Factors Affecting Human Antibody Response. III. Immunologic Responses of Men Deficient in Pantothenic Acid .......................... 85
Robert E. Hodges, William B. Bean, Margaret A. Ohlson and Roberta E. Bleiler

Pantothenic acid deficiency was produced in human volunteer subjects. Their immunologic status was studied by the response to immunizing agents and to the autoantibody of heterografts. A curious finding is a dissociation between typhoid and tetanus antibody response.

Fluoride Addition to Milk and Its Effect on Dental Caries in School Children .......................... 94

In this important pilot experiment the effect of fluoridation of milk in a school lunch program was determined by well controlled procedures. The results are highly significant from the public health standpoint.

Family Diet Pattern for Lowering the Serum Cholesterol Level .............................................. 102
Leon Swell, P. E. Schools and C. R. Treadwell

As indicated by the title, a family diet pattern is described which is effective in lowering the serum cholesterol level of clinically healthy subjects with either normal or elevated serum cholesterol levels. It does not produce any change in body weight.

Effect of the Saturation of Fats Upon the Disposition of Ingested Cholesterol .......................... 108

Because of the many variables in lipid-cholesterol experiments, these authors approached the problem in an unusual manner. As a result, their observations suggest that many workers may have been emphasizing the obverse of the basic mechanism in the "saturated versus unsaturated" fat effects.

Aldosteronuria and the Edema of Kwashiorkor ................................................................. 115
A. O. Lurie and W. P. U. Jackson

Edema is a characteristic finding in kwashiorkor. In this interesting series of observations, the excretion of aldosterone was measured in order to learn more about the fluid and electrolyte balance in this important disorder.
Use of Isolated Vegetable Proteins in the Treatment of Protein Malnutrition (Kwashiorkor) 127

These authors undertook a study of three protein blends to determine their effectiveness in the treatment of kwashiorkor in forty-five children aged one to five years. Their findings have been confirmed by others and indicate that they can be used to advantage in the treatment of this condition.

Serum Lipids and Apparent Health of Italian-American Factory Workers in a Boston Area. A Four Year Follow-Up 134
OSCAR M. JANKELSON, PATRICIA A. STEFANIK AND FREDRICK J. STARE

In a follow-up study on the development of atherosclerosis in 146 subjects living in the Boston area, whose parents had been born in the environs of Naples, Italy, no correlation could be demonstrated between serum cholesterol levels and body weight, physical activity or electrocardiographic abnormalities. The possible significance of these factors is discussed.

The Influence of Diet on Fecal Lipids in South African White and Bantu Prisoners 142
A. ANTONIS AND I. BERSOHN

The fecal excretion of sterols, bile acids and fatty acids may be expected to be a factor in the regulation of lipid metabolism. In this detailed and controlled study, alterations in the diet were found to have significant effects on serum lipid levels. In addition, the amount of fiber in the diet also influenced stool excretion patterns.

The Influence of Nonabsorbable Antibiotics on Serum Lipids and the Excretion of Neutral Sterols and Bile Acids 156
RICHARD C. POWELL, WILLIAM T. NUNES, RICHARD S. HARDING AND JOSEPH B. VACCA

This is an interesting study on the influence of neomycin or a combination of polymyxin B and bacitracin on serum lipids, the fecal excretion of bile acids and neutral sterols, the digestibility of macronutrients and the stool bacterial content. It was found that although nonabsorbable antibiotics are capable of lowering serum cholesterol and increasing the excretion of cholesterol metabolites, no firm inference may yet be drawn as to the status of total body cholesterol.
