors are critical for healthy aging and longevity. Health care professionals are uniquely positioned to develop and facilitate behavior change interventions that contribute to optimal outcomes across the lifespan. The purpose of this presentation is to discuss lifestyle behavior change as it relates to recent theoretical and research approaches and current NIH/NINR funding initiatives and priorities with application to nurses and healthcare professionals. Specifically, the presentations will discuss 1) a new theoretical perspective of behavior change by using reinforced working memory training to appreciate a future reward in addictive behaviors; and 2) a widely disseminated individual and family lifestyle behavior intervention aimed at reducing adolescent sexual risk behavior. Components of efficacious lifestyle interventions will also be discussed. Lastly, several NINR/NIH initiatives related to behavioral change research will be discussed. Dr. Joan Wasserman from NINR will present information on funding priorities as they relate to lifestyle factors and behavior change across the lifespan.

EXCESSIVE DISCOUNTING OF THE FUTURE AS A TRANS-DISEASE PROCESS
W.K. Bickel, Virginia Tech Carilion Research Institute Center for Addiction Research, Center for Addiction Research, Virginia

Temporal discounting refers to the decrease in the value of a reward as the delay to its recipient increases. The argument of this presentation is that excessive temporal discounting (i.e., not valuing the future) undergirds a wide variety of addiction and other health behaviors. Since a common process undergirds numerous problematic health behaviors we propose that discounting constitutes a trans-disease process. Additional recent advances in neuroscience suggest an understanding of discounting. This, in turn, has lead to a new theoretical model to explain discounting and its relationship to health behavior. This new theoretical model not only provides an account for the etiology of numerous diseases but it also lead to a new the development of new approaches to treatment.

PROMOTING RESPONSIBLE SEXUAL BEHAVIOR AMONG ADOLESCENTS
A.M. Villarruel, University of Michigan School of Nursing, Ann Arbor, Michigan

Adolescence provides an optimal period to promote responsible sexual behavior and reduce consequences of early and unprotected sex. As with many behaviors, sexual behavior is influenced by many individual, family, school and community, and political factors. This presentation will focus on successful individual and family approaches to reducing sexual risk behavior. Components of efficacious evidence-based programs will be reviewed. Lessons learned from the development, testing, and dissemination of a sexual risk reduction intervention designed...
Muscle strength declines with age and contributes to physical dependence and mortality. It has long been presumed that declines in muscle mass (sarcopenia) are associated with weakness. However, recent evidence indicates muscle wasting is poorly associated with weakness in older adults. Accordingly, in 2008 the term ‘dynamenia’ was coined to more accurately define the loss of muscle strength with age and encourage greater attention to be paid to alternative mechanisms underlying dynamenia. In this symposium, the introduction presentation will review the key concepts of dynamenia, and then four individual presentations will follow that highlights new research focusing on neuromuscular factors contributing to dynamenia. This translational science symposium will provide the audience an eclectic mix of studies that present data from bench science, applied physiology and epidemiology. These presentations will: 1) examine an association between indices of brain macromolecular density, volume and poor muscle strength; 2) report a series of experiments on muscle weakness suggesting that dynamenia may be related to reductions in cortical and spinal excitability; 3) investigate neuronal cell health as a critical factor in determining muscle performance across the lifespan; and 4) evaluate components of excitation-contraction coupling. Collectively, this symposium will provide new insight into the mechanisms of muscle weakness that are independent from the largely studied area of factors associated with muscle tissue size. As such, after attending this activity participants will be able to 1) define dynamenia, and 2) discuss the multi-factorial contributors to muscle weakness in older adults.

**NEUROLOGICAL CONTRIBUTORS TO MUSCLE WEAKNESS ASSOCIATED WITH AGING AND DISUSE**

B.C. Clark1, J.S. Thomas1, D. Russ2, R.L. Hoffman1, T. Manini1, G.H. Yue2, J.L. Taylor2, 1. Ohio Musculoskeletal and Neurological Institute, Ohio University, Athens, Ohio, 2. University of Florida, Gainesville, Florida. 3. Cleveland Clinic Foundation, Cleveland, Ohio, 4. University of New South Wales, Kensington, New South Wales, Australia

Muscle weakness associated with aging as well as disuse is—in part—attributed to impairments in the nervous systems ability to activate skeletal muscle. Accordingly, we have sought to understand segmental changes in the nervous system associated with aging and disuse in relation to weakness. These data indicate older adults exhibit increased short- and long-interval intracortical inhibition (SICI and LICI) in comparison to young adults (SICI: 29.0±9.2% vs. 46.2±4.8% of unconditioned pulse; LICI: 6.5±1.7% vs. 15.8±3.3% of unconditioned pulse). Similarly, three-weeks of cast immobilization in young adults—a model of weakness—increases LICI (67.5±6.9% to 53.1±6.7% of unconditioned response), and this increase is associated with strength loss (r=−0.63). Additionally, our most recent data indicates that cervicomедullary-evoked potentials—an index of alpha-motoneuron excitability—are dramatically reduced (~75%) following cast immobilization. Collectively, these findings suggest weakness is associated with reductions in corticospinal excitability, which underscores the need for neurological factors to be considered as therapeutic targets for ameliorating muscle weakness.

**MUSCLE WEAKNESS IN OLDER ADULTS**

Muscle weakness (dynamenia) and wasting (sarcopenia) occur with aging. It is clear that intramuscular factors—dependent of muscle size and neural activation—play a role in dynamenia. We recently observed reduced muscle force (~28% vs. young rats) with minimal atrophy in a rodent model of aging. Interestingly, this weakness was frequency specific, being observed only at high activation rates (~75 Hz). Coincident with this weakness, we also observed age-related impairments in key components of excitation-contraction coupling: a decline (~25%) in the peak rate of sarcoplasmic reticulum calcium release and protein-protein interactions with the calcium release channel. These are similar to impairments reported elsewhere in severe fatigue and overtraining. Our most recent data indicates that aging results in alterations in desmin expression that may have important implications for aging, as muscle cytoskeletal proteins are critical in effective force transmission. Collectively, these findings suggest that intramuscular mechanisms contribute to age-related weakness.
SESSION 790 (SYMPOSIUM)

THE ROLE OF HOSPITAL ADMISSION IN THE HEALTH TRAJECTORY OF OLDER PEOPLE
Chair: D.J. Deeg, LASA, VU University Medical Centre, Amsterdam, Netherlands
Discussant: J.M. Guralnik, University of Maryland, Baltimore, Maryland

Epidemiological studies addressing health trajectories so far have largely ignored the role of hospital admissions. Admission to an acute care hospital occurs in a sizable part of the older population, e.g. in the Netherlands in 14% annually. A hospital admission represents a set-back in health from which recovery is needed. During the past decades, hospitals have changed not only because treatments have become less invasive, allowing shorter admission periods, but also because of continued efficiency operations. Both developments have resulted in shorter hospital stays, implying either that older people are discharged earlier in their recovery process so that they are more likely to need care, or that less invasive treatments cause less of a set-back in health and thus less need of care. This symposium examines characteristics of hospital admission such as number of admissions, length of stay, functional status during admission, and post-hospital care in relation to longer-term trajectories of physical and mental health. Two studies are based on linkage between data from the Longitudinal Aging Study Amsterdam with registry-based hospital admission data. One study makes use of proxy-interviews with relatives of deceased cohort members. Another study is based on a sample of patients requiring special discharge care. The fifth study examines functional status during hospital admission in relation to risk of functional decline or new hospitalization. Together, these studies highlight the role of hospital admission, and identify specific groups that fare less well in terms of length of stay and, after discharge, health decline and need of care.

PERFORMANCE-BASED FUNCTIONAL ASSESSMENT IN OLDER HOSPITALIZED PATIENTS: SHORT AND LONG TERM PROGNOSTIC VALUE
S. Volpato, E. Savino, G. Zuliani, J.M. Guralnik, 1. University of Ferrara, Ferrara, Italy, 2. Department of Epidemiology and Public Health, University of Maryland School of Medicine, Baltimore, Maryland

We evaluated the Short Physical Performance Battery (SPPB) and grip strength, as objective indicators of function and health status in acutely ill, hospitalized, elders and we tested their value as short-and long-term prognostic tools. Prospective study of 92 patients aged 65 years and older hospitalized for an acute medical condition. They were followed every 3 months by telephone interviews, after discharge, to assess functional decline, new hospitalizations, and vital status. At hospital admission, both the SPPB and grip strength were associated with traditional indicators of clinical status. We found an inverse and independent statistically significant association of SPPB score and grip strength with the length of hospital stay (p values <.01). After adjustment for confounders SPPB, score was inversely associated with the risk of worsening disability and the risk of new hospitalization or death over the 12-month follow-up. In older acutely ill hospitalized patients, SPPB and grip strength provides important information to predict health trajectory.

OUT OF HOSPITAL: PATIENT PERCEPTION OF THE QUALITY OF DISCHARGE CARE
D.J. Deeg, R. Meiners, P. Groenewegen, 1. LASA, VU University Medical Centre, Amsterdam, Netherlands, 2. VU University/Faculty of Social Sciences, Amsterdam, Netherlands

In acute-care hospital patients needing special discharge care, factors affecting patient satisfaction with discharge care were examined. A consecutive sample of 140 patients was recruited from 14 hospitals across the Netherlands, from a variety of wards including orthopedics, surgery, lung diseases, and cardiology. Men constituted 67% of the sample; the average age was 78 years; 21% reported no health limitation prior to hospitalization. Patient satisfaction was not affected by personal characteristics. Patients who would be discharged to a home for the aged, or to their own home and were allocated medical assistive devices or meals on wheels, were more satisfied than patients who would obtain other post-acute care. Satisfaction was greater among those who had more frequent contacts with the nurse responsible for discharge care (NDC), and whose NDC was employed with a home care agency (versus the hospital). Knowledge of the home environment seems important in discharge care.

HOSPITAL ADMISSION AND LONG-TERM CARE THREE MONTHS PRIOR TO DEATH: CHANGES OVER A DECADE
P. Kaspers, R. Pasman, D.J. Deeg, B. Onwuteaka-Philipsen, 1. LASA, VU University Medical Centre, Amsterdam, Netherlands, 2. VU University Medical Centre/Dept. of Public and Occupational Health, Amsterdam, Netherlands, 3. VU University Medical Centre/EMGO Institute for Health and Care Research, Amsterdam, Netherlands

With increasing life expectancy, people die at older ages with increasingly complex health problems. With the aim to study changes over a decade in care received by older people in their last three months of life, data were collected among proxy respondents of deceased sample members of the Longitudinal Aging Study Amsterdam in 2000 (n=270, response 79%) and 2010 (n=167, response 59%). Hospital admission prior to death occurred in 30% of the sample. This percentage did not differ between 2010 and 2000, also after accounting for functional status and receipt of informal or formal care. In 2010 compared to 2000, however, care in the home was more often provided by professionals, often in combination with informal carers, and admission to a long-term care institution occurred more often. This difference remained after accounting for age, gender, and functional status. It might reflect period differences in availability of informal and formal care.

THE ASSOCIATION BETWEEN DEPRESSION AND NON-PSYCHIATRIC HOSPITALISATION AMONGST OLDER PEOPLE
M. Prina, D.J. Deeg, C. Brayne, A. Beekman, M. Huisman, 1. Institute of Public Health, University of Cambridge, Cambridge, United Kingdom, 2. VU University Medical Centre, Amsterdam, Netherlands

Older people who suffer from depression are more likely to have other physical illnesses, but the extent of the association between depression and non-psychiatric hospitalisation episodes is not well established. We therefore investigated whether depressed older people were more likely to be hospitalised for causes other than mental illnesses, and whether the outcomes for this group of people were less favourable. This was carried out by linking LASA participants with hospital data from the Dutch Medical Register. Participants with depression were more likely to be hospitalised during follow up, they had longer length of stay, a higher number of readmissions and were more likely to die while in hospital. This association was partially explained by co-morbid physical illnesses and functional limitations that were modelled using generalised estimating equations. The results emphasise the high potential for preventive action that could reduce the financial, medical and social burden related with hospital admission.

FUNCTIONAL DECLINE IN RELATION TO HOSPITAL LENGTH OF STAY: CHANGES OVER A DECADE
M. van Vliet, M. Huisman, D.J. Deeg, 1. Department of Epidemiology & Biostatistics, EMGO Institute for Health and Care Research, VU University Medical Center, Amsterdam, Netherlands, 2. Department of Psychiatry, VU University, Amsterdam, Netherlands, 3. Department of Sociology, VU University, Amsterdam, Netherlands

To study the effect of decreasing mean hospital length of stay (HLOS) in the Netherlands, we explored its relation with older people’s func-
SESSION 795 (PAPER)

PROTECTING ELDERS FROM ABUSE IN THE COMMUNITY

UNDERSTANDING AND AVOIDING FINANCIAL EXPLOITATION: RESEARCH ON SURVIVAL STRATEGIES AND WHAT EVERY COMMUNITY SHOULD KNOW

S.Y. Jones, R.L. Cosby
1. Adult Protective Services, Department of Human Services, Washington, District of Columbia, 2. HHS, Rockville, Maryland

This session will address the almost meteoric rise in Financial Exploitation across the country and consider some multi-jurisdictional responses. The rising numbers of older persons, the complexity of financial exploitation have forced local and state jurisdictions to look more carefully at this issue. National figures indicate for every reported case there are 43.9 unreported cases. For neglect cases: a staggering 57 to 1. Financial exploitation seemingly is emerging as the most prevalent form of elder mistreatment. A case study is being offered in the District of Columbia, which according to APS has seen an increase in these cases. Cases include Medicaid recipients, persons with disabilities, and persons of some financial stature. Reporting mechanisms nationwide are inadequate and the ability to track cases often breaks down across state lines. Proving financial abuse or neglect is tedious. In a downturned economy regulators and elected officials often believe deaths are due to natural causes. Proving financial abuse or neglect is the tip of an iceberg and often requires extensive documentation. The result is shame, humiliation and failure to report how pervasive the problems are and what solutions are needed. This session will offer both research and policy directives needed to address this growing problem.

DEVELOPING A TOOLKIT TO UNDERSTAND THE OFFENCES OF WILLFUL NEGLECT AND ILL-TREATMENT UNDER THE MENTAL CAPACITY ACT

J. Manthorpe, K. Samis, Social Care Workforce Research Unit, King’s College London, London, United Kingdom

The Mental Capacity Act 2005 implemented in England and Wales in 2007 provided a new framework for safeguarding people whose mental or physical capacity are affected. Two new offences of wilful neglect and ill-treatment to protect vulnerable people are now punishable by law. Exploratory qualitative interviews with 115 practitioners working with people with dementia and carers indicated positive expectation of the potential of these offences to safeguard the interests of vulnerable groups. Follow up interviews after 1 year indicated limited understanding of the specifics of these offences, and procedures to follow if these offences were found. More clarity around these topics was welcomed. Collated findings from these interviews, along with a consensus discussion with 15 experts in the field of safeguarding are lead to the development of an easy-to-read toolkit. This toolkit will enable identification of cases of ill-treatment and neglect and specify what to do when this has been found. The toolkit will be developed with the aim of using it in a wide range of service settings.

WHY DO THEY KEEP COMING BACK? AN EXAMINATION OF RECIDIVISM OF ELDER ABUSE CLIENTS WITHIN ADULT PROTECTIVE SERVICES

J. Wysong, Z.D. Gassoumis, A.E. Navarro, K. Wilber, Davis School of Gerontology, University of Southern California, Los Angeles, California

Recidivism of Adult Protective Services (APS) cases occurs when an individual is referred to APS after closure of a previous case. Repeat clients are burdensome to an overwhelmed public system and indicate case complexity and barriers to resolution. Understanding predictors of recidivism could aid in earlier identification of chronic APS clients, facilitation of tailored multidisciplinary interventions, and increased case resolution. This study tracks Los Angeles County APS clients age 65 and older for repeat cases for a year after baseline case closure (n = 14,813). Over one-fifth (21.7%) of the sample exhibited one-year recidivism. Intervention of the Los Angeles County Elder Abuse Forensic Center (the Center) was included to determine the effectiveness of a multidisciplinary approach in reducing recidivism. Almost three-fifths (56.8%) of APS clients referred to the Center are recidivists, with most repeat cases occurring before Center intervention. A logistic regression model was used to assess the variables that predict recidivism. Other factors included in the model were demographic, living situation, marital status, and abuse type. Preliminary results indicate that the strongest predictors of increased odds of recidivism are being female (OR = 1.24), suspected self-neglect (OR = 1.36), financial exploitation (OR = 1.29), physical abuse (OR = 1.21), and neglect (OR = 1.15). An analysis of risk factors for recidivism among APS clients is not currently available in the literature. Detecting likely recidivist clients early and diverting them toward multidisciplinary intervention has the potential to improve case outcomes and enable more efficient utilization of APS resources.

INTIMATE PARTNER VIOLENCE AND OLDER WOMEN: FINDINGS FROM A EUROPEAN STUDY

B.L. Penhale, T. Goergen1, B. Nagle1, B. Haller1, H. Perista2, M. Halicki3, O. Toth1, 1. University of East Anglia, Norwich, Norfolk, United Kingdom, 2. German Police University, Munster, Germany, 3. Zoom NGO, Gottingen, Germany, 4. IKF (Institute of Conflict Research), Vienna, Austria, 5. CESIS NGO, Lisbon, Portugal, 6. University of Bialystok, Bialystok, Poland, 7. University of Budapest, Budapest, Hungary

This EU-funded (Daphne III programme) study on Intimate Partner Violence (IPV) and Older women includes partners from Austria, Germany, Great Britain, Hungary, Poland, and Portugal. The study ran between January 2009 and December 2010 and addressed the question to what extent women aged sixty or older experience violence by partners or ex-partners (intimate partner violence), what kind of help and support they seek and receive and what kind of support they need. Until now, comparatively little is known about this issue and this research helps to address that knowledge deficit. The first phase of the study consisted of data collection about IPV and older women from several sources (criminal justice agencies, social services etc) in each country. Phase two undertook a survey of organizations about the extent to which they have worked since 2006 with older women experiencing IPV and a number of interviews were held with professionals who had worked in this area. The final phase concerned interviews with a small number of older women who have experienced IPV in later life. This presentation will briefly outline the method and content of the study. Findings from the different phases will be presented, particularly findings from the final phase concerning older women. There will be discussion of some of the issues raised by the topic and the research. This session will provide participants with an understanding of the key issues relating to Intimate Partner Violence and older women in Europe. It will provide opportunities for international discussion and comparison.
RERAINTS IN DOMESTIC CARE: REDUFIX-AMBULANT
T. Klé!, S. Behrend2, B. Borgloh3, D. Breidhauer!, S. Kamer!, M. Kraemer!, B. Schuhmacher!, 1. Protestant University for Applied Sciences, Freiburg, Germany; 2. University of Applied Sciences, Frankfurt, Germany

Barely one gerontological research takes account of restraints in the domestic care compared with restraints in nursing homes. The project “ReduFix-Ambulant” examines the frequency and background of restraints and develops measures of intervention to restrict the risk of restraints. Consultation based on Case Management, use of modern technologies, training for caregivers and relief for the caring family are essential components of interventions for the purpose of the project. Within the frame of the project the legal questions concerning restraints in care are also analyzed systematically. The data of the frequency of restraints in the domestic were raised on the World Elder Abuse Awareness Day 2010 and 2011. Professional staff members of home care services are interviewed in standardized questionnaires, expert interviews with physicians and judges as well as guardians reveal and focus in multi-professional manner typical forms of elder abuse and restraints against elder persons. Case studies of families show implications and effects of intervention measures. The numbers reveal clearly, that restraints in domestic care are very common (11 % of frail older persons, 50 % of patients with dementia). Reasons for restraints are found in highly stressful situations and overdrafting, missing knowledge and negative stereotyped views on old age. The results of the study emphasize that the extent of restraints in domestic care has been underestimated so far and shows that there is a need for action in law as well as in regard to infrastructural support and interventional help in individual cases.

SESSION 800 (SYMPOSIUM)

AN INTRODUCTION TO RECENT EFFORTS IN THE NATIONAL BALANCING INDICATOR PROJECT (NBIP)
Chair: S. Ruiz, IMPAQ International, Washington, District of Columbia
Co-Chair: O. Urdapilleta, IMPAQ International, Washington, District of Columbia

The purpose of this symposium is to introduce and present initial findings from the National Balancing Indicator Project (NBIP). The goal of the NBIP is to continue and expand the scope of work of the National Balancing Indicator Contract (NBIC). In 2007, the NBIC began to construct a set of national balancing indicators; however, the context in which CMS initiated the NBIC has significantly changed (i.e. health care reform and recent changes in Olmstead). Therefore, the scope of the indicators has expanded to address changes associated with the new environmental context. The key objectives of the NBIP are to: refine the 18 “core” or “short-term” measures/indicators developed under the NBIC; construct a comprehensive crosswalk of the indicators; and provide recommendations for operationalizing and implementing indicators and for improving data collection systems infrastructure to support the reporting of these indicators.

OVERALL FEDERAL EFFORTS IN LONG TERM SERVICES AND SUPPORTS
J. Howard, J.L. Poey, IMPAQ International, Washington, District of Columbia

The final presentation of the symposium will focus on two key mechanisms for achieving project objectives: 1) collaboration with agencies; and 2) findings from the development of an indicator crosswalk. To facilitate working in partnership with CMS clients and partners, the NBIP holds quarterly meetings with the federal partners and facilitates information sharing through its National Balancing Indicators portal (www.nationalbalancingindicators.com) and discussion through a Federal partners’ discussion board. For a successful and comprehensive approach, CMS and its HHS Federal partners and private and not-for-profit organizations have contributed their individual research agendas and indicators to a crosswalk document. The findings and crosswalk document will be presented during this session, matching NBIP work to other agencies with balancing indicators or equivalents.

SESSION 805 (SYMPOSIUM)

CREATING CAPACITY TO DELIVER EVIDENCE-BASED HEALTH PROMOTION PROGRAMS: NEEDS, EXPECTATIONS AND MODELS
Chair: J. Frank, UCLA, Los Angeles, California
Discussant: N. Morrow-Howell, Washington University, St. Louis, Missouri

This symposium addresses the need for and methods to assure having a prepared work force for organizations delivering evidence-based...
health promotion and disease management (EBHP) programs to older adults. Major federal funding efforts are fueling the development of statewide sustainable networks to deliver EBHP programs to older adults through health and aging service community based organizations. A key component to success and sustainability of these programs is the development of a trained workforce embedded in these agencies that is prepared to not only deliver the EBHP programs, but to provide the administrative and management support needed. We present data from a statewide survey that documents the lack of formal training in aging content of currently employed aging services employees and we use a competency discrepancy assessment method to compare current competency-based training gaps with agency needs and priorities. Data from a 10-program survey is also presented on the common critical skill sets needed for delivering training to volunteers in aging service organizations to prepare them to deliver EBHP programs. We next present a model curriculum for community colleges to prepare students from a variety of disciplines in Skills for Healthy Aging Resources and Programs (SHARP). A major component of SHARP is faculty development to prepare the teachers for the 4-course certificate program. Baseline data on faculty readiness to teach in EBHP is presented, as are curricula content and teaching tools. The implications and utilization of these data and models will be discussed.

SKILLS FOR HEALTHY AGING RESOURCES & PROGRAMS (SHARP): A PILOT CERTIFICATE PROGRAM FOR COMMUNITY COLLEGES

Based on documented needs for gerontological preparation of aging services personnel and competency-based curricula gap analyses, we developed SHARP as a career technical education (CTE) pilot program at two community colleges. SHARP provides competency-based content on aging, behavior change theories, aging services program administration, Stanford University’s Chronic Disease Self-Management Program (CDSMP) and other evidence-based healthy aging programs, and fieldwork experience in a community-based organization delivering healthy aging programs. A baseline survey of community college faculty planning to teach in SHARP (n = 18) prior to faculty development revealed that faculty perceptions of SHARP content mastery, on a 1-7 scale (1 = no content mastery), average ratings of 3.22 for competency-based student assessment, 3.33 in evidence-based health promotion, 3.39 in CDSMP and 4.11 in healthy aging. Self-reported teaching skills for the content were rated low, at an average of 2.5, on a 7-point scale, with 1 = novice level teaching skills.

CALIFORNIA AGING LABOR FORCE SURVEY: ARE STAFF IN AGING SERVICES GERONTOLOGICALLY PREPARED?

J. Damron-Rodriguez, UCLA, Los Angeles, California

The California Aging Services Labor Force Survey of 58 County Adult Service Programs and the state’s Area Agencies on Aging, their subcontractors, and adult day health care provides evidence of the need for educational preparation of aging service workers. Of the total sample combined, 60% of the agencies reported zero staff with any formal training in gerontology. In rating staff geriatric competencies, data indicated a mismatch between the “most important skills” and availability of staff with these skills. Related to evidence-based practice, the evaluation of practice effectiveness was the lowest rated skill for all aging services. Recognizing that funded programs for Older American Act services are moving into more complicated arenas of services, including evidence-based health promotion and disease prevention (EBHP), this survey provides data to support the need for gerontological competency-based training for current aging services staff and competency-based education for future aging services personnel.

THE FEASIBILITY OF A GENERIC TRAINING CURRICULUM FOR VOLUNTEERS IN HEALTH PROMOTION PROGRAMS

M. Alipeter, Institute on Aging, University of North Carolina, Chapel Hill, North Carolina

To determine the feasibility of creating a generic training curriculum for volunteers in health promotion programs for older adults, we conducted a two-phased study to review program materials from 10 national evidence-based or best practice programs. We created a spreadsheet matrix to tabulate the frequency of inclusion of elements across all 10 programs, and arrayed elements under appropriate topics. We then reviewed the matrix for comprehensiveness and added elements to augment the identified core topics. Program administrators reviewed the matrix to ensure accuracy and relevance. We found 67 elements of core content across 50% or more of the reviewed programs. We added 17 elements to enhance curriculum comprehensiveness. Our findings identify a significant body of general core content that supports the feasibility of creating a generic training curriculum for volunteers as an approach to enhance staffing capacity for health promotion programming.

SESSION 810 (SYMPOSIUM)

HOW THE LACK OF A TRAINED WORKFORCE THREATENS THE FUTURE EXPANSION OF PARTICIPANT-DIRECTED LTSS PROGRAMS

Chair: L. Simon-Rusinowitz, School of Public Health, University of Maryland, College Park, Maryland Co-Chair: K.J. Mahoney, Boston College, Chestnut Hill, Massachusetts

Discussant: K.J. Mahoney, Boston College, Chestnut Hill, Massachusetts

Since 2001, changes in Medicaid policy and expanded financial support from the Administration on Aging (AoA) and the Veteran’s Administration (VA) have led to an expanding number of participant-directed (PD) long-term services and support (LTSS) programs from 139 to over 240. The growth of PD LTSS creates a need to re-train the aging network workforce and informal caregivers, as the adoption of PD LTSS requires an organizational culture change in viewing the participants’ role in directing their own care. However, the growth of PD LTSS has occurred during challenging economic times when many states are forced to cut community-based program budgets. Using recent research from the National Resource Center for Participant-Directed Services (NRCPDS), this symposium will first provide an overview of nationwide growth of Medicaid, AoA, and VA PD programs (Mark Sciegaj). Second, the findings of recent interviews with 15 Cash and Counseling state program directors regarding PD training needs of the aging network workforce will be presented (Abby Schwartz). Finally, the findings from a survey of representatives (family members or friends) serving participants with dementia in Arkansas’ Independent Choices Program will detail the training needs for this important team member—the person who assesses and represents a participant’s preferences and needs when that person needs help in doing so (Lori Simon-Rusinowitz). NRCPDS director Kevin Mahoney will synthesize lessons from these projects and discuss approaches to meeting training needs in challenging economic times.

REPRESENTATIVES FOR PEOPLE WITH DEMENTIA IN A PARTICIPANT-DIRECTED PROGRAM: UNIQUE TRAINING NEEDS

L. Simon-Rusinowitz, E. Mahoney, D.M. Loughlin, K. Ruben, J. Health Services Administration, University of Maryland, College Park, Maryland, 2. Boston College, Boston, Massachusetts

Abstract Participant-directed (PD) services help people with all types of disabilities stay in their homes and obtain the type of personal care they prefer. However, policymakers and others have had concerns about

64th Annual Scientific Meeting

239
PD services for people with dementia. Representatives — unpaid relatives or friends — play a critical role for people with dementia as they elicit and reflect participants’ preferences about their care. PD services depend greatly on a representative who performs the role well, and is prepared for change as the participant’s ability to communicate diminishes. We will report on a telephone survey of representatives for participants with dementia in Arkansas’ IndependentChoices program. This representative-focused approach will guide construction of an innovative, evidence-based training program for representatives of participants with dementia. An important training program goal is to help representatives make decisions that promote quality of care and quality of life for both members of the participant–representative dyad.

STATE INTERVIEWS REVEAL CASH & COUNSELING INFORMATION AND TRAINING NEEDS DURING BUDGET AUSTERITY

L. Simon-Rusinowitz, D.M. Loughlin, K.J. Mahoney, A. Schwartz, Y. Donohoe, 1. Boston College Graduate School of Social Work, Chestnut Hill, Massachusetts, 2. U-MD School of Public Health, College Park, Maryland, 3. U-MD School of Public Health Dept. of Health Services Administration, College Park, Maryland

Cash and Counseling (C&C) programs help people of all ages remain independent in their communities by allowing participants to hire their own workers and direct a budget. However, program structures may vary as states meet challenges posed by differences in populations as well as state resources, requirements and regulations. The National Resource Center for Participant Directed Services developed the Membership Information Partnership (MIP) to identify the information and training needs of 15 C&C state programs and encourage staff to share program information. This presentation will report findings from recent interviews with C&C state program administrators, including their views about current successes and challenges during austere budget times and their desire for more information exchange among state peers on a variety of topics. This information will aid in the promotion of program quality, sustainability, and participant-directed policy nationally.

NATIONAL INVENTORY OF PUBLICALLY FUNDED PARTICIPANT-DIRECTED SERVICES PROGRAMS

M. Sciega, Health Policy and Administration, University Park, Pennsylvania

The number of participant-directed programs has grown considerably over the past decade. With support from the Robert Wood Johnson Foundation and Atlantic Philanthropies, the National Resource Center for Participant-Directed Services (NRCDS) at Boston College is conducting an inventory of existing programs to identify emerging state efforts to promote participant-direction. The inventory will identify these programs, describe their characteristics, and identify the extent to which participant-direction features are included along a continuum (i.e. few features to fully developed programs). This paper reviews the project goals, methods and preliminary findings regarding Medicaid Programs, non-Medicaid funded programs, and Veteran’s Administration funded programs.

SESSION 815 (SYMPOSIUM)

INNOVATIVE APPROACHES TO INCREASING ACCESS TO CULTURALLY APPROPRIATE SUPPORT FOR FAMILY CAREGIVERS

Chair: D.J. Sheets, University of Victoria, Victoria, British Columbia, Canada
Co-Chair: M. Marcus, University of Victoria, Victoria, British Columbia, Canada
Discussant: F. Torres-Gil, University of Victoria, Victoria, British Columbia, Canada

The Harry and Jeannette Weinberg Foundation is providing nearly $8 million in funding to develop the capacity of non-profit organizations to support family and informal caregivers. This symposium presents findings from selected non-profit organizations in 3 states in their second year of funding under this 3 year initiative. The projects highlight innovative approaches to addressing the needs of minority, culturally and ethnically diverse populations. One presentation assesses the use of trained bilingual care advocates to enhance service provider capacity to address the needs of underserved Asian family caregivers in a culturally and linguistically appropriate manner. Another presentation summarizes the impact of a partnership between an area agency on aging and community and faith-based organizations in the south suburbs of Chicago. The presentation highlights key aspects of this project and the development of culturally appropriate caregiver programs and services that target underserved minority, culturally and ethnically diverse family caregivers.

PROCESS AND OUTCOMES EVALUATION OF A CAREGIVER SUPPORT NETWORK VIA FAITH-BASED ORGANIZATIONS

R.L. Berman, M. Iris, Research, CJE SeniorLife, Chicago, Illinois

Caring Together, Living Better (CTLB) is a partnership between Age Options, an area agency on aging, and community and faith-based organizations in the south suburbs of Chicago. The aim of the project is to develop culturally appropriate, supportive programs for low-income, minority caregivers. CTLB objectives include mobilizing local assets to address caregiver-identified needs and improving access to services through innovative outreach strategies. As part of the evaluation, we have documented the development of the partnership, changes in relationships among churches and other organizations in the region, use of services by caregivers, and improvement in caregivers’ confidence in their ability to get assistance and access services. Findings are based on qualitative and quantitative analysis of multiple data, including network analysis. We summarize the impact of the partnership at regional, community, and caregiver levels, highlighting implications for sustaining the development of this grass-roots caregiver support network.

THE ASIAN PACIFIC ISLANDER DEMENTIA CARE NETWORK – PRELIMINARY FINDINGS

D. Cherry, P. Houseen, S. Enguidanos, R. Gongoll, 1. Institute for Change/Research, Partners in Care Foundation, San Fernando, California, 2. Alzheimer’s Association, Southland Chapter, Los Angeles, California, 3. Davis School of Gerontology - University of Southern California, Los Angeles, California

Ethnic minorities are often unaware of or hesitate using social and supportive services. As a result, Asian caregivers may lack needed support and resources. The Los Angeles-based Asian Pacific Islander Dementia Care Network (APIDCN) Project: Services for Caregivers aims to enhance service provider capacity to serve Asian family caregivers in a culturally and linguistically appropriate manner. Trained bilingual care advocates— the “heart” of the APIDCN— recruit, assess, and provide social service referrals to caregivers of persons with dementia. Preliminary analyses show that 26% of caregivers (n=23) indicated at intake (baseline) that they did not use services such as respite, support groups, or chore services. This rate decreased to 9% at follow-up, demonstrating an overall increase in supportive service utilization among caregivers. Caregivers’ knowledge about services in their community also improved. These preliminary findings suggest that culturally appro
priate outreach, assessment and referral improve access to supportive services for Asian caregivers.

CAREGIVER CENTRAL: SELF-ASSESSMENT TO INCREASE ACCESS TO SERVICES
A. Kelly, A.J. Thompson, Share the Care, Inc, Orlando, Florida

The Caregiver Central project developed a self-assessment web-tool to allow caregivers to identify their own caregiving needs. The use of this tool by a nonprofit organization provided caregivers with direct links to services, support and information. This innovative technology has resulted in the creation of a network that supports caregivers and also expands the potential for community response to caregiver needs, thus giving families more solutions earlier in the caregiving trajectory. Findings from an evaluation of the project will examine how it has increased capacity to address the needs of caregivers by developing a community network reach and response, including both process and outcome perspectives. Aspects of network expansion, such as development of service partnerships and relationships with major employers, are identified as well as implications for addressing caregiver outcomes including depression, caregiver burden and caregiver risk.

SESSION 820 (SYMPOSIUM)

FINDING YOUR VOICE: ADVOCACY TRAINING FOR THE EVERYDAY RESEARCHER
Chair: G. O’Neill, National Academy on an Aging Society, Washington, District of Columbia
Co-Chair: B. Lindberg, Consumer Coalition on Health Care, Washington, District of Columbia

With the current economic climate threatening to cut crucial funding, your voice is needed to make the case for investing in research both on the local level and in Washington. This session will feature an overview of the current funding crisis, give tips on how to set up and prepare for a congressional meeting, and provide training on framing your work and communicating effectively to policy makers. Experts in policy and advocacy will also lead a small group practice exercise to perfect your message. This extended session, chaired by Greg O’Neill, Director of the National Academy on an Aging Society, and moderated by GSA Policy Advisor Brian Lindberg, will provide you with essential tools to become an advocate for research funding and other aging services. This session is sponsored by the National Academy on an Aging Society.

SESSION 825 (SYMPOSIUM)

THE AFFORDABLE CARE ACT AND LONG-TERM CARE: AN ANALYTICAL PERSPECTIVE
Chair: E.A. Miller, Gerontology, Univ. of Massachusetts Boston, Boston, Massachusetts
Discussant: D. Grabowski, Harvard Medical School, Boston, Massachusetts

Widespread recognition of prevailing challenges has led to growing consensus that the way long-term care (LTC) is delivered, regulated, and financed needs to be reformed. Although receiving little notice in light of efforts to expand access to basic health insurance coverage, the Patient Protection and Affordable Care Act (ACA) includes a number of provisions meant to address extant deficiencies in the LTC sector. The most prominent is the Community Living Assistance Services and Supports (CLASS) Act, a national voluntary LTC insurance program. Other pertinent provisions include a number of research and demonstration projects, a grab bag of nursing home quality reforms, and additional incentives and options for expanding Medicaid home- and community-based services (HCBS). In including these provisions it was the sense of the Senate that “Congress should address long-term services and supports in a comprehensive way that guarantees elderly and dis-able individuals the care they need.” But just how effective is the ACA likely to be in addressing the problems plaguing LTC? This symposium will seek to answer this question by drawing on the expertise of eminent scholars and analysts. Mitchell LaPlante (UCSF) will examine the implications of the ACA for expanding access to home- and community-based services; Robyn Stone (LeadingAge) for the LTC workforce; and Joshua Wiener (RTI) for LTC financing.

THE IMPACT OF THE ACA ON THE ELDER CARE WORKFORCE
R. Stone, N. Bryant, LeadingAge, Washington, District of Columbia

The ACA impacts the development and sustainability of the elder care workforce in several ways. Specific provisions that support and strengthen this workforce include financial incentives to encourage individuals to pursue geriatric careers across professions, the expansion of the Geriatric Education Centers to focus on chronic care management and long-term care, and the development of core competencies and curricula for direct care workers. Indirectly, the ACA will influence this workforce through provisions designed to shift LTC from a primarily institutional to HCBS system. Promulgation of new payment methodologies designed to improve quality and efficiency in Medicare and an array of demonstration and pilot projects designed to promote better care coordination and service integration within and across settings will further impact its size and structure. Ultimately, the type of education and training and practice patterns required will need to be altered to successfully achieve the goals inherent in these provisions.

IMPLEMENTING THE CLASS ACT: DECISIONS FOR THE DEPARTMENT OF HEALTH AND HUMAN SERVICES
J. Wiener. Aging, Disability and Long-Term Care, RTI International, Washington, District of Columbia

Over the long run the CLASS Act has the potential to radically change LTC financing. Like much of the ACA, the CLASS Act delegates considerable discretion to the federal bureaucracy. This suggests that the Act’s ultimate effectiveness will depend on choices the government makes during the course of implementation. How can adverse selection be prevented? What should actuaries assume in setting premiums? What disability levels should trigger benefits? How will eligibility for benefits be determined? How much will benefits be and for what can they be used? What will the relationship be between the CLASS Act and private insurance? Decisions such as these will largely determine whether the general working population can be educated to recognize their risk of needing LTC as they age and whether they believe that the CLASS Act can help to meet future LTC needs i.e., offers value for affordable premiums.

HOME AND COMMUNITY BASED SERVICE OPTIONS
M. LaPlante, C. Harrington, T. Ng, H. Kaye, University of California, San Francisco, California

Over the past two decades state Medicaid programs have greatly expanded HCBS although considerable interstate variation in access to services remains. The ACA has three important provisions to expand HCBS. First, the Community First Choice Option allows states to provide attendant care services with enhanced federal matching assistance. Second, HCBS can be offered as an optional benefit instead of a waiver at a financial eligibility level of 300% of SSI. Third, the State Balancing Incentive Payments Program provides five years of enhanced federal matching to eligible states to increase HCBS. Although these provisions are valuable, the law does not set minimum standards for HCBS benefits. Moreover, the new incentives may not be sufficient to encourage major changes in light of ongoing state budget difficulties. Wide variations in access to HCBS can be expected to continue while HCBS competes with mandated institutional care for funding.
YEARS OF CALORIC RESTRICTION RESEARCH: WHERE ARE WE NOW?

Chair: R. McCarter, Pennsylvania State University, State College, Pennsylvania
Co-Chair: R. Anderson, University of Wisconsin, Madison, Wisconsin

Calorie restriction extends the health span and life span of multiple organisms. However, the mechanisms underlying these beneficial effects are still largely unknown. The speakers in this session will outline the background on this nutritional manipulation and provide an update on the most current work in the field. This session will include observations from the ongoing, controlled human calorie restriction trials.

CALORIE RESTRICTION IN HUMANS

E. Ravussin, Pennington Biomedical Research Center, Baton Rouge, Louisiana

The societal environment is marked by overabundant accessibility to food coupled with reduced physical activity leading to the metabolic syndrome in most individuals. Aging is considered to be either ‘primary’ - inevitable deterioration of cells, tissue structure and function occurring independent of disease and lifestyle, or ‘secondary’ - decline in tissue structure and function from external influences. The focus of my presentation will be on human research involving calorie restriction (CR) to prevent or delay the incidence of the metabolic syndrome and delay primary aging. I will start with a brief review of experiments of nature in the people living in Okinawa and the 8 Biospherians who ended up to have scarce food in Biosphere 2. CR extends median and maximal lifespan in a variety of lower species. One hypothesis for the beneficial impact of CR is that metabolic rate is reduced beyond the reduction in metabolically active mass leading to reduced oxidative damage. In a 6-mo pilot study of CR, energy expenditure decreased ~7% more than expected for the loss of metabolic mass (metabolic adaptation). Serum protein carbonyls and urinary isoprostanes were unchanged from baseline whereas DNA damage decreased in the CR group only. CR increased muscle expression of genes involved in mitochondrial biogenesis (PGC1-α, mtTFA, eNOS, SIRT1 and PAR1). In parallel, mitochondrial content increased by 35±5% in the CR group despite no change in the activity of key mitochondrial enzymes of the TCA cycle, β-oxidation or electron transport chain. Our results suggest that CR in non-obese humans improves biomarkers of aging and support the “rate of living” theory with improved mitochondrial function. Details about the design of our ongoing 2-y randomized clinical trial of 25%CR will also be presented.

IMPACT OF CALORIE RESTRICTION (CR) ON CELLULAR ASPECTS OF METABOLIC DECLINE IN AGING RHESUS SKELETAL MUSCLE

R. Anderson, 1. Medicine, University of Wisconsin-Madison, Madison, Wisconsin, 2. GRECC, Veterans Hospital, Madison, Wisconsin

In skeletal muscle, mitochondrial integrity is a key component of healthy tissue. Mitochondrial dysfunction has been associated with aging, diabetes and metabolic syndrome. We have identified a shift in skeletal muscle fiber type distribution in rhesus monkeys that is coincident with the early stages of sarcopenia. Age negatively impacts the activity of the mitochondrial electron transport system and the intracellular distribution of the most active mitochondria. Autofluorescent detection using multiphoton imaging indicates that levels of both NADH and FAD+ metabolic cofactors decline with age; and fluorescent decay lifetime analysis indicates that the cellular milieu is altered. A change in lipid distribution that is consistent with mitochondrial insufficiency is observed. Microarray analysis points to altered lipid metabolism as a possible mechanism by which CR maintains skeletal muscle mass. These data indicate that innate mechanisms of cellular adaptation contribute to aging, and suggest CR specifically activates these metabolic pathways to promote longevity.

CALORIE RESTRICTION MIMETICS: PROGRESS AND POTENTIAL

G. Roth1, D. Ingram2, 1. GeroScience Inc., Pylesville, Maryland, 2. Louisiana State University, Baton Rouge, Louisiana

Dietary calorie restriction (CR) is the most robust environmental intervention for extending lifespan and maintaining health and vitality. Its health benefits have been demonstrated in essentially every species examined, including most recently in nonhuman primates and humans. However, maintaining a 25-40% reduced intake over the bulk of the adult lifespan would be a challenge for most humans. Therefore, to obtain the same effects, but WITHOUT dieting, we have introduced the new technology of CR mimetics. Generally, these can be described as dietary supplements which mimic the effects of CR by working through various cellular and molecular mechanisms evoked by CR. Over the past few years, several candidate CR mimetics have been considered and investigated including metformin, resveratrol, and rapamycin, which generally target a specific molecular pathway. Over 12 years ago, we introduced the concept of glycolytic inhibition as a strategy for developing mimetics of CR. We have argued that inhibiting energy utilization as far upstream as possible might offer a broader range of CR-like effects as opposed to targeting a singular molecular target downstream. Our initial candidate compound as a CR mimetic was 2-deoxyglucose, which reduced insulin levels and body temperature (biomarkers shown to correlate with longevity in humans and other species), similar to actual CR, but which demonstrated a narrow window between efficacy and toxicity. Since then, other candidate glycolytic inhibitors have emerged, including the 7-carbon sugar, mannoheptulose, which appears to hold significant potential when applied in the diet in the form of a supplement derived from unripe avocados. The field of CR mimetics is gaining increased attention to direct attention toward effective aging interventions.

CALORIE RESTRICTION AND CALORIE RESTRICTION MIMETICS, WHERE ARE WE NOW?

R. De Cabo, J. Mattison, R. Minor, K. Pearson, E. Mercken, National Institute on Aging, Bethesda, Maryland

A prominent manifestation of aging is a reduced ability to respond to environmental stressors, including heat, immune and oxidative stress. This reduced stress tolerance leads to a decreased ability to maintain organismal homeostasis and is, at least, partially responsible for the increased morbidity and mortality that occurs with advancing age. The age-related attenuation of stress response pathways and increased expression of stress-response genes with increasing age are clear examples of the growing body of evidence linking reduced stress responsiveness to aging. In 1935, McCay and colleagues first reported that reducing the caloric intake of rodents could significantly lengthen their mean and maximal life span, slowing down basic aging processes. The effect of calorie restriction (CR) on delaying aging and improving health has been replicated in many animal species including nonhuman primates, although in these, potential life span alterations are still uncertain. CR causes a reduction in body weight, tissue growth, blood glucose, insulin levels and body temperature. In addition, CR prevents the age-related decline in tolerance to different stressors such as oxidative and heat, and the age-related reduction in expression of protective stress response proteins. While CR is the only intervention that has consistently been shown to increase maximum life span and prevent or delay the onset of age-associated pathophysiological changes in laboratory rodents, the underlying mechanisms remain elusive. Using calorie restriction (CR) as a research tool, gerontologists are making progress in identifying dietary and pharmacologic interventions that may be applicable to retarding aging processes in humans.
PSYCHOLOGICAL DISTRESS IN LATER LIFE

MENOPAUSAL SYMPTOMS AND DEPRESSION: A 9-YEAR PROSPECTIVE LONGITUDINAL FOLLOW-UP STUDY

J. Strauss, Wurzweiler School of Social Work, Yeshiva University, Bronx, New York

The present study sought to examine: a.) the association between depression among pre-menopausal and peri-menopausal women and subsequent difficulty with menopausal symptoms; and b.) the relationship between initial problems with menopausal symptoms and the subsequent development of depression. A prospective longitudinal regression analysis was employed to examine the association between initial depression and subsequent increases in menopausal symptoms, as well as the relationship between initial menopausal symptoms and later increases in depression, in a sample of 986 women who participated in a community survey of health and well-being in mid-life (the MIDUS Study). Initial levels of depression predicted 9-year follow-up levels of menopausal symptoms controlling for initial menopausal symptoms and demographic covariates. Initial levels of menopausal symptoms predicted 9-year follow-up levels of depression controlling for initial levels of depression and demographic covariates. Women who have more symptoms of depression in their 30’s and early 40’s may be at heightened risk for problems with menopausal symptoms. Conversely, efforts to address more severe symptoms of menopause may help to reduce the onset of depression among women during the menopausal transition. A greater understanding of factors that can reduce the impact of menopausal symptoms on the well-being of women in midlife is important not only for the women themselves, but also for the children and parents for whom they provide care.

VETERAN AND NONVETERAN DIFFERENCES IN LATER-LIFE DEPRESSION

A.S. London, M. Brown, J. Wilmoth, Sociology, Syracuse University, Syracuse, New York

A growing body of research documents how early-life-course military service shapes various later-life outcomes and how heterogeneity in military service experiences matters. For those who serve during wartime, there are greater risks of physical injury and post-traumatic stress associated with combat exposure that can negatively affect a range of outcomes. The extant research has not explicitly examined differences in later-life depression between veterans and nonveterans, veterans with and without wartime service, and veterans who served during different wars (World War II, Korean War, and multiple wars) using nationally representative data. This study uses data from the 1995-2006 Health and Retirement Study (HRS) to estimate growth curve models of age-related depression trajectories among veterans and nonveterans, as well as among veterans with different service experiences. Models control for race/ethnicity, childhood factors, later-life health status, cognitive function, sensory impairments, and attrition. Compared to nonveterans, veterans with and without war service had lower levels of depression in later life, and veterans of different wars experience different trajectories of depression with age. The degree to which childhood and later-life characteristics mediate the relationship between veteran status and depression varies across groups, although childhood disadvantage and health fully explain the lower levels of depression among non-war veterans. The selection into military service, healthy warrior, positive turning point, and post-service mortality selection hypotheses are discussed as potential explanations for observed differences in later-life depression between war-service veterans and nonveterans.

EFFECTS OF AGE AND GENDER ON THE PREVALENCE AND CORRELATES OF PSYCHOLOGICAL DISTRESS IN LATER LIFE

J.E. Byles1, E. Banks2, 1. Faculty of Health, The University of Newcastle, Newcastle, New South Wales, Australia, 2. The Australian National University, Canberra, New South Wales, Australia

As populations age, psychological distress in late life will become of increasing public health importance. However, there is currently little information about psychological distress in late life, since most studies do not involve older people. We have analyzed data from 236,508 men and women in the New South Wales 45 and Up Study, which includes participants up to 106 years old. Prevalence of high and very high scores on the Kessler Psychological Distress Scale (K-10) decreased with age up to age 80, and was lower for men than for women at all ages. Among those aged <80 years, 7.0% of men had high/very high K10 scores compared with 8.4% of women; among those aged 80 years or more 5.2% of men and 7.6% of women had high/very high scores. Higher education, married status, and higher income were associated with lower risk of psychological distress, with some modification of these effects according to age and gender. After adjusting for demographic factors, there was a strong association between psychological distress and the presence of physical comorbidities, and significant interaction according to gender and age. At the end of this presentation participants will be able to quantify the change in prevalence of psychological distress in late life, and consider the impact of age and sex on this condition.

ACCUMULATED FEELINGS OF DISADVANTAGE: A QUALITATIVE ANALYSIS OF STRESS AND COPING IN KOREAN IMMIGRANT WOMEN

M. Sin, College of Nursing, Seattle, Washington

Although stress can be a normal psychological and physical response to life situations, how one copes with stress is a critical factor for our health. Cultural beliefs and practices, including gender roles imposed by society, have a significant influence on stress-coping mechanisms. The purpose of this study was to assess sources of stress and coping strategies of Korean immigrant women. In this qualitative descriptive study, a convenience sample of 14 Korean immigrant women was recruited to participate in focus groups. Participants had to be age ≥ 40 years and living in Washington state. Four focus group discussions, 60-90 minutes in length were held with seven participants in each group. The mean age was 55 years (SD: 10.6, range: 41-74). Average residency in the U.S. was 18 years (SD: 10.2, range: 2.5-39). The typical participant was college educated (50%) and married (71%). Focus groups were audiotaped and transcribed verbatim. Data were analyzed with inductive conventional content analysis. The main stressors identified were socio-environmental changes from immigration such as language barriers, conflict in human relationships, changes in lifestyle, discrimination at work and finances. Living status and child rearing process were also identified as stressors. Both healthy (hiking, walking, and traveling, attending church, and staying busy) and unhealthy (being alone) coping strategies were used by the participants. The Korean immigrant women in this study were very stressed and were experiencing changed coping resources from immigration. Interventions that decrease the stress in this socially disadvantaged population are needed.

THE LONGITUDINAL RELATIONSHIP BETWEEN FINANCIAL HARDSHIP AND DEPRESSIVE SYMPTOMATOLOGY AMONG CAREGIVERS OF INDIVIDUALS WITH DEMENTIA: A PROPENSITY SCORE APPROACH

J. Nam, E. Choi, School of Social Work, University of Pittsburgh, Pittsburgh, Pennsylvania

Despite an increase in research focused on the effects of financial hardship on emotional health, little is known about the longitudinal relationship between financial hardship and mental health among caregivers.
of individuals with dementia. Data were from the Resources of Enhanced Alzheimer’s Caregiver Health project. Participants (N = 673) were asked one question relating to financial hardship and the CES-D was used to assess caregiver’s depressive symptomatology. A multiple linear regression was used to examine the relationship between financial hardship and depressive symptomatology. This study used propensity score analyses to account for observed selection into groups of caregivers with and without financial hardship. There were significant prediction of more depressive symptomatology by financial hardship (p < .01), after adjusting for care-recipient and caregiver characteristics. Interestingly, household income did not significantly predict more depressive symptomatology. This supports previous findings that objective income measures are not adequate predictors of psychological distress in older adults. These results revealed that financial hardship played an important and complex role in predicting depressive symptomatology of dementia caregivers. In addition, the results provide more robust evidence regarding the relationship between financial hardship and more depressive symptomatology by reducing selection bias.

SESSION 840 (SYMPOSIUM)

A LIFECOURSE APPROACH TO WOMEN’S HEALTH IN AGING: RESULTS FROM THE NURSES’ HEALTH STUDY
Chair: F. Grodstein, Brigham and Women’s Hospital, Boston, Massachusetts
Discussant: T.M. Gill, Yale University School of Medicine, New Haven, Connecticut

This symposium will feature research from the Nurses’ Health Study, with the goal of examining how risk factors during the life course relate to women’s health in aging. The Nurses’ Health Study is one of the largest, long-term studies of women’s health. In 1976, 121,700 nurses, aged 30-55 years, were recruited; the women currently range from 65-90 years. Participants have been continually followed via biennial mailed questionnaires and telephone interviews; follow-up remains 90% complete. We utilized this rich resource to consider how lifestyle and other factors influence a wide variety of health issues important in aging. Specifically, this symposium will explore how mid-life or later-life adiposity, diet, and psychological factors influence outcomes at older ages, including physical function, cognitive function, urinary incontinence, and overall successful aging (combining longevity, chronic diseases, emotional, cognitive and physical functioning). In particular, we will discuss the relation between: (1) adiposity at mid-life and late-life trajectory of physical function; (2) mid-life phobic anxiety and later-life cognitive decline; (3) mid-life vitamin D levels and later-life cognitive decline; (4) later-life intake of acidic fruit/vegetables and subsequent risk of urinary incontinence; and (5) mid-life moderate alcohol consumption and odds of successful aging. Overall, this symposium will highlight the importance of considering risk factors in earlier, as well as later life, and suggest potential interventions which may prevent or delay common morbidities of aging.

PHOBIC ANXIETY AT MID-LIFE AND COGNITIVE PERFORMANCE OVER 4 YEARS AMONG COMMUNITY-DWELLING OLDER WOMEN
O. Okereke$^1$, F. Grodstein$^{1,2}$, J. Departments of Psychiatry and Medicine, Brigham and Women’s Hospital and Harvard Medical School, Boston, Massachusetts, 2. Department of Medicine, Brigham and Women’s Hospital and Harvard Medical School, Boston, Massachusetts, 3. Department of Epidemiology, Harvard School of Public Health, Boston, Massachusetts

Phobic anxiety is associated with inflammatory mediators implicated in late-life cognitive dysfunction. However, specific relations of anxiety to late-life cognition and decline are under-studied. Among 16,351 Nurses’ Health Study participants, we prospectively examined mid-life phobic anxiety, using a validated symptom scale, and later-life cognition, using three repeated assessments of general cognition, word-list and paragraph recall (immediate and delayed), category fluency, and attention/working memory over an average of 4.4 years. Primary outcomes were general cognition, verbal memory and global score summarizing all domains; analyses used general linear models of response profiles. Higher mid-life phobic anxiety was related to significantly worse later-life performance on all outcomes; mean differences for extreme categories of anxiety were cognitively equal to 1.5-2 years of aging. Yet, profiles of cognitive decline were parallel over time regardless of anxiety scores, suggesting phobic anxiety may impact cognition earlier in life, rather than having a cumulative effect throughout later-life.

ALCOHOL CONSUMPTION AT MID-LIFE AND SUCCESSFUL AGING IN WOMEN
M.K. Townsend$^1$, Q. Sun$^{1,2}$, O. Okereke$^1$, E. Rimm$^{1,2}$, F. Grodstein$^{1,2}$, J. Channing Laboratory, Brigham and Women’s Hospital, Boston, Massachusetts, 2. Harvard School of Public Health, Boston, Massachusetts

We examined whether moderate alcohol intake is associated with successful aging among 13,906 Nurses’ Health Study participants who survived to age 70 or older. Alcohol consumption at mid-life was assessed using a food frequency questionnaire. Successful aging was defined as absence of 11 chronic diseases and no major impairments in cognition, physical function, or mental health. Overall, 11% of women achieved successful aging. Multivariable-adjusted odds ratios (95% confidence interval) for successful aging were 1.12 (0.96, 1.30) for ≤ 5.0 g/day, 1.19 (1.01, 1.40) for 5.1-15.0 g/day, 1.28 (1.03, 1.58) for 15.1-30.0 g/day, and 1.24 (0.87, 1.76) for 30.1-45.0 g/day compared with non-drinkers. Additionally, independent of total intake, alcohol drinking most days rather than 1-2 days/week was associated with higher odds of successful aging. These data suggest that light-to-moderate alcohol consumption at mid-life may be related to a modest increase in overall health status among women surviving to older ages.

PLASMA VITAMIN D AND COGNITIVE FUNCTION: 9 YEARS OF FOLLOW-UP
J.H. Kang, B. Bartali, E. Devore, F. Grodstein, Brigham and Women’s Hospital, Boston, Massachusetts

We investigated the association between plasma vitamin D in women aged 60-70 years (mean=63) and cognitive function assessed an average 9 years later. We included 1,190 Nurses’ Health Study participants who provided a blood sample in 1989-1990, had plasma vitamin D levels measured and completed a cognitive assessment in 1995-2001. The telephone-administered validated cognitive battery included tests of general cognition, verbal memory, category fluency and attention. In multivariable analyses, higher vitamin D levels were associated with better global scores (average of z-scores of all tests), verbal memory scores (average of z-scores of verbal memory tests) and digit backwards scores (a test of attention) (p-trend=0.02, 0.04, 0.06, respectively). These scores were significantly higher in the top (median=47.1 ng/mL) versus the bottom (median=19.9 ng/mL) vitamin D decile. Overall, higher plasma vitamin D in women in their 60’s was associated with better cognition 9 years later.

ACIDIC FRUIT INTAKE IN RELATION TO INCIDENT URINARY INCONTINENCE IN OLDER WOMEN
E. Devore$^1$, M.K. Townsend$^1$, N. Resnick$^2$, F. Grodstein$^{1,2}$, J. Channing Laboratory, Department of Medicine, Brigham and Women’s Hospital, and Harvard Medical School, Boston, Massachusetts, 2. Division of Geriatric Medicine, University of Pittsburgh School of Medicine, Pittsburgh, Pennsylvania, 3. Department of Epidemiology, Harvard School of Public Health, Boston, Massachusetts

Citrus fruit and tomatoes are commonly classified as bladder irritants in the lay literature, but epidemiologic data examining the asso-
association between acidic fruit intake and urinary incontinence are lacking. We ascertained incident incontinence over four years of follow-up in 34,144 women without incontinence, aged 54-79 years, in the Nurses’ Health Study. Acidic fruit consumption was measured using a food frequency questionnaire prior to incontinence onset. We found no relation between intake of acidic fruit, or specific types of fruits, and subsequent risk of incontinence; for example, the relative risk of at least monthly incontinence was 0.99 (95% confidence interval 0.92-1.07) comparing the top vs. bottom quintiles of acidic fruit intake. Additionally, acidic fruit intake was not related to specific risks of urgency, stress, or mixed incontinence. Overall, these data do not support recommendations to reduce acidic fruit intake to prevent incontinence, although future studies are needed to confirm these results.

**EFFECT OF ADIPOSITY AT MID-LIFE ON PHYSICAL FUNCTION 14 YEARS LATER**

B. Bartali, E. Devore, F. Grodstein, *Medicine, Brigham and Women's Hospital* - *Harvard Medical School, Boston, Massachusetts*

The aim of this study was to evaluate whether adiposity at mid-life predicts decline in physical function (PF) in later life. PF was assessed using the SF-36 questionnaire administered in 2000,2004,and 2008 in Nurses’ Health Study participants. Overall, 72,836 women with at least two PF assessments, and data on body mass index from the 1986 questionnaire, were included. After control for confounding, higher BMI at age 40-65 years was strongly associated with lower PF 14 years later (p-for trend=0.0001). For example, PF score was substantially lower (mean difference=-23.7) in the highest (BMI>31.2) versus lowest BMI decile (BMI<20.5). Similarly, higher mid-life BMI was associated with greater PF decline from 2000-2008 (p-for trend=0.0001), after adjustment for confounders. Women in the highest BMI decile had mean 13.1 points/year greater decline in PF versus the lowest decile (95%CI:13.91,-12.31). These results suggest that BMI at mid-life is a key predictor of PF in later life.

**DIFFERENT PERSPECTIVES ON EGO-CENTRIC SOCIAL NETWORK CHARACTERISTICS: INDIVIDUALS WITHIN VERSUS AGGREGATED NETWORKS**

N.J. Webster, T. Antonucci, *University of Michigan, Ann Arbor, Michigan*

The social networks of older adults are important predictors of health and well-being. This paper compares two perspectives and methods for analyzing the structure (contact frequency, age, emotional closeness, geographic proximity) and composition (relationship and gender) of social relations conveyed by examining: a) typologies of individuals within networks; b) typologies of aggregates through latent profile analysis (LPA). Data include respondents age 65 and older (N=293) and their network members (N=10) and report on the density, centrality, and reciprocity of the network and how those variables relate to the health of the respondent. This symposium highlights the multiple perspectives needed to explore social interactions among the diverse and growing older populations who are living in the community and receiving long-term services and supports.

**AN EVALUATION OF METHODS USED TO ASSESS ASSISTED LIVING RESIDENTS’ SOCIAL SUPPORT NETWORKS**

M.M. Perkins, M.M. Ball, C.L. Kemp, *Emory University, Atlanta, Georgia, 2. Georgia State University, Atlanta, Georgia*

We evaluate methods used in a 3-year multiple-method study that investigates social relationships in assisted living (AL). This NIA-funded project (1R01 AG030486-01) is the first study in AL to examine in-depth how residents’ social relationships develop and change over time and the impact these ties have on residents’ health and well-being. It also is the first study in AL to use Antonucci’s (1986) social network mapping tool. In addition to addressing our specific research aims, another objective of this research is to make a methodological contribution by evaluating the effectiveness of Antonucci’s instrument for use with the AL population. Data sources include 3,660 hours of observation and interviews with 244 residents and 32 providers from 9 facilities in metro Atlanta. We compare results based on multiple methods used and conclude that Antonucci’s instrument is an effective tool for use in AL. We address several challenges and make recommendations.
MEASURING SOCIAL NETWORKS AND HEALTH AMONG OLDER ADULTS RECEIVING LONG-TERM SERVICES AND SUPPORTS

The primary aim of this study is to test the feasibility of combining two methodological approaches to collecting social network information among older adults living in one neighborhood of an assisted living facility and in a dementia care nursing home. The two methods used in this study to assess social networks are the egocentric (personal network) and sociocentric (whole network) approaches. Face to face interviews were conducted with residents (N=20), family members (n=10), and employees (N=17) to obtain a more complete description of older adults social interactions. Findings reveal that combing approaches improves the data collection techniques available and allows for the creation of social network variables such as centrality, density, and reciprocity. Correlations between health variables and network characteristics are presented. Ways to measure and thereby understand the interactions of all people associated with the social network of older adults receiving long-term services will be discussed.

SESSION 850 (SYMPOSIUM)

DELIRIUM AND COGNITIVE TRAJECTORIES: RESEARCH DESIGN AND MEASUREMENT CHALLENGES
Chair: R.N. Jones, Hebrew SeniorLife, Institute for Aging Research, Boston, Massachusetts, Harvard Medical School, Beth Israel Deaconess Medical Center, Boston, Massachusetts
Discussant: R.N. Jones, Hebrew SeniorLife, Institute for Aging Research, Boston, Massachusetts

Major challenges in cognitive aging involve describing changes over time, and the impact of either acute perturbations (such as delirium) or beneficial interventions. The papers in this symposium illustrate accessible approaches to common challenges in cognitive aging research. Fong and colleagues present the validity of self-report measures for cognitive impairment, including the IQCODE and IADLs in a sample of older adults scheduled for surgery. Measures such as the IQCODE may be useful tools for identifying persons with cognitive impairment, but a reliable informant is often unavailable. Yang and colleagues discuss the development of efficient tools for the measurement of complex traits using modern psychometric methods, including item response theory. The particular substantive application is the identification of a set of items for the efficient and accurate screening for delirium in postacute care. The third paper (Gross) addresses remedies for a common challenge in longitudinal research studies: how to deal with non-equivalent test forms, such as alternate forms, different tests in same group, or repeated measures. Non-equivalent tests thwart our ability to detect individual differences in longitudinal analyses. The fourth paper (Saczynski) addresses the modeling of acute changes. Such can occur in experimental studies and in natural experiments, such as stroke, surgery or hospitalization with delirium. The appropriate characterization, and parameterization, of the magnitude, duration, and influence of the acute insult on cognitive trajectories is complicated. Delirium results in a precipitous decline followed by persistent impairment.

DELIRIUM SCREENING ITEMS IDENTIFIED USING A MODERN MEASUREMENT APPROACH
F.M. Yang1,2, R.N. Jones12, S.K. Inouye12, D. Tommel1, P.K. Crane1, J.L. Rudolph1, L.H. Ngo1, E. Marcantonio2, 1. Hebrew SeniorLife, Institute for Aging Research, Boston, Massachusetts, 2. Beth Israel Deaconess Medical Center, Boston, Massachusetts, 3. University of Washington, Seattle, Washington, 4. Brigham and Women’s Hospital, Boston, Massachusetts

Delirium is prevalent and treatable among hospitalized older adults, yet we currently lack a short, efficient, and sensitive screening tool. We sought to identify a set of indicators to assess the four features of delirium: disorganized thinking, altered level of consciousness, altered sensorial awareness, and altered sleep-wake cycle. We used psychometric data analysis techniques to assess assumptions and identified up to five indicators per unidimensional set that minimized measurement error in the region of each underlying trait relevant for delirium screening. We identified 41 indicators that were useful for screening, maintained fidelity to clinical constructs of delirium, and minimized measurement error. This reduced indicator set facilitates development of screening tools suitable for use in clinical applications or research studies.

LINKING THE UNLINKABLE: METHODS FOR EQUATING NON-EQUIVALENT COGNITIVE TESTS
A. Gross1,2, D. Habtemariam3, D. Tommel4, S.K. Inouye12, R.N. Jones12, 1. Hebrew SeniorLife, Institute for Aging Research, Boston, Massachusetts, 2. Beth Israel Deaconess Medical Center, Boston, Massachusetts

Non-equivalent tests are frequently used in common situations involving different tests in the same group, alternate forms, or repeated measures. Thus, equating methods play an important role, and our goal was to compare two methods. Linear equating is analogous to z-transformation of scores. Equipercentile methods, often used to reference a patient’s scores to a reference population’s percentiles, equates tests across their percentile distributions. These methods were applied to non-equivalent alternate tests used in a longitudinal memory intervention trial (n=1,401) and different dementia screening tests used in a clinical cohort (n=1,494). Linear and equipercentile equating demonstrated score distributions consistent with the reference test (ratio of mean squared errors comparing linear and equipercentile equating=0.96) and metric equivalence with age (p<0.15). Equipercentile equating further adjusts for practice effects and is superior for tests not normally distributed. Equating methods are broadly applicable to within and between group comparisons in both research and clinical settings.

I CAN TELL YOU HOW I’M DOING: SELF-REPORT METHODS FOR DETECTING COGNITIVE DECLINE IN OLDER ADULTS
T.G. Fong1,2, L. Huang1, A. Gross1,2, S.K. Inouye12, E. Schmitt1, D. Habtemariam1, R.N. Jones12, 1. Hebrew SeniorLife, Institute for Aging Research, Boston, Massachusetts, 2. Beth Israel Deaconess Medical Center, Boston, Massachusetts

The Informant Questionnaire on Cognitive Decline (IQCODE) is a common screening tool for cognitive impairment. A self-report version (IQCODE-SR) has been proposed as a convenient substitute. This study explores associations between IQCODE-SR and IQCODE, and investigates validity of the IQCODE-SR and self-reported instrumental activities of daily living (IADL-SR) for cognitive impairment using a reference standard neuropsychological test battery composite (NTBC). Participants were 86 community-dwelling adults over age 70 from a study of elective surgery patients. IQCODE-SR is poorly associated with IQCODE (r=0.15). NTBC is reduced by 0.09 standard deviations (SD) per 1SD worse IQCODE-SR (95%CI=-0.31,0.12) and by 0.72SD for any IADL-SR difficulty (95%CI=-0.18,0.26). Using the median NTBC as a cutpoint, criterion validity is poor for the IQCODE-SR (AUC=55%; 95%CI=43.67, but better for IADL-SR (AUC=60%; 95%CI=51.70) and IQCODE (AUC=60%; 95%CI=47.73). Screening for cognitive decline is an important clinical activity for which IADL-SR and informant IQCODE are useful; IQCODE-SR is not recommended.
Delirium, common following cardiac surgery, is associated with increased risk for adverse outcomes. We examined cognitive change following cardiac surgery and recovery of cognitive function in the month following discharge in 225 patients (mean age=73; men=76%). Cognitive function (MMSE) and delirium (Confusion Assessment Method) were assessed preoperatively, daily postoperatively, and at one month. 46% of patients developed delirium postoperatively. Linear mixed model with pairwise linear function of time was performed to estimate the change in MMSE score by delirium status. Compared to patients without delirium, those who developed delirium had significantly lower preoperative MMSE scores (27.6 vs. 26.6, P<0.01), a more precipitous drop immediately following surgery (-2.6 vs. -8.9, P<0.01), and were less likely to recover cognitive abilities 1-month after discharge (27.3 vs. 23.9, P<0.01). Our findings suggest that delirium following cardiac surgery is an independent risk factor for a precipitous drop and persistent impairment in cognitive function.

SESSION 855 (SYMPOSIUM)

FOLLOWING THE RAINBOW’S PATH: LIFECOURSE, FAMILY, AND SUCCESSFUL AGING AMONG LESBIAN, GAY, BISEXUAL, AND TRANSGENDER OLDER ADULTS

Chair: B.R. Grossman, Health Science/Gerontology, Brian.Grossman@sjsu.edu, San Jose, California

In late life, older lesbian, gay, bisexual, and transgender (LGBT) people (retell the stories of their lives, those that mirror what is expected and those that challenge key concepts in gerontology. In this symposium, Rainbow Research Group members contend with how time, health, caring, and the process of aging itself, are constructed and experienced by LGBT older adults. Three papers address the conflict between subjective interpretations and institutionalized expectations of time. Kozlov & Carpenter compare subjective age identity in relation to self-selected sexual identity. Both Bromst and Siverskog employ Judith Halberstam’s notion of “queer time”: Bromst to explore the heteronormative lifescript on the lives of aging lesbians and Siverskog to interrogate the presence and power of normativity, as it influences the lives of older LGBT adults and as it is actively resisted. The remaining two papers frame experiences of mental health for LGBT older adults - Fenley in relation to family and Van Wagenen, Driskell, & Bradford in the context of successful aging. Fenley uses survey data to explore the effect of the caregiving relationship (family of origin v. family of choice) on stress and strain in LGBT older adult caregivers. Van Wagenen, Driskell, & Bradford use interview data to develop a new model of “successful aging” for LGBT elders and highlight the the significance of adaptation in the face of illness. Collectively, these papers highlight how the lives of LGBT older adults are often ignored, elided, or obscured by mainstream gerontological approaches and offer pathways to address these omissions.

SEXUAL ORIENTATION ACROSS THE SPECTRUM: AN INCLUSIVE APPROACH TO AGE AND SEXUAL IDENTITY RESEARCH

E. Kozlov, B. Carpenter, Psychology, Washington University in St. Louis, St. Louis, Missouri

Research on identity across the lifespan has typically adopted a binary conceptualization of sexual orientation. We studied a convenience sample of 267 adults aged 18-91 and asked about sexual orientation on a spectrum (exclusively homosexual=1, exclusively heterosexual=10) to achieve a more nuanced understanding of subjective age identity. Thirty-six percent (n=96) identified as “exclusively homosexual,” 30.3% (n=81) as “exclusively heterosexual,” and 33.7% (n=90) chose values on the spectrum. Compared to similarly aged heterosexual and homosexual individuals, spectrum individuals reported different age identities (ideal, body, personality, social age). For example, spectrum individuals reported feeling 4.5 years younger than their chronological age compared to heterosexual and homosexuals who felt 9.2 and 9.7 years younger, respectively, F(2,264)=5.43, p<.01. By adopting a more inclusive definition of sexual identity, researchers may discover previously obscured and relevant relationships between sexual and age identity.

QUEER LIFE SCRIPTS - NORMATIVITY AND QUEERNESS IN OLDER LGBT PERSONS’ LIFE STORIES

A. Siverskog, National Institute for the Study of Ageing and Later Life, Linköping University, Norrköping, Sweden

The life course is surrounded with normative expectations of how to be, do and act at certain ages and certain stages of life; expectations that in turn are constructed around stable gender identities and heterosexual reproduction. This paper takes Judith Halberstam’s concept of “queer time” as a starting point, elaborating it to widen theoretical understandings of ageing and the life course. The paper is based on results from a study constituted by life story interviews with GBTLQ persons, aged 65 or older. It aims to explore how normativity relating to life scripts, age, gender and sexuality, is constructed in how these persons narrate their lives. Central themes from the results involve: 1. Heterosexual practices and closeted transpractices as ways to adapt to normativity in the past 2. Homonormativity - “we’re just like everybody else” 3. Genderqueers - visibility through norm breaking 4. Questioning normativity through queer and anti-ageist strategies.

A CONCEPTUAL MODEL TO DESCRIBE SUCCESSFUL AGING IN A SAMPLE OF LESBIAN, GAY, BISEXUAL AND TRANSGENDER (LGBT) ELDER

A. Van Wagenen, J. Driskell, J. Bradford, 1. Center for Population Research in LGBT Health, The Fenway Institute, Boston, Massachusetts, 2. Salem State University, Salem, Massachusetts

In this paper, we present a conceptual model to describe health and mental health indicators relevant to successful aging in LGBT elders. Our model responds to criticisms that a dichotomous successful aging framework overlooks the importance of adaptation to illness and disease in its definition of “success.” We group elders into three categories: avoiders who experience no mental or physical health conditions; survivors who experience a mental or physical health condition but are coping well; and strugglers who experience a mental or physical health condition but are not coping well. We believe this model is an improvement that adequately captures not only impairment and pathology but also protective factors. We analyze 22 in-depth semi-structured interviews with LGBT elders, collected in conjunction with a community-based participatory research working group organized around the goal of increasing knowledge about the health concerns, care needs and aging challenges for LGBT older adults and caregivers.

A COMPARISON OF PREDICTORS OF STRAIN AMONG OLDER LGBT CAREGIVERS CARING FOR CHRONICALLY ILL MEMBERS OF THEIR FAMILY OF ORIGIN OR FAMILY OF CHOICE

This study compared emotional, physical, and financial strain of 131 older LGBT caregivers for chronically ill members of their family of origin or family of choice.
origin or family of choice. Within the context of family type, sociodemographic characteristics, role overload, conflict, and the influence of being 'out' on strain were examined. Indices on role overload (amount and type of care) and conflict (personal, family and employment) were created. Caregiver health status was expected to mediate strain. This secondary analysis of a survey conducted by three organizations in 2000-2001 was guided by role theory and the stress proliferation framework. Mean age was 61 years; 47% cared for their family of origin and 53% were family of choice caregivers. MANOVA indicated that the family of origin caregiver experienced greater emotional and financial strain when considering role overload and greater outness, respectively. Conflict was experienced by both family caregivers. Caregiver health was not significant for strain.

THEY COULDN'T IMAGINE THAT SOMEONE LOOKING LIKE THEIR GRANDMOTHER WAS A LESBIAN

J. Bromseth, Centre for gender studies, Stockholm university, Stockholm universitet, Sweden

Life span narratives are regulated by heteronormative concepts of valuable lives. Being young, middle-aged and elder are all life phases where certain things should be ‘accomplished’ to be considered successful: having an education, finding a partner of the opposite sex and marriage, children and eventually grandchildren. Deviating from 'the straight line', having the wrong sexuality or being transgender, often implies failing the age-coded expectations of good lives. This presentation builds upon a three-year research project, looking into the life conditions and resistance strategies amongst younger and older lesbian, bisexual, trans- women and queers in Sweden. By using individual and group interviews, and field notes from participant observation, I will look into how age, gender and sexuality norms are co-constructed, taking the elder informants’ narratives as point of departure. What are the social, cultural and economical possibilities and hindrances of creating viable lives outside of the heteronormative life-script as elder women?

SESSION 860 (SYMPOSIUM)

INTERNATIONAL RESEARCH ON GRANDPARENT CAREGIVING

Chair: T.A. LaPierre, Sociology, Univ of Kansas, Lawrence, Kansas
Discussant: M. Silverstein, University of Southern California, Los Angeles, California

Grandparent caregiving is receiving increased attention from researchers in the United States and abroad. This symposium presents an international perspective on the causes, consequences and correlates of grandparent caregiving by bringing together a diverse group of scholars from the United States, Canada, Spain and the Netherlands. The first paper in this symposium examines cultural justifications for grandparent caregiving in Hawaii. In this paper Yancura broadens our understanding of the social-structural forces shaping the grandparent caregiving experience and sets the stage for thinking about the implications of cultural context in each of the subsequent papers. The second paper, by Fuller-Thomson and colleagues, investigates the rewards of grandparent caregiving using a Canadian sample. In addressing this understudied topic this paper highlights how previous research focusing on negative aspects of caregiving has contributed to a biased view of the experience. A team of researchers from across Spain provide our third paper. In this study, Triado and colleagues examine Erikson’s concepts of generativity and integrity as they relate to the auxiliary grandparent caregiving role in Spain. The final paper in this symposium analyzes the impact of grandparent caregiving on fertility within and across European countries. Using multi-level modeling Thomsen is able to demonstrate how the relationship between grandparent caregiving and fertility varies across countries. To conclude the symposium, Silverstein, who has conducted research on grandparent caregiving in China, will discuss the papers and comment on international research in this area more broadly.

CULTURAL JUSTIFICATIONS FOR CAREGIVING IN ASIAN AND NATIVE HAWAIIAN GRANDPARENTS RAISING GRANDCHILDREN

L. Yancura, University of Hawaii at Manoa, Honolulu, Hawaii

Race has been found to predict cultural justifications for family caregiving in older adults. However little is known about this relationship in another type of family caregiver, Grandparents Raising Grandchildren (GRG). This study examined relationships between race and justifications for caregiving in 259 Asian American, Native Hawaiian, and White GRG registered as students’ primary caregivers with the Hawaii State Department of Education. Participants were mailed a modified version of D’Worth-Anderson et al.’s (2005) 10-item Cultural Justifications for Caregiving (CJCJ) scale. Items on the CJCJ did not load onto a single analytic factor. Instead two factors, Custom and Responsibility, emerged. Race was predictive of Custom, with Native Hawaiian GRG having significantly higher scores than other races. These findings suggest that culture influences grandparents’ decision to raise grandchildren and adds to literature demonstrating that family caregiving occurs within cultural contexts.

‘IT HAS BROUGHT ME A LOT OF JOY’: CANADIAN GRANDPARENTS IDENTIFY THE REWARDS OF RAISING THEIR GRANDCHILDREN

E. Fuller-Thomson, L. McCormack, S. Beatty, Faculty of Social Work, University of Toronto, Toronto, Ontario, Canada

In the past 20 years, there has been a burgeoning of research on grandparents raising grandchildren. Many studies have focused on the negative physical health, mental health and economic outcomes for grandparent caregivers. Few researchers have documented grandparents’ perspectives on the rewards of caregiving. Using a grounded theory study of 15 Black and 15 White Canadian grandparent caregivers, six rewards of caregiving were identified: pride in their grandchildren’s accomplishments; lower stress once they knew the grandchildren were safe; stronger sense of purpose; greater family cohesion; the grandchildren’s love and companionship; more enjoyment and fun. Findings were validated using member checking. Researchers’ traditional focus on the negative consequences of custodial caregiving may have resulted in a biased perspective on the topic. Future research would benefit from a more balanced investigation of the joys and difficulties of raising grandchildren.

GRANDMOTHERS OFFERING CHILDCARE IN SPAIN: EXPLORING GENERATIVITY AND INTEGRITY DEVELOPMENTAL TASKS

C. Triado1, F. Villar2, C. Sole3, M. Celdran1, O. Lopez1, S. Pinazo3, J. Faba3, 1. University of Barcelona, Barcelona, Spain, 2. Universidad Ramon Llull, Barcelona, Spain, 3. Universidad de Valencia, Valencia, Spain

The aim to this study is to examine how auxiliary grandparent caregivers who offer regular care to grandchildren (but without being the main caregiver or sharing the household with them) perceive their role as caregivers and its link to generativity and integrity concepts coined by Erik Erikson. Forty-nine grandmothers responded to three incomplete sentences regarding the most positive, negative and stressful aspects of caring. Additionally, they completed a generativity and integrity’s scale. Qualitative analysis results showed that disobedient behaviours were the worst aspect of caring, and atypical daily situations (such as an illness or injury of the grandchildren) were the more stressful situations those grandmothers were facing. The generativity score was related to the length of caring, but there was no relation between Generativity and Integrity scores. The impact of the role of auxiliary caregivers and its relation with ageing identity and developmental tasks will be discussed.

248 The Gerontological Society of America
THE GRANDPARENT FACTOR IN MODERN FERTILITY ACROSS EUROPE
F. Thomese, Sociology, VU University, Amsterdam, Netherlands

Grandparental involvement in child care has been shown to facilitate additional childbearing. A common explanation for this finding is that grandparents alleviate mothers’ predicament in choosing between work and family obligations. This interpretation is countered by a lackeffect of paid child care on fertility outcomes. Using data from the European Survey on Health and Retirement (SHARE) multi-level modeling was used to analyze the effect of grandparental child care and other contact with close kin at baseline on additional births of grandchildren at the follow-up three years later. The international data allowed both the welfare state provisions for working mothers and the extent of involvement of grandparents across countries to be accounted for. Frequent child care from grandparents at baseline had a positive effect on additional childbirths at follow-up, in particular in Southern European countries. Higher contact frequency between parents and grandparents however appeared to act as a suppressor.

SESSION 865 (SYMPOSIUM)

ISSUES IN IMPLEMENTATION OF CHRONIC DISEASE SELF MANAGEMENT PROGRAMS ACROSS SETTINGS AND STATES
Chair: T. Prohaska, University of Illinois at Chicago, Chicago, Illinois
Co-Chair: C. Etkin, Rush University Medical Center, Chicago, Illinois
Discussant: B. Belza, University of Washington, Seattle, Washington

Development and translation of evidence-based health promotion and disease management programs for older adults has grown considerably in the last decade. With this growth, there has been an ever increasing effort to reach older adults in community settings who would most benefit from these programs and to maintain these programs over time. One of the most successful disease management programs for older adults is the Chronic Disease Self Management Program (CDSMP). This symposium examines efforts to implement CDSMP across Texas and Illinois. Using the RE-AIM framework the presenters discuss issues of Reach, Implementation, and Maintenance of CDSMP and other evidence-based programs across states, agencies and geographical regions. Factors contributing to successful dissemination and maintenance of CDSMP is explored from the perspective of the Agency providers (agency directors, program coordinators) the class leaders and from participants in the program. Issues pertaining to program reach and maintenance is also reported in terms of geographic difference (urban, rural) and by type of agency providing CDSMP (e.g., area agency on aging, health care setting, university based). Findings are discussed in terms of implications for delivering evidenced-based health promotion programs at a statewide level across geographic regions and types of agencies. The implications of the findings are discussed in terms of strategies for overcoming barriers in implementing evidence-based programs for older adults in diverse community settings.

CLASS LEADER AND PARTICIPANT PERSPECTIVES ON THE CHRONIC DISEASE SELF-MANAGEMENT PROGRAM IN ILLINOIS
C. Etkin1,2, D. Bright1, K.C. Carey1, 1. Rush University Medical Center, Chicago, Illinois, 2. University of Illinois at Chicago, Chicago, Illinois

For continued success in implementing evidence-based health promotion programs to older adults, it is imperative to understand elements of program implementation. We conducted baseline and 4-month follow-up assessments of older adult participants and class leaders of the Chronic Disease Self-Management Program (CDSMP) in 3 Planning and Service Areas in Illinois. Between 2008-2010, 891 older adults and 116 class leaders completed a baseline survey. Follow-up surveys indicated 73.5% of participants were continuing key components of CDSMP, including action planning and utilizing problem solving techniques. Qualitative findings indicated participants felt positive about their experiences in CDSMP. Unfortunately, for class leaders, over half (56.5%) had not facilitated a workshop by the follow up time point, while 42.9% faced barriers in implementing CDSMP in their communities. However, 72.7% of leaders felt participants benefitted a great deal from CDSMP. Findings highlight areas that will need attention as the dissemination of CDSMP is increased nationally.

TEXAS HEALTHY LIFESTYLES: GEOGRAPHIC REACH AND DISSEMINATION OF DISEASE SELF-MANAGEMENT PROGRAMS
M.L. Smith, A. Wilson, L. Salge, S. Ahn, M.G. Ory, Texas A&M University, College Station, Texas

Statewide efforts to deliver evidence-based programs to seniors are growing. This presentation will highlight the reach and adoption of Diabetes and Chronic Disease Self-Management Programs (DSMP & CDSMP) through the Texas Healthy Lifestyles program (TxHL). TxHL program dissemination spans 67 Texas counties in five regions of Texas. In 2010, 69 workshops were delivered in both English and Spanish, reaching 782 participants. The majority of workshops were hosted in senior centers (27.5%), residential facilities (14.5%), healthcare organizations (14.5%), and faith-based organizations (4.3%). Of participants enrolled in the programs, 77.5% were over age 60 years; 74.2% were female; 35.5% were Hispanic, and 31.2% resided alone. Approximately 68% of enrolled participants successfully completed the workshops. This presentation will emphasize ongoing and future strategies to expand the participant and delivery site reach statewide, build capacity to support widespread DSMP & CDSMP dissemination, and leverage resources and plan for program sustainability.

AGENCY PROVIDER PERSPECTIVES ON CDSMP IMPLEMENTATION AND MAINTENANCE ACROSS ILLINOIS

With the emphasis on providing community based health promotion and chronic disease management programs for older adults, agency directors and program coordinators have a key role in determining what programs to adopt. The level of commitment to disseminate and maintain programs may differ by type of agency. We conducted a quantitative and qualitative evaluation with directors and program coordinators responsible for implementing CDSMP to older Illinois residents. Four types of program directors and coordinators implementing CDSMP in Illinois were surveyed; university based programs (research principal investigator), health care settings, area agency on aging and community aging service director. Differences were found in terms of participant reach and commitment to program maintenance. University based research with CDSMP was most limited in reach and maintenance. While urban area agencies and health care based CDSMP had considerable participant reach, these differed in terms of anticipated maintenance. Implications for statewide success with CDSMP are discussed.

RURAL CULTURES: CHALLENGES AND SUCCESSES IN DISSEMINATING CDSMP IN RURAL COMMUNITIES
L.L. Payne1, A. Wilson2, C. Quinn3, 1. University of Illinois at Urbana-Champaign, Urbana, Illinois, 2. Texas A&M University, College Station, Texas

Rural communities have unique cultures that affect their residents’ health behaviors and attitudes toward health promotion/disease management programs. These cultures can affect the reach, adoption and implementation of the Chronic Disease Self-Management Program.
Monitoring quality as well as quantity of life is gaining a higher profile within Europe as its population ages, demonstrated by the inclusion of the Healthy Life Years indicator as one of the European Structural Indicators in 2005, alongside GDP. This indicator uncovered considerable inequalities across the then 25 countries of the European Union (EU) and indeed in most EU countries disability prevalence at later ages have not shown the consistent reductions that have been seen in the US. This symposium will explore trends in health expectancies (HE), combining health and survival, in different EU countries and the underlying mechanisms that may explain them. The first presentation sets the scene by describing whether 13 EU countries were experiencing compression or expansion of disability between 1995 and 2001 and whether this differed when all ages or just the older population were considered. The second paper, from Sweden extends the discussion into the consistency of trends for different underlying health measures. This topic is explored further in the third paper for the Netherlands which also investigates the impact of the changing burden of disease on HE. We then return to DFLE in France to discover the extent to which gender differences in trends are explained by changing social roles. Finally a new European project will be described which aims to monitor trends in HE across the now 27 EU countries, explain the drivers of inequalities and develop harmonised measures of HLE for greater cross-national comparability between Europe, the US and Japan.

C. Jagger, C. Gillies, E. Canbois, H. Van Oyer, W.J. Nusselder, J. Robine, 1. Institute for Ageing and Health, University of Newcastle, Newcastle upon Tyne, United Kingdom, 2. University of Leicester, Leicester, United Kingdom, 3. French Institute for Demographic Studies, Paris, France, 4. Scientific Institute of Public Health, Brussels, Belgium, 5. Erasmus Medical Center, Rotterdam, Netherlands, 6. INSERM, Montpellier, France

Health expectancy, combining information on mortality and disability into a single summary measure, was developed to address the competing theories of compression or expansion of disability and later, dynamic equilibrium. We use data from the European Community Household Panel with life tables to calculate life expectancy (LE) and disability-free life expectancy (DFLE) at ages 16 and 65 to address which of these theories was evident in thirteen countries of the EU from 1995-2001. We fit country-specific linear regression models to estimate the annual change in total LE, DFLE and in life expectancy with disability of all levels and with severe disability only, to determine the evidence for the competing theories. Despite significant increases in LE at early (age 16) and late (age 65) adulthood over the period in all countries there was considerable heterogeneity in DFLE trends and only 2 countries had strong evidence of compression of disability.

THE AETIOLOGY OF DECLINING HEALTH AND INCREASED DISABILITY AMONG OLDER PERSONS

C. Jagger, A. Sieurin, A. Rogeau, C. Bégin, M. Baulieu, D. Deeg, J. Robine, 1. VU University Medical Center, Amsterdam, Netherlands, 2. Altrecht Mental Health Care, Utrecht, Netherlands, 3. VU University, Amsterdam, Netherlands

Although disability-free life expectancy (DFLE) for men and women have followed similar trends over the last two decades, the most recent figures for France, based on 2008 data, shows more years lived with functional limitations and activity restrictions especially for women aged 50. Here we present recent trends in DFLE for France, using several dimensions of the disablement process, exploring the trends and patterns in different age and gender groups. We found disadvantage trends in the cohort aged 50-65 years but not in the oldest old. This trend corresponds to the first cohort where the majority of women worked. Possible reasons range from the dual roles of home and work and economic factors to other life course events.
adversely affecting women’s health, modifications in household health care organization or changes in men and women’s self-perception of health and function. Whatever the explanation, this new trend should be taken into account when estimating the future need for care.

**ADDRESSING HEALTH INEQUALITIES: THE EUROPEAN HEALTH AND LIFE EXPECTANCY INFORMATION SYSTEM (EHLEIS) JOINT ACTION**

J. Robine, Institut National pour la Santé et la Recherche Médicale, Montpellier cedex 5, France

The Healthy Life Years (HLY) indicator is a Summary Measure of Population Health (SMPH). More HLY means a healthier workforce, less retirement due to ill health and potentially less health and social care use and is thus a means of reducing the economic and social risks associated with demographic change. This presentation will describe the new EHLEIS Joint Action (JA) which will: (i) compute and disseminate HLY through an online information system and annual country reports, (ii) monitor EU trends in life and health expectancies to identify public health priorities, (iii) develop methods for computing comparable health expectancies by socio-economic status, (iv) contribute towards identifying the main determinants of healthy life in Europe, (v) integrate the former Task Force on Health Expectancies by socio-economic status, (vi) monitor EU trends in life and health expectancies to disseminate HLY through an online information system and annual country reports, (vii) monitor EU trends in life and health expectancies to disseminate HLY through an online information system and annual country reports, and (viii) propose a blueprint for a common international SMPH with the US and Japan.

**SESSION 875 (SYMPOSIUM)**

OLDER ADULTS WITH INTELLECTUAL/DEVELOPMENTAL DISABILITIES: PROMOTING WELL-BEING THROUGH TAILORED INTERVENTIONS

Chair: A.A. Williams, University of Colorado Colorado Springs, Colorado Springs, Colorado
Co-Chair: J. Gray-Stanley, Northern Illinois University, DeKalb, Illinois

Older adults with intellectual/developmental disabilities (I/DD) typically benefit from instruments, assessments, and interventions developed specifically to address their needs, whether those tools originate through their use with typically-developing adults or they are created and refined through use with adults with I/DD. Presenters will describe materials designed to promote health and to assist with planning for retirement and discussing death. Aronow and Hahn have adapted an intervention to promote well-aging in adults with disabilities. Using two modalities of assessment, interventionists using this model ultimately provide both standardized and personalized recommendations to older adults with I/DD to improve their overall health. Culler and Sterns reintroduce a Person-Centered Planning Tool that was introduced in the late 1990s, early 2000s to assist adults with I/DD in planning for work, retirement, and death. Their curriculum helps guide discussions with individuals with I/DD in order to prepare them for transitions that occur during late-life. Finally, Clute and collaborators have developed a method of talking with persons with I/DD about death and dying. Families of individuals with I/DD, like other families, find it difficult to discuss death and to prepare for a time with parents will no longer be living. Clute’s intervention is designed to help families navigate these difficult conversations with the support of community members who work with individuals with I/DD. Continued work to develop ways of assisting older adults with I/DD during their later lives has the potential to inform life choices of these individuals, promoting both physical and emotional wellness.

**PROMOTING WELL-AGING AMONG ADULTS WITH DISABILITIES: COMBINING A MULTI-DIMENSIONAL HEALTH RISK APPRAISAL AND ADVANCE PRACTICE NURSE ASSESSMENT FOR ADULTS WITH DISABILITIES**

H. Aronow1, J.E. Hahn2, K. Widmer3, M. Jacobson1. 1. Nursing Research & Development, Cedars-Sinai Medical Center, Los Angeles, California, 2. University of New Hampshire, Durham, New Hampshire, 3. Claremont Graduate University, Claremont, California

We present findings of a research program based on three studies aimed at preventing health problems and promoting well-aging among adults with disabilities. The model evolved from demonstration of comprehensive geriatric assessment for prevention among able-bodied older adults that was tailored to adults with disabilities. The focus of the current intervention includes a combined multi-dimensional health risk appraisal with a nurse practitioner assessment that prompts both standardized and personalized recommendations to address health risks. A pilot study (N – 201) established feasibility among persons with intellectual and/or developmental disability (IDD), demonstrated high prevalence of health problems among adults with IDD, and suggested health risk reduction. A second study (N = 93) indicated high risk levels in population with acquired disabilities. The current study (N = 80) focuses on understanding the relationship between recommendations, behaviors, and outcomes and includes evaluation of a center of excellence in a group home for persons with IDD.

**PERSON-CENTERED PLANNING FOR LATER LIFE: LOOKING TO THE FUTURE, BUILDING ON THE PAST**

K.L. Culler, H.L. Sterns. Psychology, Institute of Life-Span Development and Gerontology, The University of Akron, Austintown, Ohio

The Person-Centered Planning for Later Life: A Curriculum for Older Adults with Developmental Disabilities (DD) was developed in the late 1990’s-early 2000 by the Rehabilitation Research and Training Center on Aging with Developmental Disabilities. The curriculum was used and adopted in many parts of the United States. The presenters have reviewed this material and feel it may be useful to re-introduce this program designed for older adults with DD. There is a continuing need for such life planning. One module that has been especially useful has focused on issues of death and dying. This presentation will focus on the techniques used to develop the curriculum which included cognitive tasks analysis and concept development. Some of these materials are still available through the National Clearing House. The opportunity to reuse these materials could be a benefit to current older adults with DD dealing with work, retirement, and end of life issues.

**BEGINNING THE CONVERSATION ABOUT DEATH**

In Western society, death is often treated as an unexpected “crescendo” for individuals and families, especially individuals with intellectual disabilities (ID) and their families. Death is the ultimate loss we all face for loved ones and ourselves. Families are beginning to ask how to best prepare their sons and daughters with ID for loss. How do parents start and then continue these conversations? How do they explain death? How do they explain how their death might affect their son or daughter? Should adults with ID start to think about their own death? How can professionals help? Social work faculty, an MSW intern, a hospice and...
a local ARC have begun work to start building coping skills for dealing with loss and death. We will share how we have begun these discussions about change in general, loss in particular, and begun to talk about death and dying.

SESSION 880 (SYMPOSIUM)

SPIRITUALITY AND ILLNESS: SALUTARY AND DETRIMENTAL EFFECTS

Chair: J. Patrick, Psychology, West Virginia University, Morgantown, West Virginia

Discussant: P. Wink, Wellesley College, Wellesley, Massachusetts

As the empirical foundation expands in the area of spirituality, religiousness and aging, new research addresses the positive and negative effects of spirituality in a variety of contexts. This symposium focuses on both the salutary and deleterious effects of spirituality among individuals living with HIV, cardiovascular disease, dementia, and other life-threatening diseases. The papers use a variety of research methods, from rich qualitative analyses to sophisticated structural equation models, to address the ways in which spirituality influences both physical and psychological well-being. In this collection of papers, Fiske and colleagues present the results of a systematic review of the literature examining the link between spirituality and well being among adults with dementia. Ai and Wink examine the role of pre-operative prayer to post-operative well being among adults surviving cardiac surgery. Landes and Ardelt use qualitative methods to investigate the nuances of the relation between spirituality and fear of death among adults with chronic illnesses who are residing in residential care settings. Brennan and colleagues use SEM to address the mediating role of spirituality in health-related quality of life among older adults who are HIV-positive. Across these multiple health contexts and using a variety of research methods, these four papers examine the ways spirituality influences adults living with life threatening health conditions.

SPIRITUALITY, RELIGIOSITY AND COGNITION: A REVIEW OF RESEARCH WITH OLDER ADULTS AND THEIR CAREGIVERS

Spirituality and religiosity may promote cognitive and emotional health among older adults and caregivers. This study is a systematic review of empirical literature published through December 2010 examining spirituality and/or religiosity and mental health outcomes for older adults with dementia or cognitive impairment and for caregivers of persons with dementia or cognitive impairment. To be included, studies had to be written in English and include spirituality/religiosity and cognition-related search terms within the title, abstract, and/or keywords. Of 210 identified studies, 37 were eligible and included. Studies focused on older adults (46%), caregivers (46%) or both (8%). Methods included qualitative (51%), quantitative cross-sectional (30%) and longitudinal (14%) designs. Qualitative studies found that spirituality and religiosity were highly valued by many older adults with dementia and dementia caregivers. Positive outcomes were reported in most, but not all, of the quantitative studies. Additional research is needed to clarify these relationships.

SPIRITUALITY AND RESILIENCE TO DISEASE BURDEN AMONG OLDER ADULTS WITH HIV

By 2015 half of those living with HIV in the U.S. will be over age 50. Many HIV+ older adults face the early onset of age-related physical and mental health morbidities, placing them at-risk for poor quality-of-life. Resilience, the successful adaptation to negative life events, stress, or trauma, involves individual traits or strengths like spirituality. We examined how spirituality increases resilience to disease burden with regard to health-related quality of life (QoL) using structural equation modeling. Data were obtained from Research on Older Adults with HIV (Brennan et al., 2009; N=914). The model tested whether spirituality mediated the relationship between disease burden and QoL. The model fit the data well (RMSEA = .060), indicating that spirituality is a resilience factor for mental, but not physical health issues. This is noteworthy given rates of depression among OPLWH that are significantly higher than the general population. Implications for practice will be discussed.

SPIRITUAL DISCONTENT AND DEATH FEAR

S. Landes, M. Ardelt, University of Florida, Gainesville, Florida

This paper describes the relationship between spirituality and death fear in older adults dealing with a life-threatening illness or long-term disability while residing in a nursing home, hospice or community setting in north central Florida. Sources of difference in the informative influence of spirituality on death fear revolve around the participants’ expressions of spiritual contentment/discontent. The relationship between spirituality and death fear is initially framed using quantitative data on 184 adults who took part in a larger study on aging well. Qualitative analysis then details trends in the relationship between spirituality and death fear in the lives of 55 older adults who further participated in in-depth interviews on aging and dying well. While supporting quantitative findings showing a quadratic relationship between spirituality and death fear, qualitative analysis reveals that attention to expressions of spiritual contentment/discontent provide greater clarity in understanding the relationship between spirituality and death fear.

VITALITY OF CARDIAC SURGERY SURVIVORS: PREOPERATIVE PRAYER COUNTERACTS STRESS EFFECTS

This study examined the effect of preoperative faith factors, especially using prayer for coping, on long-term postoperative vitality, the opposite of fatigue, in middle-aged and older patients who survived cardiac surgery. Prayer use was assessed as a consciousness-based coping behavior. The analysis capitalized on demographics, faith factors, mental health, and medical comorbidities previously collected via two-wave personal interviews and standardized information from the Society of Thoracic Surgeons’ national database. Two hierarchical multiple regression models were performed. Preoperative using prayer for coping predicted less mental fatigue at the 30-month follow-up, after controlling for key demographics, medical comorbidities, cardiac function (previous cardiovascular intervention, congestive heart failure, left ventricular ejection fraction, New York Heart Association Classification), mental health (depression, anxiety), and protectors (optimism, hope, social support). Reversion in secular context, male gender, and preoperative anxiety predicted more mental fatigue. Older age, more medical comorbidities, and preoperative anxiety increased the likelihood of physical fatigue.
SESSION 885 (SYMPOSIUM)

THE SOCIAL CONSTRUCTION OF STIGMA IN SENIOR HOUSING: EXAMINING DIFFERENCE THROUGH CASE STUDIES
Chair: J.K. Eckert, Sociology and Anthropology, UMBC, Baltimore, Maryland
Co-Chair: E.G. Roth, Sociology and Anthropology, UMBC, Baltimore, Maryland
Discussant: R. Rubinstein, Sociology and Anthropology, UMBC, Baltimore, Maryland

Stigma and the Cultural Context of Residential Settings for the Elderly is a large-scale, ethnographic study (NIA funded) examining the experience and social construction of stigma in seven diverse senior housing settings in the Mid-Atlantic region of the U.S. Our research indicates a key component of stigma is the recognition of differences among residents. Staff members at these multi-level senior housing settings regularly assess individual health, labeling and sorting residents into levels of care in order to ensure an appropriate environmental fit. This process heightens resident and staff awareness of differences; such vigilance is what prompts a resident transition to a higher level of care. Commonly held societal prejudices are at times magnified within these settings. Conversely, negative attitudes toward old age or people with dementia, may be tempered within a setting where everyone is older or experiencing some level of physical limitation and/or memory loss. Our research is informed by the theories of Goffman, Link & Phelan, Dovidio, Major & Crocker, but our goal is to understand the emergent themes and components that might lead to stigma in these settings. This symposium presents five case studies, an approach well-suited to tackle the complexities of these multi-level settings and the highly contextual nature of stigma. These case studies address such emergent themes as the social dynamics that lead to exclusion, stereotyping, and bullying. Through this exploration of relational and environmental contexts, we suggest the possibility of improving the ability of residents, family and staff to counter stigma’s negative effects.

HELEN: FEAR OF FORCED RELOCATION IN A SENIOR HOUSING COMMUNITY
L. Keimig, S. Goldman, B. Harris-Wallace, J. Schumacher, University of Maryland, Baltimore, Maryland

Helen moved into an apartment in Stonemont Homes after her husband died 10 years ago. Over the past two years, she has developed macular degeneration and has given up driving. Fearful that the administrators will force her to move to assisted living once they learn of her diagnosis, Helen withholds information about her health from nearly everyone in the setting. With the support of her adult children and a neighbor, she hides her condition by using assistive devices such as a magnifying lamp and by traveling offsite to receive health care services. In this paper, we examine how the fear of deteriorating health and consequent forced relocation can lead to avoidance of social interaction and refusal of needed assistance. Drawing from Helen’s experiences, we consider the relationship of stigma to power, control, and image management. Implications address efforts to reduce resident fears of decline and encourage aging in place.

ROSEMARY: PREJUDICES PERSIST INSIDE SENIOR HOUSING
M.C. Nemec, A. Frankowski, S. Goldman, A.D. Peeples, Center for Aging Studies, University of Maryland, Baltimore County (UMBC), Baltimore, Maryland

Rosemary did not fit the typical image of a resident at the Riverside when she moved into an independent apartment in this upscale senior residence. Openly derided by fellow independent living residents for her mental illness, obesity, cognitive decline, poor hygiene, and masculine features, Rosemary, from the onset, was stigmatized in her new home. In this paper, we examine the multi-faceted aspects of Rosemary’s life as they relate to difference and explore the effect of labeling in a collective living setting. We frame this discussion around finding the appropriate social environment and the related challenges that persist when individuals move into “institutional” housing. Recommendations for minimizing the impact of stigma will be discussed.

AMBIGUOUS CASE OF STIGMA: MR. AND MS. BURNS
A.D. Peeples1,2, A. Frankowski1, M.C. Nemec2, S. Zimmerman1, 1. Doctoral Program in Gerontology, University of Maryland Baltimore and Baltimore County, Baltimore, Maryland, 2. Center for Aging Studies, UMBC, Baltimore, Maryland, 3. University of North Carolina at Chapel Hill, Chapel Hill, North Carolina

Married and otherwise committed couples in which the partners reside in different levels within the same multi-level setting can complicate and exacerbate the experience of stigma. This paper tells the story of one such couple. Mr. Burns lives alone in an assisted living apartment while his wife resides one floor below in the secured dementia care unit. Concerns for Ms. Burns’ safety arose when she was found outside, alone, after a visit with Mr. Burns in his apartment. Without talking directly with Mr. Burns, staff put a stop to the routine visits. We explore the factors leading up to this event, and discuss the ways in which corporate policy, administrators, direct care staff, and family shape the stigma surrounding these two residents. This case illustrates the difficulties of determining what constitutes stigma and untangling its components. Issues of power, ageism, risk, health status, and autonomy are explored.

STANLEY: PERSONAL DIFFERENCES AND EXCLUSION
R. Hrybyk1, L. Keimig1, D.J. Dobbs2, E.G. Roth1, 1. Center for Aging Studies, UMBC, Baltimore, Maryland, 2. University of South Florida, Tampa, Florida

Personal differences can lead to exclusion, shunning, and social isolation. Stanley is different from the other men at Stonemont Homes, an affinity-based senior housing community. His behavior is considered deviant in the cultural context of this community. He does not belong to the same fraternal order and some residents have complained that he does not understand how he is supposed to behave. Instead of socializing with the men, Stanley flirts with the women. The men who once sat at his dining table have all left his table one by one. They say they have nothing in common with him. If the gap between a person and his social environment is large, the “mis-fit” may become stigmatized. His case shows how personal differences can contribute to isolation in these settings.

BABY BOOMERS AND THE REJECTION OF MARTI REIS’ COHORT
E.G. Roth, L. Keimig, L. Morgan, Center for Aging Studies, UMBC, Baltimore, Maryland

Marti Reis and her friends welcomed the arrival of the baby boomers to their well-established active adult community. In a community where active engagement is highly revered, older residents anticipated fresh energy and participation from their new, younger neighbors. But when a member of the newly formed Baby Boomer club rejected Marti’s invitation to their group by stating: “We’re not interested in hanging out with old people,” the story spread “like wildfire” among long-time residents, confirming sentiments and attitudes held by both Boomers (i.e. denigrating old age) and their older cohort (i.e. valorizing youth). The implications of these recognized age differences have to some extent led to social distancing, age-based cliques, and social isolation. These attitudes potentially threaten to weaken the community’s strong tradition of neighbors helping neighbors as they age in place.
APPLYING FOR ETHICAL APPROVAL IN RESEARCH ON PEOPLE WITH DEMENTIA: STORIES FROM THE UK, THE US AND SWEDEN
Chair: A. Kydd, University of the West of Scotland, Hamilton, Lanarkshire, United Kingdom
Discussant: H. Wilkinson, Edinburgh University, Edinburgh, Lothian, United Kingdom

Applying for ethical approval can be a daunting task for researchers, especially when the research involves recruiting people with dementia to participate in studies. Ethics committees are keen to protect those who can give limited and time restricted consent or indeed cannot give informed consent to participating in research studies. Yet in protecting those with dementia, ethics committees can inadvertently disuade researchers from listening to the voice of those who have dementia by making the ethical application process difficult for researchers (Hellstrom et al. 2007). Conversely, such protection can serve to further compromise the person with dementia as it can result in silencing the stories of those people with dementia (Wilkinson, 2002). Many current studies have shown that people with dementia have a voice and there is a need to listen to the person who is experiencing the illness (Phinney, 2002). This symposium gives first hand accounts of researchers who have undergone the ethics application successfully in order to research what life is like for people with dementia. The participants are from the UK, the US and Sweden and each will give their accounts of how they got through to ethical approval and the obstacles they encountered on the way. The symposium has been put forward by a supervisor of two of the participants and discussant, Dr Heather Wilkinson, is a well known author on the subject.

INVOLVING PEOPLE WITH DEMENTIA IN UK RESEARCH
B. Sharp, A. Kydd, Health, Nursing and Midwifery, University of the West of Scotland, Hamilton, United Kingdom

A common system for ethical review of health and social care research exists across the UK in the form of the National Research Ethics System which aims to safeguard the dignity, rights, safety and well being of research participants and provide independent advice to participants, researchers, sponsors, employers and professionals. Where a study involves people with dementia and potential issues of capacity to consent, applications are considered by a specific committee under the requirements (in Scotland) of the Adults with Incapacity (Scotland) Act 2000. The process, outcomes and issues associated with an application to this committee will be discussed in relation to the involvement of people with dementia in focus groups to hear their subjective experiences of stress. Materials and approaches developed to address the issues of informed consent for this participant group and lessons learned from this study to date will be shared.

INVOLVING PEOPLE WITH DEMENTIA IN SWEDISH RESEARCH
L. Mannstål Hammar, Mälardalen University, Västerås, Sweden

Ethical considerations in research with persons with dementia in Sweden In Sweden, all research concerned human needs an ethical approval given by an ethical committee. The committees have a council, with an experienced judge as president. The council has also ten persons with research expertise, and five persons that represent public interests. Research concerned persons with dementia has to be carefully described especially of how their integrity will be protected and that the researchers need to carefully observe the persons with dementia to notice if they in some way objects to participate. Before research is introduced, confirmed consent is urged from all participants. From persons with dementia, proxy consent is given from their next of kin or a trustee.

RESEARCHING PEOPLE WITH SEVERE DEMENTIA
M. Brown, A. Kydd, Health, Nursing and Midwifery, University of the West of Scotland, Hamilton, United Kingdom

This study is about exploring quality of life for the person with severe dementia living in a care home. He or she may not be able to say more than a few words or may no longer be able to speak at all. The aim of the research is to try and understand how quality of life is experienced by someone who has reached this condition. As he or she can no longer tell in words what they feel, want or understand, it is planned to try and uncover other ways to address quality of life as observed by the researcher. The potential of the research is to use the information to develop a guide that will help those who are caring, better meet the needs of the person with severe dementia. However, this vulnerable population cannot consent to participation in the study and the process of the ethical approval needed to conduct this work is discussed.

THE ETHICS OF DEMENTIA RESEARCH IN AN AMERICAN NURSING HOME

This presentation examines the tension between research approval processes and the real need for people with dementia to participate in social activities with caring visitors. Using ethnographic data from a two-year long participant-observation study in a California nursing home, it examines the difficulties inherent in obtaining research approval, acquiring proxy consent and identifying the risks and benefits of ethnographic research. The research project involved singing songs with nursing home residents and asking them about music, yet required full committee review, with new stipulations added by each annual committee. Starting with the year-long process of obtaining approval, this presentation examines the roles of key players in the research approval process, including the research review committees, staff, volunteers, family members and, most importantly, the residents with dementia. It is intended to inform our understanding of benefits, risks, and our obligation to listen to those who are cognitively impaired.

ETHNogeriatric nursing: building the science under practice
Chair: L.R. Phillips, UCLA School of Nursing, Los Angeles, California
Discussant: M. Wykle, Frances Payne Bolton School of Nursing Case Western Reserve University, Cleveland, Ohio

From a demographic perspective, elders from minority groups are among the fastest growing segments of the U.S. population. From a nursing perspective, however, growth in the knowledge base underlying ethnogeriatric nursing is in no way keeping pace with the need. Even though the past decades have seen many advances in the field of ethnogeriatrics, few of these advances have found their way into nursing practice or research. The purpose of this symposium is to begin a discussion about the unique knowledge base needed for the practice of ethnogeriatric nursing. The first paper will discuss a model drawn from the literature on transcultural nursing and current conceptualizations in ethnogeriatrics that may be useful in growing the knowledge base. The papers that follow will identify factors associated with particular focal groups that can be used to extend our knowledge. A model for recruiting ethnically diverse nursing home residents is the focus of the second paper using Korean Americans with dementia. The third paper explores mental health issues among older immigrants from war-torn nations using Arab-Americans as the focal group. The fourth paper explores the influence of stigma on self-care among older diabetics using African-Americans as the focal group. The last paper explores issues related to
immigration experiences and overall health using elderly Lebanese-Americans as the focal group.

A MODEL FOR DEVELOPING ETHNOGERIATRIC NURSING KNOWLEDGE
L.R. Phillips, D.L. Woods, J. Mentes, M. Cadogan, UCLA School of Nursing, Los Angeles, California

By 2050, the U.S. Census bureau projects nearly half of all elders will be from minority groups yet the “typical” nurse will still be a member of the “single-race, white population.” This impending situation calls attention to the critical need for the development of models for ethnogeriatric nursing. The model we propose rests on Giger & Davidhizar model of transcultural nursing and incorporates concepts of ethnogeriatrics as identified by Stanford University. Particular attention will be given to the construction of the model and how it can be used to guide research, particularly on what are now recognized as ethnic and racial health disparities. Focus will also be given to identifying the type of knowledge needed and ways knowledge growth can be supported and sustained.

A CONCEPTUAL LOOK AT STIGMA AND SELF-CARE AMONG AFRICAN AMERICAN OLDER ADULTS WITH DIABETES
K. Skrine Jeffers, J. Mentes, L.R. Phillips, UCLA, Los Angeles, California

As the prevalence of adverse chronic disease outcomes rise due to inadequate self-care among African American older adults, an in-depth study of the hidden factors that guide their self-care behaviors is needed. Although stigma has been studied in other groups, its influence on self-care behavior among older African Americans has not been explored. Thus, stigma is an understudied phenomenon within nursing as it relates to the relationship between race, chronic disease and self-care. This paper will present a concept analysis of the word “stigma” and describe its implications in the self-care behaviors of African American older adults with type 2 diabetes. The implications of understanding stigma in building ethnogeriatric nursing science will also be examined.

RECRUITING KOREAN AMERICAN NURSING HOME RESIDENTS USING A COMMUNITY BASED PARTICIPATORY RESEARCH FRAMEWORK
H. Kim, D.L. Woods, School of Nursing, UCLA, Los Angeles, California

Recruiting ethnic minority elders is an ongoing challenge to researchers. Barriers may arise from participants’ mistrust and lack of knowledge of the scientific study, and also researchers’ misunderstanding of the culture within the community. Using a community based participatory research (CBPR) framework, this presentation will describe the strategy used to enhance recruitment of Korean American (KA) nursing home (NH) residents with dementia and non-Korean certified nursing assistants (CNAs). As a participant observer in the NH, the PI was able to: 1) identify cultural and language barriers; 2) become familiar with the NH environment, including mealtimes, and bathing time; and 3) develop a trust relationship with staff and residents. As a result, the administrator agreed to have the PI conduct the study in the NH and assign a staff member to assist with family contact. Thirteen KA residents’ families (24%) consented from 54 contacted within the first month.

ADDRESSING THE UNIQUE NEEDS OF LEBANESE-AMERICAN ELDER
N. Salem, UCLA, Los Angeles, California

Foreign-born older adults in the United States present unique characteristics and challenges to ethnogeriatric nurses. This paper will address Lebanese-Americans who comprise the largest group of the Arab Population in the U.S. Approximately 15.7% of the Lebanese population are 65 and older and the population is growing substantially. Lebanese-American elders who have immigrated to the U.S. bring experiences related to immigration status, war, resources and the challenges of living and adapting to a new cultural context. These diverse experiences are increasingly drawing the attention of ethnogeriatric nurses who are concerned with obtaining a more informed profile of elderly individuals in the United States and the nursing implications of these unique populations. This paper will present literature on the experiences of elderly Lebanese immigrants; the impact on their health and health care; the nursing implications; and the need for culturally appropriate research.

A CLOSER LOOK: WAR TORN REGIONS AND THE EFFECT OF POST-TRAUMATIC STRESS DISORDER (PTSD) ON OLDER ADULTS
B.E. Salem, L.R. Phillips, UCLA School of Nursing, Los Angeles, California

Exposure to war-torn violence over the last half century has placed Arab Americans at increased risk for post-traumatic stress disorder (PTSD). Approximately 7% of the general adult population in the United States (U.S.) suffers from the syndrome and while estimates vary, some studies have suggested that the projected lifetime risk of PTSD is 5% and increases with age. This paper will present and explore literature about the known factors which influence the substantial unmet need among this ethnic minority, specifically focusing on: (1) the prevalence of PTSD among Arabs in the Middle East and the United States, (2) the effects of migration patterns, (3) understanding cultural perceptions of mental illness, and (4) the need for culturally tailored research for building the science of ethnogeriatric nursing.

SESSION 900 (SYMPOSIUM)

LATE LIFE DEPRESSION IN URBAN CHINESE PRIMARY CARE CLINICS: PUTTING COLLABORATIVE CARE IN CONTEXT
Chair: Y. Conwell, Psychiatry, University of Rochester School of Medicine, Rochester, New York
Co-Chair: S. Chen, Zhejiang University, Hangzhou, Zhejiang, China

Late life depression is a major public health issue in China associated with greater functional impairment, utilization and cost of health care, and early mortality, including by suicide. In 2009 China released new health care policy guidelines indicating that chronic illnesses should be managed in primary care clinics. Depression is ordinarily a chronic illness shown in Western countries to be optimally managed by integration of mental health expertise, evidence-based practice guidelines, patient and provider education, and communications and decision support into the primary care workflow. No such approach, however, has been adapted for use in China. This symposium will examine the need for, and approaches to, adaptation of late life depression care management in Chinese urban primary care clinics. It will consist of four presentations and general discussion. Chen Shulin will first present data defining the prevalence and correlates of mood disorders among older adult patients of primary care clinics in Hangzhou. Second, Kimberly Van Orden will describe the course of depressive illness over one year in these older adults under “usual care” conditions. Third, Yeates Conwell and Chen Shulin will present results of a survey of Chinese primary care doctors concerning the barriers at patient, provider, and service system levels to the detection and management of depression in their elderly patients, and preliminary efforts to institute depression practice guidelines in Hangzhou primary care practices. Finally, Grace Niu will address the cultural adaptations necessary to make Problem Solving Therapy appropriate for use with Chinese older adults. Open discussion will follow.
PREVALENCE AND CORRELATES OF MAJOR DEPRESSION IN OLDER ADULT PRIMARY CARE PATIENTS IN URBAN CHINA
S. Chen1,2, Y. Conwell1, K.A. Van Orden1, N. Lu1, B. Xu2, Y. Ma3, Y. Conwell1,2, K.A. Van Orden1, N. Lu1, B. Xu2, Y. Ma3, 1. Psychiatry, University of Rochester School of Medicine, Rochester, New York, 2. Zhejiang University, Hangzhou, China, 3. Health Department, Hangzhou, China

The personal and social costs of later life depression are high, and primary care is the preferred venue for its diagnosis and treatment. The prevalence and correlates of major depressive disorder among older adult patients of Chinese primary care clinics are unknown. This presentation reports survey results of a representative sample of primary care patients over age 60. Subjects were identified by two-stage screening conducted in primary care practices in urban Hangzhou, China. Interviews included assessments of depressive diagnosis and symptom severity, physical health and functional status, social supports, and quality of life. The estimated prevalence of current major depressive disorder was 11.3%. Greater age, female sex, lower education, living alone, lower support from family, high medical illness burden, and greater functional impairment were significantly associated with major depression diagnosis. Findings have implications for the design of primary care-based interventions for late life depression in urban China.

TRAJECTORIES OF CHANGE IN DEPRESSION SEVERITY AMONG OLDER ADULT PRIMARY CARE PATIENTS IN CHINA
K.A. Van Orden1, S. Chen2, B. Xu2, A. O’Riley1, Y. Conwell1, 1. Psychiatry, University of Rochester Medical Center, Rochester, New York, 2. Zhejiang University, Hangzhou, China

The degree to which depression changes over time for primary care patients in China is unknown. Research in the U.S. identified six distinct trajectories of change. Our aims are to examine the degree of change over one year as a function of initial severity and to examine whether the same patterns of change would be found in China. We found moderate change in the high baseline group, with minimal to no change over time in the mild to low groups. We found six trajectories of change but they appear distinct from those found in the U.S. One class had a striking increase in severity over time and was distinct from a class with comparable baseline severity in terms of greater physical illness burden and functional impairment. In sum, depression severity is stable or worsens for a large proportion of older adult primary care patients in China.

MANAGEMENT OF LATE-LIFE DEPRESSION IN URBAN CHINESE PRIMARY CARE CLINICS (PCCS) – PERCEIVED BARRIERS AND APPROACHES TO OVERCOMING THEM
Y. Conwell1, S. Chen2, C. Cerulli1, Y. Ma3, 1. Psychiatry, University of Rochester School of Medicine, Rochester, New York, 2. Zhejiang University, Hangzhou, China, 3. Health Department, Hangzhou, China

Late-life depression frequently goes undiagnosed and inadequately treated in PCCs. Innovative approaches to integrated late-life depression care management have been shown effective in improving outcomes in Western primary care settings. No such studies, however, have examined these issues in China. 295 primary care physicians (PCPs) in urban Hangzhou reported their typical approach to management of depression in elderly patients and rated the extent to which variables at the patient, provider, and practice levels represented barriers to the care they provide. PCPs reported prescribing an antidepressant, referring to a mental health specialist, and prescribing traditional Chinese medicine in 15.6%, 26.8%, and 23.7% of their depressed elderly patients respectively. Common barriers included patient/family reluctance to accept the diagnosis, lack of confidence in their own skills, and lack of access to mental health specialists. We describe the implications of these findings for design of collaborative depression care management in Chinese primary care clinics.

CULTURAL ADAPTATION OF PROBLEM SOLVING TREATMENT
P.A. Arean, Psychiatry, UCSF, San Francisco, California

Objectives. Provide an example of a cultural adaptation method, Formative Method for Adapting Psychotherapies (FMAP), in the adaptation of an evidence-based intervention for a cultural group known for refusing mental health treatment. Methods. Provider and client stakeholder input combined with an iterative testing process within the FMAP framework was utilized to create the Problem Solving Therapy - Chinese Older Adult (PST-COA) manual for depression. Data from pilot-testing the intervention with a clinically depressed Chinese elderly woman are reported. Results. PST-COA is categorized as a “culturally-adapted” treatment, where core, mediating mechanisms of PST were preserved, but cultural themes of measurement methodology, stigma, hierarchical provider-client relationship expectations, and acculturation enhanced core components to make PST more understandable and relevant for Chinese elderly. PST-COA resulted in remission of depression and was found to be acceptable to test cases. Conclusions. PST, as a non-emotion-focused, evidence-based intervention, is a good fit for depressed Chinese elderly.

SESSION 905 (SYMPOSIUM)

NUTRITION AND FRAILTY IN THE AGING WORLD: OPPORTUNITIES FOR ACADEMIC AND INDUSTRY SCIENTIFIC COLLABORATION
Chair: R. McCarter, Pennsylvania State University, University Park, Pennsylvania, American Federation for Aging Research, New York, New York
Discussant: W.J. Evans, GlaxoSmithKline, Research Triangle Park, North Carolina

This symposium derives from the effort of AARP and the American Federation for Aging Research (AFAR) to launch the creation of “The Health Promotion Institute of AARP and AFAR” for the purpose of bringing greater clarity and public understanding to the work in several subfields of the science of aging, particularly the biology of aging and clinical geriatrics. In this session, speakers will outline the most important threads of the emerging science of human nutrition and hydration as it affects the health and functional status of older adults. The speakers will then address the implications of nutritional science for clinical geriatrics and the importance of addressing these issues in the ongoing care of older adults. Finally, the session will also illustrate the way in which some of the nation’s major business and industries are addressing these same issues, through their own work in food/beverage/pharmaceutical science and product development. The session will illustrate the way in which AARP and AFAR are moving to bring both the science of aging and the communication skills of AARP closer together to help the older adult general population better understand these issues and benefit from the science and product development work as it unfolds.

NUTRITION AND HYDRATION IN OLDER ADULT POPULATIONS: IS IT UNDER- OR OVER-NUTRITION, EITHER OR BOTH?
J.E. Morley, St. Louis University, St. Louis, Missouri

In this presentation, the most salient current issues in relation to the science of human nutrition and hydration among older adults will be described and illustrations will be given for how the science is progressing, challenges that have arisen, along with observations from current research that suggest the future direction for this field. Because of the different meanings and clinical significance of either under- or over-nutrition, special attention will be given to the different perspectives and paradigms of research that have contributed to our understanding of nutritional factors in the process of human aging. The presentation will provide a view of some of the more interesting and exciting new directions for research in this field.
NUTRITION AND HYDRATION IN OLDER ADULTS

In this presentation, a widely known geriatrician will discuss the way in which observations, information gained from patients, and physical exam or laboratory findings are integrated with the science of aging to understand and manage the consequences of both excessive and inadequate/inappropriate nutritional behavior among older adults. In addition, some attention will be given to the consequences of ignoring some of the important aspects of personal nutrition in the care of older adult patients. This presentation will give attention to the importance of frailty and general functional status measurement in the context of clinical geriatric practice, including the way in which such observations and measurements may reflect nutritional health status in the older patient. Some attention may be given to the way in which nutritional aspects of self-care are addressed in the course of the typical patient encounter.

THE COMMITMENT OF AMERICAN BUSINESS AND INDUSTRY TO FINDING SOLUTIONS TO NUTRITIONAL ISSUES IN HEALTH AND AGING

In this presentation, a leading figure in one of America’s largest companies in the food and beverage industry, PepsiCo, will describe the efforts of the many components of this large, global company to focus the attention of its scientists on finding more and better ways to shape the future of product development in this industry in a way that its business can contribute to societal health goals for older adult populations. The science base of the food and beverage industry is rarely observable to those who work in other aspects of aging or public health. This is one company which has made a clear public commitment to invest in the science that will enable the achievement of concrete and achievable goals for the healthful content and marketing of its products in both the food and beverage lines of its business. Working with academic and other facets of the science of aging, PepsiCo has embarked on an ambitious effort to identify specific health goals (like sodium and sugar reduction) in its full product line in order to make a significant contribution to the health of the populations who purchase its products. AARP and AFAR are working with PepsiCo and other industries who are making a similar effort to work with the leading scientists worldwide whose work is relevant to their industries in meeting these goals.

DISCUSSION: TRANSLATING THE SCIENCE OF AGING: NEXT STEPS TOWARD IMPACTING THE HEALTH OF OLDER POPULATIONS THROUGH NUTRITION

RESEARCH

W.J. Evans, GlaxoSmithKline, Research Triangle Park, North Carolina

As the discussant of the three principal contributions to this symposium, Dr. Evans, one of the leading figures in the field of muscle metabolism and the geriatric aspects of nutrition, will offer observations on how the science of nutrition is impacting other fields of the basic sciences of aging, but also how this field is helping to “translate” nutritional science in a way that it can have clinical applications in improving the health of older adults.

NUTRITION AND HYDRATION IN OLDER ADULT POPULATIONS: IS IT UNDER-OR OVER-NUTRITION, EITHER OR BOTH?

J.E. Morley, 1. Geriatrics, Saint Louis University, St Louis, Missouri, 2. St. Louis VA Medical Center, St. Louis, Missouri

Weight loss, sarcopenia and cachexia represent major problems in older persons. Poor nutritional intake and cytokine excess are key causes of weight loss. Depression is the primary cause of anorexia. Older persons fail to recognize that they are thirsty leading to dehydration, occurring commonly in this population. A good balanced diet appears to be more useful to older persons than supplements in pill form. Exercise represents a key element to reducing obesity and improving function in older persons.

SESSION 910 (SYMPOSIUM)

TRANSLATING THEORY INTO PRACTICE: SUPPORTING INFORMAL CAREGIVERS PROVIDING END-OF-LIFE CARE

Chair: J. Penrod, Penn State University, University Park, Pennsylvania

Informal caregivers contribute significantly to the care of adults living with and dying from life limiting conditions. Based on preliminary research demonstrating that informal caregiving trajectories mirror distinct disease trajectories, this series of studies was conducted to refine the theory in preparation for translation into practice. Each of the qualitative methods used in this series of studies provided unique prospective of the experiences of informal caregivers and formal care providers in varied clinical settings. However, the integration of findings was critical to a coherent theoretical model was critical to the translation efforts. In this presentation, three distinct qualitative approaches to examining the phenomenon of informal caregiving through the end of life are presented as exemplars of incremental studies contributing to a theory guided, research-based assessment and intervention protocol to support informal caregivers across end-of-life trajectories. Paper 1 discusses a large ethnographic study of informal caregiving across three distinct death trajectories. Paper 2 explores the culture of care manifest in distinct delivery systems through qualitative and quantitative analyses in an ethology. Paper 3 applies instrumental case study methods to examine the unique challenges faced by older adult caregivers providing end-of-life care across varied death trajectories. Paper 4 then addresses theory building in action and the translation of findings into practice.

ETHNOGRAPHIC INQUIRY: UNDERSTANDING THE CULTURE OF CARE

S.J. Loeb, J. Penrod, B. Baney, Penn State University, University Park, Pennsylvania

Ethnographic methods were applied to maximize conceptual understanding of the influences of prevailing values and beliefs, or the culture of care, on healthcare providers’ interactions with informal caregivers. Longitudinal observational and interview data were collected from healthcare providers and informal caregivers across the trajectory of illness in outpatient clinics serving patients living with/dying from heart failure, amyotrophic lateral sclerosis, and advanced lung cancer. Findings revealed that the formal care providers’ values and beliefs, based on practice theory derived through prolonged engagement with a distinct patient population were communicated verbally and non-verbally to family caregivers during ongoing visits. Three model of care delivery reflected the prevailing culture of care in each setting: Provider Dominant; Cooperative Network; and Interdisciplinary. An important contribution of this work was to explicate implicit or intuitive practice theory that influenced interactions with informal caregivers at the interface of informal/formal caregivers.

ETHNOLOGY: UNDERSTANDING THE CAREGIVER INTERFACE

J. Penrod, B. Baney, Penn State University, University Park, Pennsylvania

Qualitatively, it was revealed that values, beliefs and information are exchanged at the interface between healthcare providers and informal caregivers as co-providers and/or co-recipients of care. In this study, ethology was applied to examine the behaviors manifest at the interface during brief office visits. First, an ethogram (descriptive patterns of behaviors) was derived inductively from observational data. Using this
schema, the data were coded, thus quantifying demographic and behavioral patterns. Multivariable logistic regression was used to determine significant variables associated with patterns of interaction. Adjusted for patient and caregiver sex, the care delivery model was the strongest predictor how the informal caregiver was integrated into the visit. This study confirms the qualitatively-derived theory: implicit values and beliefs shape the culture of care, which in turn influences the experiences of informal caregivers. Too often, the prevailing culture of care obscures opportunities to support caregivers as co-recipients of care.

**INSTITUTIONAL CASE STUDY: UNDERSTANDING END-OF-LIFE CARE PROVIDED BY OLDER ADULT CAREGIVERS**

G. McGhan, J. Penrod, Penn State University, University Park, Pennsylvania

Medical advances have increased longevity, while prolonging the trajectory of dying. In this study, institutional case study methods were applied to a purposive sample extracted from the longitudinal interview data from the larger ethnographic study to examine the experiences of older adults providing end-of-life care. Using the Model of End of Life Caregiving to theoretically frame the phenomenon of interest, the experiences of older adult caregivers were examined to uncover challenges or facilitators in each of the four phases of the model. Unique challenges emerged for older adult caregivers: they often suffered health issues that impacted their capacity to provide care for another while attending to their own health needs. Analysis revealed four common themes that inform supportive strategies for older adult caregivers providing end-of-life care: difficulty juggling treatment regimens for co-morbidities; feeling exhausted and overwhelmed; de-prioritizing one’s own health needs; and feelings of isolation.

**BUILDING THEORY TO GUIDE PRACTICE: SUPPORTING INFORMAL CAREGIVERS PROVIDING END-OF-LIFE CARE**

J. Penrod, Penn State University, University Park, Pennsylvania

This paper provides an overview of the integration of findings highlighted in this symposium with foundational research on states distressed caregiving. The resultant product is a coherent theoretical schema of informal caregiving through the end of life from which clinical implications for the assessment of informal caregivers and strategies to support these partners in care are extracted. Specifically, assessment must focus on the informal caregiver’s sense of confidence and control. Since caregiver distress may be situational or existential, both realms must be addressed in assessment. Supportive strategies must be phase-specific, recognizing the importance of the course and duration of the trajectory toward death, addressing needs or sustaining efforts while protecting the caregivers’ health. Informal caregivers are often integrated as co-providers or “care extenders” outside the formal delivery system. It is time to fully embrace these instrumental partners in care as co-recipients of care who warrant our attention and support.

**SESSION 915 (PAPER)**

**OLDER WORKERS**

**FLEXIBLE EMPLOYMENT: USING FLEXIBILITY TO AID OLDER WORKER EMPLOYMENT AND LATER LIFE OUTCOMES**

E. Aiden, School of Social Policy, University of Kent, Canterbury, Kent, United Kingdom

Many organisations in the UK report having flexibility policies in place to support their workers as they attempt to balance various life-stage issues in the home. This presentation provides a review of a recent qualitative research project sponsored by Age UK which looked at how these policies actually work in ‘practice’ for employees aged 50+. The realities of the daily use of flexibility policies were assessed from two viewpoints. First, from the employer view in regards to full implementation of policies and ‘buy-in’ at all levels including line-management and employee peers. Second, from the employee viewpoint including desire to work collaboratively with their employer in finding a flexible solution for work exit (often requiring discussions through the life course) and personal views of flexible working and work exit planning. Through this, the realities of the current use of flexibility policies became more apparent, insight into employee views of flexible working and collaborative employer discussions were obtained, and further support for earlier life course interventions in regards to work exit planning were found. Refocusing flexibility policies in this alternative way may hold the key to retaining ageing workers in the current economic downturn. This has significant employment and social policy implications, not just in the UK, as flexibility policies can be used to keep older workers in employment in order to avoid benefit dependence, and the poor financial and health outcomes which can often follow early employment exit, as well as ensuring an extended retention of older worker knowledge within organisations.

**POST-RETIREMENT CONTRACTING IN MA STATE AGENCIES: PATTERNS AND PREDICTORS**

A. Tull, 1. Gerontology, University of Massachusetts Boston, Weymouth, Massachusetts, 2. Commonwealth Corporation, Boston, Massachusetts

Incentivizing older public sector employees to continue working beyond the normal retirement age is difficult when defined benefit pension programs are designed to encourage workers to retire upon reaching the maximum benefit. Massachusetts state agencies have one policy tool at their disposal to mitigate knowledge or skill loss resulting from worker retirements: a mechanism within the pension laws that allows retirees to return to work as part-time contract employees. This study utilized state human resource data for 2,916 retirees to specify a logistic regression model predicting post-retirement contract utilization within 16 Health and Human Service (HHS) agencies. The study also included contextual data from key informant interviews on the benefits and drawbacks to the post-retirement contracting policy. The results suggest that post-retirement contracting is used as a flexible staffing tool to mitigate the negative effects of retirement, particularly for retirees who hold specific licenses such as registered nurses or licensed social workers (OR=2.90, p=.000). However, the results suggest serious equity concerns, with the odds of post-retirement contracting for non-unionized managers (OR=8.76, p=.000) and white (OR=2.97, p=.000) retirees significantly higher than otherwise similar front-line and minority employees. Yet, in spite of these limitations, this analysis suggests the policy can be an effective tool for facilitating intergenerational knowledge transfer and managing labor costs. This paper also includes a policy analysis that explains the pros and cons of the post-retirement contracting policy relative to alternative approaches to retaining older workers, such as phased retirement, DRO Plan and flexible work options.

**DYNAMIC WAGE AND EMPLOYMENT EFFECTS OF ELDER PARENT CARE**

M. Skira, Economics, Boston College, Chestnut Hill, Massachusetts

This paper formulates and estimates a dynamic discrete choice model of elder parent care and work to analyze how caregiving affects a woman’s current and future labor force participation and wages. Since a typical caregiver is in her fifties or early sixties, and hence in her prime working years, understanding the short and long-term effects of caregiving on work and wages is an important policy issue. The model incorporates several dynamic elements such as the health of the parent, human capital accumulation and the availability of job offers. These extensions allow for long-term costs of informal care that may arise due to the accumulation of foregone or lower wages and/or decreased job opportunities during and after a caregiving spell. Such long-term costs have been
overlooked in the previous literature. The model is estimated on a sample of midlife women using data from the Health and Retirement Study by efficient method of moments. Using the estimates from the model, I simulate several elder care work leave policy experiments which have been debated at the national and state-level. I simulate an unpaid leave longer than currently available under the Family and Medical Leave Act of 1993 and a paid leave to analyze their effects on a woman’s caregiving and work decisions and whether they allow women to better maintain employment throughout and after a caregiving spell.

THE EFFECT OF COMMUTING ON THE OLDER WORKER
C. Nicolle, R. Talbot, M. Maguire, Loughborough University, Loughborough, United Kingdom

With the abolition of the default retirement age in the UK, the government is acknowledging that keeping older people in the workforce has wide-reaching benefits. Transport difficulties are one of the barriers to employment experienced by people aged 50 plus. Conflicts may arise regarding work location, travel arrangements, mode of travel, family or caring commitments, and the need for leisure time and a well-earned degree of freedom and flexibility. The journey to work is being investigated as part of “Working Late”, a collaborative research project funded by the UK’s New Dynamics of Ageing Programme (www.workinglate.org). The overall project, running from 2008-2012, is addressing a range of practice and policy relevant issues and is developing strategies to enhance productive and healthy environments for the older workforce. This paper focuses on one aspect of the research: private and public transport commuting to and from work, and the enablers, barriers and choices that older workers may face in this area. A questionnaire survey, telephone interviews and focus groups have been conducted with people over the age of 45. These have identified current difficulties (cost, stress, health, time, and fatigue) and anticipated difficulties (cost, relocation, change in circumstances, and traffic). It was clear from talking with people that they had concerns which they were not sure how they would address in the future. This presentation will provide their stories, potential solutions and inclusive strategies to support personally sustainable travel and well-being, not just for older people but for all employees.

SESSION 920 (SYMPOSIUM)

CHANGING AGE: EDUCATIONAL PERSPECTIVES ON RECONSTRUCTING SOCIETAL VIEWS OF GROWING OLD
Chair: D. Shenk, Gerontology Program, University of North Carolina Charlotte, Charlotte, North Carolina
Co-Chair: G.D. Rowles, University of Kentucky, Lexington, Kentucky

The ways in which societies view the biological, psychological and social processes of aging shape the creation and maintenance of community values, social structures and the role and care of elders in those societies. The presence and resilience of such values, social structures, roles and approaches to care, in turn, reinforce societal views of aging in a never ending feedback loop, a cycle that determines the lifestyles and lifespan of older adults by shaping their life course. Particularly in Western societies, the pervasive view of aging is predominantly negative, stereotypical and ageist. Increasing awareness in the research community that growing old is a far more complex and variegated phenomenon than is reflected in societal views and that the process itself is constantly changing has yet to be effectively translated into public consciousness. This symposium explores “changing age” within the interwoven themes of lifestyle, lifespan and life course. Focusing on transitional views as manifest in a series of topical domains, contributors from four different disciplines explore educational implications and impacts of changing age and aging. Rick Moody will provide an overview and philosophical perspective. Caleb Finch will discuss the evolution of human aging as a unique multigenerational system and its future in a post Darwinian world. Murna Downs will focus on the specific case of dementia and how the view of the person with dementia has been framed and changed. Jennie Keith will provide an anthropological perspective on changing age in changing cultures.

AGING IN THE RISK SOCIETY: A GUIDE TO THE PERPLEXED
H. Moody, Academic Affairs, AARP, Washington, District of Columbia

Two decades ago Robert Butler published his book titled “Who Is Responsible for My Old Age?” The answer, increasingly, is the individual self. It is a paradox of post-modern aging society that structural ageism is reinforced by economic and cultural institutions (advertising and the labor market), while individuals face ever larger threats in a “risk society” (Giddens, Beck) accompanied by the “great risk shift” (Hacker) that dismantles collective provision in later life. This duality is explored in four domains where structural and individual forces are in contradiction: (1) Climate change and risks to future generations; (2) Longevity risk and financial planning; (3) Later-life entrepreneurship and the imperative to reinvent oneself; and (4) Illusions of informed-consent in healthcare decisions. A philosophical perspective on risk, autonomy and security suggests that only a self-reflexive consciousness will enable tomorrow’s elders to flourish in a world that is perplexing, indeed.

FROM HOPELESS PATIENT TO PERSON WITH RIGHTS: THE IMPLICATIONS OF DE-DEMENTING AGEING
M. Downs, Bradford Dementia Group, University of Bradford, Bradford, United Kingdom

Explanatory models of dementia differ across time and within and between cultures. These include dementia as a neuropsychiatric disease, a neurological disease, a normal part of ageing or as retribution for moral misdeed. Explanatory models have implications for the social value we ascribe to people with dementia and for how we approach their care and support. Education and training play a role in forming, maintaining and challenging explanatory models. Education fosters skills in critical analysis and reflection – key to promoting culture change in dementia care. Yet most of our efforts are devoted to training. We need practitioners and professionals who challenge existing practice and chart a new course of care which upholds the humanity and human rights of the most vulnerable members of our society. Best practice in the US and UK will be used to illustrate how this might be achieved.

THE EVOLUTION OF HUMAN AGING: DOES THE PAST PREDICT THE FUTURE?
C. Finch, Andrus Gerontology Center, Los Angeles, California

Humans have evolved the greatest longevity among primates and unique multi-generational systems of social support. The genetic basis for these huge differences in life history is dimly understood. Since 1800, in less than 8 generations, human longevity has again doubled, through improved hygiene, medicine, and nutrition that minimized chronic inflammation and infections. However, modern populations also incur high levels of chronic diseases during aging that are rarer in aging chimpanzees: cancer, coronary disease, and dementia. Ancient Egyptians also incurred advanced atherosclerosis and cancer, possibly at younger ages. Looking ahead, the global spread of obesity is a recognized risk to adult health. Moreover, global environmental trends challenge health from increased air pollution (ozone and fossil fuels). Warming alone threatens the elderly who are vulnerable to temperature extremes, as well as favoring expansion of insect vectors into temperate zones. Adequate municipal water is also a concern to hygiene. Thus, further global gains in longevity may be attenuated, or even be reversed with trends towards higher inflammatory environments. Nonetheless, we may expect genomic research to identify health-promoting environment-gene interactions, despite environmental challenges. Multi-generational support is likely to remain important in the well-being of the elderly in all environments.
EXAMINING INNOVATIVE PROGRAMS THAT LEVERAGE COMMUNITIES TO PROMOTE AGING-IN-PLACE
Chair: E. A. Greenfield, Rutgers, The State University of New Jersey, New Brunswick, New Jersey

Given demographic changes—such as smaller family sizes—there is concern that families will become increasingly less available to serve as the “backbone” of long-term care in the United States (U.S.). Moreover, systems of formal services to prevent or forestall relocation to skilled nursing facilities have been characterized as fragmented, inefficient, inaccessible, inconsistent across communities, and unresponsive to changing needs and preferences. Recognizing these challenges, community-based aging initiatives recently have developed with the aim of creating more coherent and comprehensive networks of formal and informal supports within a specified geographic area to promote aging-in-place. This symposium will provide an overview and analysis of national initiatives, and will identify future directions for evaluation research to support policy and practice efforts in this area. The first paper will present results from a national survey of 124 community-based aging initiatives, along with a classification system to categorize these initiatives. The second paper will present results from a qualitative study of professionals leading Naturally Occurring Retirement Community Supportive Services Programs (NORC-SSPs), providing an analysis of how community-based initiatives potentially promote aging-in-place in ways that differ from traditional service delivery systems. The third paper will present results from a national survey of Villages to provide an in-depth understanding of how this particularly prominent, innovative, and consumer-led model has been implemented in diverse regions of the U.S. The fourth paper will discuss the need for rigorous evaluation research on community-based aging initiatives, as well as multiple criteria to evaluate the initiatives’ effects on individuals and communities.

DEVELOPING THEORIES OF CHANGE FOR NORC-SSPS: PERSPECTIVES FROM LEAD AGENCY STAFF
E.A. Greenfield, School of Social Work, Rutgers University, New Brunswick, NJ

Despite the rapid emergence of NORC-SSPs over the past two decades, there has been scant empirical research regarding how the initiatives intend to promote older adults’ aging-in-place, particularly in comparison to traditional home- and community-based services (HCBS) delivery. This study drew on data from qualitative interviews with lead agency staff of 15 NORC-SSPs in New Jersey. Data were coded at progressively greater levels of abstraction. Results indicated the largely social-relational ways in which NORC-SSPs not only facilitate more HCBS (e.g., professionals facilitate older adult community members helping each other), but also strive to help older adults use HCBS more effectively (e.g., NORC-SSPs allow formal providers to establish a long-term presence in a community to engender trust with potential service recipients). Specifying the potentially innovative ways in which NORC-SSPs provide supportive services can help to guide evaluation research, practice, and policy on optimizing community-based initiatives to promote older adults’ aging-in-place.

THE ‘VILLAGE’ MODEL: WHAT MAKES IT UNIQUE?
A.E. Scharlach, Social Welfare, University of California, Berkeley, California

Although at least 50 Villages have developed in the U.S., and at least 100 others are in formation, little is known about the unique characteristics of this emerging model of aging services. This paper reports findings from a survey of operational Villages, examining their mission, organizational structure, and member characteristics. Like other HCBS models, Villages primarily focus on promoting aging in place, meeting older adults’ service needs, and improving members’ health and well-being. Unlike other HCBS models, the majority of Villages are independent non-profit organizations developed by consumers and supported by member fees and gifts. Consumers are typically involved in organizational development, governance, and providing peer support. Less than 5% of Village members are non-White, and few have discounted memberships by income level. These findings suggest that Villages occupy a relatively unique organizational space, but prompt questions about this model’s ability to meet the needs of less-resourced individuals and communities.

PROMOTING AGING IN COMMUNITY: AN OVERVIEW OF COMMUNITY-BASED AGING IN PLACE INITIATIVES
A.J. Lehning, School of Social Work, University of Michigan, Ann Arbor, Michigan

This paper will provide an overview of the growing number of initiatives that aim to help older adults age in place in their community. Both traditional home- and community-based services and these initiatives share the goal of helping older adults remain in their homes and communities for as long as possible, but these initiatives often go beyond direct service provision to foster community change. This paper will present findings from a survey of 124 initiatives across the country identified through a web-based search. Focusing particularly on efforts to address the social infrastructure (e.g., access to support, social interactions, community engagement), this paper will present a conceptually and empirically-informed classification system of these community-based initiatives and discuss variations in strategies for service provision, practice philosophy, level of elder involvement, and financing mechanisms. Understanding the differences and similarities between these initiatives can inform future evaluations of the effectiveness and sustainability of these diverse efforts.

CONCEPTUAL FRAMING OF COMMUNITY-BASED AGING IN PLACE INITIATIVES: CHARTING AN EMPIRICAL PATH

Community-based initiatives focused on helping older adults age in-place in their community, have burgeoned across the country. The Village movement, NORC-SSPs and other initiatives are focused on expanding the existing aging services network to improve or maintain older adults’ health and functional status, enabling them to remain independent and engaged. However, research on the efficacy and sustainability of such models is limited. Likewise, little is known about the structure of these programs, the range of variations within/between the models and best practice strategies for implementation. Derived from expert review and analysis, this paper proposes a conceptual framework to guide future research on community-based aging in place initiatives. A critical discussion of research challenges, such as defining, and oper-
FILIAL PIETY AND WELLBEING IN OLD AGE: VIEWS FROM FOUR ASIAN SOCIETIES

Chair: R.J. Chou, University of South Carolina, Columbia, South Carolina

FILIAL PIETY AND ELDER SUPPORT, AND SOCIAL POLICY: VIEWS FROM FOUR ASIAN SOCIETIES

FILIAL PIETY, ELDER SUPPORT, AND SOCIAL POLICY: VIEWS FROM FOUR ASIAN SOCIETIES

Chair: R.J. Chou, University of South Carolina, Columbia, South Carolina

FILIAL PIETY AND WELLBEING IN OLD AGE: VIEWS OF MIDDLE-AGED AND OLDER HONG KONG CHINESE

A.M. Chong, Applied Social Studies, City University of Hong Kong, Kowloon, Hong Kong

Aim: This paper reports the views of middle-aged and older Hong Kong Chinese on filial piety, and the way in which filial piety could contribute towards wellbeing in late life. Methods: A total of 89 Hong Kong Chinese aged 40 or above were invited to 15 focus groups, the membership of which represented a balanced mix of relevant personal characteristics such as socio-economic status, age and health conditions. Findings: All participants considered material, emotional and companionship support from their children beneficial in old age. However, most of them entertained very realistic and even low expectation on their adult children’s filial behaviour. The reasons for this would be analyzed adopting a cultural-societal perspective. Relevance to the conference theme: The support from adult children, affected by cultural-societal factors, is crucial to wellbeing in late life.

EXTENT OF PARENTAL PERCEIVED FILIAL PIETY AND COVARIATES OF FILIAL PIETY ON PARENTAL AND FAMILY WELL-BEING: A NATIONWIDE STUDY OF OLDER ADULTS IN CHINA

R.J. Chou, College of Social Work, University of South Carolina, Columbia, South Carolina

In Confucian Asian countries, filial piety entails respecting, loving, and taking good care of one’s parents. In societies with very limited public elder support, filial piety becomes even more critical as a means to ensure elder care and support. This study examines the extent of parental perceived filial piety and the role of filial piety in the well-being of parents and families in China. The study uses both descriptive and regression analyses on data from a nationally representative sample of 19,483 Chinese parents age 60 and above from the 2006 Sample Survey on Aged Population in Urban/Rural China. Results indicate discrepancies in parental perceived filial piety between urban and rural areas. Results also show that filial piety is negatively associated with worries about resources for living, medical care, and personal care, and positively associated with perceived financial security, life satisfaction, happiness, and family harmony. Theoretical and policy implications are discussed.

THE ROLE OF FAMILY CAREGIVING UNDER THE NATIONAL LONG-TERM CARE INSURANCE IN JAPAN

L. Chen, School of Social Work, Kwansei Gakuin University School of Human Welfare Studies, Nishinomiya, Japan

In Japan, provision of long-term care for older adults was traditionally relied on families. In particular, wives and daughter-in-laws were main caregivers. However, with the advent of the rapidly aging population coupled with the modernization of Japanese families, family caregiving increasingly became a burden both socially and financially. To ameliorate this problem, the national long-term care insurance (NLTCI) was introduced in April 2000. The new system aimed to socialize familial care in Japan, and evidences show that it has succeeded to do so in many respects. However, care still remains on the shoulders of Japanese women. Japanese still grapple with fulfilling filial obligations to older adults and simultaneously, integrating modern values such as work/life balance. This paper will provide an overview of the effects of the NLTCI on caregiving in Japan, and discuss the value conflicts rising as the NLTCI revised its laws over the past 10 years.

A POLITICAL ECONOMY EXAMINATION OF THE MAINTENANCE OF PARENTS ACT OF 1995 IN SINGAPORE

P.A. Rozario, S. Hong, 1. School of Social Work, Adelphi University, Garden City, New York, 2. National University of Singapore, Singapore, Singapore

In the decades ahead, the Singapore government projects a dramatic growth in its aging population. The Singapore Parliament took a proactive approach to this potential problem by enacting the Maintenance of Parents Act in 1995. Under this law, adult children are held financially responsible for their indigent elderly parents. Relying on archival data, including parliamentary debates, official reports, and print media records, this study examines the underlying ideologies and cultural assumptions that supported and justified the enactment of the Act. We extend the analyses beyond the rhetoric of filial piety to uncover inherent contradictions in the manifest and latent functions of the Act. Further, drawing on the political economy of aging perspective, we examine how the enactment of the Act is influenced by larger governmental goals of nation-building, regime maintenance and wealth accumulation and its coherence with other governmental ideologies, namely self-reliance and pragmatism.
service delivery challenged the status quo of institutional care, but now has perhaps settled into a status quo of its own. Deeply-held values that characterize organizational culture, the inertia that can make it difficult for a well-established infrastructure to be agile, and the sustainability of innovation are three notable challenges to revolutionary systemic change. This symposium will explore these challenges and will: 1) pose questions about the extent to which organizational change can ever be anything other than incremental, since every system is defined by regulations, values and restrictions that limit change from within, and, 2) will explore the lessons to be learned from both the successes and the challenges faced by the aging network in long-term care system change. Several examples of aging network initiatives designed to transform or build capacity within existing systems will illustrate successes and barriers. Finally, participants will discuss the role of research in providing navigation for organizational, programmatic, and policy change.

WHAT WE LEARNED FROM WHAT DIDN'T WORK
E. Carpio, S. Kunkel, Gerontology, Miami University, Oxford, Ohio

Results from the 2010 National Aging Network Survey, demonstrates how Area Agencies on Aging (AAA’s) play a vital role in the planning and delivery of community-based services that allow older adults to remain in their homes and communities for as long as possible. Although AAA’s look for new opportunities to do more in their communities, proactively seek ways to expand the services they provide, and implement new services or practices without directives from governing bodies, they are faced with numerous systemic barriers. The presentation will include data about specific barriers faced by the aging network such as, long-term care role limited by structure or legislation despite transformation initiatives, increasing expenses and decreasing funding and staff shortages due to economic downturn. The paradigmatic shifts necessary to meet the goals of transformation efforts will also be discussed.

MOVING THE TITANIC WHILE AVOIDING THE ICEBERGS: OHIO’S NURSING HOME TRANSITION AND DIVERSION INITIATIVE
E. Carpio, R. Applebaum, A. Bardo, S. Kunkel, Gerontology, Miami University, Oxford, Ohio

The growing demand for long-term services and supports has and will continue to place an enormous strain on state Medicaid budgets. Therefore, it is essential for long-term care systems to make sure that individuals receive services and support in the appropriate setting. With institutional care paid for by Medicaid costing $5000 per month, identifying ways to keep individuals out of institutions as well as developing mechanisms to help transition individuals who are in institutions back to the community have become critical to state Medicaid programs. Although the expansion of home and community-based services began in the 1970’s, more aggressive long-term care system transformation efforts are now on the policy agendas of many states and federal entities. In this presentation, we describe Ohio’s nursing home transition and diversion initiative including, data about the systematic barriers faced by the initiative and the extent to which consumers successfully remain in the community.

THE ROLE OF STATE UNITS ON AGING IN SHIFTING THE BALANCE TO HOME- AND COMMUNITY-BASED SERVICES
L.S. Noecker, R. Browdie, Benjamin Rose Institute, Cleveland, Ohio

A key component of the Aging Network are State Units on Aging (SUA’s) that have a critical role in shifting the balance of long term care (LTC) services to Home- and Community-Based Services (HCBS). Their role varies widely in relation to state leadership and policies for LTC, size and geographic factors, population demographics, the state’s economic base, and the number and role of state agencies involved in LTC. Findings from a survey of 49 SUAs and HCBS programs for older adults and adults with disabilities across five funding streams revealed the complexities and disparities in the states progress toward LTC system transformation. States typically have evolved complex structures for managing HCBS that can be costly to manage and challenge operational efficiencies. This presentation provides a broader understanding of the divergences in SUAs’ roles in LTC HCBS programs and the successes and barriers they report in state efforts to transform LTC.

SESSION 940 (SYMPOSIUM)

INTEGRATED ASSESSMENT & MOBILITY COUNSELING FOR OLDER ADULTS
Chair: T.M. Meuser, Gerontology Graduate Program, University of Missouri - St. Louis, St. Louis, Missouri

Age-related changes in health and/or functional status can impact negatively on personal mobility. Arthritis and vision loss, for example, may make walking long distances difficult if not impossible. Cognitive change involving forgetfulness and inattention may necessitate eventual retirement from driving for safety reasons. Health and social service professionals play valuable informational and instrumental roles in such mobility transitions. Some do so through the provision of mobility counseling, an individualized, process-oriented approach to ensure continued, positive mobility. In the case of driving retirement, it is important for the counselor to provide viable, accessible alternative modes of transportation. Simply listing resources is not enough. The counselor must first assess and understand the feelings, beliefs, values, abilities and needs of the older client, and then tailor recommended plans for maximal potential impact. The first two presentations in this Symposium will detail specific approaches for individualized assessment. The third presentation will demonstrate how these approaches inform a full mobility counseling intervention. Basic principles of mobility counseling will be discussed; brief video segments will highlight important points.

ASSESSING READINESS FOR MOBILITY TRANSITIONS: INTERPRETATIONS & APPLICATIONS OF A NEW ASSESSMENT TOOL
T.M. Meuser, Gerontology Graduate Program, University of Missouri - St. Louis, St. Louis, Missouri

The Assessment of Readiness for Mobility Transition (ARMT) is a 24-item tool for assessing emotional and attitudinal readiness to cope successfully with a mobility transition, such as retirement from driving. This presentation will review the ARMT and new validation data from a sample of community-dwelling elders (n = 135). Correlations with measures of preferred coping style, physical and emotional functioning, vision loss, fall risk, and a number of other constructs, will be discussed with respect to interpretation. High scores on the ARMT suggest beliefs and feelings that may interfere with adaptive coping. High scorers are likely to feel threatened by impending changes and are likely to resist help from others. Low scorers, in contrast, express flexible views about their functioning and dependence, such that they are more willing to consider alternative approaches. The professional can enhance the potential effectiveness of an intervention by taking these individual differences into account.

HEIGHTENING OLDER ADULTS’ AWARENESS OF MOBILITY PREPAREDNESS USING MULTIPLE SEGMENT FACTORIAL VIGNETTES
J.D. Stowe, University of Missouri, Columbia, Missouri

A vignette-based intervention protocol was tested for effectiveness of increasing older adults’ awareness of potential mobility transitions as an issue of personal concern. 66 community dwelling older adults (ages 61-93) were randomly assigned to experimental (n=32) and control (n = 34) groups to gauge the effectiveness of an intervention focused upon hypothetical vignettes that portrayed older adults facing mobility challenges and likely transitions. Experimental condition participants
were asked to formulate a solution to the fictitious character’s mobility challenge, and then to suggest how they would resolve the mobility challenge personally. Intervention effectiveness was conceptualized as a lower score on the Assessment of Readiness for Mobility Transition (ARMT) from pre to post intervention. Although mean differences on total scores of the ARMT were not significant between groups, future analyses will explore mean differences of groups on subscales within the measure, and how administration of the ARMT may be augmented by vignettes.

A CASE STUDY APPROACH TO MOBILITY COUNSELOR TRAINING
M. Berg-Wege, School of Social Work, Saint Louis University, St. Louis, Missouri

Developing knowledge and skills to engage in mobility counseling with older adults is critical for gerontological practitioners. Built on an assessment using the ARMT, this presentation will discuss a person-centered, strengths-based approach to conducting a mobility counseling intervention. Incorporating video vignettes of older adults produced by the authors, the principles and components of this new approach to mobility intervention will be presented. The engagement, assessment, planning, intervention, and follow-up stages of the mobility counseling process will be depicted. The video vignettes will provide insights into appropriate planning for a range of scenarios, including intervening with an older adult who scores high on the ARMT and is resistant to mobility transitions, working with a married couple, and counseling an older adult with a longstanding chronic illness. Participants will be provided with materials that can be integrated into educating students and professionals in the area of mobility counseling.

SESSION 945 (SYMPOSIUM)

POLICY SERIES: SAVING SOCIAL SECURITY: IS RAISING THE RETIREMENT AGE THE ANSWER?
Chair: R. Hudson, Boston University, Waltham, Massachusetts
Co-Chair: S.E. Rix, AARP Public Policy Institute, Washington, District of Columbia

The Social Security reform debate is heating up and promises to move to the front burner within the next two years, if not before. There is already talk about raising the age of eligibility for full Social Security benefits. A higher age would be good for Social Security, the economy, and workers—if they are able to remain at work. Yet a higher eligibility age is not popular. Workers oppose it, as do unions. Employers are not enthusiastic about it. Nonetheless, a higher age could have such a positive impact on the system’s solvency that it is bound to feature prominently among the proposed solvency solutions. This symposium, co-chaired by Sara Rix and Robert Hudson, will bring together experts from all four sections of GSA (BS, HS, BSS, and SRPP) and from the women’s and minority task forces to examine from an interdisciplinary perspective the impact of raising the eligibility age for full Social Security benefits, generally referred to as the retirement age. This symposium builds on the Spring 2011 issue of Public Policy & Aging Report on this topic. Some of the issues to be addressed include: What accounts for political interest in increasing the age and what do reform proposals involve? Are older Americans able to work longer, i.e., has there been a compression of morbidity or has morbidity been extended over a longer period of time? What about age-related cognitive changes? What would an increase mean for women and minorities? What health interventions could help prolong working life? Ample opportunity will be provided for audience discussion of what has proven to be a very thorny, and hot, political issue.

SESSION 950 (SYMPOSIUM)

USING A NURSING HOME REPORT CARD TO IMPROVE QUALITY OF LIFE
Chair: R. Kane, School of Public Health, University of Minnesota, Minneapolis, Minnesota
Co-Chair: V. Cooke, Minnesota Department of Human Services, St. Paul, Minnesota

Minnesota has been in the vanguard of developing a nursing home report card designed to provide consumers with useful information about care in its 379 nursing homes and to provide feedback to the individual nursing homes. For the past five years it has published on-line a nursing home report card which includes several components: quality of care score based on 24 case-mix adjusted quality measures from the MDS, quality of life measures in 10 domains based on interviews with a sample of residents in each facility, serious deficiencies from the annual surveys, staffing information, number of private rooms, and most recently a measure of family satisfaction. The online system allows users to select the data elements they believe are most relevant to them and to sort facilities (in a defined geographic area) in terms of their personal priorities, but they can get full information on as many facilities and items as they wish. This symposium will describe Minnesota’s experience in developing the QOL component of its report card and the uses that have been made of the data generated. It will describe how the QOL score was created and how the survey was conducted, how the QOL results differ for people with dementia, how the QOL scores correlate with family satisfaction at the facility level, and how this data has been used in performance-based incentive payments and other quality improvement initiatives.

BUILDING A BETTER MEASURE OF QUALITY OF LIFE
T. Lewis1,2, R. Kane3, R.A. Kane1, I. MN Department of Human Services, St. Paul, Minnesota, 2. School of Public Health, University of Minnesota, Minneapolis, Minnesota

Quality of life has become an important concern for nursing facilities, but the lack of reliable measurement tools has made it difficult to track and improve. Under contract with the Centers for Medicare and Medicaid Services (CMS), the University of Minnesota developed a brief interview tool to elicit opinions from nursing facility residents on their quality of life. The tool covered multiple quality of life domains identified as important in the literature, and was designed to be understandable by respondents with varying levels of cognitive ability. This session will begin by briefly describing the tool’s development. We will then discuss the changes made to the tool for its statewide implementation in Minnesota, including the addition of validated satisfaction and mood scales. Finally, we will present factor analysis work incorporating these satisfaction and mood scales, in addition to measures of functional status, for a newly comprehensive look at quality of life.

THE RELATIONSHIP OF FAMILY SATISFACTION AND RESIDENT QUALITY OF LIFE AT A FACILITY LEVEL
R. Kane, R.A. Kane, T.P. Shippee, School of Public Health, University of Minnesota, Minneapolis, Minnesota

The segment describes how measures of family satisfaction correlate with measures of residents’ quality of life (QOL) at the facility level. Because the QOL data are drawn from only a sample of residents in each facility, the analyses need to be conducted at the facility level. While the QOL measures yield 10 domains, the family satisfaction produces a single strong factor. Data from the 2010 family satisfaction survey was regressed against each of 10 domains in the resident QOL survey. Regression equations include facility characteristics and family and resident respondent characteristics.
RAISING THE BAR: MINNESOTA’S EXPERIENCE WITH QUALITY INITIATIVES WITH A FOCUS ON RESIDENT QUALITY OF LIFE
V. Cooke, 1. T. Lewis, 2. I. MN Department of Human Services, St. Paul, Minnesota. 2. School of Public Health, University of Minnesota, Minneapolis, Minnesota

Minnesota has taken a multi-faceted approach to quality improvement in nursing homes with several policy goals in mind; transparency for consumers to allow for better choices about placement and to advocate for improvement; benchmarking for providers, information for referral agents, and a basis for financial incentive payments. Minnesota’s policy makers place a high priority on the voices of nursing facility residents, including those residents with dementia or impaired cognition. The state has made a significant financial investment in measuring resident’s QOL via face-to-face interviews, but yet the investment is overall less than 1% of the Medicaid nursing home budget. We present how Minnesota utilizes QOL data in its performance-based incentive payment system, statewide education efforts, professional technical assistance for providers, and ombudsman and volunteer initiated quality improvement projects. This session will close with an examination of risk-adjusted quality of life trends since 2006.

PROVIDING A CLEAR VOICE: HOW TO COLLECT VALID AND RELIABLE DATA FROM NURSING FACILITY RESIDENTS AND FAMILY MEMBERS IN LARGE SCALE QUALITY INITIATIVES
M. Wheatley, C. Hoskins, G.C. Uman, H. Urman, Vital Research, LLC, Los Angeles, California

This segment will explain how consumer satisfaction and quality of life data were collected from all Minnesota nursing facilities. In 2010, over 13,000 residents were interviewed face-to-face and more than 16,000 family members completed a paper, online, or phone survey during three months of data collection. The number of resident and family surveys completed for each facility averaged 35 and 45, respectively, and depended on meeting or exceeding a (+/-) 6.5% margin of error at the dimension level. Survey administration activities included survey form creation, sampling, interview recruitment and training, scheduling facilities and interviewers, ensuring fidelity to interviewing techniques and protocols, family survey mailings and reminders, and data management. The session will highlight respondent eligibility, response rates, the level of accuracy of the data, and the feasibility of including nursing facility resident and family opinions in large-scale initiatives.

DEMENTIA SEVERITY, SPECIAL CARE UNITS AND THE QUALITY OF LIFE OF NURSING HOME RESIDENTS
G. Arling, 1. K. Abrahamson, 2. C. Mueller, 1. D. Clark, 1. A. Perkins, 1. Indiana University Center for Aging Research, Indianapolis, Indiana, 2. Western Kentucky University, Bowling Green, Kentucky, 3. University of Minnesota - School of Nursing, Minneapolis, Minnesota

Using data from the 2008 Minnesota NH Resident Quality of Life and Consumer Satisfaction Survey (N=14,000), we investigated the relationship between cognitive status, placement in a dementia special care unit (SCU) and quality of life (QoL). We applied multilevel models (resident and facility) to examine the relationship between the resident’s score on each QoL domain, the resident’s cognitive impairment (CI) level, and placement on an SCU after controlling for covariates such as ADL dependency, pain, depression or psychiatric diagnoses, and length of stay. Residents with greater CI scored significantly lower on privacy, individuality, meaningful relationships, and positive mood. They scored higher on the physical environment domain. Residents on SCUs had significantly higher scores on activities and autonomy. There were no significant differences by CI or SCU on the comfort or negative mood domains. We present recommendations for incorporating our findings into the Minnesota Nursing Home Report Card and other applications.

SESSION 955 (POSTER)

BIOLOGICAL MECHANISMS OF AGING II

IMPACT OF MALNUTRITION AND MODERATE AEROBIC TRAINING ON THE STRUCTURE OF ARTERIAL WALL IN AGING RATS
V.C. Brito, 1, D. Mauz, 2. B. Oliveira, 2. C. Silva, 1. R. Costa, 1. S. Paes, 1. S. Moraes, 1. 1. Federal Rural University of Pernambuco, Recife, Pernambuco, Brazil. 2. Institute of Integral Medicine Prof. Fernando Figueira, Recife, Pernambuco, Brazil, 3. Federal University of Pernambuco, Recife, Pernambuco, Brazil, 4. Caruaruense Association of Higher Education, Caruaru, Pernambuco, Brazil

It was evaluated the effects of Multidefective diet during the period of lactation and the possible benefits of Moderate Aerobic Training in Luminal Diameter and Intima-Media Area of Left Common Carotid Arteries, Horizontal Aorta and Thoracic Horizontal Aorta Walls. Twenty-Four Male Rats, Wistar, were Separated According to Diet and Training: SNG – Sedentary Nourished, TNG - Training nourished, SMG - Sedentary Malnourished and TMG - Training Malnourished. At 10 Months of Life, TNG and TMG Were Submitted to Swimming Exercises for 8 Weeks. The Rats Were Anesthetized, Sacrificed, and Later, Arterial Fragments Were Collected for Histological Processing. The Intima-Media Area of Blood Vessels Were Measured by the Difference Between External and Internal Areas of the Arterial Wall; and Luminal Diameter was Measured from the Average of 2 Diameters Measured Starting at 4 Points Marked on the Inner layer of the vessel. It was observed a decrease in the intima-media area of horizontal Aorta When We Compared the Groups SNG × SMG (p = 0.015) and an Increase in Left Common Carotid Artery Between the Groups TNG and SMG (p = <0.001). It was observed an increase in the thoracic aorta luminal diameter (p = 0.041) when we Compared the SMG With TMG. Multicerebral Diet Induced, Partially, Changes in Horizontal Aortic Wall; and the Training, Also Partially, Promoted Changes in the Intima-Media Area of the Left Common Carotid Artery and Thoracic Aorta Luminal Diameter.

SALIVA LEVEL OF NORADRENALINE METABOLITE (MHPG) AS A MARKER FOR LATER MENTAL HEALTH IN ELDERLY MEN
S. Yamada, 1. I. Watanabe, 2. I. Yamamura, 1. N. Nabeta, 1. K. Kunitake, 1. N. Kojima, 1. G. Li, 1. Psychiatry, Saga University Faculty of Medicine, Saga, Japan, 2. The First Affiliated Hospital to Changchun University, Changchun, China, 3. Kojima Hospital, Imari, Japan

To examine the association of saliva level of 3-methoxy-4-hydroxy-phenylglycol (sMHPG) with a later depressive state and cognitive reduction in elderly people living in a rural community, baseline sMHPG levels were measured in 214 elderly subjects followed by completion of the Beck Depression Inventory (BDI) and Frontal Assessment Battery (FAB) from 2004 to 2006 (time A), then the same cohort underwent BDI and FAB again from 2007 to 2009 (time B). One hundred forty-four subjects (44 men, 100 women) were reassessed by the BDI at time B. Baseline sMHPG in men who was non-depressive (BDI score ≤9) at time A and depressive at time B (BDI score ≥10) was significantly higher than that in the subjects who was non-depressive at time A and time B. Moreover, Baseline sMHPG in men who was non-demented (FAB score <14) at time A and demented at time B (FAB score ≥13) was significantly higher than that in the subjects who was non-demented at time A and time B. The baseline sMHPG was significantly associated with the score on BDI and FAB at time B in men. These
CONTRASTING EFFECTS OF TESTOSTERONE AND CORTISOL ON COGNITIVE FUNCTIONING IN MIDDLE-AGED MEN

M.S. Panizzon1, C.E. Franz2, R.L. Hauger1,2, S.P. Mendoza1, K.C. Jacobson4, H. Khan2, M. Lyons2, W. Kremen1, 2. Psychiatry, University of California San Diego, La Jolla, California, 2. San Diego VA Medical Center; San Diego, California, 3. University of California Davis, Davis, California, 4. University of Chicago, Chicago, Illinois, 5. University of St. Louis, St. Louis, Missouri, 6. Boston University, Boston, Massachusetts

Cortisol and testosterone have both been shown to be associated with cognitive functioning in middle-aged and older adults. Despite similar sites of action within the brain, specifically the hippocampus and prefrontal cortex, as well as evidence of antagonistic effects on one another, the simultaneous effects of these hormones on cognition have yet to be examined. We therefore assessed the combined effects of cortisol and testosterone on cognitive functioning in 778 middle-aged male twins. Participants ranged in age from 51 to 60. Hormone levels were obtained via saliva samples collected on three non-consecutive days. Cognitive domains included general cognitive ability, abstract reasoning, processing speed, short-term memory, working memory, episodic memory, visual-spatial ability, and executive functioning. After controlling for general cognitive ability at age 20, as well as numerous medical conditions, there were significant effects of both hormones on late midlife general cognitive ability, processing speed, and episodic memory. In each case the effects of the hormones were found to go in opposing directions; higher levels of testosterone were associated with better cognitive performance, while higher levels of cortisol were associated with poorer performance. A significant interaction between the two hormones was observed only for verbal episodic memory. These results suggest that neuroendocrine factors provide both deleterious and protective effects on domains of functioning central to cognitive aging. Moreover, they highlight the importance of simultaneously examining the effects of different neuroendocrine factors, rather than studying individual hormones in isolation.

MECHANISMS UNDERLYING THE ALTERED DENDRITIC CELL FUNCTION IN AGED HUMANS

S. Ulagoozhan, A. Agrawal, J. Cao, S. Agrawal, S. Gupta, University of California, Irvine, Irvine, California

Dendritic cells (DC) are the major antigen presenting cells of the body that are critical for generation of immunity and maintenance of tolerance. Advancing age has a profound affect on dendritic cell function. DCs from aged display a higher basal level of activation and secrete pro-inflammatory cytokines even without activation leading to chronic inflammation. This also compromises the capacity of aged DCs to maintain peripheral self tolerance contributing further to inflammation. In contrast to self antigens, DCs from aged subjects are impaired in their ability to mount effective immune responses against foreign antigens such as influenza virus. There is reduced Interferon secretion as well as reduced capacity to prime T cell responses. The mechanisms underlying the altered DC function in aged humans are not well understood. We have previously shown that functions of NFkB and PI3Kinase signaling pathways are altered in aged DCs. Our more recent studies with Affymetrix gene analysis of DCs from aged and young subjects suggests that processes such as antigen presentation, ubiquitination and transcription are also significantly affected with age. Studies using chromatin-immunoprecipitation (CHIP-IP) with histone antibodies (H3K4, H3K9) suggest chromatin remodeling may also be a key player in altering the response of DCs with age. We found that there may be increased association of IFN-I and IFN-III promoters with suppressor histone, H3K9 in aged DCs. Age-associated alterations at the genetic as well as chromatin remodeling may therefore be responsible for the changes in the function of DCs from aged subjects.

ROLE OF VITAMIN D STATUS ON STRENGTH TRAINING MEDIATED EFFECTS ON SKELETAL MUSCLE HEALTH WITH CKD

C. Castaneda-Sceppa1, F. Castaneda2, M. Rao1, 1. Bouve College of Health Sciences, Northeastern University, Boston, Massachusetts, 2. Klinik Herzberg, Herzberg am Harz, Germany, 3. Nephrology Division, Tufts Medical Center, Boston, Massachusetts

There is an association between sarcopenia and declining GFR, with the risk reaching 4- to 6-fold among older patients with chronic kidney disease (CKD). Vitamin D (VitD) deficiency is a risk factor for sarcopenia, and strongly associated with both advancing age and CKD. Currently the only proven strategy to increase muscle mass/strength in older individuals or in patients with CKD is strength training. However, the effectiveness of strength training may be suboptimal in populations where VitD deficiency is widespread. We investigated whether VitD levels mediate the effect of strength training on muscle mass/strength in older (64±10 y of age) patients with CKD stage 3-4 (median GFR: 28 mL/min). Twenty-three patients following a prescribed low protein diet (~0.6 g/kg/d) were randomized to strength training (n=13) or an attention control (n=10) group for 12 weeks. Previously published data from this study showed that participants in the exercise group significantly increased muscle strength and skeletal muscle mass and mitochondrial content and reduced inflammatory mediators; compared to controls (P<0.05). Re-examination of this study showed that participants were VitD deficient (25OHD levels 10±7 ng/mL) and VitD levels were correlated with muscle strength (r=0.72, P<0.0001) at baseline. After the intervention, muscle strength showed a markedly stronger relationship with baseline VitD levels with strength training (r=0.79, P=0.001), suggesting an interactive/synergistic effect. More research is needed to understand the potential synergy between VitD and strength training on muscle health. Optimal therapy of CKD patients will translate in better long-term disease outcomes, reduced health care costs and improved quality of life.

A SYSTEMS-LEVEL APPROACH TO DECIPHER REGULATORY MECHANISMS IN CALORIC RESTRICTION-MEDIATED EFFECT ON SKELETAL MUSCLE HEALTH

J. de Magalhaes, D. Wuttke, M. Plank, C. Vora, University of Liverpool, Liverpool, United Kingdom

Caloric restriction (CR) can retard the aging process in several model organisms, yet its underlying mechanisms remain poorly understood. In recent years, hundreds of genes have been shown to affect lifespan in model organisms, many of which acting synergistically while others act antagonistically with CR. Clearly, genes interact with each other and with the environment to determine the aging phenotype and to relay signals triggered by CR. The rules governing these interactions and nutrient-sensing signalling pathways, however, remain unknown. To study the life-extending effects of CR on a systems-level, we first compiled a list of over 100 genes associated in model organisms with CR-mediated life-extension based on genetic manipulations that cancel out or disrupt CR life-extension effects. These CR-essential genes have been made available online in our GenAge database (http://genomics.senescence.info/genes/). We then derived and analysed network models of these genes to identify central proteins in the network, which are candidate regulatory hubs, as well as new candidate genes for a role in CR which we are validating experimentally. To identify conserved molecular signatures of CR effects, we performed a meta-analysis of CR-induced gene expression profiles in multiple mammalian tissues. Our meta-profile reveals several signatures of CR which we integrated with CR-essential genes, co-expression data and analyses of transcriptional regulation to identify candidate regulators of CR effects on aging. Overall, this session will detail systematic approaches to gain new insights
into the molecular mechanisms of CR which reveal candidate key regulatory genes and pathways involved in CR life-extending effects.

THE SECRETS OF EXTREME LONGEVITY IN NONHUMAN PRIMATES: DECELERATION OF METABOLIC TRAJECTORIES
B.C. Hansen, Internal Medicine, University of South Florida, Tampa, Florida

Nonhuman primates (NHPs) have shorter life spans than humans, but appear to follow the same longitudinal trajectories regarding biomarkers of aging and diseases of aging, including hyperlipidemia, insulin resistance, and type 2 diabetes. When individually housed monkeys are provided a consistent minimally changing environment, including a constant “healthy” chow diet, high quality daily care, daily determination of actual food intake, biweekly monitoring of body weight, and excellent veterinary support, monkeys nevertheless show a wide range of natural longevity. In this longitudinal study of aging in 147 adult NHPs (rhesus, Macaca mulatta), death by natural causes occurred in 113 between the ages of 20 and 30 yrs (~60 to 90 human age yrs), and in 34 between 30 and 41 yrs (~90 to 122 human yrs, with the extremely old monkey (age 41 yrs) being highly comparable in relative age to Jeanne Louise Calment, the French woman whose well documented life span was 122.5 yrs, thus exceeding all other humans. Longitudinal study of these rhesus showed that the pattern of progression of diseases associated with aging was the same in both groups, however the extremely long lived primates showed a 6 to 12 year delay in crossing each impairment threshold, including fasting plasma glucose (6 yrs); impaired glucose tolerance (8 yrs); hyperinsulinemia (10 yrs); and beta cell hyperresponsiveness (12 yrs) (All p’s >0.001). Deceleration of metabolic trajectories appears to be a major contributor to or marker of extreme longevity. Unlike Madame Calment, these monkeys neither smoked nor drank port daily!

DOES THE RCAN1 GENE LINK OXIDATIVE STRESS AND ALZHEIMER DISEASE?
K.J. Davies, Bio-Gerontology, University of Southern California, Los Angeles, California

We discovered RCAN1 (originally called Adapt78 or DSCR1) as an oxidative stress-adaptive gene. Gene linkage analysis indicated that RCAN1 is also involved in Down syndrome. Since Down syndrome patients typically suffer an aggressive and early-onset form of Alzheimer disease, we tested if RCAN1 might be a common factor. Post mortem analysis of brains from both Alzheimer disease patients and Down syndrome patients (in comparison with ‘control’ brains) revealed more than a doubling of RCAN1 protein levels in affected brain regions, and no increase in unaffected regions. RCAN1 proteins (several isoforms exist) inhibit calcineurin, a major serine/threonine phosphatase. Calcineurin activation) and diminished tau proteolytic degradation; these events may generate paired helical filaments and could, ultimately, result in the formation of neurofibrillary tangles of the type seen in Alzheimer disease.

SEX-SPECIFIC EFFECTS IN FAMILIAL LONGEVITY: BIODEMOGRAPHIC STUDY OF AMERICAN CENTENARIANS
L.A. Gavrilov, N.S. Gavrilova, NORC and the University of Chicago, Chicago, Illinois

It is known that biological relatives of centenarians have substantial survival advantage compared to relatives of shorter-lived individuals. However little is known about the role of centenarian’s sex in these effects. This study explores effects of centenarian sex on survival of their biological and non-biological relatives. We have developed and analyzed a new computerized database on 1,945 validated centenarians born in 1880-1895 in the United States, their parents, 15,103 siblings, and 11,693 siblings-in-law. Brothers of male centenarians live significantly longer compared to brothers of female centenarians: their remaining life expectancy at age 50 is 29.01 years and 26.86 years respectively (p=0.001). Sisters of male centenarians have no survival advantage compared to sisters of female centenarians. Life expectancy of biologically unrelated siblings-in-law is not affected by sex of centenarians. In addition to brothers, fathers of male centenarians demonstrate significant survival advantage compared to fathers of female centenarians: 27.22 vs 25.97 years at age 50, p=0.04. This effect is sex-specific and is observed for fathers but not for mothers of male centenarians. Male sex of centenarians has a significant effect on survival of male relatives (brothers and fathers) but not on survival of female relatives. Female sex of centenarians has no effect on survival of female relatives. These findings are consistent with hypothesis that some longevity genes may be located on male Y-chromosome although social and economic explanations could not be excluded at this stage of the study. This study was supported by the National Institute on Aging (R01 AG028620 grant).

ASSOCIATION OF THE TRANSFORMING GROWTH FACTOR-β1 GENETIC POLYMORPHISM WITH LEAN BODY MASS
N. Fuku1, S. Mori2, H. Murakami1, Y. Gando1, H. Zhou2, H. Ito2, M. Tanaka2, M. Miyachi2, 1. Tokyo Metropolitan Institute of Gerontology, Itabashi-ku, Tokyo, Japan, 2. Tokyo Metropolitan Geriatric Hospital, Itabashi-ku, Tokyo, Japan, 3. National Institute of Health and Nutrition, Shinjuku-ku, Tokyo, Japan

Purpose: Sarcopenia is the degenerative significant loss of skeletal muscle mass and strength associated with aging and is one of the components of frailty. In the present study, we examined the relation of the 29C>T polymorphism in the transforming growth factor-β1 (TGFβ1) gene to indicators of sarcopenia such as lean body mass (LBM), which is also called fat free mass (FFM) as well as various anthropometric parameters in Japanese population. Subjects and Methods: A total of 479 adults comprising 143 men and 336 women participated in the present study. Total body fat (fat mass, FM) and total FFM were obtained from DEXA (Hologic QDR-4500A scanner). The whole body FFM was divided into several regions to estimate leg FFM, arm FFM, appendicular FFM (sum of arms and legs), and relative skeletal muscle index (RSMI), Genotyping for rs1800470 (29C>T, Pro101Leu) in the TGFβ1 gene was carried out by TaqMan SNP genotyping assay method. Data of measures were compared with CC genotype to CT+TT genotypes by use of ANOVA. Result: FFM, leg FFM, appendicular FFM and RSMI were significantly lower in male subjects with the CT+TT genotypes than those with the CC genotype, but not in female subjects. When we divided female subjects into two groups according to the menstruation status; in subjects without menstruation, arm FFM was significantly lower in subjects with the CT+TT genotypes than those with the CC genotype. Conclusions: TGFβ1 genotype was negatively associated with indicators of the sarcopenia such as lean body mass in Japanese men and postmenopausal women.
CD4+ LYMPHOCYTES FROM INDIVIDUALS WHO HAVE RECOVERED FROM WEST NILE VIRUS POSSESS UNIQUE “AGED” PHENOTYPE

To assess impact of an infectious disease which shows pronounced age-related mortality, the West Nile virus (WNV) upon the immune system, we studied three immunological parameters which have each separately been found associated with impaired immunity and/or decreased longevity in experimental animals and humans. We followed T-cell naïve/memory ratios (by 8-11 color flow cytometry), number of T-cell clonal expansion (TCE) and exposure to CMV. Low T-cell naïve/memory ratios, high number of T-cell clonal expansions (TCE) and CMV exposure are hypothesized to represent separately or together, risk factors for poor immunity in older adults, and, perhaps, could also predispose for increased WNV susceptibility and/or severity. We followed cohorts of WNV sero-positive and age matched healthy human subjects. Whole blood was processed to obtain peripheral blood mononuclear cells which were analyzed for polychromatic flow cytometry to determine both CD4+ and CD8+ naïve (CD28intCD95low) or [jnikolich] (CD45RA+CD27+); central memory (CD28hiCD95hi) or (CD45RA-CD27+); and effector memory (CD28negCD95hi) or (CD45RA-CD27-) populations. We assayed 47 WNV sero-positive and 126 age matched healthy controls (65+ yrs) and found that the CD4+ naïve population ratios were significantly lower for the WNV sero-positive vs. respective age matched controls. Moreover, the WNV sero-positive individuals exhibited a significant inflation of the central memory pool over and above that seen with aging alone. Preliminary data also shows increased prevalence of T cell clonal expansion in the WNV sero-positive individuals. In addition, functional assays reveal a paucity of cytokine expression upon stimulation in WNV sero-positive individuals compared to non-exposed counterparts. Experiments are in progress to examine whether this is a primary consequence of aging or a secondary consequence of WNV infection.

SELECTIVE T CELL EXPANSION DURING AGING OF CD8 MEMORY REPERTOIRES TO INFLUENZA REVEALED BY MODELING

E.N. Naumova1, Y.N. Naumov1, M.B. Yassai2, J. Gorski2, 1. Tufts University School of Engineering, Medford, Massachusetts, 2. University of Massachusetts Medical School, Worcester, Massachusetts, 3. BloodCenter of Wisconsin, Milwaukee, Wisconsin

The aging of T cell memory is often considered in terms of senescence, a process viewed as decay and loss of memory T cells. How senescence would affect memory is a function of the initial structure of the memory repertoire and whether the T cell lineages (clonotypes) that makes up the repertoire decay at random. We examine this issue using the T cell memory generated to the conserved epitope from Influenza A matrix protein M1 (positions 58 to 66) which induces a strong, focused, but polyclonal CD8 T cell response in HLA-A2 typed individuals. We analyzed the CD8 T cell memory repertoires in eight healthy middle-aged and eight healthy older blood donors representing an average age difference of ~27 years. While the repertoires show broadly similar clonotype distributions, the number of observable clonotypes decreases significantly. This decrease disproportionally affects low-frequency clonotypes. Rank frequency analysis shows the same two-component clonotype distribution described earlier for these repertoires. The first component includes lower frequency clonotypes whose distribution can be described by a power law. The slope of this first component is significantly steeper in the older cohort. Generating a representative repertoire for each healthy cohort allowed agent-based modeling of the aging process. Interestingly, simple senescence of middle-aged repertoires is insufficient to describe the older clonotype distribution. Rather, a selective clonotype expansion must be included to achieve the best fit. We propose that responses to periodic virus exposure may drive such expansion, ensuring that the remaining clonotypes are optimized for continued protection.

HANDGRIIP STRENGTH REFLECTS DECREASED LEAN TISSUE AND FUNCTION IN ELDERLY HEART FAILURE PATIENTS

D. Forman1,2, K. Allsup3, A. Zavin1, A. Lazzari1,2, S. Lecker2, J. Joseph1,2, R. Arena, 1, VA Boston Healthcare System, Boston, Massachusetts, 2. Harvard Medical School, Boston, Massachusetts, 3. Boston University School of Medicine, Boston, Massachusetts, 4. University of New Mexico, Albuquerque, New Mexico

Introduction: Handgrip strength (HGS) is commonly used to assess functional capacity in older adults, however it is rarely used to assess function among heart failure patients (HF) despite common complaints of functional decline in this population. We analyzed HGS in older HF patients vs. healthy controls to ascertain its clinical utility. Methods: Comprehensive functional assessment batteries were completed on 20 elderly HF patients (66.8±10 years) and 31 age-matched healthy controls (67±10 years). Assessments included HGS; cardiopulmonary exercise (CPX) testing (peak oxygen consumption [Peak VO2], VO2 at anaerobic threshold [VAT], and ventilatory efficiency [VE/VO2 slope]); dual-energy x-ray absorptiometry (DXA); leg strength/endurance (1-repetition maximum [1RM], maximal power [1RM-power], 60% of the 1RM [60%RM], and average power during 60%RM [60%RM-power]). Results: Peak VO2, VAT, 1RM, and 60%RM-power were significantly reduced in HF vs. controls; VE/VO2 slope was significantly higher. Among HF and controls, significant correlations between HGS and 1RM (r=0.75 p<0.0001; r=0.53, p<0.002), 60%RM (r=0.78, p<0.0001; r=0.52, p<0.002), 60%RM-power (r=0.44, p<0.05; r=0.53, p<0.002), and arm lean (r=0.58, p<0.007; r=0.41, p<0.02) were detected. However, only in HF, HGS correlated to legs lean (r=0.52, p<0.02), total lean (r=0.53, p<0.01), and trunk lean (r=0.47, p<0.04). Discussion: Older HF patients demonstrated decreased CPX performance compared to controls. HGS provided complementary information. In HF patients and healthy controls, low HGS indicated reduced strength/endurance. Among HF patients, low HGS also indicated reduced proportions of lean tissue.

TRANSCRIPTIONAL AND PROLIFERATIVE DEFECTS IN T-CELL EFFECTOR DIFFERENTIATION WITH AGING ERODE IMMUNE DEFENSE

J. Nikolich-Zugich, Center on Aging and Department of Immunobiology, University of Arizona College of Medicine, Tucson, Arizona

Aging is often accompanied by an increased Susceptibility to Infection, and the Decline of Protective Immunity with Aging is Believed to be the Primary Reason. While many Facets of Immune Response Remain to be Unambiguously Examined in Older Animals and Humans, Defects in Adaptive Immune Responses, which are Particularly Pronounced in Aging T-Cells, Strongly Contribute to Immune Senescence. We have Developed and Characterized two Models of Infection in Old Mice, Using the West Nile Virus and Listeria Monocytogenes Bacterium, as Models of Different and Distinct Intracellular Infections. In Both Models, we Observed Impaired T-Cell Differentiation into Effector Cells. Proliferative Expansion was also Affected, and these Defects Led to both Quantitatively and Qualitatively Diminished Immune Responses. Analysis of Intracellular Pathways Revealed Defects in Upregulation of Key Transcription Factors of Effector Differentiation and in Down-regulation of Antiproliferative Molecules in Old T-Cells. This Identifies Potential Targets for Intervention in Immune Senescence.
LATERALIZATION AND BRAIN AGING: A COMPARISON OF STATIC OF STATIC AND DYNAMIC LONITUDINAL ASSOCIATIONS BETWEEN COGNITIVE FUNCTIONING AND PURE-TONE THRESHOLDS IN THE LEFT AND RIGHT EAR

K. Kiely1, N. Cherbuin1, D. Gerstorf2, M. Laszcz2, K. Anstey1. 1. Ageing Research Unit, CMHRI, The Australian National University, Canberra, Australian Capital Territory, Australia. 2. Pennsylvania State University, State College, Pennsylvania, 3. Flinders University, Adelaide, South Australia, Australia

Studies investigating associations between hearing and cognition have typically aggregated pure-tone thresholds across the left (LE) and right (RE) ears. This ignores the predominant contra-lateral projection of the ear to the auditory-cortex and could obscure inter-hemispheric differences in auditory-cognitive associations. Investigating lateralized differences is important because the left-hemisphere is more vulnerable to aging processes and could underlie more pronounced RE deficits. This paper will compare: 1) the effects of processing-speed and low cognitive functioning on change in LE and RE thresholds, and 2) time-ordered interrelations between processing-speed and LE or RE thresholds. METH-ODS: 2087 adults (mean age=78, 50% male) from the Australian Longitudinal Study of Ageing were followed over 4 waves for 12 years. Measures included unaided pure-tone thresholds, Digit Symbol Substitution test (DSS), and Mini Mental State Examination (MMSE). Latent growth curves (LGC) tested the effects of MMSE and DSS on change in LE and RE. Dual change score models (DCSM) tested lead-lag associations between hearing thresholds and DSS. RESULTS: Annual LE change (βslope=-0.71) was greater than RE change (βslope=-0.68). Associations between REslope with MMSEintercept (r=18, p<0.01), DSSintercept (r=1.4, p=0.02) and DSSslope (r=21, p<0.04), were marginally stronger than LEslope with MMSEintercept (r=14, p=0.06), DSSintercept (r=12, p<0.05) and DSSslope (r=16, p<0.14). Adjusting for socio-demographic, health and lifestyle attenuated these effects, though the pattern remained. DCSMs identified both LE and RE as leading indicators of decline in DSS. DISCUSSION: Cognitive abilities sub-served by the left hemisphere may be more sensitive to declining RE function. These findings also indicate dynamic links between hearing and cognition, with hearing levels predictive of subsequent decline in processing-speed.

EFFECT OF ELECTROLYZED REDUCED WATER ON OXIDATIVE-STRESS RESPONSE AND LIFESPAN IN C. ELEGANS

S. Park, S. Park, J. Park. Medical Biotechnology, Soonchunhyang University, Asan, Chungnam, Republic of Korea

A Large Number Of Studies Show That Age-Related Accumulation Of Oxidative Damage In Cellular Macromolecules, Such As DNA, Protein, And Lipids, Is Positively Correlated With Aging. Free Radical Theory Of Aging Suggests Oxidative Stress Caused By Free Radicals Plays A Pivotal Role In Normal Aging. Electrolysis Of Water Produces Reduced Water At The Cathode And Oxidized Water At The Anode. Previous Studies Reports That Electrolyzed Reduced Water Has Extremely Negative Oxidation-Reduction Potential. Electrolyzed Reduced Water Could Block The Activity Of Reactive Oxygen Species Produced As A Byproduct Of Metabolism In Cells And Protect Cellular DNA From Oxidative Damage Caused By Free Radicals In Human Lymphocyte. However, The Effect Of Electrolyzed Reduced Water On Aging Has Not Been Studied Yet. Here, We First Tested The Effect Of Electrolyzed Reduced Water On Resistance To Oxidative Stress In The Nematode Caenorhabditis elegans; Worms Grown On Media Made With Electrolyzed Reduced Water Have Increased Resistance To Oxidative Stress Caused By Paraquat. We Also Observed A Significant Lifespan-Extending Effect Of Electrolyzed Reduced Water In Caenorhabditis elegans. These Data Shows For The First Time That Electrolyzed Reduced Water May Play As A Powerful Radical Scavenger And, As A Result Of That, Can Extend Lifespan Of Caenorhabditis elegans.

DIETARY SUPPLEMENTATION WITH COFFEE IMPROVES MOTOR AND COGNITIVE PERFORMANCE IN AGED RATS

A.N. Carey, B. Shukitt-Hale, USDA, HNRCA at Tufts University, Boston, Massachusetts

Polyphenols found in fruits and nuts have anti-inflammatory properties that may provide protection against the decline of cognitive, motor and neuronal function in senescence. The presence of a number of bioactive compounds (e.g., polyphenols) implicates coffee as a potential nutritional therapeutic to curtail brain aging. Moderate (3–5 cups a day) coffee consumption in humans has been associated with a significant decrease in the risk of developing chronic diseases such as Parkinson’s disease, type-2 diabetes, and cancer. Therefore, we hypothesized that coffee supplementation would attenuate specific cognitive deficits in aged animals. Aged rats (19 months) were given one of five coffee-supplemented (n=15/group) (0%, 0.165%, 0.275%, 0.55%, 0.825% of the diet) for 8 weeks before motor and cognitive behavior assessment. The graded doses were equivalent to 3, 5, 10, and 15 cups/day, respectively, for humans. The ages rats supplemented with 0.55% coffee diet, equivalent to 10 cups of coffee, performed better in psychomotor testing (rotarod) and in a working memory task (Morris water maze) compared to aged rats on control diet. This appeared to be the optimal dose in this study. The 0.165% coffee-supplemented groups (3 cups) showed some improvement in reference memory performance in the Morris water maze. In a subsequent study, the effects of caffeine alone did not account for the performance improvements. These studies suggest that coffee supplementation, in achievable amounts, may have some benefit in reducing both motor and cognitive deficits in aging.

NEURONAL HOUSEKEEPING IN THE AGING BRAIN: A FUNCTIONAL ROLE OF ACAI BERRIES AND WALNUTS

S.M. Poulose1, D.F. Bielinski2, B. Shukitt-Hale1. 1. Neurosciece, USDA-ARS, Human Nutrition Research Center on Aging at Tufts University, Boston, Massachusetts. 2. Human Nutrition Research Center on Aging at Tufts University, Boston, Massachusetts

The central nervous system in brain is highly susceptible to oxidative stress (OS) and inflammation (INF); both increase in tandem with age, causing injury or toxicity to brain cells with increased intracellular debris. The neurotoxic effects of OS, INF and debris have been implicated in multiple age-related neurodegenerative diseases, severely compromising quality of life while raising medical costs. We investigated the effects of acai berries, an Amazonian fruit having an array of health-promoting phytonutrients, and walnuts in activating neuronal housekeeping (autophagy) using BV2 microglia and HT22 hippocampal neurons. The acai berry and walnut extracts, at varying concentrations, significantly reduced lipopolysaccharide, dopamine, or bafilomycinA1 induced OS/INF, by decreasing TNF alpha expression, phosphorylation of NF-kB and p38-MAPK, in addition to decreasing reactive nitrogen species and inflammatory intermediates. The decreasing effects on OS/INF were correlated with the activation of autophagy measured in terms of p62, MAP1B-LC3 turnover, beclin1 activation and inhibition of mTOR. More robust activation of autophagy was observed in the BV2 microglial cells than in neurons under stress conditions, indicating a secondary protection on neurons. Specific effects of acai and walnut extracts on the mechanisms of autophagy were further characterized using autophagy-deficient mutant ATG5-/- and control (+/+) fibroblast cells. The results indicate brain health-enhancing effects of acai berries and walnuts in aging.

MOBILITY AND COGNITION IN AGING

M.G. Miller1,2, B. Shukitt-Hale1,2. 1. Psychology, Tufts University, Medford, Massachusetts. 2. Human Nutrition Center on Aging at Tufts University, Boston, Massachusetts, 3. USDA/ARS, Boston, Massachusetts

Changes in aging, in both animals and humans, include parallel decrements in mobility and cognition, even in the absence of degenerative
disorders such as Parkinson’s or Alzheimer’s diseases. In humans, these alterations can lead to impaired productivity, independence, and quality of life. In this study, men and women were recruited from a variety of age ranges (21-40, 41-50, 51-60, 61-65, 66-70, 71-75). Balance and gait were measured using a treadmill instrumented with an array of high-density pressure sensors. Balance was assessed during both eyes-open and -closed conditions as well as in both pre- and post-walking conditions. Gait was assessed at both 1.5 mph and preferred walking speeds. Spatial working memory and navigation were measured using a virtual environment. Abnormal gait was measured using the trail-making test (TMT). Results demonstrate age-related increases in postural sway velocity and stride length variance when walking at 1.5 mph. Older adults show impaired acquisition and probe trial performance in the vWM and declines in psychomotor speed on the TMT. This study reports age-related alterations in mobility and cognition and establishes methodology for subsequent dietary intervention studies in aged humans.

THE BRAIN CORTICAL THICKNESS CHANGES OF LATE-LIFE DEPRESSION COMPARED WITH NORMAL ELDERS BY USING MRI

S. Lee, Psychiatry, Chang Gung Memorial Hospital, Taoyuan, Taiwan

ABSTRACT Background: Convergent data demonstrate regional cortical abnormalities in depressed elders. The aims of this study are twofold: 1) to compare the regional cortical thickness between patients with late-life depression and comparison older adults; and 2) to investigate the relationship between cortical thickness and cognitive performance in older adults. Methods: Morphometric magnetic resonance imaging methods were applied to measure regional cortical thickness in 19 patients with late-life depression and 19 older comparison subjects. Results: Compared with the comparison group, the depressed group showed decreased cortical thickness in the right banksts (cortical areas around superior temporal sulcus), but increased cortical thickness in the left and superior frontal gyri. Psychomotor speed, one of frontal-related functions, was positively correlated with cortical thickness in the right superior frontal gyrus where cortical thickness was greater in the comparison group than in the depressed group. Conclusions: Our results suggest that there are cortical structural and functional abnormalities in late-life depression compared with healthy aging individuals. Regionally specific measures of cortical thickness may prove to be important biomarkers in late-life depression.

SESSION 960 (POSTER)

ANXIETY AND STRESS IN LATER LIFE: INDICATORS AND INTERVENTIONS

NEGATIVE AFFECT MEDIATES THE ASSOCIATION BETWEEN LONELINESS AND HAIR CORTISOL IN CANADIAN SENIORS

D. Wong, C.A. Hoppmann, The University of British Columbia, Vancouver, British Columbia, Canada

Advances in stress research have recently validated the use of human hair as a novel biomarker of cortisol exposure over several months. So far, no study has exclusively investigated the utility of hair as a retrospective calendar of chronic stress in an older adult sample. We use cross-sectional data from 80 community-dwelling older adults aged 65 years and above to examine the association between loneliness, negative affect, and hair cortisol. Three cm of hair were sampled from the posterior vertex of the head to analyze cortisol reflecting chronic stress exposure during the 3 months prior to the study. Preliminary analyses, using a subset (n = 28) of the sample, suggest that loneliness is positively associated with negative affect and hair cortisol (controlling for the effect of thyroid dysfunction, smoking, and body mass index). Furthermore, the relationship between loneliness and hair cortisol seems to be partially mediated by negative affect. These findings show that hair cortisol is meaningfully associated with psychosocial variables, thus offering novel ways to address the health-relevance of psychosocial processes in older adults.

BRINGING LATE-LIFE ANXIETY TREATMENT TO THE COMMUNITY: OPEN TRIAL OF CALMER LIFE PROGRAM

S. Shrestha,1,2, M. Armento1,2, J. Calleo1,2,3, A. Bush1,2, N. Wilson1,2, T. Harris1, M.E. Kunik1,2,3, M. Stanley1,2,3,1. Psychiatry and Behavioral Medicine, Baylor College of Medicine, Houston, Texas, 2. Houston VA Health Service Research and Development Center of Excellence, Houston, Texas, 3. Michael E. DeBakey Veterans Affairs Medical Center, Houston, Texas

Cognitive behavior therapy (CBT) is efficacious for treating anxiety in older adults. However, all outcome studies have been conducted in academic and primary care settings, and minority groups are significantly underrepresented. New treatment models and additional research are needed to test outcomes in underserved communities with high prevalence of minority elders. The Calmer Life program (CL) offers CBT to older adults who live, work, worship or receive services in four targeted underserved, mostly minority, geographic areas. Treatment is modular and personalized according to participant preference. Participants have options related to delivery site (community sites, telephone, in-home), number of sessions (6 to 12), and skills they want to learn, including the option to incorporate religion and spirituality into standard CBT coping skills. A CL pilot study is ongoing. To date, 10 participants with GAD or worry and ADNOS have been included. All participants are female; nine African American and one Caucasian, with an average age of 62.2 years (range 51-67 years) and mean education of 14.6 years (range 12-20 years). Outcomes for all participants (no attrition) at 3-months show decreases in worry (Penn State Worry Questionnaire - Abbreviated: pre = 26.0; post = 20.0; d = .81), anxiety (Geriatric Anxiety Inventory: pre = 8.8; post = 5.0; d = .57), depression (Geriatric Depression Scale – 15 items: pre = 4.9; post = 2.4; d = .53), and sleep (Insomnia Severity Index: pre = 11.9; post = 8.1; d = .88). The treatment shows promise in treating late-life anxiety in minority elders.

RECRUITMENT AND RETENTION OF AFRICAN AMERICANS IN A RANDOMIZED CLINICAL TRIAL FOR LATE-LIFE GENERALIZED ANXIETY DISORDER IN PRIMARY CARE

S. Shrestha,1,2, M.K. Jones1,2, J. Calleo1,2,3, C. Kraus-Schuman3,1, A. Bush1,2, M.E. Kunik1,2,3, M. Stanley1,2,3, N. Wilson1,2, 1. Psychiatry and Behavioral Medicine, Baylor College of Medicine, Houston, Texas, 2. Houston VA Health Service Research and Development Center of Excellence, Houston, Texas, 3. University of Houston, Houston, Texas

Retention of minority participants in treatment research is a challenge. Issues including stigma, mistrust, and history of racism have been identified as possible barriers. Here, we present data related to the recruitment of African American participants in a clinical trial of CBT for late-life generalized anxiety disorder (GAD) in primary care. At the end of the first year of recruitment, African Americans who consented to participate in the project and had screened positive for anxiety withdrew (lost contact before the completion of the diagnostic interview at a higher rate (26.7%) than those who were Caucasians (6%) (Calleo, Kraus-Schuman, Wilson, Khan, Cully, Kunik and Stanley, 2009). To increase participation of African Americans, the following changes were made to the study procedure: 1) the participant’s name was highlighted on the envelope of an initial informational letter to distinguish this correspondence from other mail; 2) a one-page project flyer with photographs...
of ethnically diverse older adults was created to include in the initial
contact letter; 3) potential participants were kept better informed at every
step about who would contact them next; 4) participant preferences for
meeting times were solicited and honored; and 5) reminder letters were
sent regarding all appointments. At the end of second year of recruit-
ment, there was improvements in retention of African American par-
ticipants with only 13.6% (N=3) who withdrew/lost contact compared
to 9.5% (N=4) Caucasians. Differences in retention were significant
between African Americans and Caucasians at end of first year (p=.001),
but no difference remained at end of second year. Despite systemic
barriers, engagement of African Americans can be increased by improv-
ing communication and keeping potential participants well informed
of the study process.

CORRELATES OF ANXIETY SYMPTOMS AMONG
INDIVIDUALS WITH COGNITIVE IMPAIRMENT
G.I. Diefenbach1, K. Blank2, 1. Anxiety Disorders Center, Institute of
Living, Hartford, Connecticut, 2. Memory Disorders Center, Institute of
Living, Hartford, Connecticut

The aim of the current study was to determine clinical correlates of
anxiety symptoms among patients with cognitive impairment. Anxiety
symptoms were assessed using the Geriatric Anxiety Inventory (GAI) – a
standardized self-report measure, and the Neuropsychiatric Inter-
view Anxiety Item (NPI) – a clinician rated measure. Participants were
120 outpatients (n = 60 with dementia; n = 60 cognitive impairment no
dementia [CIND]) evaluated at a Memory Disorders Center. Fifty adults
ages 60 and older without subjective memory complaints served as a
comparison group for scores on the GAI. Cognitively-impaired indi-
viduals reported more severe anxiety on the GAI (CIND M = 7.4,
Dementia M = 6.7) than did control participants (M = 1.4) [F (2, 127) =
19.49, p < .001]. There were no differences between patients with
CIND or dementia on the GAI or NPI, and so these groups were com-
bined for further analyses. Anxiety symptoms correlated significantly
(p < .05) with the number of functional impairments as assessed on the
Functional Activities Questionnaire (GAI = .19, NPI = .32) and Global
Assessment of Functioning (GAI r = -.23, NPI = -.52). In addition, the
NPI correlated significantly with insight (r = .33) and severity of cog-
nitive impairment as assessed on the Dementia Rating Scale (r = -.34).
The GAI correlated significantly with age (r = -.20). Results suggest
that anxiety is associated with functional impairments among individ-
uals with cognitive decline. Risk factors for high anxiety in these patients
included younger age, insight, and severity of cognitive impairments.

NEEDS OF AGING ADULTS LIVING IN URBAN PUBLIC
HOUSING
S. Bowland1, V. Hines-Martin2, 1. Kent School of Social work,
University of Louisville, Louisville, Kentucky, 2. University of
Louisville, Louisville, Kentucky

Nursing and social work investigators are conducting assessments
of health status and psycho-social needs of African Americans with
chronic mental and physical disabilities living in a low-income hous-
ing community, using multiple measures. Needs being assessed include:
medical conditions, medication, psychological problems, and social sup-
port. The sample is composed of disabled adults over the age of 18,
and elderly over the age of 60 living in senior housing in the same
complex. All but two of the residents interviewed (N = 29), appear to be
aging in place, that is they have no plans to move out of this commu-

nity. Most rated their health as fair or poor. Physical and/or emotional
health was frequently reported as interfering with social activities,
although residents with social contact appeared to be faring better than
those without social support. Twenty-one residents identified signifi-
cant levels of depression. Notably, residents stated that treatment for
their physical illnesses is much easier to obtain than treatment for psy-
chological ones. Most of the depression and stress reported by partici-
pants remains untreated. Several residents are not accessing any social
services for which they may qualify. By default residents are often aging
in place, and they do not have supports in place for healthy aging. While
more community programs are needed for residents to manage psy-
cho-social concerns, on-site education and advocacy may be keys to
accessing existing services that could make a difference for these resi-
dents and lower health care costs in the long run.

MENTAL HEALTH SYMPTOMS AND PATIENT
SATISFACTION IN A VA GERIATRIC MENTAL HEALTH
CLINIC
B. Kelly1, M. Karel1,2, J. Moyer1,2, E. Archambault1, T.L. Neecker2,3, A. Pless
Katz2,3, 1. VA Boston Healthcare System, Boston, Massachusetts, 2. Department of Psychiatry,
Harvard Medical School, Boston, Massachusetts, 3. Boston University School of Medicine, Boston,
Massachusetts

Older veterans’ often complex histories present many challenges for
mental health providers. In this study of 50 older veterans referred to
an outpatient mental health clinic, we surveyed the impact of Late-Onset
Stress Symptomatology (LOSS), PTSD, depression, and anxiety on
patient functioning and satisfaction with treatment. Participants com-
pleted mental health and neuropsychological assessments, including the
Geriatric Depression Scale-15, General Anxiety Inventory, and LOSS
Scale. Three months after initial evaluation, patients completed the GDS-
15, GAI, and a Client Satisfaction Questionnaire. At initial assessment,
63% of patients scored 5 or more points on the GDS-15 (range 3-13,
M=6.08, SD=2.72), signifying symptoms consistent with depression.
56% of combat veterans met criteria for PTSD and 41% met criteria for
LOSS. 30 of the 50 patients responded to the 3-month follow-up
survey. Veterans with comorbid combat histories and PTSD exhibited
increased depressive symptoms, whereas those without PTSD had
decreased depressive symptoms. Overall, participants conveyed a high
level of satisfaction with care. 83.3% of respondents reported that most
or almost all of their needs were met; 80% reported that they would def-
initely recommend the program to a friend; and the majority reported
that services helped them deal more effectively with their problems
(53.3% “a great deal” and 36.7% “somewhat”). Patient satisfaction with
services was not related to self-reported depression or anxiety. Chal-
lenes of conducting research with this clinical population and the impact
of comorbidities on treatment will be discussed.

BECK ANXIETY INVENTORY FACTOR STRUCTURE IN A
NURSING HOME SAMPLE
N. Briggs, S. Meeks, Dept. of Psychological & Brain Sciences, Univ
Louisville, Louisville, Kentucky

In recent years, there has been an increased interest in the assess-
ment and treatment of anxiety disorders in underserved populations,
including older adults. However, the majority of the research on assess-
ing the factor structure of the Beck Anxiety Inventory (BAI) with older
adults has been performed almost exclusively with community dwelling
adults. Research suggests that nursing home residents are at a greater
risk for the development of mental health problems than their commu-
nity dwelling peers. In an effort to further understanding and improve
the psychometric properties of the BAI in older adults, we sought to
investigate the reliability and validity of the two-factor model (i.e. cog-
nitive and somatic dimensions) assessed by the BAI in a sample of 84
nursing home residents. The internal consistency of the two-factor BAI
was above .85 for each dimension. Item analyses were conducted on
the 21 items hypothesized to assess the cognitive and somatic dimen-
sions of anxiety. Initially each item was correlated with its own dimen-
sion (with the item removed) and with the other anxiety dimension. In
three cases items were more highly correlated with the other anxiety
dimension than their own dimension. The three items were “fear of
losing control”, “unsteady” and “faint/lightheaded”. These items were
also problematic in the four- and six-factor solutions. Findings suggest
that the dimensionality of the anxiety symptoms measured by the BAI
may be different in medically ill older adults than has been found in community-residing samples.

TEMPORAL DYNAMICS OF ANXIETY & STRESSFUL LIFE EVENTS IN LATER LIFE: FINDINGS FROM THE SWEDISH ADOPTION/TWIN STUDY OF AGING

L. Lee1, M. Gatz2, N.L. Pedersen1, C. Prescot1. 1. University of Southern California, Los Angeles, California, 2. Karolinska Institute, Stockholm, Sweden

Considerable research supports the association of stressful life events (SLE) with anxiety in adults. However, little is known regarding the applicability of these findings from younger to older adults, as well as the timing of SLE and anxiety. We addressed the temporality of anxiety and SLE in later life by testing the hypotheses that: (1) high levels of cumulative life stress was a leading indicator of subsequent increase in anxiety; and (2) high levels of anxiety was a leading indicator of subsequent occurrence of SLE in later life (i.e., anxious individuals tend to encounter/create more SLE than less anxious individuals). This study was based on data from the Swedish Adoption/Twin Study of Aging collected over 5 occasions between 1984-93. We fitted multiple-group bivariate latent change score structural equation models to examine differences in dynamic expressions of anxiety and SLE in 1,439 individuals across age groups (ages 50-59, 60-64, 65-70, 70-74, 75+/ at study entry). Anxiety was measured using the State Trait Personality Inventory – State Anxiety subscale. A composite SLE score was created from the Social Readjustment Rating Scale. Overall, results indicated that SLE was a leading indicator of subsequent increase in anxiety across all age groups. In contrast, high levels of anxiety were not associated with greater subsequent occurrence of SLE. Older groups had higher levels of anxiety at study entry and slightly less systematic increase in anxiety over time. Our results add to current knowledge on pathways that underlie the development of anxiety in later life.

SESSION 965 (POSTER)

ASSESSMENT ISSUES, MEASURES, STRATEGIES, AND OUTCOMES

THE ERICKSON LIFE STUDY: A LONGITUDINAL EXAMINATION OF RESIDENTS OF A CONTINUING CARE RETIREMENT COMMUNITY

K.A. Marx1,2, J.M. Gaines1, B. Resnick1, J.M. Parrish1. 1. Erickson Living Foundation, Catonsville, Maryland, 2. University of Maryland, Baltimore County, Catonsville, Maryland, 3. University of Maryland at Baltimore, Baltimore, Maryland

Changes in the health status of older adults, subsequent to their transition to a Continuing Care Retirement Community (CCRC), have seldom been assessed longitudinally. The purpose of this study was to describe changes in CCRC residents during the first five years post move-in. 184 participants (baseline mean age = 77.2 years, s.d. = 5.9) provided data for five annual assessments using a standardized tool that collects data across five domains: physical, functional, mental, cognitive, and social. Using the baseline scores as the covariate, a repeated measures model was fit to the data. Significant changes were observed in the physical (p < .006) and functional (p < .001) domain scores. Pairwise comparisons of changes in the physical domain revealed that detected changes occurred between Year 3 (M = 20.8, s.d. = 2.3) and Year 5 (M = 20.4, s.d. = 2.4; p = .014). Changes in functional status were detected beginning at Year 4. Within the physical domain, self-rated health was found to be significantly lower at Year 5 than at baseline (68.0% selected “very good/excellent” at baseline vs. 60.6% at Year 5, p = .001). At Year 5, the mean number of comorbid conditions reported (5.0, s.d. = 2.9) was significantly higher than at baseline (m = 3.2, s.d. = 2.0, p = .002). Longitudinal assessment of health changes among CCRC residents pinpoints opportunities for clinical practitioners to provide comprehensive, evidence-based services that may protect against unwanted changes in older adults’ health status over time, and increase the quality of care provided.

EFFECTIVENESS OF BEHAVIORAL HEALTH SERVICES IN AN INTEGRATED SENIOR PRIMARY CARE CLINIC USING THE ORS

S.C. Gibson, D.L. Segal, Psychology, University of Colorado at Colorado Springs, Colorado Springs, Colorado

Introduction: Health care delivery systems for older adults are shifting to an integrated model that utilizes behavioral health services within primary care settings. This study examined the preliminary effectiveness of a behavioral health program in a community senior health clinic using a brief outcome measure. Method: Participants (N = 14) were older adults (M age = 64.14 years) receiving multiple psychotherapy sessions in a primary care setting. The Outcome Rating Scale (ORS; Miller & Duncan, 2000) was administered at each session. The ORS contains four subscales which are summed to comprise the total score: Overall, Individually, Interpersonally, and Socially. Results: Internal consistency of the ORS ranged from adequate (Session 1; Cronbach’s α = .58) to good (Session 5; Cronbach’s α = .97). ORS scores significantly increased from Session 1 (M = 14.31, SD = 6.37) to Session 2 (M = 18.91, SD = 10.15) (t(13) = -2.53, p = .02), with a large effect size (Cohen’s d = 0.54). Changes in ORS scores beyond Session 2 were not significant. However, the increase in ORS scores from Session 1 to Session 5 was significant (t(13) = -2.24, p = .04) with a large effect size (Cohen’s d = 0.70). Discussion: Results indicate that the ORS has reasonable internal consistency for this sample of seniors utilizing behavioral health services within a primary care setting. Findings also indicate that psychotherapy initially results in increased well-being with gradual improvement over time. Clinical implications and practice issues in integrated settings with older adults are discussed.

STAFF COMMITMENT TO PERSONS WITH SCHIZOPHRENIA AS A DETERMINANT OF PATIENT MEASURES OF WELL-BEING

E. Hess1,2, V. Cardenas1, S. Abel1,2, D. Isley1, J. Head1, L. Le1, B. Mausbach1. 1. University of California-San Diego, San Diego, California, 2. San Diego State University, San Diego, California, 3. Alliant International University (CSPP), San Diego, California

Quality of life in schizophrenia is the function of a number of important clinical factors, including neurocognitive functioning, symptoms of psychosis, and functional ability. Equally important in patient quality of life are social and environmental factors, such as social and rehabilitative support. Patients often interact with staff at board-and-care facilities, day-treatment programs, and clubhouses, and the level of interest in rehabilitation and overall well-being on the part of staff members may influence measures of patient well-being. We rated a total of 10 facilities in San Diego, CA in terms of the staff’s commitment to patient rehabilitation, with ratings of 1 = high personal interest in the participants’ overall rehabilitation and well-being; 2 = moderate interest in overall rehabilitation and well-being; and 3 = low interest in overall rehabilitation and well-being. The purpose of this study is to explore the extent to which staff commitment to rehabilitation and well-being is related to a number of patient well-being factors, including patient self-efficacy, hope, depressive symptoms, goal and success orientation, and life satisfaction. We will discuss findings in the context of existing facility-level factors as determinants of treatment provision.

COGNITIVE SCREENING ITEM REFUSAL AMONG LONG-TERM CARE RESIDENTS WITH MENTAL ILLNESS

J.J. Gregg, C.M. Ciliberti, B. Edelstein. Psychology, West Virginia University, Morgantown, West Virginia

Cognitive screening instruments may have less utility in populations with moderate to severe levels of cognitive impairment and among people with serious mental illness (Camp, Koss, &Judge, 1999) because...
THE RELATIONSHIP OF SELF AND PROXY REPORTS OF MEMORY COMPLAINTS AND PERFORMANCE: THE ROLE OF LIVING SITUATION

A. Pearman, E. Fisher, A. Johannaber, Georgia State Univ, Atlanta, Georgia

Standardized cognitive tests administered by healthcare professionals are a useful way to measure memory and cognitive impairments in older adults. However, these tests are thought to be most beneficial when used in conjunction with self-appraisals and proxy reports. Findings thus far suggest that self-reports overestimate cognitive problems and proxy reports tend to underestimate functional and memory problems. This mixed-methods pilot study is designed to examine differences in proxy and self-reports with a specific focus on living situation. Eighteen older adults who lived alone and twelve older adults who lived with a spouse, partner, or family member were interviewed, given cognitive tests, and administered self-report questionnaires. In addition, every participant identified a proxy to fill out a series of questionnaires regarding the participant. Results indicate that proxy reports were more highly correlated (r = .26-.51) with participants’ actual test performance than self-reports (r = -.11-.04). In addition, people who were living alone identified proxies who were more accurate (r = .51-.67) at accurately reporting memory problems than those living with a family member, spouse, or partner (r = .29-.38). While these findings appear to differ from previous studies that have suggested that proxies that live with a spouse, or partner (r = .29-.38), while these findings appear to differ from previous studies that have suggested that proxies that live with a spouse, or partner (r = .29-.38). While these findings appear to differ from previous studies that have suggested that proxies that live with a spouse, or partner (r = .29-.38). While these findings appear to differ from previous studies that have suggested that proxies that live with a spouse, or partner (r = .29-.38). While these findings appear to differ from previous studies that have suggested that proxies that live with a spouse, or partner (r = .29-.38).
these students did not regard older adults as positive figures, they still regarded older adults (M = 33.6, SD = 4.2). The results showed that even though they showed positive attitudes toward working with elderly. The Cronbach's alpha of the two attitudinal scales was 0.73.

OBJECTIVE: To evaluate the physicians' knowledge and attitude toward medication use in high polypharmacy risk older adults. MATERIALS and METHODS: During Dec. 2007 to Dec. 2008, 217 high polypharmacy risk older adults were enrolled in the medication safety review clinic (MSRC) study to indentify their problems (DRPs) with interventions proposed to their prescribing physicians (Total N=139). Among them, 134 physicians agreed to fill a self-administered questionnaire regarding their demographic data, practice related characteristics and prescribing behaviors for the elderly. Ninety-eight doctors (73%) completed the questionnaire. Exploratory analysis of the questionnaire data was performed using χ² test with Fisher’s exact method when appropriate. RESULTS: The mean age of the participants was 46.9 years and 94% were men. Sixty-three percent physicians belong to the internal medicine plus family practitioner group (IF group). Only 29% had ever received formal education on geriatric medication prescribing principles in the last 3 years. Most physicians (79%) didn’t know Beers Criteria for potentially inappropriate medications in older adults. Almost every physician (96%) considered that MSRC was helpful to improve drug related problems in the elderly. Compare the IF group with other physicians, they were more likely to review the patient’s medications regularly (66% vs. 42%, p=0.03). They were also more likely to check the medication effects regularly (98% vs. 69%, p<0.001), to monitor medication side effects more regularly (82% vs. 61%, p=0.02), and to add medications for untreated indications (73% vs. 42%, p=0.002).

CONCLUSION: Most physicians apply certain degrees of geriatric medication prescribing principles to their older patients. The internists and family physicians were more likely to manage DRPs of their geriatric patients than other specialties. There is still strong need to provide training programs in geriatric DRPs and prescriptions in the future.

TAIPEI TECHNICAL HIGH SCHOOL STUDENTS’ ATTITUDES TOWARDS WORKING WITH OLDER ADULTS

S. Lin, B. Chang, C. Chou, J. Scott, 1. Chinese Culture University, Taipei, Taiwan, 2. Texas Tech University, Lubbock, Texas

In Taiwan, the older population has reached 2.6 million, or about 10.7% of the total population in 2011. Today, more than 331,988 older adults currently reside in the largest metropolitan city in Taiwan - Taipei City. For every 100 persons aged 15 and under, there are approximately 87 persons aged 65 and over in Taipei. These numbers will continue to increase. We conducted an exploratory study among high school students with human services and health service related majors at technical schools in Taipei City. The purpose of the study was to investigate students’ attitudes toward working with older adults. Convenience sampling was used in our research, and eight schools agreed to participate. The instrument had 57 questions, including a modified semantic differential attitude scale about elderly and a revised attitudinal scale about working with elderly. The Cronbach’s alpha of the two attitudinal scales were .87 and .83, respectively. We surveyed 1,311 students, 981 females and 64 males, who were 16.8 years old on average. Respondents’ attitudes toward older adults were slightly negative (scores = 67.4, SD = 11.8). However, they showed positive attitudes toward working with older adults (M = 33.6, SD = 4.2). The results showed that even though these students did not regard older adults as positive figures, they still viewed serving older adults “interesting,” “worthwhile,” and “respectable.” We suggest that in-depth interviews should be conducted in future research to examine other possible factors that influence their attitudes toward working with older adults.

ANTICIPATED SELVES: PORTRAYALS OF SELF AT 70 YEARS OLD

The present study examined attitudes towards aging through the qualitative analysis of essays describing anticipated selves at 70 years old. Students from an urban state university and a historically black urban college wrote personal essays predicting their future selves, who they expected to be at age 70 years, as assignments in gerontology courses. The essay requirements included prompts for considering: appearance, lifestyle behaviors, health, social network, challenges, and life satisfaction at age 70. The essays (N= 69) were analyzed for evidence of course-related knowledge, student expectations of continuity or discontinuity in different domains, and the presence of stereotypic views of aging. Analyses indicated that students’ essays often included specific course information, particularly regarding lifestyle behaviors and their health-related outcomes. Expectations of discontinuous or continuous development were domain-specific and the prediction of whether or not a particular domain would show change varied among students. An emergent theme of the analysis was the realism of the overall portrayal of life at age 70 years. Students sometimes recognized the likelihood of an outcome (e.g. perfect health at age 70), but predicted it nonetheless. Further, while the essays demonstrated knowledge of aging, stereotypic portrayals were still present as in “I will be grumpier” or “wear Grandma shoes.” Age of student appeared to be related to the ease of projecting oneself into the future. Younger students tended to report the exercise of anticipating an older self was more challenging than those who were middle-aged. Known older adults often served as the models upon which to base predictions.

THE IMPACT OF A SERVICE LEARNING COURSE ON COLLEGE STUDENTS’ KNOWLEDGE AND ATTITUDES TOWARD AGING

B. Luo, Sociology, Western Washington University, Bellingham, Washington

Service learning is an educational method in which students engage in organized service designed to meet the needs of the community. The academic curriculum is infused with opportunities for students to provide meaningful service to a community agency and then to reflect on the service experience via personal journals and classroom discussion (Westacott & Hegeman, 1996). In the winter quarter of 2010 in a medium-sized university in Pacific Northwest, the author implemented service-learning pedagogy in course “Aging in America,” which was designed to increase student’s knowledge of aging, promote direct contact with older people, and provide services to the elders who are in need. A pre-course survey and a post-course survey were conducted with each student who is enrolled in this course. The survey consists of two components—a revised version of Palmore’s Fact on Aging Quiz and a revised version of Fraboni Scale of Ageism. In addition, a pre-course focus-group interview and post-course interview were also used to help explain students’ answers on the surveys. Findings reveal that increased interactions and direct services to the aging population significantly improved college students’ knowledge on aging and positively changed their attitudes toward the elderly population.

MEASURES IN JAPAN
FALLING AND DROWNING AND TAKING PREVENTION
DISCREPANCIES BETWEEN ATTITUDES TOWARD
TO CARE OR NOT TO CARE?: EFFECTS OF NURSE
and age salience are evident in judgments about one’s self.
istics of young and older adults, and the extent to which positivity bias
between young and older adults in their views of the typical character-
ical (a “self-positivity bias”), however, older, but not young, partici-
and older participants judged positive characteristics as more self-typ-
icality and valence influenced young and older adults’ self-rel-
relevance ratings to characteristics that were rated as negative
they were for their own-age group. Moreover, older adults gave the low-
and older (M= 66.51, SD= 3.75) living in urban areas of Japan. Partic-
pants completed questionnaires seeking to assess their attitudes toward
falling and drowning on the one hand, and actually taking measures to
prevent falls and drowning incidents. Results show that 30.8% believed
fall prevention measures to be practical on the Man factor of the 4M
analysis, and 43.6% reported drowning prevention measures to be prac-
tical on the Machine factor. They indicated that they had not taken any
special measures, but would consider doing so henceforth. We also asked
about their reasons for having taken no measures even while consider-
ning that they might be practical. For measures having to do with pre-
venting household falls, 64.5% reported being unaware of the extent of
the decline in their physical capabilities. As for actions which might
prevent drowning accidents in their bathtubs, 32.5% reported being
deterred by the high costs and length of time required to do anything.
Findings suggest that there may be defects in predicting the decline of
physical capabilities in older adults, which might cause or increase the
risk of falling and/or drowning.

HOW DO YOUNG AND OLDER ADULTS RATE THE SELF
RELEVANCE OF AGE-TYPICAL CHARACTERISTICS?
E. Ankudowich, N.C. Ebner, K.J. Mitchell, M.K. Johnson, Yale University, New Haven, Connecticut

Prior work has shown that adults sometimes identify with their own-
age group, and other times they distance themselves from same-aged
peers. The factors that influence whether or not young and older adults
see themselves as similar to their own-age group have not yet been identi-
tified. The present study examined how characteristics that varied in
age typicality and valence influenced young and older adults’ self-rel-
evance ratings. Young and older participants rated adjectives (e.g., adventu-
rous, disagreeable, knowledgeable, resigned) on whether they were
more typical of young or older adults, on whether they were positive or
negative, and on whether they were typical of themselves. Both young
and older participants judged positive characteristics as more self-typ-
ical (a “self-positivity bias”), however, older, but not young, partici-
pants also endorsed characteristics to a greater extent the more typical
they were for their own-age group. Moreover, older adults gave the low-
est self-relevance ratings to characteristics that were rated as negative
and typical of young adults. We discuss similarities and differences
between young and older adults in their views of the typical character-
istics of young and older adults, and the extent to which positivity bias
and age salience are evident in judgments about one’s self.

THE PRESENTATION OF DEMENTIA IN THE MOVIES:
CLINICAL PICTURE AND COPING
Y. Kuin, D.L. Gerritsen, 1. Radboud University Nijmegen/Behavioural Science Institute, Nijmegen, Netherlands, 2. Radboud University Nijmegen Medical Centre/Dept. of Primary and Community Care, Nijmegen, Netherlands

Visual media influences the general public’s perceptions and atti-
itudes regarding mental disorders. Therefore, it is important to know how
dementia is presented in movies. In this study we focus on 1) depiction of
clinical features of dementia, and 2) attitudes of significant others
concerning the person with dementia. Using search terms ‘dementia’, ‘Alzheimer’s disease’ and ‘senility’, motion pictures were sought on the
Internet Movie Database, release period 2000-2010. The selection pro-
cedure resulted in 12 films. Son of the Bride, Iris, The Alzheimer Affair,
It runs in the Family, The Notebook, Aurora Borealis, Away from her,
The Savages, Is Anybody There?, Choke, I’ve loved you so long, and
‘Alzheimer’s disease’ and ‘senility’, motion pictures were sought on the
Internet Movie Database, release period 2000-2010. The selection pro-
cedure resulted in 12 films. Son of the Bride, Iris, The Alzheimer Affair,
It runs in the Family, The Notebook, Aurora Borealis, Away from her,
The Savages, Is Anybody There?, Choke, I’ve loved you so long, and
Black. Independently, both authors watched all movies, selected rele-
vant scenes, and noted symptoms and capacities, characters’ behav-
iors, remarkable aspects, and interpretations. Then, the authors discussed
these and reached consensus. Nearly all main characters with dementia
show memory problems and disorientation. In only a few movies other

“65 ISN’T WHAT IT USED TO BE”: CHANGES AND
TRENDS IN PERCEPTIONS OF OLDER ADULTS
M. Plötkuh, A. Niehaus, R.D. Reeves, Department of Law, Politics, and Society, University of Evansville, Evansville, Indiana

With increasing life expectancy, adults can look forward to more
years after age 65 than previous generations, many with better health.
Yet many Americans feel that the “golden years” are anything but idyl-
lic, perceiving that older adults face a lonely life filled with health, finan-
cial, and medical worries. However, as the Baby Boomer generation hits
the stage in the life course, more Americans are confronted with a chang-
ing image of what it means to be 65 years or older. Using two studies,
Myth and Reality of Aging (National Council on Aging 1974) and Amer-
ican Perceptions of Aging in the 21st Century (Cutler and Whitehall
2000), the authors examine changing trends in perceptions of adults 65
years or older. Specifically, we explore the following questions: 1) how
are the lives older adults perceived?; 2) how have perceptions of older
adults changed over the last 35 years?; and 3) how might the Baby
Boomer generation influence perceptions of the lives of older adults?
Prediminary findings suggest that perceptions of older adults have
become less negative, particularly in the areas of perceived loneliness,
fear of crime, and concerns for poor health, suggesting that a growing
understanding of issues faced by older adults has led to a more realistic
view of the older years. The need for further exploration of percep-
tions with the aging of the Baby Boomer generation is discussed.
cognitive, emotional or behavioral problems are shown. In six movies the character with dementia has critical moments of lucidity. Significant others are mostly patient and respectful, react warmly, and reassuringly with only a few signs of burden, struggle and frustration. In general the clinical picture is rather limited; challenging behaviors are seldom shown. The burden of caring is generally underestimated. Only one movie (Iris) comes close to reality with regard to both research aims.

**AGE DIFFERENCES IN STEREOTYPES OF AGENTIC ORIENTATION AS A FUNCTION OF TARGET AGE, GENDER, AND ETHNICITY**

C. Andreoletti, W. Disch, J.P. Leszczynski. 1. Psychology, Central Connecticut State University, New Britain, Connecticut. 2. Eastern Connecticut State University; Willimantic, Connecticut

Although stereotypes about gender, race, and age have been studied independently, few have examined the content of compound stereotypes, which consider these characteristics together. Furthermore, most research on age stereotypes has focused on old age. We examined age differences in stereotypes of agentic orientation as a function of target age (15 to 95 years), ethnicity (Black/White), and gender (male/female). Using bipolar scales, 134 young (M age = 18.7 years, SD = 1.5) and 77 older adults (M age = 77.7 years, SD = 7.3) rated target groups (e.g., Black, 45-year-old females) on 10 attributes. Only agentic attributes (aggressive, ambitious, skilled at business, competitive, dominant) are reported here. Each participant rated 20 groups and were randomly assigned to rate either 15-, 25-, 45-, 65-, and 85-year-old targets or 15-, 35-, 55-, 75-, and 95-year-old targets. We hypothesized that perceived agency would decline with target age as a function of target gender and ethnicity. We also predicted that the timing and extent of perceived decline would vary by participant age group. Results indicated that both younger and older participants rated the agentic attributes as significantly declining as target age increased. Furthermore, younger participants rated the attributes as declining somewhat earlier than the older participants. For example, younger participants rated aggression, ambition, and competitiveness as declining most at approximately 60 years, whereas older participants indicated a decline closer to 70 years. Differences by target gender and ethnicity are also discussed. Results will be used to increase knowledge and awareness of compound stereotypes.

**WHADDYA KNOW?: ETHNICITY DIFFERENCES IN KNOWLEDGE OF AGING**

Knowledge about aging has been shown to affect both perceptions of aging and individual outlook on aging. A common way to assess such knowledge is with Palmore’s Facts on Aging Quiz (FAQ). In an ongoing study of attitudes toward aging, the FAQ was given to 1120 persons ranging in age from 18 to 94 (M = 37.89; SD = 16.62). Because attitudes toward aging have also been shown to differ by ethnicity, ethnic differences in knowledge were assessed. The sample included 281 African Americans, 146 Asian Americans, 570 White Americans, 102 Hispanic Americans, 17 American Indians, 60 people who identified as Multiracial, and 11 Japanese participants living in Japan for a total of 1220 respondents. Overall knowledge of aging was significantly different, F (6, 1198) = 4.194, p < .001. Japanese participants scored the highest and Hispanic Americans scored the lowest. There were no differences in negative bias, however there were differences in positive bias in answering the FAQ, F (6, 1197) = 5.42, p < .001. American Indians had the highest positive bias and White Americans had the lowest. A question was added to the FAQ to examine knowledge of ethnicity difference in rates of Alzheimer disease. Significant differences revealed that American Indians and Multiracial respondents had the highest scores on this question and Hispanic and White Americans the lowest, F (5, 1051) = 4.93, p < .001. These results are discussed in terms of their inter-

**AGING ANXIETY IN KOREA**

The aging of Baby Boomers is a challenge for Korean policymakers, as in many countries around the world. Using the nationally representative 2010 KGSS, we examined whether older Koreans are more likely than younger people to be anxious about physical dependence in old age (“I worry about not being able to get around on my own as I get older”), cognitive dependence (“I worry others will have to make decisions for me as I get older”), and financial dependence (“Financial dependence on others is one of my greatest fears about old age”). The response category was a 5-point Likert scale ranging from strongly agree to strongly disagree. For our dependent variable, we dichotomized each response into agree versus other. Preliminary analysis shows that about 52% worry about physical dependence, 40% about cognitive dependence, and 44% about financial dependence. Compared to those aged 25-34, older people are 31% more likely to be worried about physical, 29% more about cognitive, and 17% more about financial dependency. After adjusting for socio-demographic variables, we found a significant difference between age groups in physical, but not cognitive or financial anxieties. Interestingly, only the 45-54 age group is more concerned about dependence than the younger group in all three dependence categories. Our findings may reflect the job insecurity and underemployment experienced by Baby Boomers in the 1997 financial crisis, or being a sandwich generation that might be the last raised to take care of parents and the first not expecting support of their children.

**THE RELATIONSHIP BETWEEN AGING SELF-PERCEPTIONS, COGNITIVE AND SENSORY FUNCTIONING**

M.E. Paggi, D.S. Jopp, M. Schmitt. 1. Fordham University, Bronx, New York. 2. Heidelberg University, Heidelberg, Germany

The impact of aging self-perceptions on cognitive functioning has been demonstrated only through experimental research using priming techniques. Vision and hearing have also been found to be associated with aging self-perceptions. The current study investigated the relationships between aging self-perceptions, cognitive and sensory functioning utilizing data from the Interdisciplinary Longitudinal Study on Aging (ILSE) (Martin, Grünendahl, & Martin, 2001). The database consists of 412 older adults (mean age 62.86, SD = 0.89, range: 61 – 65 years) and 457 middle-aged adults (mean age 44.17, SD = 0.90, range: 43 – 46 years). Aging self-perceptions were measured with the Philadelphia Geriatric Center Morale Scale (Lawton, 1975); the participants also underwent cognitive assessments and vision tests. Correlational analysis with the older cohort indicated that positive aging self-perceptions were related to higher cognitive performance, less hearing loss and higher visual acuity. However, in the middle-aged cohort, aging self-perceptions were correlated with fewer cognitive measures. Low-frequency hearing loss and with visual acuity. These results indicate that beliefs about aging are related to cognition and sensory abilities in both older and middle-aged adults, but these relationships are limited to fewer areas of cognition and to more progressive hearing loss in middle-aged adults, suggesting that aging self-perceptions vary with age-related changes in cognitive and sensory functioning.

**UNMASKING THE SECRETS OF HEALTHY AGEING: CENTENARIAN VIEWS ON THE ATTAINMENT OF ADVANCED LONGEVITY**

S. Freeman, J.M. Garcia. Health Studies and Gerontology, University of Waterloo, Waterloo, Ontario, Canada

Pathways healthy and physically functional centenarians take to achieve advanced age have fascinated mankind for centuries. With continuous developments in medical care, individuals are anticipated to live
COMMUNITY ATTITUDES TOWARD COGNITIVELY IMPAIRED YOUTHFUL, MIDDLE-AGED, AND OLDER PRISONERS

A. Rodriguez1, R.S. Allen1, J. McAlpine1, R. Cavanaugh2, 1. Psychology, The University of Alabama, Tuscaloosa, Alabama. 2. Alabama Department of Corrections, Montgomery, Alabama

A cause of concern in psychology in the last 20 years has been the ever-growing prison population and legislative changes (e.g. harsher sentences, abolishment of parole) that have made spending greater time in prison across a lifetime more likely. Research regarding prisoner health has provided consistent support for the adverse effects related to incarceration, including psychiatric disorders, cognitive impairment, and accelerated aging (Loeb & AbuDagg, 2006; Loeb, Steffensmeier & Lawrence, 2008; Shinkfield & Graffam, 2010). Unfortunately, these issues may be overlooked in society due to negative attitudes toward prisoners. These obstacles put prisoners at high risk for vulnerability. Psychologists have investigated attitudes toward prisoners for decades (Melvin, Gramling, & Gardner, 1985; Silvia, Graham, & Chasidy, 2005; Church, Baldwin, Brannen, & Clements, 2009). The current study examined community-dwelling older adults’ attitudes toward prisoners. Participants included 40 older adults (M = 71.85, SD = 10.10) whose ages ranged from 54 to 88. The majority of participants were female (77.5%); 52.5% self-identified as Caucasian and 47.5% self-identified as African American from Tuscaloosa, Alabama and surrounding areas. Researchers investigated participant attitudes toward cognitively impaired and healthy prisoners of varying ages (i.e. 15 years, 30 years, 60 years) and found significant differences in older adults’ attitudes toward prisoners based on prisoner age and health.
is a mechanism for cognitive training gains as measured by the Useful Field of View Test (UF OV). A total of 278 adults between the ages of 62 and 95 participated in two studies of cognitive training (Edwards et al., 2002; Edwards, et al., 2005). A 4x2 mixed-model ANOVA was conducted to determine the effect of different cognitive training conditions (adaptive vs. standard vs. internet training vs. no contact control) and time (pre- vs. post-training) on UF OV performance. Results indicated significant main effects of time, F(1,252)=276.80, p < .001, training group, F(3,252)= 13.59, p < .001 and a group x time interaction, F(3,252)= 32.32, p < .001. Tukey’s HSD was performed to examine group differences. Only the adaptive training group performed significantly better than either the internet training group or no contact control group, who performed similarly. No other significant differences were found. These results suggest that adaptive training may be most beneficial for improving older adults’ speed of processing, and that cognitive stimulation, such as internet training, does not immediately improve UF OV performance.

PROMOTING BRAIN HEALTH: PRACTICES IN HEALTH SYSTEMS, SENIOR CENTERS, AND PUBLIC HEALTH AGENCIES
J.N. Laditka, S.B. Laditka, K.B. Lowe, Public Health Sciences, University of North Carolina at Charlotte, Charlotte, North Carolina

As baby boomers age, more Americans will seek ways to promote brain health. There is little evidence from randomized trials that behaviors affect brain health, but reviews fault their poor study designs. Much stronger evidence from epidemiology and animal studies particularly suggests the usefulness of physical activity, healthy diets, and social involvement. We used the Internet to study brain health promotion in three sectors. We examined: health care systems, using Thompson Reuter’s Top 100 Hospitals; nationally accredited senior centers (National Council on Aging, n=180); and health departments of all 50 states and the 20 largest U.S. cities. Searches included a variety of terms indicating brain health, successful aging, and dementia. We analyzed website text, graphics, brochures, and posters promoting brain health. Products or services to treat dementia were excluded from the analysis. In results specifically for brain health promotion, among health care systems 26% emphasized the usefulness of cognitive activity, 22% nutrition, 22% physical activity, 18% social involvement, and 10% drugs or other products. Among public health agencies, 25% suggested physical activity, 18% nutrition, 17% brain activity, and 7% social involvement. Senior centers emphasized cognitive activities and social involvement (both 13%), physical activity (3%), and nutrition (2%). The science base suggests it may be useful to promote healthy behaviors specifically for brain health, acknowledging the uncertainty of knowledge in this area. Health care systems and public health agencies are beginning to do so. Based on Internet evidence, few senior centers explicitly promote brain health.

THE EFFECTS OF 3-YEAR COGNITIVE ACTIVITY PROGRAMS ON COGNITIVE FUNCTIONS AMONG THE JAPANESE ELDERLY
N. Yatomi, Institute of Gerontology, The University of Tokyo, Kashiwa, Chiba, Japan

Dementia is the greatest health concern in the elderly. The prevalence rate is near 10% of elderly population in Japan. From recent studies, it has been suggested that improving of lifestyles related to amiodo beta deposition and intellectual habits may postpone the onset of Alzheimer disease. The purpose of this study is to examine the effects of 3-year training of executive functions through leisure activities such as cooking, traveling, learning PC skill, and gardening. The subjects were 388 elderly people who live in Setagaya Ward, Tokyo. The experimental group was consisted of 134 elderly (35 males, 99 females; mean age=71.7 yrs (sd: 5.7)). The control group was consisted of 254 elderly (104 male, 175 females, mean age=72.1 yrs (sd: 5.4)). The subjects were tested with neuropsychological examination test of various cognitive domains such as memory, attention, thinking, language, and visuospatial function, at base line and 3 years later. The experimental group member participated in walking program and one of cognitive training programs; cooking, traveling, PC learning and gardening by once per week for three years. The results showed that the experimental group had a more improvement on the category cued recall test(p <0.05), the delayed recall of Logical Memory Test(p <0.05), the Trail Making Test(p <0.01), and the similarity test(p <0.05). This results suggest that leisure activities such as cooking, traveling, learning PC skill, and gardening improve cognitive functions such as episode memory, divided attention, abstract thinking.

CARE DYAD CLOSENESS AND PROVIDING COGNITIVELY STIMULATING ACTIVITIES PREDICT COGNITIVE BENEFITS FOR PERSONS WITH DEMENTIA
E.B. Fauth1, K.A. Treiber1, M.C. Norton1, C. Corcoran1, K. Piercey1, P. Rahins2, C. Lyketsos2, J. Tschanz1, 1. Family, Consumer, and Human Development, Utah State University, Logan, Utah, 2. Johns Hopkins University, Baltimore, Maryland

Research suggests that caregiving environments impact rates of cognitive decline in persons with dementia (PWD). For example, cognitive performance declines less severely when caregivers report closer emotional relationships to the PWD. We hypothesize that closer caregivers may be more likely to provide cognitively stimulating activities (CSA) to the care recipient, which in turn, explains why cognitive resources decline less dramatically in these PWD. To test these relationships, we used 187 care dyads from the Cache County Dementia Progression Study, a population-based study of persons with incident dementia and their caregivers assessed semi-annually for an average of 2.7 (SD=0.4) years. Mean PWD age was 84.6 (SD = 5.8), education was 13.2 (SD = 2.9), and 65% were female. Linear mixed models examined the effects of closeness (Relationship Closeness Scale) and cognitively stimulating activities (Lifestyle Activities Questionnaire) on rate of change in MMSE, controlling for age, sex, education, occupational attainment, estimated premorbid IQ, APOE ε4, dementia duration, and general health. In separate models, greater closeness and CSA were each associated with slower cognitive decline (F=6.2, p=0.01; F=7.4, p<0.01), particularly at earlier stages of dementia. When both variables were entered into a single model, closeness effects were robust and CSA was associated with better overall MMSE performance but no longer with rate of change. We conclude that both closeness and CSA predict slower cognitive decline, and have both unique and shared variance in explaining cognitive change. Cognitively stimulating activities is not the only mechanism by which closer dyad relationships influence cognitive change.

COGNITIVE SPEED OF PROCESSING TRAINING REDUCES DEPRESSIVE SYMPTOMS AMONG PERSONS WITH PARKINSON’S DISEASE
E.M. Hudak1, M.L. O’Connor1, C. Haley1, C.L. Peronto1, C. McNeel1, J. O’Brien1, J.D. Edwards1, 1. School of Aging Studies, University of South Florida, Tampa, Florida, 2. University of Virginia, Charlottesville, Virginia

Depression is common among individuals with Parkinson’s disease (PD; McDonald, Richard, DeLong, 2003). Cognitive speed of processing training (SOPT) is protective against increases in depression among healthy older adults (Wolinsky et al., 2009). This study examines the effects of SOPT on depressive symptoms among older adults diagnosed with PD. The study included 32 community-dwelling adults (M = 67.12 years) who were randomized to immediate SOPT (n=13) or a delayed training control condition (n=19). Inclusion criteria included PD in Hoehn and Yahr stages 1 to 3, Mini-Mental State Exam score of 23 or

64th Annual Scientific Meeting 277
CHALLENGING VIDEO GAME ON COGNITIVE PD. Other benefits of cognitive training for persons with PD should be compared to an increase in depressive symptoms among controls (mean decrease in number of depressive symptoms (mean change = -3.15) as compared to an increase in depressive symptoms among controls (mean change = 2.36). This study indicates that SOPT may effectively reduce the number of depressive symptoms experienced among adults with PD. Other benefits of cognitive training for persons with PD should be examined.

BEHINGTONS OF PLAYING A COMPLEX, SPATIALLY CHALLENGING VIDEO GAME ON COGNITIVE FUNCTIONING IN OLDER ADULTS

A. Trujillo1, L.A. Whitlock1, T. Patterson1, A. McLaughlin1, J.C. Alaire1, M. Gandy1, J. North Carolina State University, Raleigh, North Carolina, 2. Georgia Institute of Technology, Atlanta, Georgia

Recent research suggests that playing commercially available video games may have a positive effect on the cognitive functioning across the life span (Basak, Boot, Voss & Kramer, 2008; De Lisi & Wolford, 2002; Feng, Spence & Pratt, 2007; Green & Bavelier, 2006). The current study examined the extent to which playing a cognitive complex, spatially challenging video game confers benefits to older adults’ cognitive functioning. The sample consisted of 56 of community dwelling elders with an average age of 81 (SD = 6.28; range = 66 – 93). Participants completed a pre-test session before being randomly assigned to either a control or experimental conditions. The experimental condition consisted of 15 hour long sessions where participants worked through a series of levels in the game BoomBloxx on the Nintendo Wii. BoomBloxx is a multi-player action-puzzle interactive game that requires action gestures to cause strategic destruction of blocks. The training levels required low attentional demands, while the more advanced levels contained high working memory and perceptual speed demands. After the 15 sessions were completed, all participants returned for a post-test session. Results from repeated measures analysis of variance revealed marginally significant pre- to post-test by condition interaction for digit symbol recall [F(1, 50) = 3.73, p=.06, η2=.03] with intervention participants performing better at post-test than controls. A similar pattern of results was also found for measures assessing spatial ability and processing speed. Discussion will focus on the potential applied impact of video games on the cognitive competency of older adults.

EFFECT OF GROUP ACTIVITY-ORIENTED WALKING PROGRAM ON COGNITIVE, MENTAL AND PERFORMANCE STATUS: A RANDOMIZED, CONTROLLED TRIAL

C. Ura, R. Takahashi, F. Miyamae, N. Kojima, N. Sakuma, H. Kodama, S. Awata, Tokyo Metropolitan Institute of Gerontology, Tokyo, Japan

BACKGROUND: Physical activity is associated with cognitive functioning in older people. However, evidence from randomized trials is limited. OBJECTIVE: To investigate whether walking program organized and oriented as a small group activity has any beneficial effects on cognitive, mental and performance status in older persons with at least one memory problem. DESIGN: One hundred thirty-six men and women aged 65-79 years were randomly assigned to a 12-week walking class or to a waiting-list control. Walking program is an integrated program that regularly adjusts to individual ability, and consists of a daily home-based walking and a weekly group activity-oriented class. Cognitive, mental and performance status were assessed using the Trail Making Test Part A & B (executive function), WAIS-III coding (processing speed), Five-Cog test (multidimensional cognitive battery), WHO-5 and TMIG Index of Competence (everyday performance). RESULTS: Overall compliance was 88.4%. At 12 weeks, no between-group differences were seen in cognitive functions; however, among participants with lower MMSE score (<27 points), the Trail Making Test Part B in the intervention group improved more than that in the control group (p<.05). Intervention participants reported significantly greater increases in WHO-5 (p<.05) and everyday performance (p<.05) than the control group. CONCLUSION: Group activity-oriented walking program was associated with improved mental health and everyday performance. With regard to cognitive function, particular advantage may be seen in older persons with mild cognitive decline. This program seems to be suitable for implementation in the community and successful settlement of walking habit.

THE EFFECTS OF LEISURE ACTIVITIES ON THE COGNITIVE FUNCTIONING OF NURSING HOME RESIDENTS: A PLACE-CONTROLLED RANDOMIZED TRIAL

S. Cheng, P. Chow. Department of Psychological Studies, Hong Kong Institute of Education, Tai Po, Hong Kong

Objectives: To examine the effects of cognitive stimulation (mahjong) and physical exercise (Tai Chi) on the cognitive functioning of nursing home residents. Methods: 110 residents were randomized into three conditions: (a) mahjong, (b) Tai Chi, and (c) handicrafts (placebo). Inclusion criteria were MMSE ≥10 and ≤24, and suffering from at least very mild dementia (Clinical Dementia Rating [CDR] ≥0.5). Exclusion criteria were audio/visual impairment, contraindication to do mahjong or Tai Chi or regular participation in either activities in the past 3 months. Each activity was carried out three times a week over a 3-month period. Outcome measures including Mini-Mental State Examination (MMSE), verbal memory (immediate and delayed recall), verbal fluency, digit span, and CDR sum of boxes were collected at baseline, and 3, 6, 9, and 15 months. Results: There were moderate effects of mahjong on most outcome measures up to 9 months; the Tai Chi group had less and shorter-term effects. Controlling for age, education, daily cognitive activities, cardiovascular risk factors, blood pressure, and genetic predisposition to Alzheimer disease (ApoE4) did not alter the findings. Conclusion: Leisure activities, especially mental activities such as mahjong, can be effective measures to improve cognitive functioning in nursing home residents and may even delay dementia progression. They are pleasurable to the participants and likely to be sustainable as long as physical conditions allow. The lack of effects at 15 months was difficult to interpret due to an H1N1 pandemic.

CAN MEMORY TRAINING BENEFIT FROM EXECUTIVE FUNCTION TRAINING? EVIDENCE FROM HEALTHY OLDER ADULTS

J. Li, Institute of Psychology, Chinese Academy of Sciences, Beijing, China

As executive function declining is taken as one of the underlying mechanisms for memory aging, we hypothesized memory training would benefit more with executive training as a warm-up basis compared with memory training alone. 42 healthy elders were randomly assigned to memory only (M) or memory plus executive function training (ME) groups. The format of the training was 1 hour per session, 3 sessions per week, for total 16 sessions. M Group (n=22) received memory training (mnemonics) for all the 16 sessions. MG Group (n=20) received an 8-session EF training (updating & switching) followed by 8-session memory training which included the same mnemonics as in M group. Participants were tested on trained and transferred cognitive tasks before and after the training. In contrast to our hypothesis, M group performed better on both trained and near-transferred memory tasks compared with ME group, though which improved more on executive tests.
MEMORY SELF-EFFICACY PREDICTS RESPONSIVENESS TO INDUCTIVE REASONING TRAINING IN OLDER ADULTS

Although cognitive training interventions often produce clear improvement in specifically trained abilities among older adults, there are individual differences in the effectiveness of training. While prior research has found that certain factors (e.g., age, initial cognitive ability, pre-existing health conditions) moderate the degree to which older adults gain from these interventions, little research has examined the role of self-referential and motivational variables, such as self-efficacy. In the current study, we assessed the relationship between memory self-efficacy at pre-test and responsiveness to inductive reasoning training in a sample of older adults. Participants completed a measure of self-efficacy assessing beliefs about memory capacity. Participants were then randomly assigned to a waitlist control group or an inductive reasoning training intervention. Latent change score models were used to examine the moderators of change in inductive reasoning. The training produced clear improvements in inductive reasoning compared to the control. Within the training group, initial memory capacity beliefs significantly predicted change in inductive reasoning such that those with higher levels of capacity beliefs showed greater responsiveness to the intervention. Further analyses revealed that self-efficacy had effects on how trainees allocated time to the training materials over the course of the intervention. Results indicate that self-referential beliefs about cognitive potential may be an important factor contributing to plasticity in adulthood.

COGNITIVE TRAINING BENEFITS TRANSFER TO UNTRAINED TASKS BY BOLSTERING UNDERLYING COGNITIVE ABILITIES: FACTORIAL INVARIANCE AND IMPROVED PERFORMANCE ACROSS TIME IN THE IMPACT CLINICAL TRIAL
S.E. Dalton, E. Zelnikis, Gerontology, University of Southern California, Los Angeles, California

Declines in fluid cognition across the adult lifespan are associated with functional impairments which lead to lost independence, increased risk for nursing home placement, and increased mortality in late age. The theory of cognitive enrichment proposes that maintained cognitive plasticity throughout life allows for certain behaviors, including participation in cognitive training programs, to have a positive influence on cognitive function. The efficacy of training programs to improve cognition in a manner that benefits everyday functioning is demonstrated when participants show transfer of benefits to cognitive abilities that are distinct from the rehearsed skill. This project examines data from a large-scale randomized and controlled test of a computerized training program consisting of a series of mental exercises which intend to enhance cognition in healthy older adults. In addition to demonstrating improved performance on the trained tasks as a result of participation in the program, the study includes two measures of transfer to overall working and short-term memory and auditory memory function. This report first uses latent variable structural equation models to examine the factor patterns of the transfer variables and factor invariance among loadings, variances, and covariances across time. The resulting models are organized progressively and establish metric invariance between pre-randomization and post-training measures of memory performance indicating that the same underlying constructs are measured at each time point. The report subsequently demonstrates significant improvement on the transfer measures as a result of training and the ability of cognitive training to extend influence beyond what was rehearsed to improve memory performance.

SESSION 980 (POSTER)

EMOTIONS AND AGING

DOES LEISURE TIME UNCOUPLE POSITIVE AND NEGATIVE AFFECT?: APPLYING THE DYNAMIC MODEL OF AFFECT
X.L. Qian, D. Almeida, C.M. Yarnal, The Pennsylvania State University, University Park, Pennsylvania

The Dynamic Model of Affect (DMA) argues that the experience of stressors leads to a highly inverse PA-NA (positive and negative affect) relationship which can be uncoupled by positive events (i.e., a PA-NA relationship closer to zero). The DMA led us to propose that the ability to uncouple PA and NA is a criterion to assess the effectiveness of leisure time availability as a coping resource. Prior research has identified leisure as a coping resource, but has not used the DMA to study its effectiveness. The current study fills this research gap. Participants from the National Study of Daily Experiences (NSDE; N=2008, age 33 to 86), part of the National Survey of Midlife in the United States (MIDUS), completed telephone interviews about daily stressful events, time use and affective experiences for eight consecutive days. We examined the effect of daily stressors and leisure time availability on the PA-NA relationship using multilevel models. Results showed that PA and NA were more negatively related on days participants experienced more stressors than usual (controlling that day’s leisure time availability). Meanwhile, having more leisure time than usual on those days was associated with the uncoupling of the negative PA-NA relationship (controlling that day’s number of stressors). Our findings provide empirical support for the DMA and extend the application of the DMA to leisure as a coping resource. Our study also demonstrates the effectiveness of leisure time availability in helping people cope with daily stressors and the importance of studying leisure as time use.

AGE DIFFERENCES IN DELIBERATELY IMPLEMENTING ATTENTIONAL DEPLOYMENT TO MANAGE MOOD
M. Lohani, D. Isaacowitz, Brandeis University, Waltham, Massachusetts

Older adults are found to naturally show attentional preferences for positive information; however, no previous study has investigated age differences in managing mood by deliberately focusing attention to aspects of emotional information, termed attentional deployment. Forty-two young participants (Mage = 18.5) and 48 older participants (Mage = 71.42) watched two sadness-inducing video clips (about death and terminal illness, 4-5 minutes long) under two experimental conditions - natural viewing (no regulation) and attentional deployment (manage mood by diverting attention away from negative). We used a multi-method approach to investigate age-differences in implementing attentional deployment; participants: a) reported their mood (0 = worst, 100 = most pleasant) after both conditions; we objectively measured their b) fixation patterns via eye-tracking; c) negative expressions via corrugator muscle activity; and d) physiological response via skin conductance level. In the natural viewing condition, consistent with previous work, older participants fixated lesser on the negative regions of the stimuli. In attentional deployment condition, both younger and older participants were able to implement deliberate attentional deployment. However, only older participants and not young experienced mood improvements relative to the natural viewing condition. No age differences in negative expressions of emotions or physiology were found. Thus, attentional deployment was found to be a more beneficial emotion regulation strategy for older participants as they experienced significantly better mood than their younger counterparts.
RISKY CHOICE IN YOUNGER VERSUS OLDER ADULTS: CONTEXT MATTERS
Y.H. Huang, S. Wood, D.E. Berger, Y. Hanoch, 1. Claremont Graduate University, Claremont, California, 2. Scripps College, Claremont, California, 3. University of Plymouth, Plymouth, United Kingdom

Pursuant to earlier findings that showed that older adults tend to experience decline in their deliberative capacity while their affective abilities tend to remain intact, the present study investigated performance of younger and older adults on a risk-taking task that included deliberative and affective conditions. Two versions of the Columbia Card Task (CCT) were used to trigger either affective decision-making (i.e., the “hot” CCT) or deliberative decision-making (i.e., the “cold” CCT). It was predicted that older and younger adults would demonstrate similar risk patterns in risky environments where emotion was involved, but older adults would perform more poorly in risky environments that required more deliberative processing. Compared to younger adults, older adults performed more poorly in both emotional and deliberative conditions, but the difference was greater in the deliberative condition. The use of available probability information was correlated with working memory and numeracy. Overall older adults considered less information relevant to probability assessment across task conditions. The relationship between information use and age was partially mediated by numeracy. This finding adds to the growing literature linking numeric skills to effective risk assessment.

ACCURACY AND CONFIDENCE IN THE APPRAISAL OF FACIAL EXPRESSIONS OF EMOTION: THE EFFECTS OF AGE
S. Rastegar, J. Kellough, B.G. Knight, Department of Psychology, University of Southern California, Los Angeles, California

Research suggests that older adults may be less accurate in identifying facial expressions of certain basic emotions (Isacowitz, 2007; Orgeta, 2010). In the current study, 126 older and 111 younger adults were presented with sets of standardized facial expressions of emotion (Happy, Sad, Angry, Fear; Ekman, 1976). Participants indicated the presence of as many positive and negative emotions as perceived from a list of 16 emotions, as well as confidence ratings for the emotion(s) endorsed. No age differences were found for accuracy with Happy faces. For Sad and Angry faces, older adults were less accurate than younger adults (Sad: 57.4% vs. 69.4% accuracy, Z=3.772, p<0.05; Angry: 81.5% vs. 86.9%, z=2.183, p<0.05). However, for Fear trials, older adults were more accurate than younger adults (78.1% vs. 71.23%, Z=2.364, p<0.05). When participants accurately identified the correct emotion, younger adults were more confident in their ratings of Happy faces than older adults, F(1, 234) = 4.325, p=0.039. No age differences in confidence for negative emotions were found. Our findings add to previous research suggesting that older adults may be less likely to correctly identify sad and angry faces, but not in recognizing happy or fear faces (Phillips, 2002). Differences in confidence ratings for specific emotions by age do not fully explain differences in accuracy.

AGE DIFFERENCES IN THE COMPLEXITY OF EMOTION PERCEPTION
S. Kim, J. Kellough, B.G. Knight, 1. Gerontology, University of Southern California, Los Angeles, California, 2. University of Southern California, Los Angeles, California

Lifespan developmental theories of emotion suggest that complexity in emotion perception increases in later life. To test this idea, we examined age differences in emotion differentiation in the judgment of emotion from facial expressions. Younger adults (n=120) and older adults (n=111) identified emotions on facial expressions and the degree of confidence for each emotion was rated. The faces represented two levels of ambiguity: The low level of ambiguity consisted of clearly expressed emotional faces, and the high level of ambiguity was from morphed faces that combined features of a happy face and a face showing negative emotion (sad, angry, or fearful). The number of factors was the measure of emotion differentiation and extracted from intra-individual factor analysis of confidence ratings on facial expressions. We compared younger vs. older adults’ number of factors at the two levels of ambiguity (low and high). A main effect for age was found, such that older adults showed a greater number of factors in the judgment of emotions in facial expressions compared to younger adults. A main effect for ambiguity was found, that both age groups reported fewer factors at the high level of ambiguity. There was no interaction of age and ambiguity. Findings were consistent with the existing literature suggesting that older adults display more complexity in emotion perception than younger adults. The ambiguous emotional stimuli appear to result in a decrease in the range of perceived emotions, which lead to fewer factors in the judgment of emotion in facial expressions.

EMOTION RECOGNITION FOR DYNAMIC FAMILIAR AND STRANGER FACES: AGE AND GENDER MATTER
J.T. Stanley, D. Isacowitz, Brandeis University, Waltham, Massachusetts

Past work suggests older adults are less accurate at recognizing facial expressions than young adults. However, most of these studies used static photos of strangers. In the present study, we sought to determine whether age differences in emotion recognition accuracy could be attenuated if the stimuli were dynamic facial expressions of familiar partners. Young (18-30 years) and older (60-80 years) adult couples participated in two sessions. First, their facial expressions were recorded while they watched film clips intended to evoke sad, angry, happy, fearful, and disgusted feelings. These videos were edited into short videos of facial expressions. In a second session two to eight months later, each participant was asked to identify the facial expressions of their partner and a same-age stranger. Using video as unit of analysis, older adults (n=37) were less accurate at recognizing emotion in dynamic stimuli than young adults (n=40), p<.001 and all participants were better at recognizing familiar partners than strangers, p<.001. Gender and emotion interacted with familiarity and age, p<.05, such that young adults outperformed older adults at recognizing sad videos of familiar female targets but older adults outperformed young adults at recognizing sad videos of female strangers. These results suggest that many facets of the stimuli influence the emotion recognition accuracy of young and older adults. The results are discussed from a discrete emotions perspective.

THE ROLE OF SENSORY IMPAIRMENT INFLUENCING LONELINESS AMONG CENTENARIANS: FINDINGS FROM THE GEORGIA CENTENARIAN STUDY
R.B. Hensley, P. Martin, M. MacDonald, L. Poon, 1. Psychology, The College of Saint Scholastica, Duluth, Minnesota, 2. Iowa State University, Ames, Iowa, 3. Kansas State University, Manhattan, Kansas, 4. University of Georgia, Athens, Georgia
